(old) htmldiff from- (new)

AArch32 -- Base Instructions (alphabetic order)

ADC, ADCS (immediate): Add with Carry (immediate).

ADC, ADCS (register): Add with Carry (register).

ADC, ADCS (register-shifted register): Add with Carry (register-shifted register).

ADD (immediate, to PC): Add to PC: an alias of ADR.

ADD, ADDS (immediate): Add (immediate).

ADD, ADDS (register): Add (register).

ADD, ADDS (register-shifted register): Add (register-shifted register).

ADD, ADDS (SP plus immediate): Add to SP (immediate).

ADD, ADDS (SP plus register): Add to SP (register).

ADR: Form PC-relative address.

AND, ANDS (immediate): Bitwise AND (immediate).

AND, ANDS (register): Bitwise AND (register).

AND, ANDS (register-shifted register): Bitwise AND (register-shifted register).

ASR (immediate): Arithmetic Shift Right (immediate): an alias of MOV, MOVS (register).

ASR (register): Arithmetic Shift Right (register): an alias of MOV, MOVS (register-shifted register).

ASRS (immediate): Arithmetic Shift Right, setting flags (immediate): an alias of MOV, MOVS (register).

ASRS (register): Arithmetic Shift Right, setting flags (register): an alias of MOV, MOVS (register-shifted register).

B: Branch.

BFC: Bit Field Clear.

BFI: Bit Field Insert.

BIC, BICS (immediate): Bitwise Bit Clear (immediate).

BIC, BICS (register): Bitwise Bit Clear (register).

BIC, BICS (register-shifted register): Bitwise Bit Clear (register-shifted register).

BKPT: Breakpoint.

BL, BLX (immediate): Branch with Link and optional Exchange (immediate).

BLX (register): Branch with Link and Exchange (register).

BX: Branch and Exchange.

BXJ: Branch and Exchange, previously Branch and Exchange Jazelle.

CBNZ, CBZ: Compare and Branch on Nonzero or Zero.

CLREX: Clear-Exclusive.

CLZ: Count Leading Zeros.

CMN (immediate): Compare Negative (immediate).

CMN (register): Compare Negative (register).

CMN (register-shifted register): Compare Negative (register-shifted register).

CMP (immediate): Compare (immediate).

CMP (register): Compare (register).

CMP (register-shifted register): Compare (register-shifted register).

CPS, CPSID, CPSIE: Change PE State.

CRC32: CRC32.

CRC32C: CRC32C.

CSDB: Consumption of Speculative Data Barrier.

DBG: Debug hint.

DCPS1~~DCPS1, DCPS2, DCPS3~~: Debug Change PE State to EL1.~~State.~~

DCPS2: Debug Change PE State to EL2.

DCPS3: Debug Change PE State to EL3.

DMB: Data Memory Barrier.

DSB: Data Synchronization Barrier.

EOR, EORS (immediate): Bitwise Exclusive OR (immediate).

EOR, EORS (register): Bitwise Exclusive OR (register).

EOR, EORS (register-shifted register): Bitwise Exclusive OR (register-shifted register).

ERET: Exception Return.

ESB: Error Synchronization Barrier.

HLT: Halting Breakpoint.

HVC: Hypervisor Call.

ISB: Instruction Synchronization Barrier.

IT: If-Then.

LDA: Load-Acquire Word.

LDAB: Load-Acquire Byte.

LDAEX: Load-Acquire Exclusive Word.

LDAEXB: Load-Acquire Exclusive Byte.

LDAEXD: Load-Acquire Exclusive Doubleword.

LDAEXH: Load-Acquire Exclusive Halfword.

LDAH: Load-Acquire Halfword.

LDC (immediate): Load data to System register (immediate).

LDC (literal): Load data to System register (literal).

LDM (exception return): Load Multiple (exception return).

LDM (User registers): Load Multiple (User registers).

LDM, LDMIA, LDMFD: Load Multiple (Increment After, Full Descending).

LDMDA, LDMFA: Load Multiple Decrement After (Full Ascending).

LDMDB, LDMEA: Load Multiple Decrement Before (Empty Ascending).

LDMIB, LDMED: Load Multiple Increment Before (Empty Descending).

LDR (immediate): Load Register (immediate).

LDR (literal): Load Register (literal).

LDR (register): Load Register (register).

LDRB (immediate): Load Register Byte (immediate).

LDRB (literal): Load Register Byte (literal).

LDRB (register): Load Register Byte (register).

LDRBT: Load Register Byte Unprivileged.

LDRD (immediate): Load Register Dual (immediate).

LDRD (literal): Load Register Dual (literal).

LDRD (register): Load Register Dual (register).

LDREX: Load Register Exclusive.

LDREXB: Load Register Exclusive Byte.

LDREXD: Load Register Exclusive Doubleword.

LDREXH: Load Register Exclusive Halfword.

LDRH (immediate): Load Register Halfword (immediate).

LDRH (literal): Load Register Halfword (literal).

LDRH (register): Load Register Halfword (register).

LDRHT: Load Register Halfword Unprivileged.

LDRSB (immediate): Load Register Signed Byte (immediate).

LDRSB (literal): Load Register Signed Byte (literal).

LDRSB (register): Load Register Signed Byte (register).

LDRSBT: Load Register Signed Byte Unprivileged.

LDRSH (immediate): Load Register Signed Halfword (immediate).

LDRSH (literal): Load Register Signed Halfword (literal).

LDRSH (register): Load Register Signed Halfword (register).

LDRSHT: Load Register Signed Halfword Unprivileged.

LDRT: Load Register Unprivileged.

LSL (immediate): Logical Shift Left (immediate): an alias of MOV, MOVS (register).

LSL (register): Logical Shift Left (register): an alias of MOV, MOVS (register-shifted register).

LSLS (immediate): Logical Shift Left, setting flags (immediate): an alias of MOV, MOVS (register).

LSLS (register): Logical Shift Left, setting flags (register): an alias of MOV, MOVS (register-shifted register).

LSR (immediate): Logical Shift Right (immediate): an alias of MOV, MOVS (register).

LSR (register): Logical Shift Right (register): an alias of MOV, MOVS (register-shifted register).

LSRS (immediate): Logical Shift Right, setting flags (immediate): an alias of MOV, MOVS (register).

LSRS (register): Logical Shift Right, setting flags (register): an alias of MOV, MOVS (register-shifted register).

MCR: Move to System register from general-purpose register or execute a System instruction.

MCRR: Move to System register from two general-purpose registers.

MLA, MLAS: Multiply Accumulate.

MLS: Multiply and Subtract.

MOV, MOVS (immediate): Move (immediate).

MOV, MOVS (register): Move (register).

MOV, MOVS (register-shifted register): Move (register-shifted register).

MOVT: Move Top.

MRC: Move to general-purpose register from System register.

MRRC: Move to two general-purpose registers from System register.

MRS: Move Special register to general-purpose register.

MRS (Banked register): Move Banked or Special register to general-purpose register.

MSR (Banked register): Move general-purpose register to Banked or Special register.

MSR (immediate): Move immediate value to Special register.

MSR (register): Move general-purpose register to Special register.

MUL, MULS: Multiply.

MVN, MVNS (immediate): Bitwise NOT (immediate).

MVN, MVNS (register): Bitwise NOT (register).

MVN, MVNS (register-shifted register): Bitwise NOT (register-shifted register).

NOP: No Operation.

ORN, ORNS (immediate): Bitwise OR NOT (immediate).

ORN, ORNS (register): Bitwise OR NOT (register).

ORR, ORRS (immediate): Bitwise OR (immediate).

ORR, ORRS (register): Bitwise OR (register).

ORR, ORRS (register-shifted register): Bitwise OR (register-shifted register).

PKHBT, PKHTB: Pack Halfword.

PLD (literal): Preload Data (literal).

PLD, PLDW (immediate): Preload Data (immediate).

PLD, PLDW (register): Preload Data (register).

PLI (immediate, literal): Preload Instruction (immediate, literal).

PLI (register): Preload Instruction (register).

POP: Pop Multiple Registers from Stack.

POP (multiple registers): Pop Multiple Registers from Stack: an alias of LDM, LDMIA, LDMFD.

POP (single register): Pop Single Register from Stack: an alias of LDR (immediate).

PSSBB: Physical Speculative Store Bypass Barrier.

PUSH: Push Multiple Registers to Stack.

PUSH (multiple registers): Push multiple registers to Stack: an alias of STMDB, STMFD.

PUSH (single register): Push Single Register to Stack: an alias of STR (immediate).

QADD: Saturating Add.

QADD16: Saturating Add 16.

QADD8: Saturating Add 8.

QASX: Saturating Add and Subtract with Exchange.

QDADD: Saturating Double and Add.

QDSUB: Saturating Double and Subtract.

QSAX: Saturating Subtract and Add with Exchange.

QSUB: Saturating Subtract.

QSUB16: Saturating Subtract 16.

QSUB8: Saturating Subtract 8.

RBIT: Reverse Bits.

REV: Byte-Reverse Word.

REV16: Byte-Reverse Packed Halfword.

REVSH: Byte-Reverse Signed Halfword.

RFE, RFEDA, RFEDB, RFEIA, RFEIB: Return From Exception.

ROR (immediate): Rotate Right (immediate): an alias of MOV, MOVS (register).

ROR (register): Rotate Right (register): an alias of MOV, MOVS (register-shifted register).

RORS (immediate): Rotate Right, setting flags (immediate): an alias of MOV, MOVS (register).

RORS (register): Rotate Right, setting flags (register): an alias of MOV, MOVS (register-shifted register).

RRX: Rotate Right with Extend: an alias of MOV, MOVS (register).

RRXS: Rotate Right with Extend, setting flags: an alias of MOV, MOVS (register).

RSB, RSBS (immediate): Reverse Subtract (immediate).

RSB, RSBS (register): Reverse Subtract (register).

RSB, RSBS (register-shifted register): Reverse Subtract (register-shifted register).

RSC, RSCS (immediate): Reverse Subtract with Carry (immediate).

RSC, RSCS (register): Reverse Subtract with Carry (register).

RSC, RSCS (register-shifted register): Reverse Subtract (register-shifted register).

SADD16: Signed Add 16.

SADD8: Signed Add 8.

SASX: Signed Add and Subtract with Exchange.

SB: Speculation Barrier.

SBC, SBCS (immediate): Subtract with Carry (immediate).

SBC, SBCS (register): Subtract with Carry (register).

SBC, SBCS (register-shifted register): Subtract with Carry (register-shifted register).

SBFX: Signed Bit Field Extract.

SDIV: Signed Divide.

SEL: Select Bytes.

SETEND: Set Endianness.

SETPAN: Set Privileged Access Never.

SEV: Send Event.

SEVL: Send Event Local.

SHADD16: Signed Halving Add 16.

SHADD8: Signed Halving Add 8.

SHASX: Signed Halving Add and Subtract with Exchange.

SHSAX: Signed Halving Subtract and Add with Exchange.

SHSUB16: Signed Halving Subtract 16.

SHSUB8: Signed Halving Subtract 8.

SMC: Secure Monitor Call.

SMLABB, SMLABT, SMLATB, SMLATT: Signed Multiply Accumulate (halfwords).

SMLAD, SMLADX: Signed Multiply Accumulate Dual.

SMLAL, SMLALS: Signed Multiply Accumulate Long.

SMLALBB, SMLALBT, SMLALTB, SMLALTT: Signed Multiply Accumulate Long (halfwords).

SMLALD, SMLALDX: Signed Multiply Accumulate Long Dual.

SMLAWB, SMLAWT: Signed Multiply Accumulate (word by halfword).

SMLSD, SMLSDX: Signed Multiply Subtract Dual.

SMLSLD, SMLSLDX: Signed Multiply Subtract Long Dual.

SMMLA, SMMLAR: Signed Most Significant Word Multiply Accumulate.

SMMLS, SMMLSR: Signed Most Significant Word Multiply Subtract.

SMMUL, SMMULR: Signed Most Significant Word Multiply.

SMUAD, SMUADX: Signed Dual Multiply Add.

SMULBB, SMULBT, SMULTB, SMULTT: Signed Multiply (halfwords).

SMULL, SMULLS: Signed Multiply Long.

SMULWB, SMULWT: Signed Multiply (word by halfword).

SMUSD, SMUSDX: Signed Multiply Subtract Dual.

SRS, SRSDA, SRSDB, SRSIA, SRSIB: Store Return State.

SSAT: Signed Saturate.

SSAT16: Signed Saturate 16.

SSAX: Signed Subtract and Add with Exchange.

SSBB: Speculative Store Bypass Barrier.

SSUB16: Signed Subtract 16.

SSUB8: Signed Subtract 8.

STC: Store data to System register.

STL: Store-Release Word.

STLB: Store-Release Byte.

STLEX: Store-Release Exclusive Word.

STLEXB: Store-Release Exclusive Byte.

STLEXD: Store-Release Exclusive Doubleword.

STLEXH: Store-Release Exclusive Halfword.

STLH: Store-Release Halfword.

STM (User registers): Store Multiple (User registers).

STM, STMIA, STMEA: Store Multiple (Increment After, Empty Ascending).

STMDA, STMED: Store Multiple Decrement After (Empty Descending).

STMDB, STMFD: Store Multiple Decrement Before (Full Descending).

STMIB, STMFA: Store Multiple Increment Before (Full Ascending).

STR (immediate): Store Register (immediate).

STR (register): Store Register (register).

STRB (immediate): Store Register Byte (immediate).

STRB (register): Store Register Byte (register).

STRBT: Store Register Byte Unprivileged.

STRD (immediate): Store Register Dual (immediate).

STRD (register): Store Register Dual (register).

STREX: Store Register Exclusive.

STREXB: Store Register Exclusive Byte.

STREXD: Store Register Exclusive Doubleword.

STREXH: Store Register Exclusive Halfword.

STRH (immediate): Store Register Halfword (immediate).

STRH (register): Store Register Halfword (register).

STRHT: Store Register Halfword Unprivileged.

STRT: Store Register Unprivileged.

SUB (immediate, from PC): Subtract from PC: an alias of ADR.

SUB, SUBS (immediate): Subtract (immediate).

SUB, SUBS (register): Subtract (register).

SUB, SUBS (register-shifted register): Subtract (register-shifted register).

SUB, SUBS (SP minus immediate): Subtract from SP (immediate).

SUB, SUBS (SP minus register): Subtract from SP (register).

SVC: Supervisor Call.

SXTAB: Signed Extend and Add Byte.

SXTAB16: Signed Extend and Add Byte 16.

SXTAH: Signed Extend and Add Halfword.

SXTB: Signed Extend Byte.

SXTB16: Signed Extend Byte 16.

SXTH: Signed Extend Halfword.

TBB, TBH: Table Branch Byte or Halfword.

TEQ (immediate): Test Equivalence (immediate).

TEQ (register): Test Equivalence (register).

TEQ (register-shifted register): Test Equivalence (register-shifted register).

TSB CSYNC: Trace Synchronization Barrier.

TST (immediate): Test (immediate).

TST (register): Test (register).

TST (register-shifted register): Test (register-shifted register).

UADD16: Unsigned Add 16.

UADD8: Unsigned Add 8.

UASX: Unsigned Add and Subtract with Exchange.

UBFX: Unsigned Bit Field Extract.

UDF: Permanently Undefined.

UDIV: Unsigned Divide.

UHADD16: Unsigned Halving Add 16.

UHADD8: Unsigned Halving Add 8.

UHASX: Unsigned Halving Add and Subtract with Exchange.

UHSAX: Unsigned Halving Subtract and Add with Exchange.

UHSUB16: Unsigned Halving Subtract 16.

UHSUB8: Unsigned Halving Subtract 8.

UMAAL: Unsigned Multiply Accumulate Accumulate Long.

UMLAL, UMLALS: Unsigned Multiply Accumulate Long.

UMULL, UMULLS: Unsigned Multiply Long.

UQADD16: Unsigned Saturating Add 16.

UQADD8: Unsigned Saturating Add 8.

UQASX: Unsigned Saturating Add and Subtract with Exchange.

UQSAX: Unsigned Saturating Subtract and Add with Exchange.

UQSUB16: Unsigned Saturating Subtract 16.

UQSUB8: Unsigned Saturating Subtract 8.

USAD8: Unsigned Sum of Absolute Differences.

USADA8: Unsigned Sum of Absolute Differences and Accumulate.

USAT: Unsigned Saturate.

USAT16: Unsigned Saturate 16.

USAX: Unsigned Subtract and Add with Exchange.

USUB16: Unsigned Subtract 16.

USUB8: Unsigned Subtract 8.

UXTAB: Unsigned Extend and Add Byte.

UXTAB16: Unsigned Extend and Add Byte 16.

UXTAH: Unsigned Extend and Add Halfword.

UXTB: Unsigned Extend Byte.

UXTB16: Unsigned Extend Byte 16.

UXTH: Unsigned Extend Halfword.

WFE: Wait For Event.

WFI: Wait For Interrupt.

YIELD: Yield hint.

ADC, ADCS (register)

Add with Carry (register) adds a register value, the Carry flag value, and an optionally-shifted register value, and writes the result to the destination register.

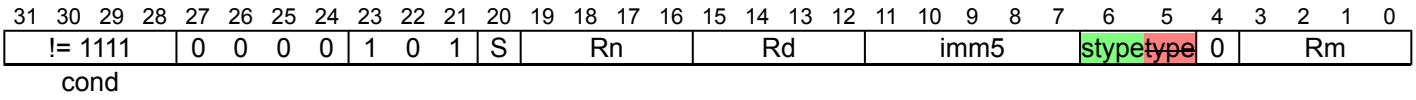
If the destination register is not the PC, the ADCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ArmARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ADC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- The ADCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores *PSTATE* from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state*.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 and T2) .

A1



ADC, rotate right with extend (S == 0 && imm5 == 00000 && stypetype == 11)

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ADC, shift or rotate by value (S == 0 && !(imm5 == 00000 && stypetype == 11))

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

ADCS, rotate right with extend (S == 1 && imm5 == 00000 && stypetype == 11)

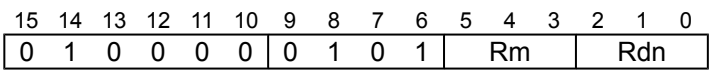
```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ADCS, shift or rotate by value (S == 1 && !(imm5 == 00000 && stypetype == 11))

```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}

d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);(type, imm5);
```

T1



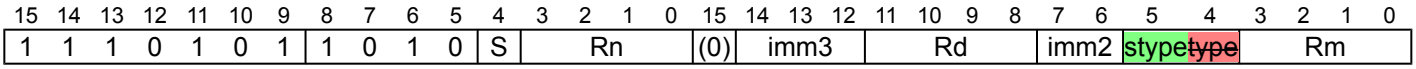
T1

```
ADC<c>{<q>} {<Rdn>,} <Rdn>, <Rm> // (Inside IT block)

ADCS{<q>} {<Rdn>,} <Rdn>, <Rm> // (Outside IT block)

d = UInt(Rdn);  n = UInt(Rdn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



ADC, rotate right with extend (S == 0 && imm3 == 000 && imm2 == 00 && stypetype == 11)

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ADC, shift or rotate by value (S == 0 && !(imm3 == 000 && imm2 == 00 && stypetype == 11))

```
ADC<c>.W {<Rd>,} <Rn>, <Rm> // (Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1)

ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

ADCS, rotate right with extend (S == 1 && imm3 == 000 && imm2 == 00 && stypetype == 11)

```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ADCS, shift or rotate by value (S == 1 && !(imm3 == 000 && imm2 == 00 && stypetype == 11))

```
ADCS.W {<Rd>,} <Rn>, <Rm> // (Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1)

ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
(type, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rdn> Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the ADC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- For the ADCS variant, the instruction performs an exception return, that restores *PSTATE* from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

- Outside an IT block, if ADCS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ADCS <Rd>, <Rn> had been written.
- Inside an IT block, if ADC<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ADC<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, PSTATE.C);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

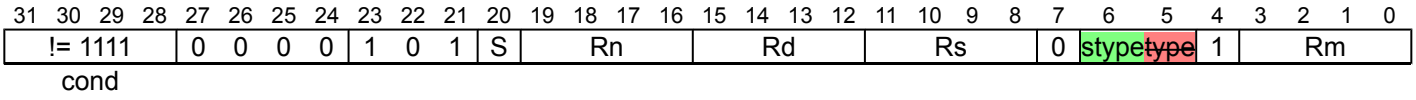
- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

Internal version only: isa v00_96~~v00_88~~, pseudocode r8p5_00bet2_rc5~~v85-xml-00bet9_rc1_1~~ ; Build timestamp: 2019-03-28T07~~2018-12-12T12~~:59~~33~~

ADC, ADCS (register-shifted register)

Add with Carry (register-shifted register) adds a register value, the Carry flag value, and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1



Flag setting (S == 1)

```
ADCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift><type> <Rs>
```

Not flag setting (S == 0)

```
ADC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift><type> <Rs>
```

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(stype);
(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

For more information about the CONSTRAINED UNPREDICTABLE behavior, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<shifttype> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shifttype>
00	LSL
01	LSR
10	ASR
11	ROR

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

ADD, ADDS (register)

Add (register) adds a register value and an optionally-shifted register value, and writes the result to the destination register.

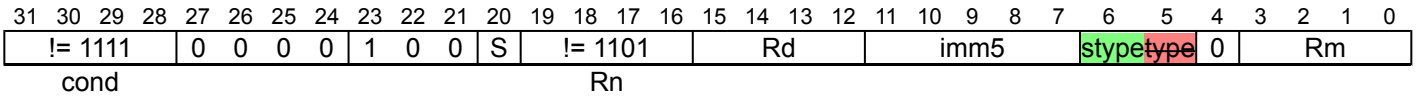
If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- The ADDS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores *PSTATE* from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state*.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 , T2 and T3) .

A1



ADD, rotate right with extend (S == 0 && imm5 == 00000 && stypetype == 11)

```

if Rn == '1101' then SEE "ADD (SP plus register)";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c>	See *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.

<Rdn> Is the general-purpose source and destination register, encoded in the "DN:Rdn" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is a simple branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.

The assembler language allows <Rdn> to be specified once or twice in the assembler syntax. When used inside an IT block, and <Rdn> and <Rm> are in the range R0 to R7, <Rdn> must be specified once so that encoding T2 is preferred to encoding T1. In all other cases there is no difference in behavior when <Rdn> is specified once or twice.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. If the PC is used:

- For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- For the ADDS variant, the instruction performs an exception return, that restores *PSTATE* from SPSR_<current_mode>. Arm deprecates use of this instruction.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field.

When used inside an IT block, <Rd> must be specified. When used outside an IT block, <Rd> is optional, and:

- If omitted, this register is the same as <Rn>.
- If present, encoding T1 is preferred to encoding T2.

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used. If the SP is used, see *ADD (SP plus register)*.

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

For encoding T3: is the first general-purpose source register, encoded in the "Rn" field. If the SP is used, see *ADD (SP plus register)*.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T3: is the second general-purpose source register, encoded in the "Rm" field.

For encoding T2: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

<shift> Is the type of shift to be applied to the second source register, encoded in "stype~~type~~":

stype~~type~~	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Inside an IT block, if ADD<c> <Rd>, <Rn>, <Rd> cannot be assembled using encoding T1, it is assembled using encoding T2 as though ADD<c> <Rd>, <Rn> had been written. To prevent this happening, use the .W qualifier.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, '0');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:

    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

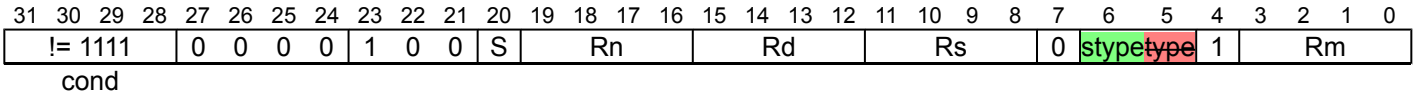
(old) htmldiff from- (new)

ADD, ADDS (register-shifted register)

Add (register-shifted register) adds a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1



Flag setting (S == 1)

```
ADDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift><type> <Rs>
```

Not flag setting (S == 0)

```
ADD{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift><type> <Rs>
```

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(stype);
(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

For more information about the CONSTRAINED UNPREDICTABLE behavior, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<shifttype> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shifttype>
00	LSL
01	LSR
10	ASR
11	ROR

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], shifted, '0');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
```

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

- Outside an IT block, if ANDS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ANDS <Rd>, <Rn> had been written.
- Inside an IT block, if AND<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though AND<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

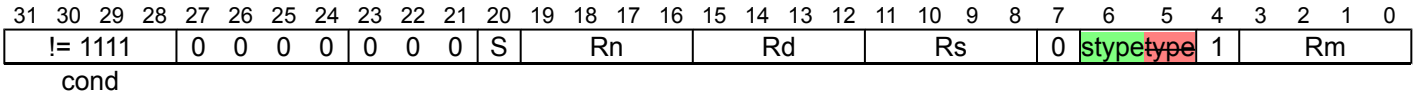
AND, ANDS (register-shifted register)

Bitwise AND (register-shifted register) performs a bitwise AND of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1



Flag setting (S == 1)

```
ANDS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift><type> <Rs>
```

Not flag setting (S == 0)

```
AND{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift><type> <Rs>
```

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(stype);
(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

For more information about the CONSTRAINED UNPREDICTABLE behavior, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<shifttype> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shifttype>
00	LSL
01	LSR
10	ASR
11	ROR

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Operational information

(old) htmldiff from- (new)

BIC, BICS (register)

Bitwise Bit Clear (register) performs a bitwise AND of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register.

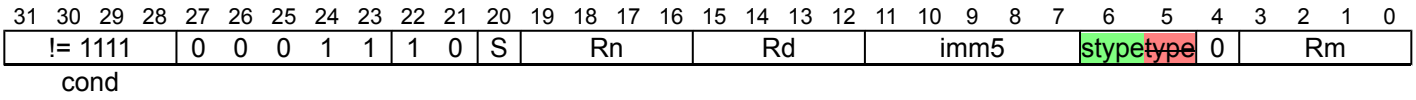
If the destination register is not the PC, the BICS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ArmARM deprecates any use of these encodings. However, when the destination register is the PC:

- The BIC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- The BICS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores *PSTATE* from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state*.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 and T2) .

A1



BIC, rotate right with extend (S == 0 && imm5 == 00000 && stypetype == 11)

```
BIC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

BIC, shift or rotate by value (S == 0 && !(imm5 == 00000 && stypetype == 11))

```
BIC{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

BICS, rotate right with extend (S == 1 && imm5 == 00000 && stypetype == 11)

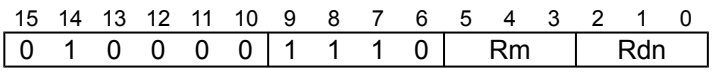
```
BICS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

BICS, shift or rotate by value (S == 1 && !(imm5 == 00000 && stypetype == 11))

```
BICS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);(type, imm5);
```

T1



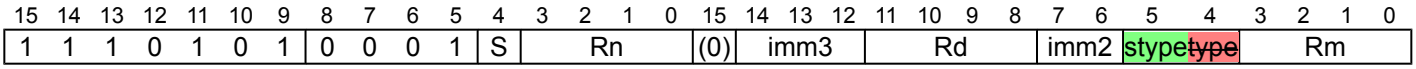
T1

```
BIC<c>{<q>} {<Rdn>,} <Rdn>, <Rm> // (Inside IT block)

BICS{<q>} {<Rdn>,} <Rdn>, <Rm> // (Outside IT block)
```

```
d = UInt(Rdn);  n = UInt(Rdn);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



BIC, rotate right with extend (S == 0 && imm3 == 000 && imm2 == 00 && stypetype == 11)

```
BIC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

BIC, shift or rotate by value (S == 0 && !(imm3 == 000 && imm2 == 00 && stypetype == 11))

```
BIC<c>.W {<Rd>,} <Rn>, <Rm> // (Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1)

BIC{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

BICS, rotate right with extend (S == 1 && imm3 == 000 && imm2 == 00 && stypetype == 11)

```
BICS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

BICS, shift or rotate by value (S == 1 && !(imm3 == 000 && imm2 == 00 && stypetype == 11))

```
BICS.W {<Rd>,} <Rn>, <Rm> // (Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1)

BICS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
(type, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;  // Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rdn> Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the BIC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- For the BICS variant, the instruction performs an exception return, that restores *PSTATE* from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND NOT(shifted);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

Operational information

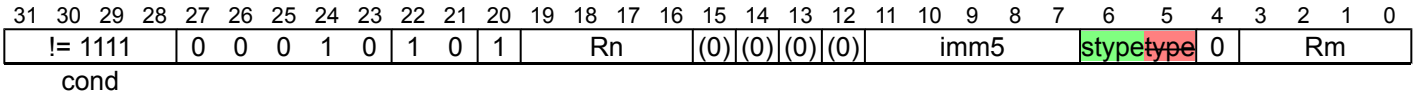
CMP (register)

Compare (register) subtracts an optionally-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 , T2 and T3) .

A1



Rotate right with extend (imm5 == 00000 && stypetype == 11)

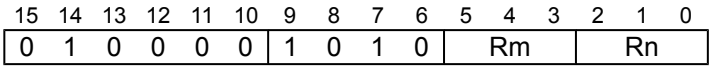
```
CMP{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value (!(imm5 == 00000 && stypetype == 11))

```
CMP{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(stype, imm5);(type, imm5);
```

T1

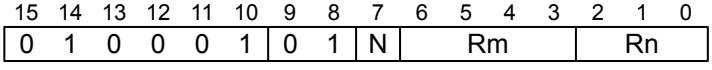


T1

```
CMP{<c>}{<q>} <Rn>, <Rm> // (<Rn> and <Rm> both from R0-R7)

n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



T2

```
CMP{<c>}{<q>} <Rn>, <Rm> // (<Rn> and <Rm> not both from R0-R7)

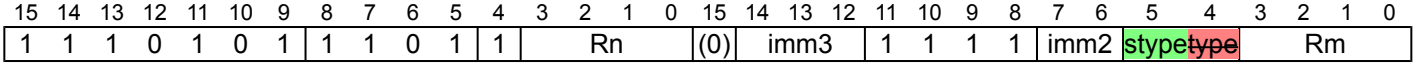
n = UInt(N:Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, 0);
if n < 8 && m < 8 then UNPREDICTABLE;
if n == 15 || m == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `n < 8 && m < 8`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The condition flags become UNKNOWN.

T3



Rotate right with extend (imm3 == 000 && imm2 == 00 && stypetype == 11)

```
CMP{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value (!(imm3 == 000 && imm2 == 00 && stypetype == 11))

```
CMP{<c>}.W <Rn>, <Rm> // (<Rn>, <Rm> can be represented in T1 or T2)

CMP{<c>}{<q>} <Rn>, <Rm>, <shift> #<amount>
```

```
n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
(type, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1 and T3: is the first general-purpose source register, encoded in the "Rn" field.

For encoding T2: is the first general-purpose source register, encoded in the "N:Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1, T2 and T3: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    PSTATE.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

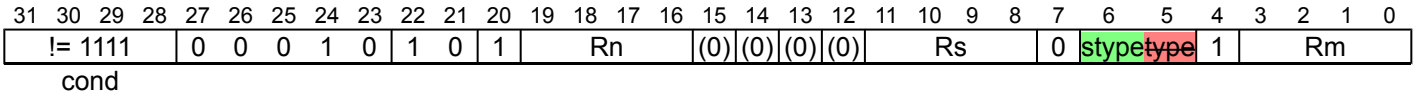
CMP (register-shifted register)

Compare (register-shifted register) subtracts a register-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

A1



A1

```
CMP{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>
```

```
n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(stype);
(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

For more information about the CONSTRAINED UNPREDICTABLE behavior, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<type> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<type>
00	LSL
01	LSR
10	ASR
11	ROR

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    PSTATE.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

DCPS1

Debug Change PE State to EL1 allows the debugger to move the PE into EL1 from EL0 or to a specific mode at the current Exception Level.

`DCPS1` is UNDEFINED if any of:

- The PE is in Non-debug state.
- EL2 is implemented, EL2 is implemented and enabled in the current Security state, and any of:
  - EL2 is using AArch32 and HCR.TGE is set to 1.
  - EL2 is using AArch64 and HCR_EL2.TGE is set to 1.

When the PE executes `DCPS1` at EL0, EL1 or EL3:

- If EL3 or EL1 is using AArch32, the PE enters SVC mode and LR_svc, SPSR_svc, DLR, and DSPSR become UNKNOWN. If `DCPS1` is executed in Monitor mode, SCR.NS is cleared to 0.
- If EL1 is using AArch64, the PE enters EL1 using AArch64, selects SP_EL1, and ELR_EL1, ESR_EL1, SPSR_EL1, DLR_EL0 and DSPSR_EL0 become UNKNOWN.

When the PE executes `DCPS1` at EL2 the PE does not change mode, and ELR_hyp, HSR, SPSR_hyp, DLR and DSPSR become UNKNOWN.

For more information on the operation of this instruction, see *DCPS*.

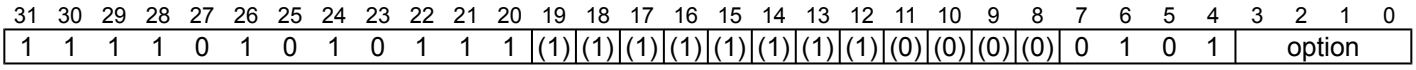
DMB

Data Memory Barrier is a memory barrier that ensures the ordering of observations of memory accesses, see *Data Memory Barrier (DMB)*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

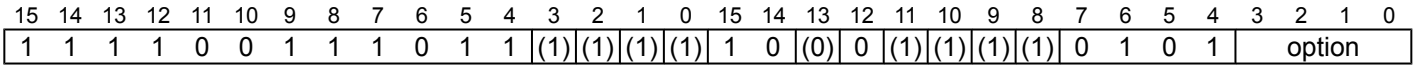


A1

```
DMB{<c>}{<q>} {<option>}

// No additional decoding required
```

T1



T1

```
DMB{<c>}{<q>} {<option>}

// No additional decoding required
```

For more information about the CONSTRAINED UNPREDICTABLE behavior, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. Must be AL or omitted.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<option> Specifies an optional limitation on the barrier operation. Values are:

SY
Full system is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Can be omitted. This option is referred to as the full system barrier. Encoded as option = 0b1111.

ST
Full system is the required shareability domain, writes are the required access type, both before and after the barrier instruction. SYST is a synonym for ST. Encoded as option = 0b1110.

LD
Full system is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1101.

ISH
Inner Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as option = 0b1011.

ISHST
Inner Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as option = 0b1010.

ISHLD
Inner Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1001.

NSH
Non-shareable is the required shareability domain, reads and writes are the required access, both before and after the barrier instruction. Encoded as option = 0b0111.

NSHST
Non-shareable is the required shareability domain, writes are the required access type both before and after the barrier instruction. Encoded as option = 0b0110.

NSHLD
Non-shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b0101.

OSH
Outer Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as option = 0b0011.

OSHST
Outer Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as option = 0b0010.

OSHLD
Outer Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b0001.

For more information on whether an access is before or after a barrier instruction, see *Data Memory Barrier (DMB)*. All other encodings of option are reserved. All unsupported and reserved options must execute as a full system DMB operation, but software must not rely on this behavior.

~~For more information on whether an access is before or after a barrier instruction, see *Data Memory Barrier (DMB)*. All other encodings of option are reserved. It is IMPLEMENTATION DEFINED whether options other than SY are implemented. All unsupported and reserved options must execute as a full system DMB operation, but software must not rely on this behavior.~~

The instruction supports the following alternative <option> values, but Arm recommends that software does not use these alternative values:

- SH as an alias for ISH.
- SHST as an alias for ISHST.
- UN as an alias for NSH.
- UNST as an alias for NSHST.

Operation

```
if ConditionPassed() then

EOR, EORS (register)

Bitwise Exclusive OR (register) performs a bitwise Exclusive OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

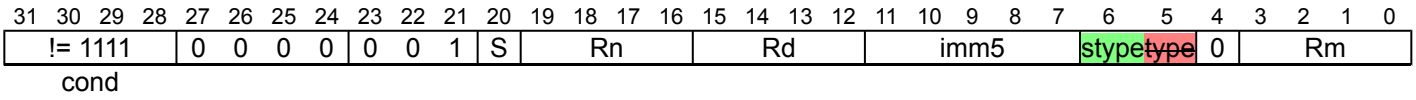
If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ArmARM deprecates any use of these encodings. However, when the destination register is the PC:

- The EOR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores *PSTATE* from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state*.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 and T2) .

A1



EOR, rotate right with extend (S == 0 && imm5 == 00000 && stypetype == 11)

```
EOR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

EOR, shift or rotate by value (S == 0 && !(imm5 == 00000 && stypetype == 11))

```

(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rdn> Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the EOR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- For the EORS variant, the instruction performs an exception return, that restores *PSTATE* from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

- Outside an IT block, if EORS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though EORS <Rd>, <Rn> had been written
- Inside an IT block, if EOR<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though EOR<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

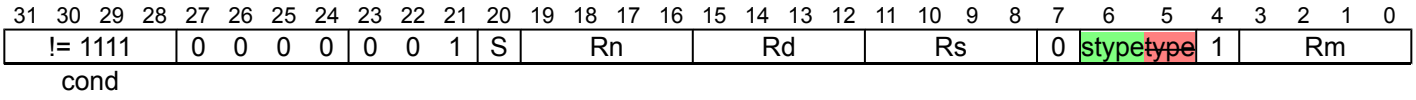
(old) htmldiff from- (new)

EOR, EORS (register-shifted register)

Bitwise Exclusive OR (register-shifted register) performs a bitwise Exclusive OR of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1



Flag setting (S == 1)

```
EORS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift><type> <Rs>
```

Not flag setting (S == 0)

```
EOR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift><type> <Rs>
```

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(stype);
(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

For more information about the CONSTRAINED UNPREDICTABLE behavior, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<shifttype> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shifttype>
00	LSL
01	LSR
10	ASR
11	ROR

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

(old) htmldiff from- (new)

ERET

Exception Return.

The PE branches to the address held in the register holding the preferred return address, and restores *PSTATE* from SPSR_<current_mode>.

The register holding the preferred return address is:

- *ELR_hyp*, when executing in Hyp mode.
- LR, when executing in a mode other than Hyp mode, User mode, or System mode.

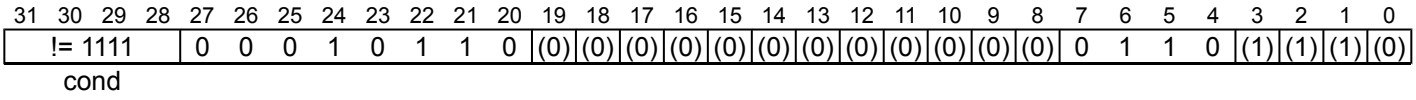
The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state*.

Exception Return is CONSTRAINED UNPREDICTABLE in User mode and System mode.

In Debug state, the T1 encoding of ERET executes the DRPS operation.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

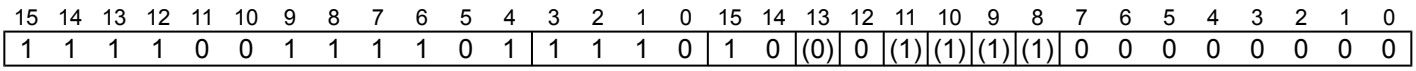


A1

```
ERET{<c>}{<q>}

// No additional decoding required
```

T1



T1

```
ERET{<c>}{<q>}

if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c>	See *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if !     if PSTATE.M IN {Halted() then
        if PSTATE.M IN {M32_User,M32_System} then
            UNPREDICTABLE;                          // UNDEFINED or NOP
        else
            new_pc_value = if PSTATE.EL == EL2 then ELR_hyp else R[14];
            AArch32.ExceptionReturn(new_pc_value, SPSR[]);
    else                                            // Perform DRPS operation in Debug state
        if PSTATE.M == M32_User then
            UNDEFINED;
        elsif PSTATE.M == M32_System then
            UNPREDICTABLE;                          // UNDEFINED or NOP
        else
            SynchronizeContext();
            SetPSTATEFromPSR(SPSR[]);
            // PSTATE.{N,Z,C,V,Q,GE,SS,A,I,F} are not observable and ignored in Debug state, so
            // behave as if UNKNOWN.
            PSTATE.<N,Z,C,V,Q,GE,SS,A,I,F> = bits(13) UNKNOWN;
            // In AArch32 Debug state, all instructions are T32 and unconditional.
            PSTATE.IT = '00000000';  PSTATE.T = '1';        // PSTATE.J is RES0
            DLR = bits(32) UNKNOWN;  DSPSR = bits(32) UNKNOWN;
            UpdateEDSCRFields();                    // Update EDSCR PE state flags[]);
```

CONSTRAINED UNPREDICTABLE behavior

If `PSTATE.M IN {M32_User,M32_System}`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

(old) htmldiff from- (new)

ESB

Error Synchronization Barrier is an error synchronization event that might also update DISR and VDISR. This instruction can be used at all Exception levels and in Debug state.

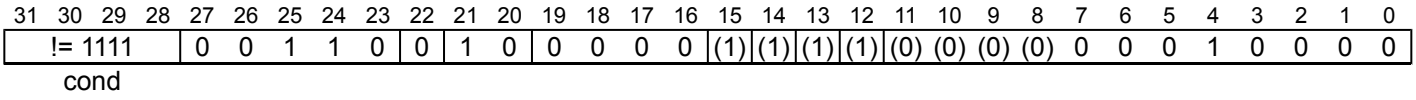
In Debug state, this instruction behaves as if SError interrupts are masked at all Exception levels. See Error Synchronization Barrier in the ARM(R) Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for ARMv8-A architecture profile.

If the RAS Extension is not implemented, this instruction executes as a NOP.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

(Armv8.2)



A1

```
ESB{<c>}{<q>}

if !HaveRASExt() then EndOfInstruction();  // Instruction executes as NOP
if cond != '1110' then UNPREDICTABLE;      // ESB must be encoded with AL condition
```

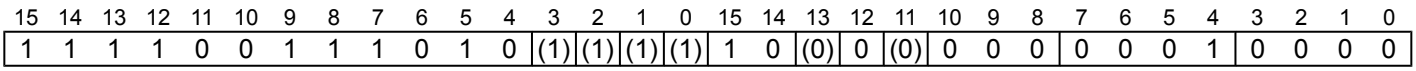
CONSTRAINED UNPREDICTABLE behavior

If `cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes unconditionally.
- The instruction executes conditionally.

T1

(Armv8.2)



T1

```
ESB{<c>}.W

if !HaveRASExt() then EndOfInstruction();  // Instruction executes as NOP
if InITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes unconditionally.
- The instruction executes conditionally.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();

    SynchronizeErrors();
    AArch32.ESBOperation();
    if PSTATE.EL IN {    ifEL2Enabled() && PSTATE.EL IN {EL0, EL1} && EL2Enabled() then} then AArch32.vES
    TakeUnmaskedSErrorInterrupts();
```

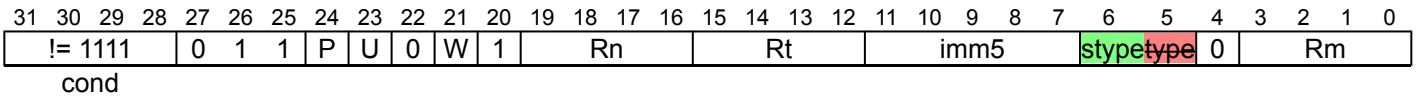
LDR (register)

Load Register (register) calculates an address from a base register value and an offset register value, loads a word from memory, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses, see *Memory accesses*.

The T32 form of LDR (register) does not support register writeback.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 and T2) .

A1



Offset (P == 1 && W == 0)

```
LDR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]
```

Post-indexed (P == 0 && W == 0)

```
LDR{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

Pre-indexed (P == 1 && W == 1)

```
LDR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!
```

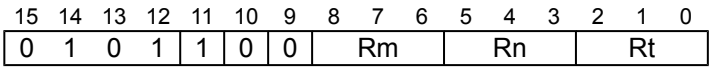
```
if P == '0' && W == '1' then SEE "LDRT";
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
(type, imm5);
if m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `wback && n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

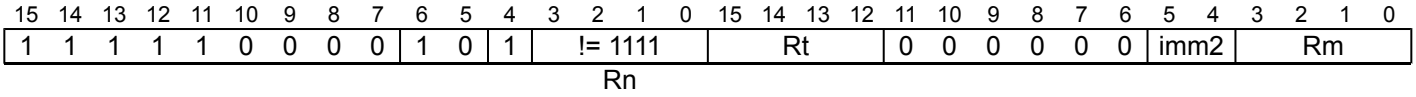


T1

```
LDR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]
```

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



T2

```
LDR{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // (<Rt>, <Rn>, <Rm> can be represented in T1)

LDR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]
```

```
if Rn == '1111' then SEE "LDR (literal)";
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This branch is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.

For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

For encoding T2: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.

<Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.

For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

+/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in “U”:

U	+/-
0	-
1	+

\+ Specifies the index register is added to the base register.

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see *Shifts applied to a register*.

<imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation

```
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
        offset_addr = if add then (R[n] + offset) else (R[n] - offset);
        address = if index then offset_addr else R[n];
        data = MemU[address,4];
        if wback then R[n] = offset_addr;
        if t == 15 then
            if address<1:0> == '00' then
                LoadWritePC(data);
            else
                UNPREDICTABLE;
        else
            R[t] = data;
else
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
        offset_addr = (R[n] + offset);
        address = offset_addr;
        data = MemU[address,4];
        if t == 15 then
            if address<1:0> == '00' then
                LoadWritePC(data);
            else
                UNPREDICTABLE;
        else
            R[t] = data;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

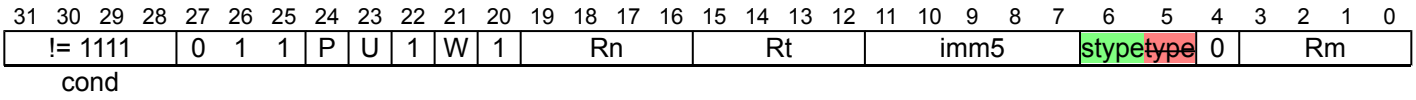
(old) htmldiff from- (new)

LDRB (register)

Load Register Byte (register) calculates an address from a base register value and an offset register value, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses see *Memory accesses*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 and T2) .

A1



Offset (P == 1 && W == 0)

```
LDRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]
```

Post-indexed (P == 0 && W == 0)

```
LDRB{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

Pre-indexed (P == 1 && W == 1)

```
LDRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!
```

```
if P == '0' && W == '1' then SEE "LDRBT";
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
(type, imm5);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `wback && n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

LDRBT

Load Register Byte Unprivileged loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see *Memory accesses*.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

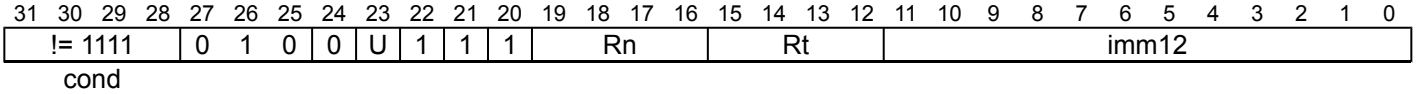
LDRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1) .

A1



A1

```
LDRBT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}

t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

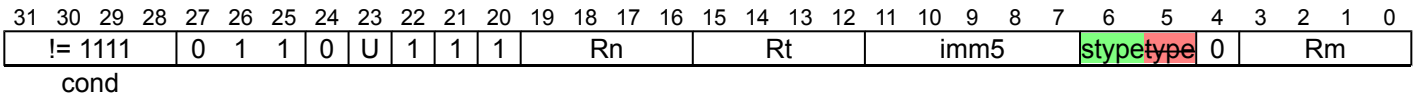
If `n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in *Using R15*.
- The instruction uses immediate offset addressing with the base register as PC, without writeback.

If `n == t && n != 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

A2



A2

```
LDRBT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}

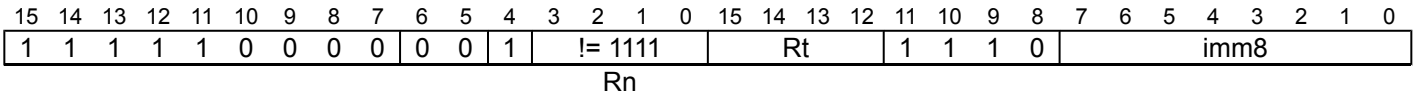
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);  postindex = TRUE;  add = (U == '1');
register_form = TRUE;  (shift_t, shift_n) = DecodeImmShift(stype, imm5);
(type, imm5);
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `n == t && n != 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1



T1

```
LDRBT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]

if Rn == '1111' then SEE "LDRB (literal)";
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

+/- For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in “U”:

U	+/-
0	-
1	+

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in “U”:

U	+/-
0	-
1	+

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see *Shifts applied to a register*.

+ Specifies the offset is added to the base register.

<imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    R[t] = ZeroExtend(MemU_unpriv[address,1],32);
    if postindex then R[n] = offset_addr;
```

CONSTRAINED UNPREDICTABLE behavior

If `PSTATE.EL == EL2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDRB (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

(old) htmldiff from- (new)

LDRT

Load Register Unprivileged loads a word from memory, and writes it to a register. For information about memory accesses see *Memory accesses*.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

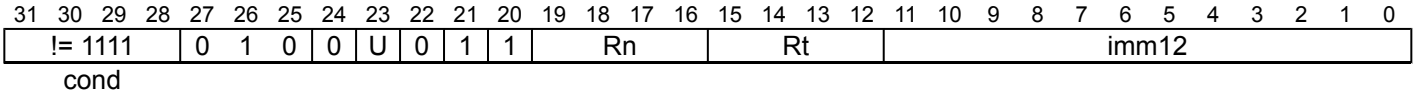
LDRT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1) .

A1



A1

```
LDRT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}
```

```
t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

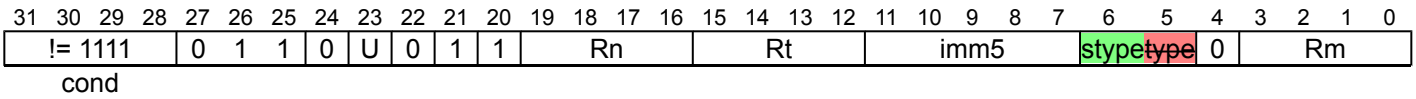
If `n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in *Using R15*.
- The instruction is treated as if bit[24] == '1' and bit[21] == '0'. The instruction uses immediate offset addressing with the base register as PC, without writeback.

If `n == t && n != 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

A2



A2

```
LDRT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

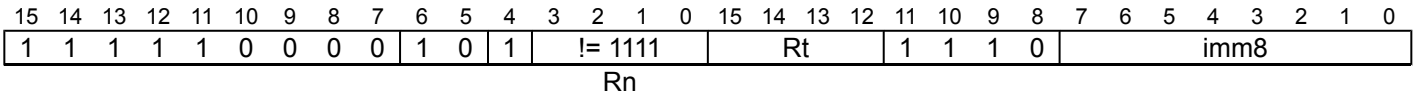
```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);  postindex = TRUE;  add = (U == '1');
register_form = TRUE;  (shift_t, shift_n) = DecodeImmShift(stype, imm5);
(type, imm5);
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `n == t && n != 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1



T1

```
LDRT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]

if Rn == '1111' then SEE "LDR (literal)";
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

+/- For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in “U”:

U	+/-
0	-
1	+

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in “U”:

U	+/-
0	-
1	+

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see *Shifts applied to a register*.

+ Specifies the offset is added to the base register.

<imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    data = MemU_unpriv[address,4];
    if postindex then R[n] = offset_addr;
    R[t] = data;
```

CONSTRAINED UNPREDICTABLE behavior

If `PSTATE.EL == EL2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDR (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

(old) htmldiff from- (new)

MOV, MOVS (register)

Move (register) copies a value from a register to the destination register.

If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

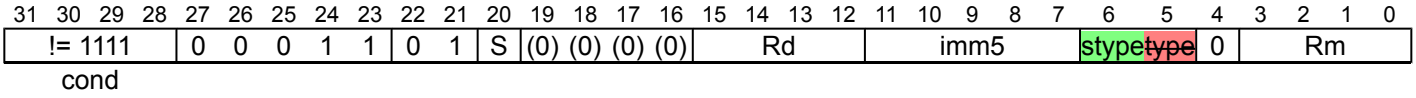
The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The MOV variant of the instruction is a branch. In the T32 instruction set (encoding T1) this is a simple branch, and in the A32 instruction set it is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores *PSTATE* from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state*.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is used by the aliases ASRS (immediate), ASR (immediate), LSLS (immediate), LSL (immediate), LSRS (immediate), LSR (immediate), RORS (immediate), ROR (immediate), RRXS, and RRX.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 , T2 and T3) .

A1



MOV, rotate right with extend (S == 0 && imm5 == 00000 && stypetype == 11)

```
MOV{<c>}{<q>} <Rd>, <Rm>, RRX
```

MOV, shift or rotate by value (S == 0 && !(imm5 == 00000 && stypetype == 11))

```
MOV{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

MOVS, rotate right with extend (S == 1 && imm5 == 00000 && stypetype == 11)

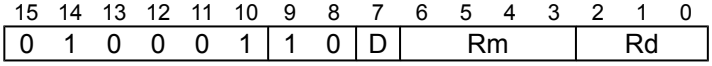
```
MOVS{<c>}{<q>} <Rd>, <Rm>, RRX
```

MOVS, shift or rotate by value (S == 1 && !(imm5 == 00000 && stypetype == 11))

```
MOVS{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}

d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);(type, imm5);
```

T1

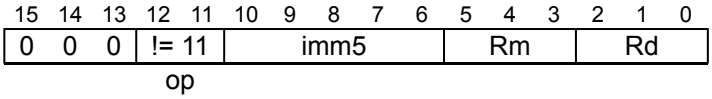


T1

```
MOV{<c>}{<q>} <Rd>, <Rm>

d = UInt(D:Rd);  m = UInt(Rm);  setflags = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
if d == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

T2



T2

```
MOV<c>{<q>} <Rd>, <Rm> {, <shift> #<amount>} // (Inside IT block)

MOVS{<q>} <Rd>, <Rm> {, <shift> #<amount>} // (Outside IT block)

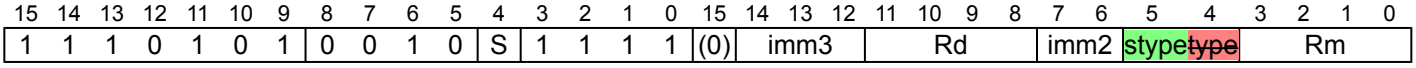
d = UInt(Rd);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = DecodeImmShift(op, imm5);
if op == '00' && imm5 == '00000' && InITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `op == '00' && imm5 == '00000' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passed its condition code check.
- The instruction executes as NOP, as if it failed its condition code check.
- The instruction executes as MOV Rd, Rm.

T3



MOV, rotate right with extend (S == 0 && imm3 == 000 && imm2 == 00 && stypetype == 11)

```
MOV{<c>}{<q>} <Rd>, <Rm>, RRX
```

MOV, shift or rotate by value (S == 0 && !(imm3 == 000 && imm2 == 00 && stypetype == 11))

```
MOV{<c>}.W <Rd>, <Rm> {, LSL #0} // (<Rd>, <Rm> can be represented in T1)

MOV<c>.W <Rd>, <Rm> {, <shift> #<amount>} // (Inside IT block, and <Rd>, <Rm>, <shift>, <amount> can be r

MOV{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

MOVS, rotate right with extend (S == 1 && imm3 == 000 && imm2 == 00 && stypetype == 11)

```
MOVS{<c>}{<q>} <Rd>, <Rm>, RRX
```

MOVS, shift or rotate by value (S == 1 && !(imm3 == 000 && imm2 == 00 && stypetype == 11))

```
MOVS.W <Rd>, <Rm> {, <shift> #<amount>} // (Outside IT block, and <Rd>, <Rm>, <shift>, <amount> can be re

MOVS{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

```
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
(type, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used:

- For the MOV variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*. Arm deprecates use of the instruction if <Rn> is the PC.
- For the MOVS variant, the instruction performs an exception return, that restores *PSTATE* from SPSR_<current_mode>. Arm deprecates use of the instruction if <Rn> is not the LR, or if the optional shift or RRX argument is specified.

For encoding T1: is the general-purpose destination register, encoded in the "D:Rd" field. If the PC is used:

- The instruction causes a branch to the address moved to the PC. This is a simple branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- The instruction must either be outside an IT block or the last instruction of an IT block.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<Rm> For encoding A1 and T1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used. Arm deprecates use of the instruction if <Rd> is the PC.

For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.

<shift> For encoding A1 and T3: is the type of shift to be applied to the source register, encoded in "stype~~type~~":

stype~~type~~	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

For encoding T2: is the type of shift to be applied to the source register, encoded in "op":

op	<shift>
00	LSL
01	LSR
10	ASR

<amount> For encoding A1: is the shift amount, in the range 0 to 31 (when <shift> = LSL), or 1 to 31 (when <shift> = ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 0 to 31 (when <shift> = LSL) or 1 to 31 (when <shift> = ROR), or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

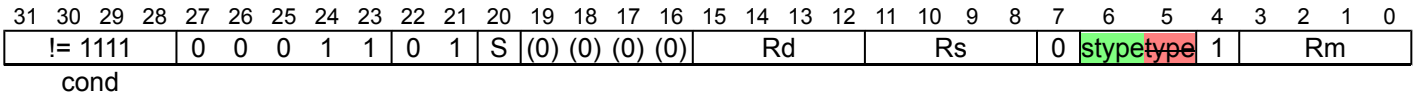
MOV, MOVS (register-shifted register)

Move (register-shifted register) copies a register-shifted register value to the destination register. It can optionally update the condition flags based on the value.

This instruction is used by the aliases ASRS (register), ASR (register), LSLS (register), LSL (register), LSRS (register), LSR (register), RORS (register), and ROR (register).

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 and T2) .

A1



Flag setting (S == 1)

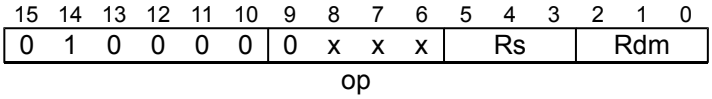
```
MOVS{<c>}{<q>} <Rd>, <Rm>, <shift><type> <Rs>
```

Not flag setting (S == 0)

```
MOV{<c>}{<q>} <Rd>, <Rm>, <shift><type> <Rs>

d = UInt(Rd);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(stype);
(type);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

T1



Arithmetic shift right (op == 0100)

```
MOV<c>{<q>} <Rdm>, <Rdm>, ASR <Rs> // (Inside IT block)

MOVS{<q>} <Rdm>, <Rdm>, ASR <Rs> // (Outside IT block)
```

Logical shift left (op == 0010)

```
MOV<c>{<q>} <Rdm>, <Rdm>, LSL <Rs> // (Inside IT block)

MOVS{<q>} <Rdm>, <Rdm>, LSL <Rs> // (Outside IT block)
```

Logical shift right (op == 0011)

```
MOV<c>{<q>} <Rdm>, <Rdm>, LSR <Rs> // (Inside IT block)

MOVS{<q>} <Rdm>, <Rdm>, LSR <Rs> // (Outside IT block)
```

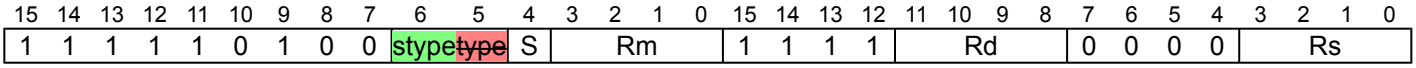
Rotate right (op == 0111)

```
MOV<c>{<q>} <Rdm>, <Rdm>, ROR <Rs> // (Inside IT block)

MOVS{<q>} <Rdm>, <Rdm>, ROR <Rs> // (Outside IT block)
```

```
if !(op IN {'0010', '0011', '0100', '0111'}) then SEE "Related encodings";
d = UInt(Rdm);  m = UInt(Rdm);  s = UInt(Rs);
setflags = !InITBlock();  shift_t = DecodeRegShift(op<2>:op<0>);
```

T2



Flag setting (S == 1)

```
MOVS.W <Rd>, <Rm>, <shift><type> <Rs> // (Outside IT block, and <Rd>, <Rm>, <shifttype>, <Rs> can be repr

MOVS{<c>}{<q>} <Rd>, <Rm>, <shift><type> <Rs>
```

Not flag setting (S == 0)

```
MOV<c>.W <Rd>, <Rm>, <shift><type> <Rs> // (Inside IT block, and <Rd>, <Rm>, <shifttype>, <Rs> can be rep

MOV{<c>}{<q>} <Rd>, <Rm>, <shift><type> <Rs>
```

```
d = UInt(Rd);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(stype);
(type);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Related encodings: In encoding T1, for an op field value that is not described above, see *Data-processing (two low registers)*.

<c>	See *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<Rdm>	Is the general-purpose source register and the destination register, encoded in the "Rdm" field.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rm>	Is the general-purpose source register, encoded in the "Rm" field.

<shifttype> Is the type of shift to be applied to the second source register, encoded in “stypetype”:

stypetype	<shifttype>
00	LSL
01	LSR
10	ASR
11	ROR

<Rs> Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Alias Conditions

Alias	Of variant	Is preferred when
ASRS (register)	A1 (flag setting)	`S == '1' && stypetype == '10'`
ASRS (register)	T1 (arithmetic shift right)	`op == '0100' && !InITBlock()`
ASRS (register)	T2 (flag setting)	`stypetype == '10' && S == '1'`
ASR (register)	A1 (not flag setting)	`S == '0' && stypetype == '10'`
ASR (register)	T1 (arithmetic shift right)	`op == '0100' && InITBlock()`
ASR (register)	T2 (not flag setting)	`stypetype == '10' && S == '0'`
LSLS (register)	A1 (flag setting)	`S == '1' && stypetype == '00'`
LSLS (register)	T1 (logical shift left)	`op == '0010' && !InITBlock()`
LSLS (register)	T2 (flag setting)	`stypetype == '00' && S == '1'`
LSL (register)	A1 (not flag setting)	`S == '0' && stypetype == '00'`
LSL (register)	T1 (logical shift left)	`op == '0010' && InITBlock()`
LSL (register)	T2 (not flag setting)	`stypetype == '00' && S == '0'`
LSRS (register)	A1 (flag setting)	`S == '1' && stypetype == '01'`
LSRS (register)	T1 (logical shift right)	`op == '0011' && !InITBlock()`
LSRS (register)	T2 (flag setting)	`stypetype == '01' && S == '1'`
LSR (register)	A1 (not flag setting)	`S == '0' && stypetype == '01'`
LSR (register)	T1 (logical shift right)	`op == '0011' && InITBlock()`
LSR (register)	T2 (not flag setting)	`stypetype == '01' && S == '0'`
RORS (register)	A1 (flag setting)	`S == '1' && stypetype == '11'`
RORS (register)	T1 (rotate right)	`op == '0111' && !InITBlock()`
RORS (register)	T2 (flag setting)	`stypetype == '11' && S == '1'`
ROR (register)	A1 (not flag setting)	`S == '0' && stypetype == '11'`
ROR (register)	T1 (rotate right)	`op == '0111' && InITBlock()`
ROR (register)	T2 (not flag setting)	`stypetype == '11' && S == '0'`

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (result, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

MVN, MVNS (register)

Bitwise NOT (register) writes the bitwise inverse of a register value to the destination register.

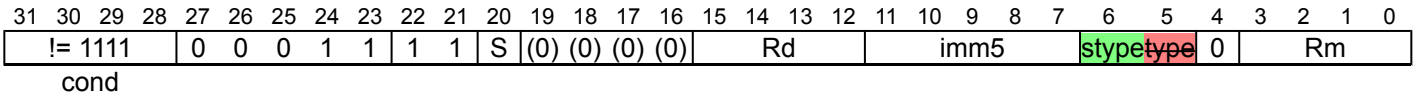
If the destination register is not the PC, the MVNS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MVN variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- The MVNS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores *PSTATE* from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state*.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 and T2) .

A1



MVN, rotate right with extend (S == 0 && imm5 == 00000 && stypetype == 11)

```
MVN{<c>}{<q>} <Rd>, <Rm>, RRX
```

MVN, shift or rotate by value (S == 0 && !(imm5 == 00000 && stypetype == 11))

```
MVN{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

MVNS, rotate right with extend (S == 1 && imm5 == 00000 && stypetype == 11)

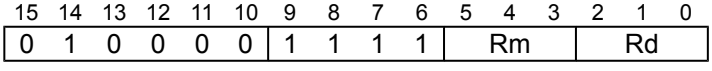
```
MVNS{<c>}{<q>} <Rd>, <Rm>, RRX
```

MVNS, shift or rotate by value (S == 1 && !(imm5 == 00000 && stypetype == 11))

```
MVNS{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}

d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);(type, imm5);
```

T1



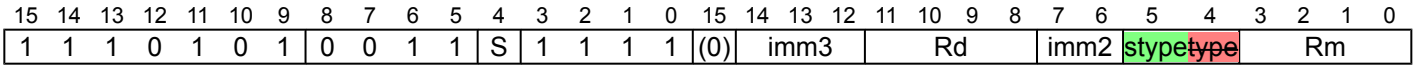
T1

```
MVN<c>{<q>} <Rd>, <Rm> // (Inside IT block)

MVNS{<q>} <Rd>, <Rm> // (Outside IT block)

d = UInt(Rd);  m = UInt(Rm);  setflags = !InITBlock();
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



MVN, rotate right with extend (S == 0 && imm3 == 000 && imm2 == 00 && stypetype == 11)

```
MVN{<c>}{<q>} <Rd>, <Rm>, RRX
```

MVN, shift or rotate by value (S == 0 && !(imm3 == 000 && imm2 == 00 && stypetype == 11))

```
MVN<c>.W <Rd>, <Rm> // (Inside IT block, and <Rd>, <Rm> can be represented in T1)

MVN{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

MVNS, rotate right with extend (S == 1 && imm3 == 000 && imm2 == 00 && stypetype == 11)

```
MVNS{<c>}{<q>} <Rd>, <Rm>, RRX
```

MVNS, shift or rotate by value (S == 1 && !(imm3 == 000 && imm2 == 00 && stypetype == 11))

```
MVNS.W <Rd>, <Rm> // (Outside IT block, and <Rd>, <Rm> can be represented in T1)

MVNS{<c>}{<q>} <Rd>, <Rm> {, <shift> #<amount>}
```

```
d = UInt(Rd);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
(type, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the MVN variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- For the MVNS variant, the instruction performs an exception return, that restores *PSTATE* from SPSR_<current_mode>.

For encoding T1 and T2: is the general-purpose destination register, encoded in the "Rd" field.

<Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the source register, encoded in "stypetype":

stypetype	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

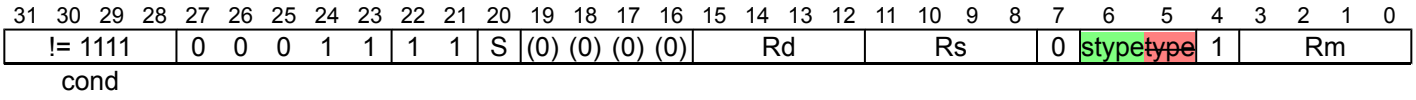
Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = NOT(shifted);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

MVN, MVNS (register-shifted register)

Bitwise NOT (register-shifted register) writes the bitwise inverse of a register-shifted register value to the destination register. It can optionally update the condition flags based on the result.

A1



Flag setting (S == 1)

```
MVNS{<c>}{<q>} <Rd>, <Rm>, <shift><type> <Rs>
```

Not flag setting (S == 0)

```
MVN{<c>}{<q>} <Rd>, <Rm>, <shift><type> <Rs>
```

```
d = UInt(Rd);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(stype);
(type);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rm> Is the general-purpose source register, encoded in the "Rm" field.

<shifttype> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shifttype>
00	LSL
01	LSR
10	ASR
11	ROR

<Rs> Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

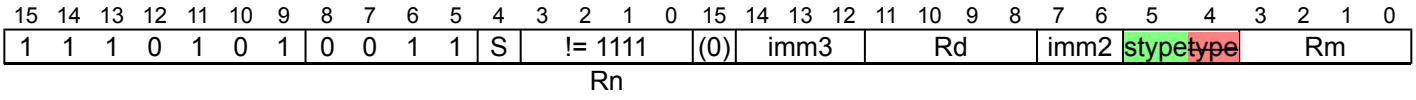
```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = NOT(shifted);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

(old) htmldiff from- (new)

ORN, ORNS (register)

Bitwise OR NOT (register) performs a bitwise (inclusive) OR of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

T1



ORN, rotate right with extend (S == 0 && imm3 == 000 && imm2 == 00 && stypetype == 11)

```
ORN{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ORN, shift or rotate by value (S == 0 && !(imm3 == 000 && imm2 == 00 && stypetype == 11))

```
ORN{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

ORNS, rotate right with extend (S == 1 && imm3 == 000 && imm2 == 00 && stypetype == 11)

```
ORNS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ORNS, shift or rotate by value (S == 1 && !(imm3 == 000 && imm2 == 00 && stypetype == 11))

```
ORNS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

```
if Rn == '1111' then SEE "MVN (register)";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
(type, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> Is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] OR NOT(shifted);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

ORR, ORRS (register)

Bitwise OR (register) performs a bitwise (inclusive) OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

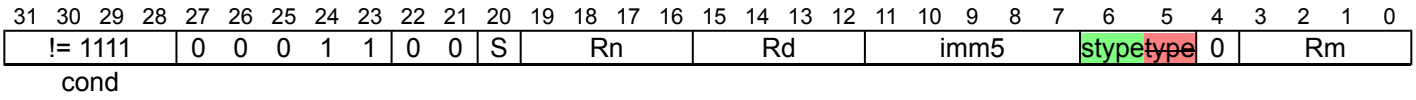
If the destination register is not the PC, the ORRS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ORR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- The ORRS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores *PSTATE* from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state*.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 and T2) .

A1



ORR, rotate right with extend (S == 0 && imm5 == 00000 && stypetype == 11)

```
ORR{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

ORR, shift or rotate by value (S == 0 && !(imm5 == 00000 && stypetype == 11))

```
ORR{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

```

```
if Rn == '1111' then SEE "Related encodings";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
(type, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Related encodings: *Data-processing (shifted register)*

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rdn> Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the ORR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- For the ORRS variant, the instruction performs an exception return, that restores *PSTATE* from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

- Outside an IT block, if ORRS <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORRS <Rd>, <Rn> had been written.
- Inside an IT block, if ORR<c> <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORR<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] OR shifted;
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v00_96~~v00_88~~, pseudocode r8p5_00bet2_rc5~~v85-xml-00bet9_rc1_1~~ ; Build timestamp: 2019-03-28T07~~2018-12-12T12~~:59~~33~~

PLD, PLDW (register)

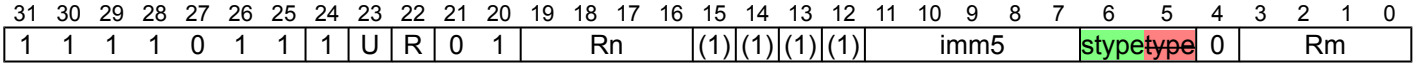
Preload Data (register) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The PLD instruction signals that the likely memory access is a read, and the PLDW instruction signals that it is a write.

The effect of a PLD or PLDW instruction is IMPLEMENTATION DEFINED. For more information, see *Preloading caches*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Preload read, optional shift or rotate (R == 1 && !(imm5 == 00000 && stypetype == 11))

```
PLD{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]
```

Preload read, rotate right with extend (R == 1 && imm5 == 00000 && stypetype == 11)

```
PLD{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]
```

Preload write, optional shift or rotate (R == 0 && !(imm5 == 00000 && stypetype == 11))

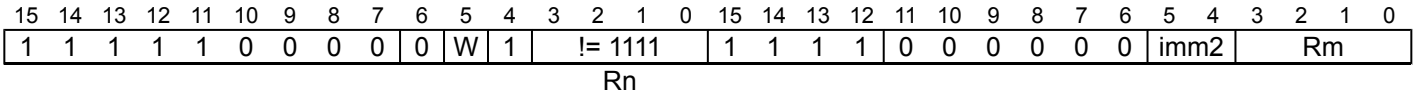
```
PLDW{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]
```

Preload write, rotate right with extend (R == 0 && imm5 == 00000 && stypetype == 11)

```
PLDW{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]
```

```
n = UInt(Rn);  m = UInt(Rm);  add = (U == '1');  is_pldw = (R == '0');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
(type, imm5);
if m == 15 || (n == 15 && is_pldw) then UNPREDICTABLE;
```

T1



Preload read (W == 0)

```
PLD{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]
```

Preload write (W == 1)

```
PLDW{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]
```

```
if Rn == '1111' then SEE "PLD (literal)";
n = UInt(Rn);  m = UInt(Rm);  add = TRUE;  is_pldw = (W == '1');
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. <c> must be AL or omitted.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used.

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

+/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in “U”:

U	+/-
0	-
1	+

\+ Specifies the index register is added to the base register.

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the index register, encoded in “stype~~type~~”:

stype~~type~~	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 0 to 3, defaulting to 0 and encoded in the "imm2" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    address = if add then (R[n] + offset) else (R[n] - offset);
    if is_pldw then
        Hint_PreloadDataForWrite(address);
    else
        Hint_PreloadData(address);
```

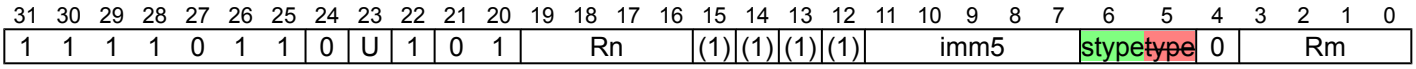
PLI (register)

Preload Instruction signals the memory system that instruction memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as pre-loading the cache line containing the specified address into the instruction cache.

The effect of a PLI instruction is IMPLEMENTATION DEFINED. For more information, see *Preloading caches*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Rotate right with extend (imm5 == 00000 && stypetype == 11)

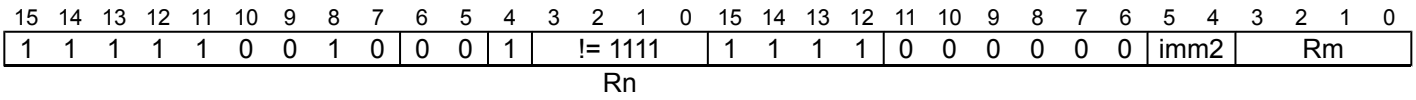
```
PLI{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]
```

Shift or rotate by value (!(imm5 == 00000 && stypetype == 11))

```
PLI{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]
```

```
n = UInt(Rn);  m = UInt(Rm);  add = (U == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
(type, imm5);
if m == 15 then UNPREDICTABLE;
```

T1



T1

```
PLI{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]
```

```
if Rn == '1111' then SEE "PLI (immediate, literal)";
n = UInt(Rn);  m = UInt(Rm);  add = TRUE;
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. <c> must be AL or omitted.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

+/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in “U”:

U	+/-
0	-
1	+

+ Specifies the index register is added to the base register.

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the index register, encoded in “stype~~type~~”:

stype~~type~~	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 0 to 3, defaulting to 0 and encoded in the "imm2" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    address = if add then (R[n] + offset) else (R[n] - offset);
    Hint_PreloadInstr(address);
```

(old) htmldiff from- (new)

RSB, RSBS (register)

Reverse Subtract (register) subtracts a register value from an optionally-shifted register value, and writes the result to the destination register.

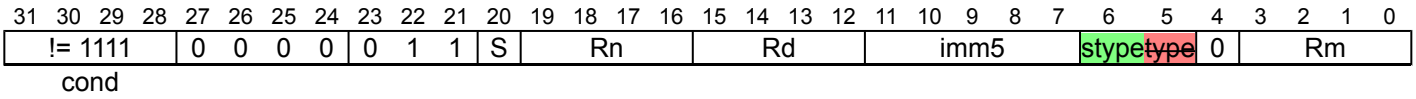
If the destination register is not the PC, the RSBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- The RSBS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores *PSTATE* from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state*.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



RSB, rotate right with extend (S == 0 && imm5 == 00000 && stypetype == 11)

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

RSB, shift or rotate by value (S == 0 && !(imm5 == 00000 && stypetype == 11))

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

RSBS, rotate right with extend (S == 1 && imm5 == 00000 && stypetype == 11)

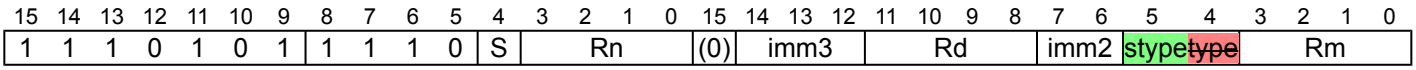
```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

RSBS, shift or rotate by value (S == 1 && !(imm5 == 00000 && stypetype == 11))

```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}

d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);(type, imm5);
```

T1



RSB, rotate right with extend (S == 0 && imm3 == 000 && imm2 == 00 && stype == 11)

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

RSB, shift or rotate by value (S == 0 && !(imm3 == 000 && imm2 == 00 && stype == 11))

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

RSBS, rotate right with extend (S == 1 && imm3 == 000 && imm2 == 00 && stype == 11)

```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

RSBS, shift or rotate by value (S == 1 && !(imm3 == 000 && imm2 == 00 && stype == 11))

```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
(type, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the RSB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- For the RSBS variant, the instruction performs an exception return, that restores *PSTATE* from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in "stype":

stype	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(NOT(R[n]), shifted, '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

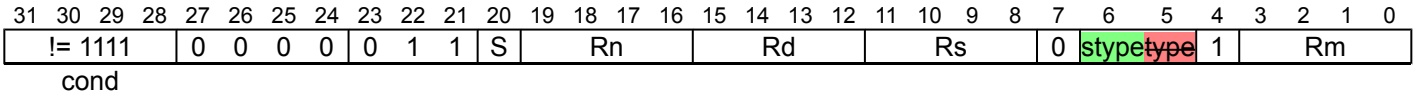
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v00_96~~v00_88~~, pseudocode r8p5_00bet2_rc5~~v85-xml-00bet9_rc1_1~~ ; Build timestamp: 2019-03-28T07~~2018-12-12T12~~:59~~33~~

RSB, RSBS (register-shifted register)

Reverse Subtract (register-shifted register) subtracts a register value from a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1



Flag setting (S == 1)

```
RSBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift><type> <Rs>
```

Not flag setting (S == 0)

```
RSB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift><type> <Rs>
```

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(stype);
(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<shifttype> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shifttype>
00	LSL
01	LSR
10	ASR
11	ROR

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(NOT(R[n]), shifted, '1');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rdn> Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the SBC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- For the SBCS variant, the instruction performs an exception return, that restores *PSTATE* from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), PSTATE.C);
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

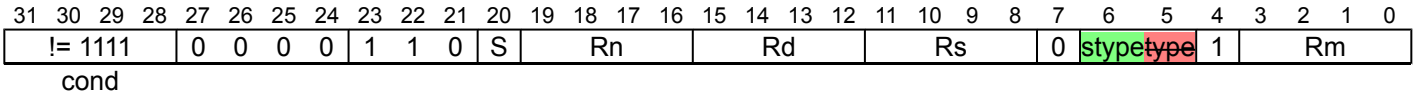
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v00_96~~v00_88~~, pseudocode r8p5_00bet2_rc5~~v85-xml-00bet9_rc1_1~~ ; Build timestamp: 2019-03-28T07~~2018-12-12T12~~:59~~33~~

SBC, SBCS (register-shifted register)

Subtract with Carry (register-shifted register) subtracts a register-shifted register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1



Flag setting (S == 1)

```
SBCS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift><type> <Rs>
```

Not flag setting (S == 0)

```
SBC{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift><type> <Rs>
```

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(stype);
(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<shifttype> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shifttype>
00	LSL
01	LSR
10	ASR
11	ROR

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

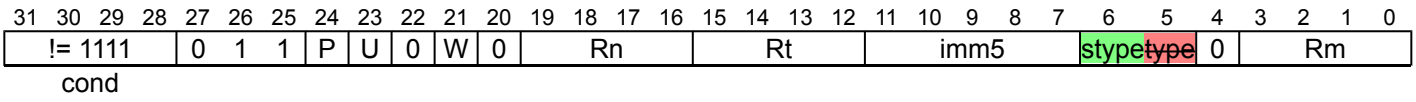
STR (register)

Store Register (register) calculates an address from a base register value and an offset register value, stores a word from a register to memory. The offset register value can optionally be shifted. For information about memory accesses see *Memory accesses*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 and T2) .

A1



Offset (P == 1 && W == 0)

```
STR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]
```

Post-indexed (P == 0 && W == 0)

```
STR{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

Pre-indexed (P == 1 && W == 1)

```
STR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!
```

```
if P == '0' && W == '1' then SEE "STRT";
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
(type, imm5);
if m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

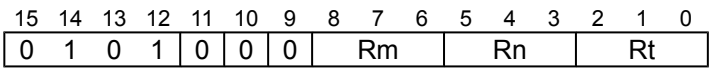
If `wback && n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If `wback && n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1

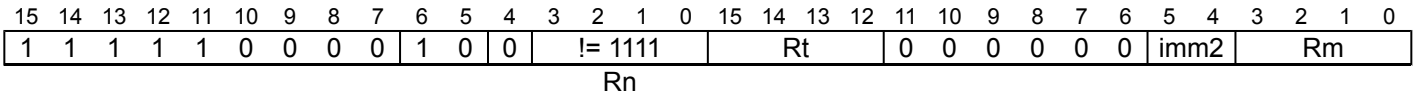


T1

```
STR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]

t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



T2

```
STR{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // (<Rt>, <Rn>, <Rm> can be represented in T1)

STR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if t == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

+/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in “U”:

U	+/-
0	-
1	+

\+ Specifies the index register is added to the base register.

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see *Shifts applied to a register*.

<imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    if t == 15 then  // Only possible for encoding A1
        data = PCStoreValue();
    else
        data = R[t];
    MemU[address,4] = data;
    if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Internal version only: isa v00_96~~v00_88~~, pseudocode r8p5_00bet2_rc5~~v85-xml-00bet9_rc1_1~~ ; Build timestamp: 2019-03-28T07~~2018-12-12T12~~:59~~33~~

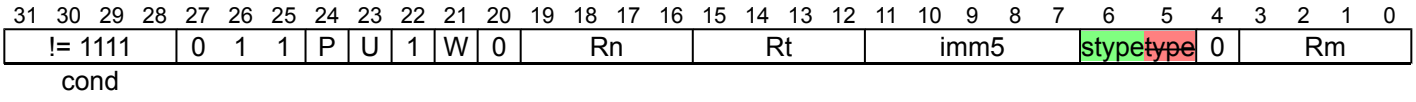
STRB (register)

Store Register Byte (register) calculates an address from a base register value and an offset register value, and stores a byte from a register to memory. The offset register value can optionally be shifted. For information about memory accesses see *Memory accesses*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 and T2) .

A1



Offset (P == 1 && W == 0)

```
STRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]
```

Post-indexed (P == 0 && W == 0)

```
STRB{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

Pre-indexed (P == 1 && W == 1)

```
STRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!
```

```
if P == '0' && W == '1' then SEE "STRBT";
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
(type, imm5);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

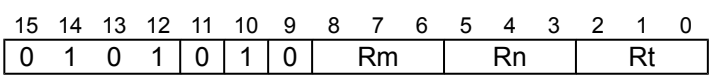
If `wback && n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If `wback && n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1

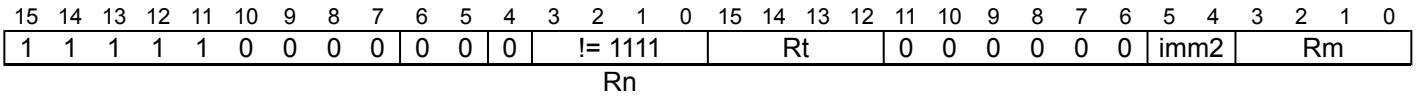


T1

```
STRB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]

t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, 0);
```

T2



T2

```
STRB{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // (<Rt>, <Rn>, <Rm> can be represented in T1)

STRB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);
index = TRUE;  add = TRUE;  wback = FALSE;
(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if t == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

+/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in “U”:

U	+/-
0	-
1	+

\+ Specifies the index register is added to the base register.

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see *Shifts applied to a register*.

<imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    MemU[address,1] = R[t]<7:0>;
    if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

STRBT

Store Register Byte Unprivileged stores a byte from a register to memory. For information about memory accesses see *Memory accesses*.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

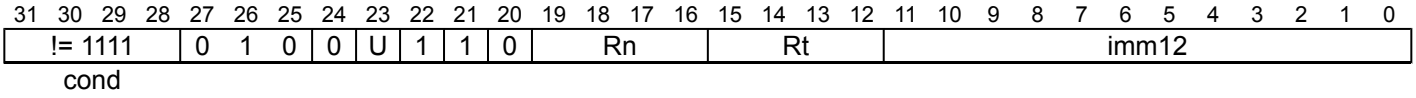
STRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1) .

A1



A1

```
STRBT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}

t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

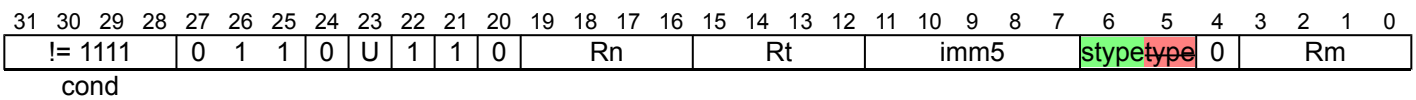
If `n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If `n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

A2



A2

```
STRBT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);  postindex = TRUE;  add = (U == '1');
register_form = TRUE;  (shift_t, shift_n) = DecodeImmShift(stype, imm5);
(type, imm5);
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

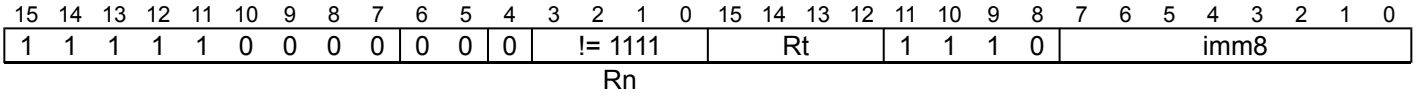
If `n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If `n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1



T1

```
STRBT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]
```

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c>	See *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<Rt>	For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

+/- For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in “U”:

U	+/-
0	-
1	+

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in “U”:

U	+/-
0	-
1	+

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see *Shifts applied to a register*.

+ Specifies the offset is added to the base register.

<imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    MemU_unpriv[address,1] = R[t]<7:0>;
    if postindex then R[n] = offset_addr;
```

CONSTRAINED UNPREDICTABLE behavior

If `PSTATE.EL == EL2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as STRB (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

STRT

Store Register Unprivileged stores a word from a register to memory. For information about memory accesses see *Memory accesses*.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

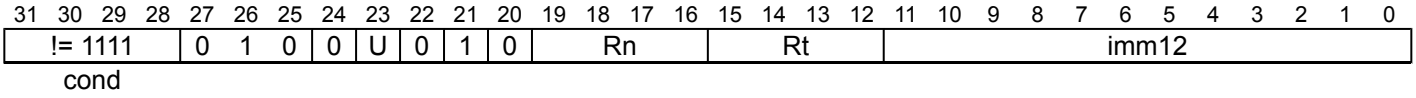
STRT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1) .

A1



A1

```
STRT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}
```

```
t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm12, 32);
if n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

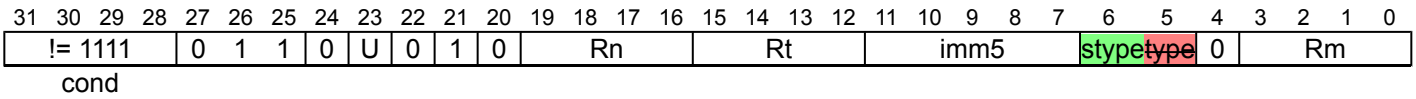
If `n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If `n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

A2



A2

```
STRT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}
```

```
t = UInt(Rt);  n = UInt(Rn);  m = UInt(Rm);  postindex = TRUE;  add = (U == '1');
register_form = TRUE;  (shift_t, shift_n) = DecodeImmShift(stype, imm5);
(type, imm5);
if n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

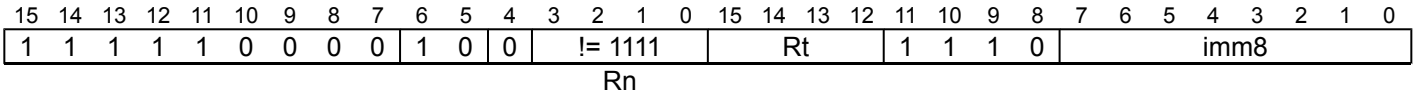
If `n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If `n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1



T1

```
STRT{<c>}{<q>} <Rt>, [<Rn> {, #{+}<imm>}]

if Rn == '1111' then UNDEFINED;
t = UInt(Rt);  n = UInt(Rn);  postindex = FALSE;  add = TRUE;
register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `t == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rt> For encoding A1 and A2: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

+/- For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in “U”:

U	+/-
0	-
1	+

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in “U”:

U	+/-
0	-
1	+

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see *Shifts applied to a register*.

\+ Specifies the offset is added to the base register.

<imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    if t == 15 then  // Only possible for encodings A1 and A2
        data = PCStoreValue();
    else
        data = R[t];
    MemU_unpriv[address,4] = data;
    if postindex then R[n] = offset_addr;
```

CONSTRAINED UNPREDICTABLE behavior

If `PSTATE.EL == EL2`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as STR (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

(old) htmldiff from- (new)

SUB, SUBS (register)

Subtract (register) subtracts an optionally-shifted register value from a register value, and writes the result to the destination register.

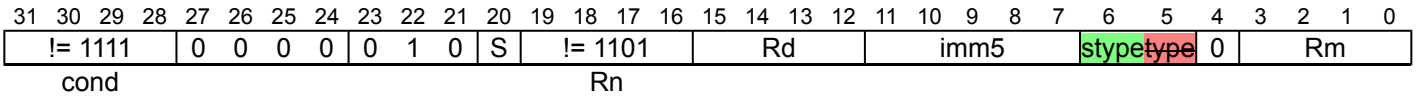
If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. However, when the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- The SUBS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores *PSTATE* from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state*.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 and T2) .

A1



SUB, rotate right with extend (S == 0 && imm5 == 00000 && stypetype == 11)

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

SUB, shift or rotate by value (S == 0 && !(imm5 == 00000 && stypetype == 11))

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

SUBS, rotate right with extend (S == 1 && imm5 == 00000 && stypetype == 11)

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, RRX
```

SUBS, shift or rotate by value (S == 1 && !(imm5 == 00000 && stypetype == 11))

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, <shift> #<amount>}
```

```
if Rn == '1101' then SEE "SUB (SP minus register)";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');

```

```
if Rd == '1111' && S == '1' then SEE "CMP (register)";
if Rn == '1101' then SEE "SUB (SP minus register)";
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
(type, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- For the SUBS variant, the instruction performs an exception return, that restores *PSTATE* from SPSR_<current_mode>.

For encoding T1 and T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. If the SP is used, see *SUB (SP minus register)*.

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field. If the SP is used, see *SUB (SP minus register)*.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

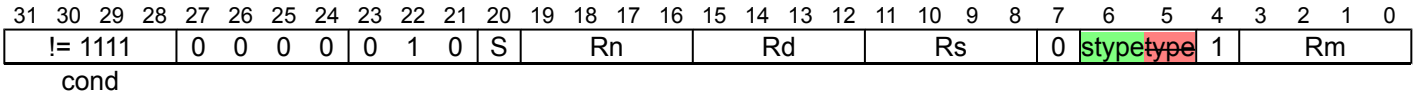
SUB, SUBS (register-shifted register)

Subtract (register-shifted register) subtracts a register-shifted register value from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1



Flag setting (S == 1)

```
SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift><type> <Rs>
```

Not flag setting (S == 0)

```
SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift><type> <Rs>
```

```
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
setflags = (S == '1');  shift_t = DecodeRegShift(stype);
(type);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<shifttype> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<shifttype>
00	LSL
01	LSR
10	ASR
11	ROR

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

(old) htmldiff from- (new)

SUB, SUBS (SP minus register)

Subtract from SP (register) subtracts an optionally-shifted register value from the SP value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC*.
- The SUBS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores *PSTATE* from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state*.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

TST{<c>}{<q>} <Rn>, <Rm>, RRX
```

Shift or rotate by value (!(imm3 == 000 && imm2 == 00 && stypetype == 11))

```
TST{<c>}.W <Rn>, <Rm> // (<Rn>, <Rm> can be represented in T1)

TST{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

n = UInt(Rn);  m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
(type, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in "stype~~type~~":

stype~~type~~	<shift>
00	LSL
01	LSR
10	ASR
11	ROR

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

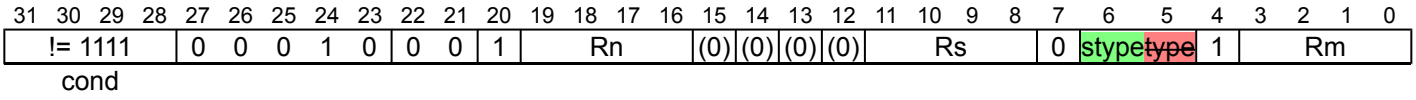
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v00_96~~v00_88~~, pseudocode r8p5_00bet2_rc5~~v85-xml-00bet9_rc1_1~~ ; Build timestamp: 2019-03-28T072018-12-12T12:5933

TST (register-shifted register)

Test (register-shifted register) performs a bitwise AND operation on a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1



A1

```
TST{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>
```

```
n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(stype);
(type);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<type> Is the type of shift to be applied to the second source register, encoded in "stypetype":

stypetype	<type>
00	LSL
01	LSR
10	ASR
11	ROR

<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

WFE

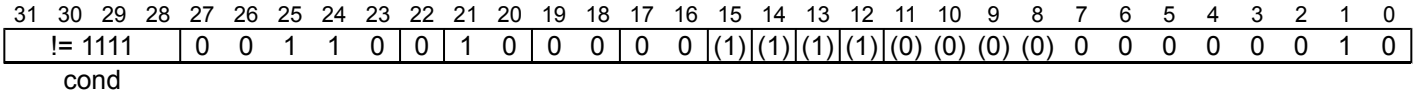
Wait For Event is a hint instruction that indicates that the PE can enter a low-power state and remain there until a wakeup event occurs. Wakeup events include the event signaled as a result of executing the SEV instruction on any PE in the multiprocessor system. For more information, see *Wait For Event and Send Event*.

As described in *Wait For Event and Send Event*, the execution of a WFE instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level, see:

- *Traps to Undefined mode of PL0 execution of WFE and WFI instructions*.
- *Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions*.
- *Traps to Monitor mode of the execution of WFE and WFI instructions in modes other than Monitor mode*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 and T2) .

A1

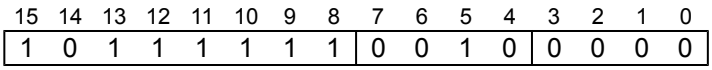


A1

```
WFE{<c>}{<q>}

// No additional decoding required
```

T1

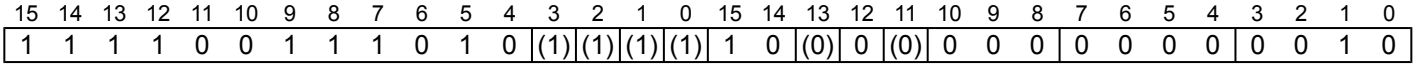


T1

```
WFE{<c>}{<q>}

// No additional decoding required
```

T2



T2

```
WFE{<c>}.W

// No additional decoding required
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c>	See *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if IsEventRegisterSet() then
        ClearEventRegister();
    else
        if PSTATE.EL == EL0 then
            // Check for traps described by the OS which may be EL1 or EL2.
            AArch32.CheckForWFxTrap(EL1, TRUE);
        if PSTATE.EL IN {            ifEL2Enabled() && PSTATE.EL IN {EL0, EL1} && EL2Enabled() && !} && !IsIn
            // Check for traps described by the Hypervisor.
            AArch32.CheckForWFxTrap(EL2, TRUE);
        if HaveEL(EL3) && PSTATE.M != M32_Monitor then
            // Check for traps described by the Secure Monitor.
            AArch32.CheckForWFxTrap(EL3, TRUE);
        WaitForEvent();
```

Internal version only: isa v00_96v00_88, pseudocode r8p5_00bet2_rc5v85-xml-00bet9_rc1_1 ; Build timestamp: 2019-03-28T072018-12-12T12:5933

WFI

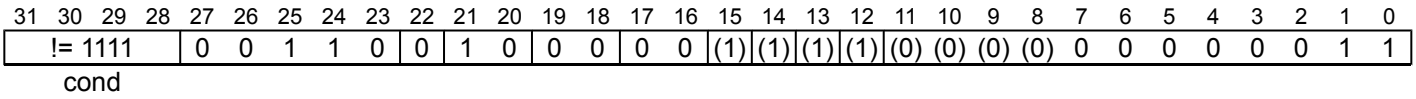
Wait For Interrupt is a hint instruction that indicates that the PE can enter a low-power state and remain there until a wakeup event occurs. For more information, see *Wait For Interrupt*.

As described in *Wait For Interrupt*, the execution of a `WFI` instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level, see:

- *Traps to Undefined mode of PL0 execution of WFE and WFI instructions*.
- *Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions*.
- *Traps to Monitor mode of the execution of WFE and WFI instructions in modes other than Monitor mode*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1 and T2) .

A1

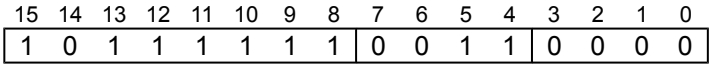


A1

```
WFI{<c>}{<q>}

// No additional decoding required
```

T1

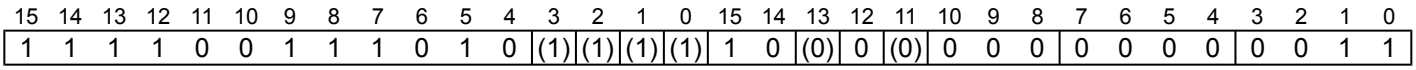


T1

```
WFI{<c>}{<q>}

// No additional decoding required
```

T2



T2

```
WFI{<c>}.W

// No additional decoding required
```

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c>	See *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if !InterruptPending() then
        if PSTATE.EL == EL0 then
            // Check for traps described by the OS which may be EL1 or EL2.
            AArch32.CheckForWFxTrap(EL1, FALSE);
        if PSTATE.EL IN {            ifEL2Enabled() && PSTATE.EL IN {EL0, EL1} && EL2Enabled() && !} && !IsIn
            // Check for traps described by the Hypervisor.
            AArch32.CheckForWFxTrap(EL2, FALSE);
        if HaveEL(EL3) && PSTATE.M != M32_Monitor then
            // Check for traps described by the Secure Monitor.
            AArch32.CheckForWFxTrap(EL3, FALSE);
        WaitForInterrupt();
```

AArch32 -- SIMD&FP Instructions (alphabetic order)

AESD: AES single round decryption.

AESE: AES single round encryption.

AESIMC: AES inverse mix columns.

AESMC: AES mix columns.

FLDM*X (FLDMDBX, FLDMIAX): FLDM*X.

FSTMDBX, FSTMIAX: FSTMX.

SHA1C: SHA1 hash update (choose).

SHA1H: SHA1 fixed rotate.

SHA1M: SHA1 hash update (majority).

SHA1P: SHA1 hash update (parity).

SHA1SU0: SHA1 schedule update 0.

SHA1SU1: SHA1 schedule update 1.

SHA256H: SHA256 hash update part 1.

SHA256H2: SHA256 hash update part 2.

SHA256SU0: SHA256 schedule update 0.

SHA256SU1: SHA256 schedule update 1.

VABA: Vector Absolute Difference and Accumulate.

VABAL: Vector Absolute Difference and Accumulate Long.

VABD (floating-point): Vector Absolute Difference (floating-point).

VABD (integer): Vector Absolute Difference (integer).

VABDL (integer): Vector Absolute Difference Long (integer).

VABS: Vector Absolute.

VACGE: Vector Absolute Compare Greater Than or Equal.

VACGT: Vector Absolute Compare Greater Than.

VACLE: Vector Absolute Compare Less Than or Equal: an alias of VACGE.

VACLT: Vector Absolute Compare Less Than: an alias of VACGT.

VADD (floating-point): Vector Add (floating-point).

VADD (integer): Vector Add (integer).

VADDHN: Vector Add and Narrow, returning High Half.

VADDL: Vector Add Long.

VADDW: Vector Add Wide.

VAND (immediate): Vector Bitwise AND (immediate): an alias of VBIC (immediate).

VAND (register): Vector Bitwise AND (register).

VBIC (immediate): Vector Bitwise Bit Clear (immediate).

VBIC (register): Vector Bitwise Bit Clear (register).

VBIF: Vector Bitwise Insert if False.

VBIT: Vector Bitwise Insert if True.

VBSL: Vector Bitwise Select.

VCADD: Vector Complex Add.

VCEQ (immediate #0): Vector Compare Equal to Zero.

VCEQ (register): Vector Compare Equal.

VCGE (immediate #0): Vector Compare Greater Than or Equal to Zero.

VCGE (register): Vector Compare Greater Than or Equal.

VCGT (immediate #0): Vector Compare Greater Than Zero.

VCGT (register): Vector Compare Greater Than.

VCLE (immediate #0): Vector Compare Less Than or Equal to Zero.

VCLE (register): Vector Compare Less Than or Equal: an alias of VCGE (register).

VCLS: Vector Count Leading Sign Bits.

VCLT (immediate #0): Vector Compare Less Than Zero.

VCLT (register): Vector Compare Less Than: an alias of VCGT (register).

VCLZ: Vector Count Leading Zeros.

VCMLA: Vector Complex Multiply Accumulate.

VCMLA (by element): Vector Complex Multiply Accumulate (by element).

VCMP: Vector Compare.

VCMPE: Vector Compare, raising Invalid Operation on NaN.

VCNT: Vector Count Set Bits.

VCVT (between double-precision and single-precision): Convert between double-precision and single-precision.

VCVT (between floating-point and fixed-point, Advanced SIMD): Vector Convert between floating-point and fixed-point.

VCVT (between floating-point and fixed-point, floating-point): Convert between floating-point and fixed-point.

VCVT (between floating-point and integer, Advanced SIMD): Vector Convert between floating-point and integer.

VCVT (between half-precision and single-precision, Advanced SIMD): Vector Convert between half-precision and single-precision.

VCVT (floating-point to integer, floating-point): Convert floating-point to integer with Round towards Zero.

VCVT (integer to floating-point, floating-point): Convert integer to floating-point.

VCVTA (Advanced SIMD): Vector Convert floating-point to integer with Round to Nearest with Ties to Away.

VCVTA (floating-point): Convert floating-point to integer with Round to Nearest with Ties to Away.

VCVTB: Convert to or from a half-precision value in the bottom half of a single-precision register.

VCVTM (Advanced SIMD): Vector Convert floating-point to integer with Round towards -Infinity.

VCVTM (floating-point): Convert floating-point to integer with Round towards -Infinity.

VCVTN (Advanced SIMD): Vector Convert floating-point to integer with Round to Nearest.

VCVTN (floating-point): Convert floating-point to integer with Round to Nearest.

VCVTP (Advanced SIMD): Vector Convert floating-point to integer with Round towards +Infinity.

VCVTP (floating-point): Convert floating-point to integer with Round towards +Infinity.

VCVTR: Convert floating-point to integer.

VCVTT: Convert to or from a half-precision value in the top half of a single-precision register.

VDIV: Divide.

VDUP (general-purpose register): Duplicate general-purpose register to vector.

VDUP (scalar): Duplicate vector element to vector.

VEOR: Vector Bitwise Exclusive OR.

VEXT (byte elements): Vector Extract.

VEXT (multibyte elements): Vector Extract: an alias of VEXT (byte elements).

VFMA: Vector Fused Multiply Accumulate.

VFMAL (by scalar): Vector Floating-point Multiply-Add Long to accumulator (by scalar).

VFMAL (vector): Vector Floating-point Multiply-Add Long to accumulator (vector).

VFMS: Vector Fused Multiply Subtract.

VFMSL (by scalar): Vector Floating-point Multiply-Subtract Long from accumulator (by scalar).

VFMSL (vector): Vector Floating-point Multiply-Subtract Long from accumulator (vector).

VFNMA: Vector Fused Negate Multiply Accumulate.

VFNMS: Vector Fused Negate Multiply Subtract.

VHADD: Vector Halving Add.

VHSUB: Vector Halving Subtract.

VINS: Vector move Insertion.

VJCVT: Javascript Convert to signed fixed-point, rounding toward Zero.

VLD1 (multiple single elements): Load multiple single 1-element structures to one, two, three, or four registers.

VLD1 (single element to all lanes): Load single 1-element structure and replicate to all lanes of one register.

VLD1 (single element to one lane): Load single 1-element structure to one lane of one register.

VLD2 (multiple 2-element structures): Load multiple 2-element structures to two or four registers.

VLD2 (single 2-element structure to all lanes): Load single 2-element structure and replicate to all lanes of two registers.

VLD2 (single 2-element structure to one lane): Load single 2-element structure to one lane of two registers.

VLD3 (multiple 3-element structures): Load multiple 3-element structures to three registers.

VLD3 (single 3-element structure to all lanes): Load single 3-element structure and replicate to all lanes of three registers.

VLD3 (single 3-element structure to one lane): Load single 3-element structure to one lane of three registers.

VLD4 (multiple 4-element structures): Load multiple 4-element structures to four registers.

VLD4 (single 4-element structure to all lanes): Load single 4-element structure and replicate to all lanes of four registers.

VLD4 (single 4-element structure to one lane): Load single 4-element structure to one lane of four registers.

VLDM, VLDMDB, VLDMIA: Load Multiple SIMD&FP registers.

VLDR (immediate): Load SIMD&FP register (immediate).

VLDR (literal): Load SIMD&FP register (literal).

VMAX (floating-point): Vector Maximum (floating-point).

VMAX (integer): Vector Maximum (integer).

VMAXNM: Floating-point Maximum Number.

VMIN (floating-point): Vector Minimum (floating-point).

VMIN (integer): Vector Minimum (integer).

VMINNM: Floating-point Minimum Number.

VMLA (by scalar): Vector Multiply Accumulate (by scalar).

VMLA (floating-point): Vector Multiply Accumulate (floating-point).

VMLA (integer): Vector Multiply Accumulate (integer).

VMLAL (by scalar): Vector Multiply Accumulate Long (by scalar).

VMLAL (integer): Vector Multiply Accumulate Long (integer).

VMLS (by scalar): Vector Multiply Subtract (by scalar).

VMLS (floating-point): Vector Multiply Subtract (floating-point).

VMLS (integer): Vector Multiply Subtract (integer).

VMLSL (by scalar): Vector Multiply Subtract Long (by scalar).

VMLSL (integer): Vector Multiply Subtract Long (integer).

VMOV (between general-purpose register and half-precision): Copy 16 bits of a general-purpose register to or from a 32-bit SIMD&FP register.

VMOV (between general-purpose register and single-precision): Copy a general-purpose register to or from a 32-bit SIMD&FP register.

VMOV (between two general-purpose registers and a doubleword floating-point register): Copy two general-purpose registers to or from a SIMD&FP register.

VMOV (between two general-purpose registers and two single-precision registers): Copy two general-purpose registers to a pair of 32-bit SIMD&FP registers.

VMOV (general-purpose register to scalar): Copy a general-purpose register to a vector element.

VMOV (immediate): Copy immediate value to a SIMD&FP register.

VMOV (register): Copy between FP registers.

VMOV (register, SIMD): Copy between SIMD registers: an alias of VORR (register).

VMOV (scalar to general-purpose register): Copy a vector element to a general-purpose register with sign or zero extension.

VMOVL: Vector Move Long.

VMOVN: Vector Move and Narrow.

VMOVX: Vector Move extraction.

VMRS: Move SIMD&FP Special register to general-purpose register.

VMSR: Move general-purpose register to SIMD&FP Special register.

VMUL (by scalar): Vector Multiply (by scalar).

VMUL (floating-point): Vector Multiply (floating-point).

VMUL (integer and polynomial): Vector Multiply (integer and polynomial).

VMULL (by scalar): Vector Multiply Long (by scalar).

VMULL (integer and polynomial): Vector Multiply Long (integer and polynomial).

VMVN (immediate): Vector Bitwise NOT (immediate).

VMVN (register): Vector Bitwise NOT (register).

VNEG: Vector Negate.

VNMLA: Vector Negate Multiply Accumulate.

VNMLS: Vector Negate Multiply Subtract.

VNMUL: Vector Negate Multiply.

VORN (immediate): Vector Bitwise OR NOT (immediate): an alias of VORR (immediate).

VORN (register): Vector bitwise OR NOT (register).

VORR (immediate): Vector Bitwise OR (immediate).

VORR (register): Vector bitwise OR (register).

VPADAL: Vector Pairwise Add and Accumulate Long.

VPADD (floating-point): Vector Pairwise Add (floating-point).

VPADD (integer): Vector Pairwise Add (integer).

VPADDL: Vector Pairwise Add Long.

VPMAX (floating-point): Vector Pairwise Maximum (floating-point).

VPMAX (integer): Vector Pairwise Maximum (integer).

VPMIN (floating-point): Vector Pairwise Minimum (floating-point).

VPMIN (integer): Vector Pairwise Minimum (integer).

VPOP: Pop SIMD&FP registers from Stack: an alias of VLDM, VLDMDB, VLDMIA.

VPUSH: Push SIMD&FP registers to Stack: an alias of VSTM, VSTMDB, VSTMIA.

VQABS: Vector Saturating Absolute.

VQADD: Vector Saturating Add.

VQDMLAL: Vector Saturating Doubling Multiply Accumulate Long.

VQDMLSL: Vector Saturating Doubling Multiply Subtract Long.

VQDMULH: Vector Saturating Doubling Multiply Returning High Half.

VQDMULL: Vector Saturating Doubling Multiply Long.

VQMOVN, VQMOVUN: Vector Saturating Move and Narrow.

VQNEG: Vector Saturating Negate.

VQRDMLAH: Vector Saturating Rounding Doubling Multiply Accumulate Returning High Half.

VQRDMLSH: Vector Saturating Rounding Doubling Multiply Subtract Returning High Half.

VQRDMULH: Vector Saturating Rounding Doubling Multiply Returning High Half.

VQRSHL: Vector Saturating Rounding Shift Left.

VQRSHRN (zero): Vector Saturating Rounding Shift Right, Narrow: an alias of VQMOVN, VQMOVUN.

VQRSHRN, VQRSHRUN: Vector Saturating Rounding Shift Right, Narrow.

VQRSHRUN (zero): Vector Saturating Rounding Shift Right, Narrow: an alias of VQMOVN, VQMOVUN.

VQSHL (register): Vector Saturating Shift Left (register).

VQSHL, VQSHLU (immediate): Vector Saturating Shift Left (immediate).

VQSHRN (zero): Vector Saturating Shift Right, Narrow: an alias of VQMOVN, VQMOVUN.

VQSHRN, VQSHRUN: Vector Saturating Shift Right, Narrow.

VQSHRUN (zero): Vector Saturating Shift Right, Narrow: an alias of VQMOVN, VQMOVUN.

VQSUB: Vector Saturating Subtract.

VRADDHN: Vector Rounding Add and Narrow, returning High Half.

VRECPE: Vector Reciprocal Estimate.

VRECPS: Vector Reciprocal Step.

VREV16: Vector Reverse in halfwords.

VREV32: Vector Reverse in words.

VREV64: Vector Reverse in doublewords.

VRHADD: Vector Rounding Halving Add.

VRINTA (Advanced SIMD): Vector Round floating-point to integer towards Nearest with Ties to Away.

VRINTA (floating-point): Round floating-point to integer to Nearest with Ties to Away.

VRINTM (Advanced SIMD): Vector Round floating-point to integer towards -Infinity.

VRINTM (floating-point): Round floating-point to integer towards -Infinity.

VRINTN (Advanced SIMD): Vector Round floating-point to integer to Nearest.

VRINTN (floating-point): Round floating-point to integer to Nearest.

VRINTP (Advanced SIMD): Vector Round floating-point to integer towards +Infinity.

VRINTP (floating-point): Round floating-point to integer towards +Infinity.

VRINTR: Round floating-point to integer.

VRINTX (Advanced SIMD): Vector round floating-point to integer inexact.

VRINTX (floating-point): Round floating-point to integer inexact.

VRINTZ (Advanced SIMD): Vector round floating-point to integer towards Zero.

VRINTZ (floating-point): Round floating-point to integer towards Zero.

VRSHL: Vector Rounding Shift Left.

VRSHR: Vector Rounding Shift Right.

VRSHR (zero): Vector Rounding Shift Right: an alias of VORR (register).

VRSHRN: Vector Rounding Shift Right and Narrow.

VRSHRN (zero): Vector Rounding Shift Right and Narrow: an alias of VMOVN.

VRSQRTE: Vector Reciprocal Square Root Estimate.

VRSQRTS: Vector Reciprocal Square Root Step.

VRSRA: Vector Rounding Shift Right and Accumulate.

VRSUBHN: Vector Rounding Subtract and Narrow, returning High Half.

VSDOT (by element): Dot Product index form with signed integers..

VSDOT (vector): Dot Product vector form with signed integers..

VSELEQ, VSELGE, VSELGT, VSELVS: Floating-point conditional select.

VSHL (immediate): Vector Shift Left (immediate).

VSHL (register): Vector Shift Left (register).

VSHLL: Vector Shift Left Long.

VSHR: Vector Shift Right.

VSHR (zero): Vector Shift Right: an alias of VORR (register).

VSHRN: Vector Shift Right Narrow.

VSHRN (zero): Vector Shift Right Narrow: an alias of VMOVN.

VSLI: Vector Shift Left and Insert.

VSQRT: Square Root.

VSRA: Vector Shift Right and Accumulate.

VSRI: Vector Shift Right and Insert.

VST1 (multiple single elements): Store multiple single elements from one, two, three, or four registers.

VST1 (single element from one lane): Store single element from one lane of one register.

VST2 (multiple 2-element structures): Store multiple 2-element structures from two or four registers.

VST2 (single 2-element structure from one lane): Store single 2-element structure from one lane of two registers.

VST3 (multiple 3-element structures): Store multiple 3-element structures from three registers.

VST3 (single 3-element structure from one lane): Store single 3-element structure from one lane of three registers.

VST4 (multiple 4-element structures): Store multiple 4-element structures from four registers.

VST4 (single 4-element structure from one lane): Store single 4-element structure from one lane of four registers.

VSTM, VSTMDB, VSTMIA: Store multiple SIMD&FP registers.

VSTR: Store SIMD&FP register.

VSUB (floating-point): Vector Subtract (floating-point).

VSUB (integer): Vector Subtract (integer).

VSUBHN: Vector Subtract and Narrow, returning High Half.

VSUBL: Vector Subtract Long.

VSUBW: Vector Subtract Wide.

VSWP: Vector Swap.

VTBL, VTBX: Vector Table Lookup and Extension.

VTRN: Vector Transpose.

VTST: Vector Test Bits.

VUDOT (by element): Dot Product index form with unsigned integers..

VUDOT (vector): Dot Product vector form with unsigned integers..

VUZP: Vector Unzip.

VUZP (alias): Vector Unzip: an alias of VTRN.

VZIP: Vector Zip.

VZIP (alias): Vector Zip: an alias of VTRN.

VCGE (register)

Vector Compare Greater Than or Equal takes each element in a vector, and compares it with the corresponding element of a second vector. If the first is greater than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

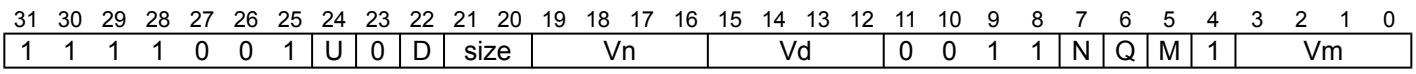
The operand vector elements are the same type, and are signed integers, unsigned integers, or floating-point numbers. The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

This instruction is used by the pseudo-instruction VCLE (register).

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1



64-bit SIMD vector (Q == 0)

```
VCGE{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

```

CONSTRAINED UNPREDICTABLE behavior

If `sz == '1' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler Symbols

<c>	For encoding A1 and A2: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1 and T2: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<dt>	For encoding A1 and T1: is the data type for the elements of the operands, encoded in "U:size":

U	size	<dt>
0	00	S8
0	01	S16
0	10	S32
1	00	U8
1	01	U16
1	10	U32

For encoding A2 and T2: is the data type for the elements of the vectors, encoded in “sz”:

sz	<dt>
0	F32
1	F16

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
enumeration VCGEtype {VCGEtype_signed, VCGEtype_unsigned, VCGEtype_fp};

if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[n+r],e,esize];  op2 = Elem[D[m+r],e,esize];
            case vtype of
            case type of
                when VCGEtype_signed    test_passed = (SInt(op1) >= SInt(op2));
                when VCGEtype_unsigned  test_passed = (UInt(op1) >= UInt(op2));
                when VCGEtype_fp        test_passed = FPCompareGE(op1, op2, StandardFPSCRValue());
            Elem[D[d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v00_96v00_88, pseudocode r8p5_00bet2_rc5v85_xml-00bet9_re1_1 ; Build timestamp: 2019-03-28T072018-12-12T12:5933

VCGT (register)

Vector Compare Greater Than takes each element in a vector, and compares it with the corresponding element of a second vector. If the first is greater than the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

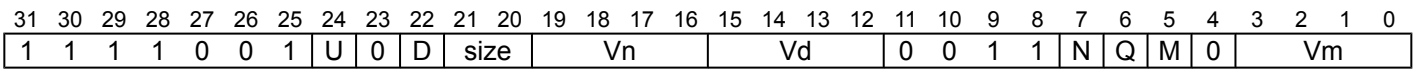
The operand vector elements are the same type, and are signed integers, unsigned integers, or floating-point numbers. The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

This instruction is used by the pseudo-instruction VCLT (register).

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1



64-bit SIMD vector (Q == 0)

```
VCGT{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

128-bit SIMD vector (Q == 1)

VFMAL (vector)

Vector Floating-point Multiply-Add Long to accumulator (vector). This instruction multiplies corresponding values in the vectors in the two source SIMD&FP registers, and accumulates the product to the corresponding vector element of the destination SIMD&FP register. The instruction does not round the result of the multiply before the accumulation.

Depending on settings in the *CPACR*, *NSACR*, *HCPTR*, and *FPEXC* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

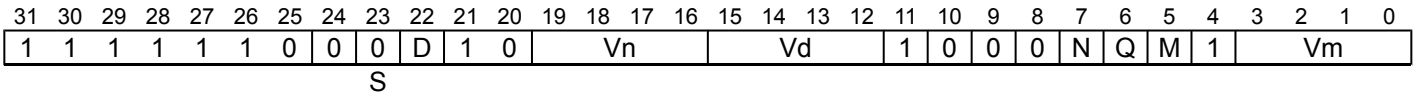
In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

ID_ISAR6.FHM indicates whether this instruction is supported.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

(Armv8.2)



64-bit SIMD vector (Q == 0)

```
VFMAL{<q>}.F16 <Dd>, <Sn>, <Sm>
```

128-bit SIMD vector (Q == 1)

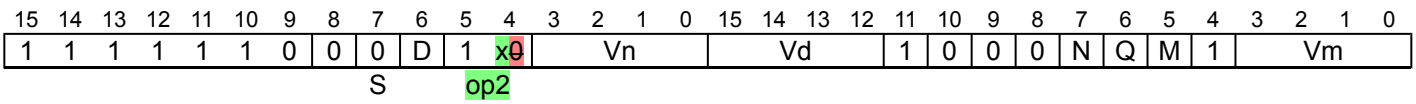
```
VFMAL{<q>}.F16 <Qd>, <Dn>, <Dm>
```

```
if !HaveFP16MulNoRoundingToFP32Ext() then UNDEFINED;
if Q == '1' && Vd<0> == '1' then UNDEFINED;

integer d = UInt(D:Vd);
integer n = if Q == '1' then UInt(N:Vn) else UInt(Vn:N);
integer m = if Q == '1' then UInt(M:Vm) else UInt(Vm:M);
integer esize = 32;
integer regs = if Q=='1' then 2 else 1;
integer datasize = if Q=='1' then 64 else 32;
boolean sub_op = S=='1';
```

T1

(Armv8.2)



64-bit SIMD vector (op2 == 10 && Q == 0)

```
VFMAL{<q>}.F16 <Dd>, <Sn>, <Sm>
```

128-bit SIMD vector (op2 == 11 && Q == 1)

```
VFMAL{<q>}.F16 <Qd>, <Dn>, <Dm>
```

```
if InITBlock() then UNPREDICTABLE;
if !HaveFP16MulNoRoundingToFP32Ext() then UNDEFINED;
if Q == '1' && Vd<0> == '1' then UNDEFINED;

integer d = UInt(D:Vd);
integer n = if Q == '1' then UInt(N:Vn) else UInt(Vn:N);
integer m = if Q == '1' then UInt(M:Vm) else UInt(Vm:M);

Related encodings: See *Advanced SIMD element or structure load/store* for the T32 instruction set, or *Advanced SIMD element or structure load/store* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1 and A2: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1 and T2: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<size> Is the data size, encoded in “size”:

size	<size>
00	8
01	16
10	32
11	RESERVED

<list> Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

{ <Dd>, <Dd+1> }

Two single-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "itype~~type~~" field as 0b1000.

{ <Dd>, <Dd+2> }
Two double-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "itypetype" field as 0b1001.

{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }
Three single-spaced registers. Selects the A2 and T2 encodings of the instruction.

The register <Dd> is encoded in the "D:Vd" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access*, and is encoded in the "align" field as 0b00.

Whenever <align> is present, the permitted values are:

64
64-bit alignment, encoded in the "align" field as 0b01.

128
128-bit alignment, encoded in the "align" field as 0b10.

256
256-bit alignment, encoded in the "align" field as 0b11. Available only if <list> contains four registers.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *Advanced SIMD addressing mode*.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r], e] = MemU[address,ebytes];
            Elem[D[d2+r],e] = MemU[address+ebytes,ebytes];
            address = address + 2*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 16*regs;
```

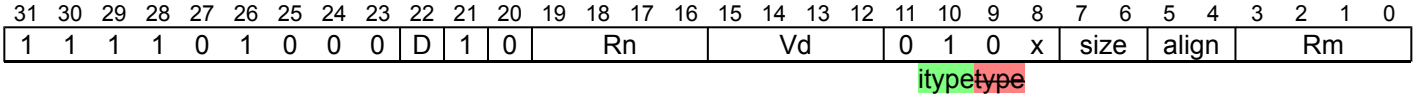
VLD3 (multiple 3-element structures)

Load multiple 3-element structures to three registers loads multiple 3-element structures from memory into three registers, with de-interleaving. For more information, see *Element and structure load/store instructions*. Every element of each register is loaded. For details of the addressing mode see *Advanced SIMD addressing mode*.
Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Offset (Rm == 1111)

```
VLD3{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Post-indexed (Rm == 1101)

```
VLD3{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Post-indexed (Rm != 11x1)

```
VLD3{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

```
case itype of
case type of
    when '0100'
        inc = 1;
    when '0101'
        inc = 2;
    otherwise
        SEE "Related encodings";
if size == '11' || align<1> == '1' then UNDEFINED;
alignment = if align<0> == '0' then 1 else 8;
ebytes = 1 << UInt(size);  elements = 8 DIV ebytes;
d = UInt(D:Vd);  d2 = d + inc;  d3 = d2 + inc;  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d3 > 31 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d3 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

T1

VNMLA

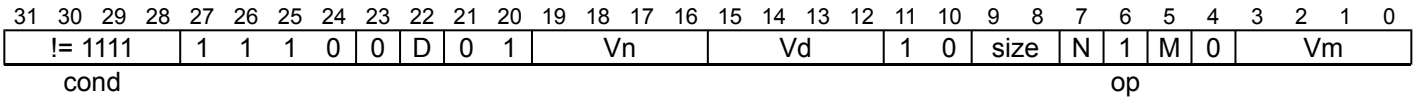
Vector Negate Multiply Accumulate multiplies together two floating-point register values, adds the negation of the floating-point value in the destination register to the negation of the product, and writes the result back to the destination register.

Arm recommends that software does not use the VNMLA instruction in the Round towards Plus Infinity and Round towards Minus Infinity rounding modes, because the rounding of the product and of the sum can change the result of the instruction in opposite directions, defeating the purpose of these rounding modes.

Depending on settings in the *CPACR*, *NSACR*, *HCPTR*, and *FPEXC* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Half-precision scalar (size == 01)

(Armv8.2)

```
VNMLA{<c>}{<q>}.F16 <Sd>, <Sn>, <Sm>
```

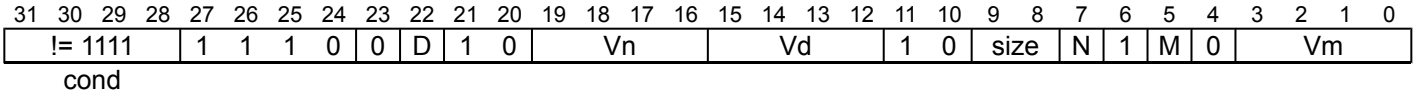
VNMUL

Vector Negate Multiply multiplies together two floating-point register values, and writes the negation of the result to the destination register. Depending on settings in the *CPACR*, *NSACR*, *HCPTR*, and *FPEXC* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Half-precision scalar (size == 01)

(Armv8.2)

```
VNMUL{<c>}{<q>}.F16 {<Sd>,} <Sn>, <Sm>
```

Single-precision scalar (size == 10)

```
VNMUL{<c>}{<q>}.F32 {<Sd>,} <Sn>, <Sm>
```

Double-precision scalar (size == 11)

```
VNMUL{<c>}{<q>}.F64 {<Dd>,} <Dn>, <Dm>
```

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '01' && !HaveFP16Ext() then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
vtype = VFPNegMul_VNMUL;
type = VFPNegMul_VNMUL;
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

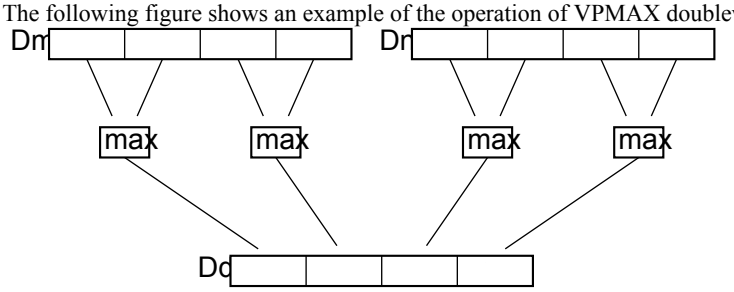
VPMAX (integer)

Vector Pairwise Maximum compares adjacent pairs of elements in two doubleword vectors, and copies the larger of each pair into the corresponding element in the destination doubleword vector.

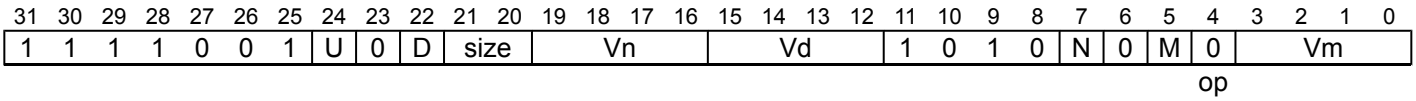
The following figure shows an example of the operation of VPMAX doubleword operation for data type S16 or U16.



Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

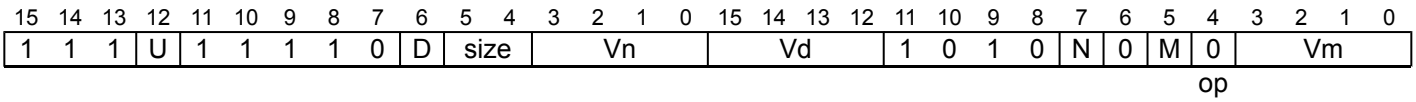


A1

```
VPMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

if size == '11' then UNDEFINED;
if size == '11' || Q == '1' then UNDEFINED;
maximum = (op == '0');  unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

T1



T1

```
VPMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

if size == '11' then UNDEFINED;
if size == '11' || Q == '1' then UNDEFINED;
maximum = (op == '0');  unsigned = (U == '1');
esize = 8 << UInt(size);  elements = 64 DIV esize;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);
```

Assembler Symbols

<c>	For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<dt>	Is the data type for the elements of the operands, encoded in “U:size”:

U	size	<dt>
0	00	S8
0	01	S16
0	10	S32
1	00	U8
1	01	U16
1	10	U32

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    bits(64) dest;
    h = elements DIV 2;

    for e = 0 to h-1
        op1 = Int(Elem[D[n],2*e,esize], unsigned);
        op2 = Int(Elem[D[n],2*e+1,esize], unsigned);
        result = if maximum then Max(op1,op2) else Min(op1,op2);
        Elem[dest,e,esize] = result<esize-1:0>;
        op1 = Int(Elem[D[m],2*e,esize], unsigned);
        op2 = Int(Elem[D[m],2*e+1,esize], unsigned);
        result = if maximum then Max(op1,op2) else Min(op1,op2);
        Elem[dest,e+h,esize] = result<esize-1:0>;

    D[d] = dest;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

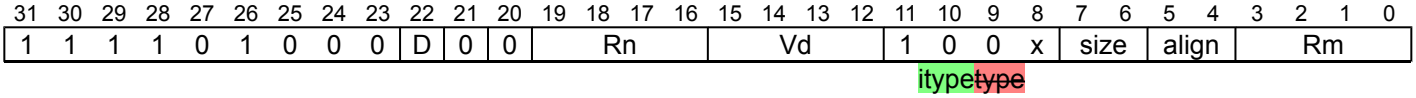
VST2 (multiple 2-element structures)

Store multiple 2-element structures from two or four registers stores multiple 2-element structures from two or four registers to memory, with interleaving. For more information, see *Element and structure load/store instructions*. Every element of each register is saved. For details of the addressing mode see *Advanced SIMD addressing mode*.
Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1



Offset (Rm == 1111)

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Post-indexed (Rm == 1101)

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Post-indexed (Rm != 11x1)

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

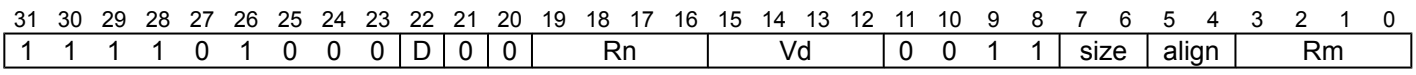
```
regs = 1;  if align == '11' then UNDEFINED;
if size == '11' then UNDEFINED;
inc = if itype == '1001' then 2 else 1;
inc = if type == '1001' then 2 else 1;
alignment = if align == '00' then 1 else 4 << UInt(align);
ebytes = 1 << UInt(size);  elements = 8 DIV ebytes;
d = UInt(D:Vd);  d2 = d + inc;  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d2+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d2+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

A2



Offset (Rm == 1111)

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Post-indexed (Rm == 1101)

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Post-indexed (Rm != 11x1)

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

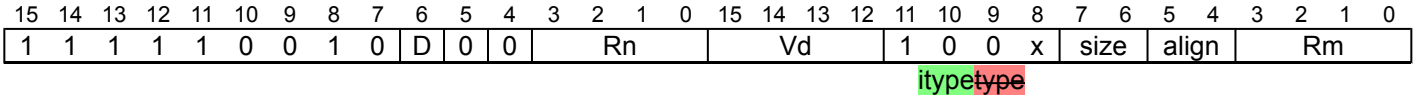
```
regs = 2;  inc = 2;
if size == '11' then UNDEFINED;
alignment = if align == '00' then 1 else 4 << UInt(align);
ebytes = 1 << UInt(size);  elements = 8 DIV ebytes;
d = UInt(D:Vd);  d2 = d + inc;  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d2+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d2+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T1



Offset (Rm == 1111)

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Post-indexed (Rm == 1101)

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Post-indexed (Rm != 11x1)

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

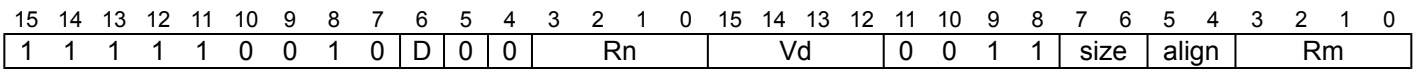
```
regs = 1;  if align == '11' then UNDEFINED;
if size == '11' then UNDEFINED;
inc = if itype == '1001' then 2 else 1;
inc = if type == '1001' then 2 else 1;
alignment = if align == '00' then 1 else 4 << UInt(align);
ebytes = 1 << UInt(size);  elements = 8 DIV ebytes;
d = UInt(D:Vd);  d2 = d + inc;  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d2+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d2+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T2



Offset (Rm == 1111)

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Post-indexed (Rm == 1101)

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Post-indexed (Rm != 11x1)

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

```
regs = 2;  inc = 2;
if size == '11' then UNDEFINED;
alignment = if align == '00' then 1 else 4 << UInt(align);
ebytes = 1 << UInt(size);  elements = 8 DIV ebytes;
d = UInt(D:Vd);  d2 = d + inc;  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d2+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d2+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VST2 (multiple 2-element structures)*.

Related encodings: See *Advanced SIMD element or structure load/store* for the T32 instruction set, or *Advanced SIMD element or structure load/store* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1 and A2: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1 and T2: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<size> Is the data size, encoded in "size":

size	<size>
00	8
01	16
10	32
11	RESERVED

<list> Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

{ <Dd>, <Dd+1> }
Two single-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "itypetype" field as 0b1000.

{ <Dd>, <Dd+2> }
Two double-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "itypetype" field as 0b1001.

{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }
Three single-spaced registers. Selects the A2 and T2 encodings of the instruction.

The register <Dd> is encoded in the "D:Vd" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access*, and is encoded in the "align" field as 0b00.

Whenever <align> is present, the permitted values are:

64
64-bit alignment, encoded in the "align" field as 0b01.

128
128-bit alignment, encoded in the "align" field as 0b10.

256
256-bit alignment, encoded in the "align" field as 0b11. Available only if <list> contains four registers.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *Advanced SIMD addressing mode*.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = TRUE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            MemU[address,       ebytes] = Elem[D[d+r], e];
            MemU[address+ebytes,ebytes] = Elem[D[d2+r],e];
            address = address + 2*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 16*regs;
```

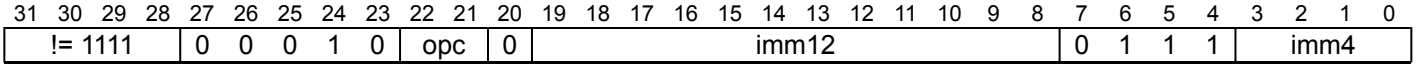
	111	Exception Generation
	000	Move special register (register)
	100	Cyclic Redundancy Check
	101	Integer Saturating Arithmetic

Exception Generation

These instructions are under Miscellaneous.

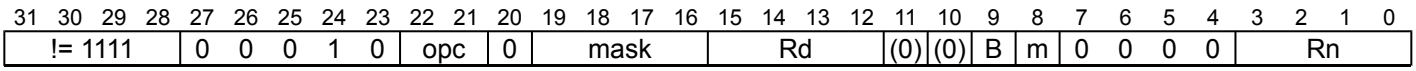


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	Instruction Details
00	HLT
01	BKPT
10	HVC
11	SMC

Move special register (register)

These instructions are under Miscellaneous.

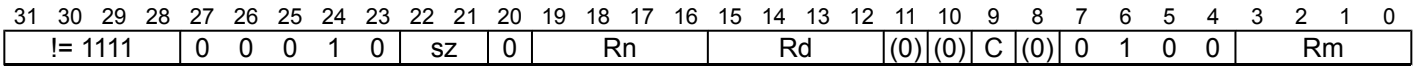


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	B	Instruction Details
x0	0	MRS
x0	1	MRS (Banked register)
x1	0	MSR (register)
x1	1	MSR (Banked register)

Cyclic Redundancy Check

These instructions are under Miscellaneous.



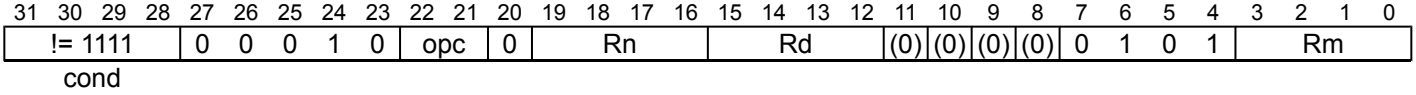
The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields sz	C	Instruction Details
00	0	CRC32 — CRC32B
00	1	CRC32C — CRC32CB
01	0	CRC32 — CRC32H
01	1	CRC32C — CRC32CH
10	0	CRC32 — CRC32W
10	1	CRC32C — CRC32CW
11		CONSTRAINED UNPREDICTABLE

The behavior of the CONSTRAINED UNPREDICTABLE encodings in this table is described in *CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instruction encodings*

Integer Saturating Arithmetic

These instructions are under Miscellaneous.

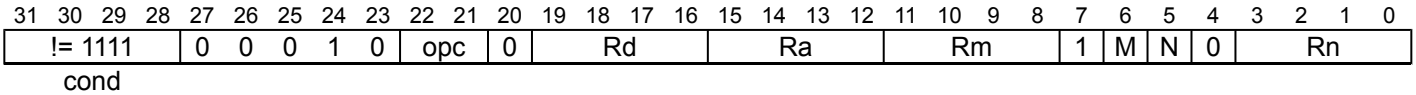


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	Instruction Details
00	QADD
01	QSUB
10	QDADD
11	QDSUB

Halfword Multiply and Accumulate

These instructions are under Data-processing and miscellaneous instructions.



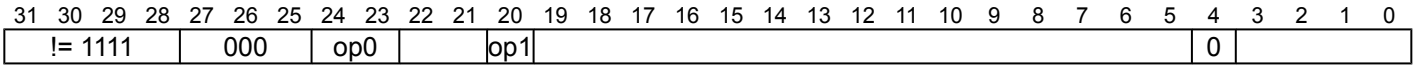
The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	M	N	Instruction Details
00			SMLABB, SMLABT, SMLATB, SMLATT
01	0	0	SMLAWB, SMLAWT — SMLAWB
01	0	1	SMULWB, SMULWT — SMULWB

Decode fields opc	M	N	Instruction Details
01	1	0	SMLAWB, SMLAWT — SMLAWT
01	1	1	SMULWB, SMULWT — SMULWT
10			SMLALBB, SMLALBT, SMLALTB, SMLALTT
11			SMULBB, SMULBT, SMULTB, SMULTT

Data-processing register (immediate shift)

These instructions are under Data-processing and miscellaneous instructions.

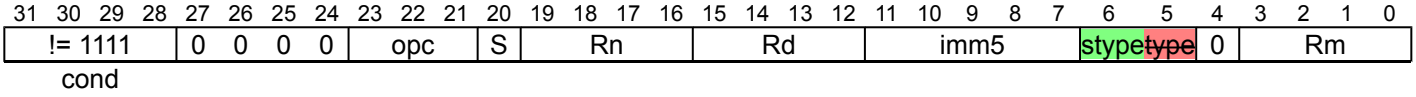


The following constraints also apply to this encoding: op0:op1 != 100

Decode fields op0	op1	Instruction details
0x		Integer Data Processing (three register, immediate shift)
10	1	Integer Test and Compare (two register, immediate shift)
11		Logical Arithmetic (three register, immediate shift)

Integer Data Processing (three register, immediate shift)

These instructions are under Data-processing register (immediate shift).

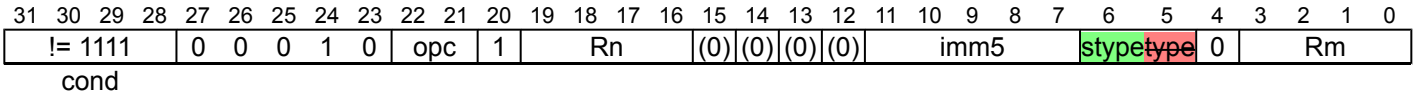


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	S	Rn	Instruction Details
000			AND, ANDS (register)
001			EOR, EORS (register)
010	0	!= 1101	SUB, SUBS (register) — SUB
010	0	1101	SUB, SUBS (SP minus register) — SUB
010	1	!= 1101	SUB, SUBS (register) — SUBS
010	1	1101	SUB, SUBS (SP minus register) — SUBS
011			RSB, RSBS (register)
100	0	!= 1101	ADD, ADDS (register) — ADD
100	0	1101	ADD, ADDS (SP plus register) — ADD
100	1	!= 1101	ADD, ADDS (register) — ADDS
100	1	1101	ADD, ADDS (SP plus register) — ADDS
101			ADC, ADCS (register)
110			SBC, SBCS (register)
111			RSC, RSCS (register)

Integer Test and Compare (two register, immediate shift)

These instructions are under Data-processing register (immediate shift).

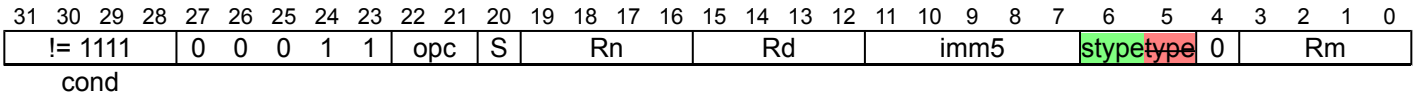


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	Instruction Details
00	TST (register)
01	TEQ (register)
10	CMP (register)
11	CMN (register)

Logical Arithmetic (three register, immediate shift)

These instructions are under Data-processing register (immediate shift).

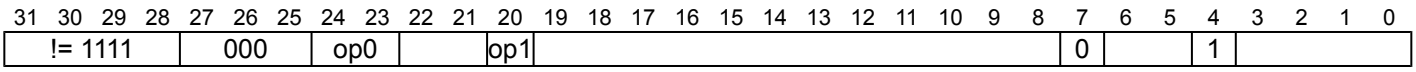


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	Instruction Details
00	ORR, ORRS (register)
01	MOV, MOVS (register)
10	BIC, BICS (register)
11	MVN, MVNS (register)

Data-processing register (register shift)

These instructions are under Data-processing and miscellaneous instructions.

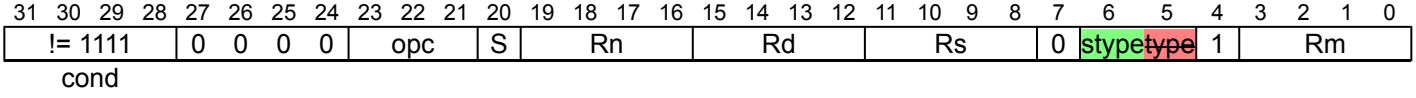


The following constraints also apply to this encoding: op0:op1 != 100

Decode fields op0	op1	Instruction details
0x		Integer Data Processing (three register, register shift)
10	1	Integer Test and Compare (two register, register shift)
11		Logical Arithmetic (three register, register shift)

Integer Data Processing (three register, register shift)

These instructions are under Data-processing register (register shift).

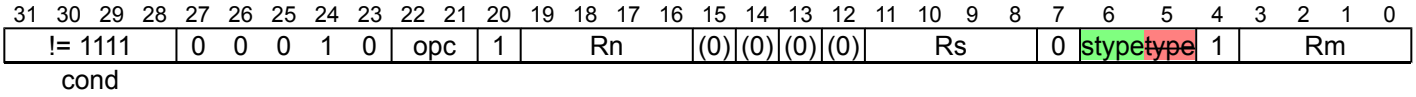


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	Instruction Details
000	AND, ANDS (register-shifted register)
001	EOR, EORS (register-shifted register)
010	SUB, SUBS (register-shifted register)
011	RSB, RSBS (register-shifted register)
100	ADD, ADDS (register-shifted register)
101	ADC, ADCS (register-shifted register)
110	SBC, SBCS (register-shifted register)
111	RSC, RSCS (register-shifted register)

Integer Test and Compare (two register, register shift)

These instructions are under Data-processing register (register shift).

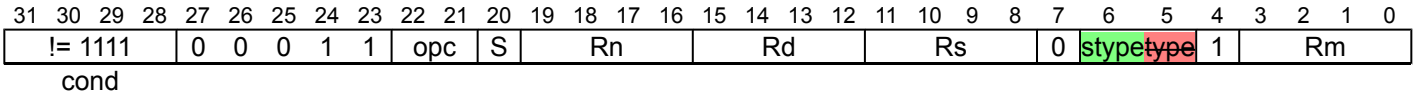


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	Instruction Details
00	TST (register-shifted register)
01	TEQ (register-shifted register)
10	CMP (register-shifted register)
11	CMN (register-shifted register)

Logical Arithmetic (three register, register shift)

These instructions are under Data-processing register (register shift).

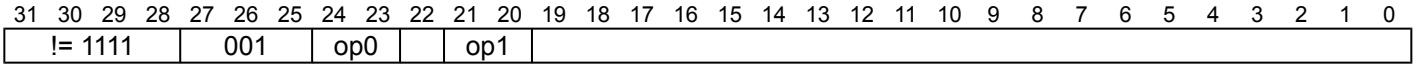


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	Instruction Details
00	ORR, ORRS (register-shifted register)
01	MOV, MOVS (register-shifted register)
10	BIC, BICS (register-shifted register)
11	MVN, MVNS (register-shifted register)

Data-processing immediate

These instructions are under Data-processing and miscellaneous instructions.

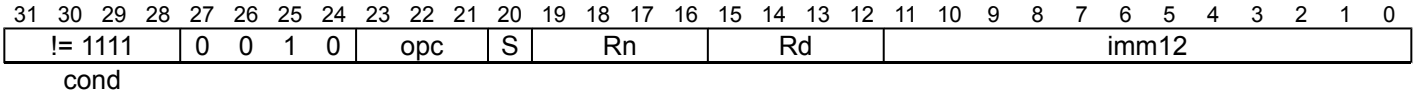


Decode fields op0	op1	Instruction details

0x		Integer Data Processing (two register and immediate)
10	00	Move Halfword (immediate)
10	10	Move Special Register and Hints (immediate)
10	x1	Integer Test and Compare (one register and immediate)
11		Logical Arithmetic (two register and immediate)

Integer Data Processing (two register and immediate)

These instructions are under Data-processing immediate.



The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	S	Rn	Instruction Details
000			AND, ANDS (immediate)
001			EOR, EORS (immediate)
010	0	!= 11x1	SUB, SUBS (immediate) — SUB
010	0	1101	SUB, SUBS (SP minus immediate) — SUB
010	0	1111	ADR — A2
010	1	!= 1101	SUB, SUBS (immediate) — SUBS
010	1	1101	SUB, SUBS (SP minus immediate) — SUBS
011			RSB, RSBS (immediate)
100	0	!= 11x1	ADD, ADDS (immediate) — ADD

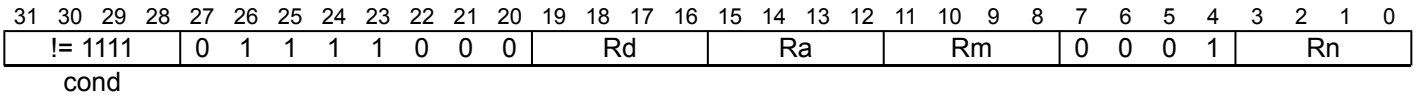
Unsigned Sum of Absolute Differences

These instructions are under Media instructions.

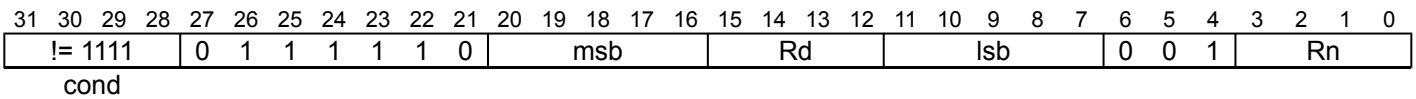


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields Ra	Instruction Details
!= 1111	USADA8
1111	USAD8

Bitfield Insert

These instructions are under Media instructions.



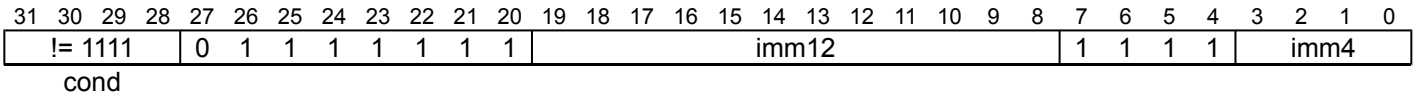
The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields Rn	Instruction Details
!= 1111	BFI

Decode fields Rn	Instruction Details
1111	BFC

Permanently UNDEFINED

These instructions are under Media instructions.

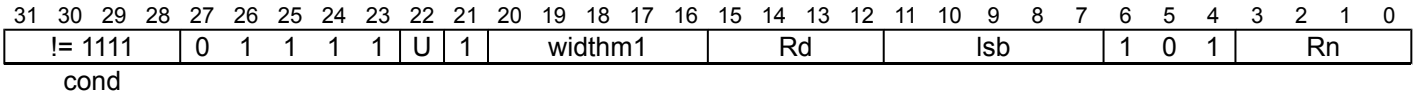


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields cond	Instruction Details
0xxx	UNALLOCATED
10xx	UNALLOCATED
110x	UNALLOCATED
1110	UDF

Bitfield Extract

These instructions are under Media instructions.

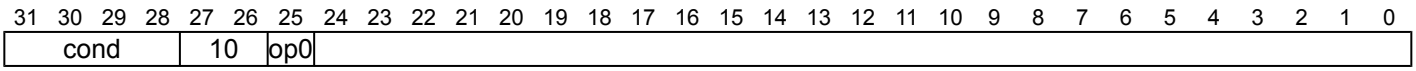


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields U	Instruction Details
0	SBFX
1	UBFX

Branch, branch with link, and block data transfer

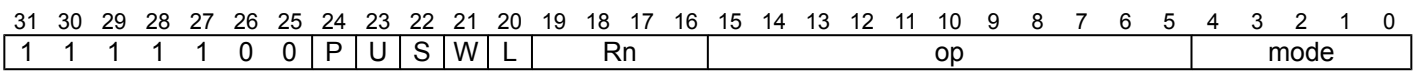
These instructions are under the top-level.



Decode fields cond	op0	Instruction details
1111	0	Exception Save/Restore
!= 1111	0	Load/Store Multiple
	1	Branch (immediate)

Exception Save/Restore

These instructions are under Branch, branch with link, and block data transfer.



Decode fields P	U	S	L	Instruction Details
		0	0	UNALLOCATED
0	0	0	1	RFE, RFEDA, RFEDB, RFEIA, RFEIB — Decrement After
0	0	1	0	SRS, SRSDA, SRSDB, SRSIA, SRSIB — Decrement After

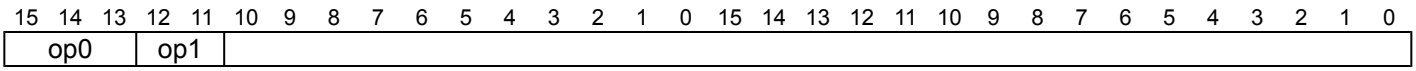
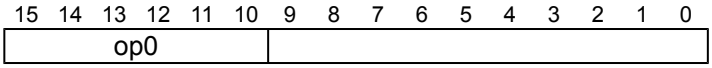
Top-level encodings for T32



Decode fields op0	op1	Instruction details
!= 111		16-bit
111	00	B — T2
111	!= 00	32-bit

16-bit

These instructions are under the top-level.

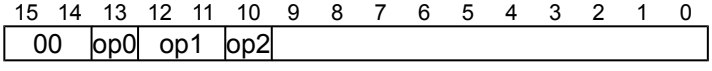


The following constraints also apply to this encoding: op0<5:3> != 111

Decode fields op0	Instruction details
00xxxx	Shift (immediate), add, subtract, move, and compare
010000	Data-processing (two low registers)
010001	Special data instructions and branch and exchange
01001x	LDR (literal) — T1
0101xx	Load/store (register offset)
011xxx	Load/store word/byte (immediate offset)
1000xx	Load/store halfword (immediate offset)
1001xx	Load/store (SP-relative)
1010xx	Add PC/SP (immediate)
1011xx	Miscellaneous 16-bit instructions
1100xx	Load/store multiple
1101xx	Conditional branch, and Supervisor Call

Shift (immediate), add, subtract, move, and compare

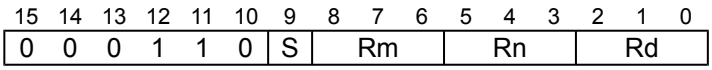
These instructions are under 16-bit.



Decode fields op0	op1	op2	Instruction details
0	11	0	Add, subtract (three low registers)
0	11	1	Add, subtract (two low registers and immediate)
0	!= 11		MOV, MOVS (register) — T2
1			Add, subtract, compare, move (one low register and immediate)

Add, subtract (three low registers)

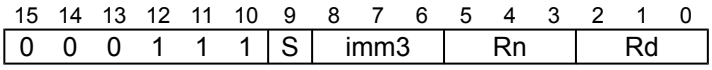
These instructions are under Shift (immediate), add, subtract, move, and compare.



Decode fields S	Instruction Details
0	ADD, ADDS (register)
1	SUB, SUBS (register)

Add, subtract (two low registers and immediate)

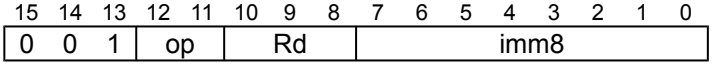
These instructions are under Shift (immediate), add, subtract, move, and compare.



Decode fields S	Instruction Details
0	ADD, ADDS (immediate)
1	SUB, SUBS (immediate)

Add, subtract, compare, move (one low register and immediate)

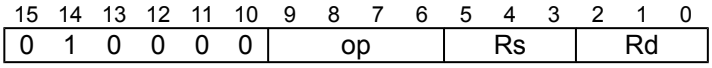
These instructions are under Shift (immediate), add, subtract, move, and compare.



Decode fields op	Instruction Details
00	MOV, MOVS (immediate)
01	CMP (immediate)
10	ADD, ADDS (immediate)
11	SUB, SUBS (immediate)

Data-processing (two low registers)

These instructions are under 16-bit.

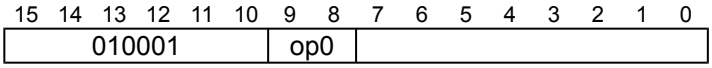


Decode fields op	Instruction Details
0000	AND, ANDS (register)
0001	EOR, EORS (register)
0010	MOV, MOVS (register-shifted register) — logical shift left
0011	MOV, MOVS (register-shifted register) — logical shift right
0100	MOV, MOVS (register-shifted register) — arithmetic shift right
0101	ADC, ADCS (register)
0110	SBC, SBCS (register)
0111	MOV, MOVS (register-shifted register) — rotate right
1000	TST (register)

Decode fields op	Instruction Details
1001	RSB, RSBS (immediate)
1010	CMP (register)
1011	CMN (register)
1100	ORR, ORRS (register)
1101	MUL, MULS
1110	BIC, BICS (register)
1111	MVN, MVNS (register)

Special data instructions and branch and exchange

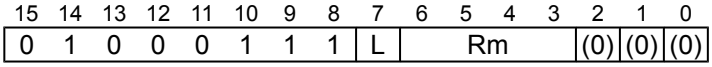
These instructions are under 16-bit.



Decode fields op0	Instruction details
11	Branch and exchange
!= 11	Add, subtract, compare, move (two high registers)

Branch and exchange

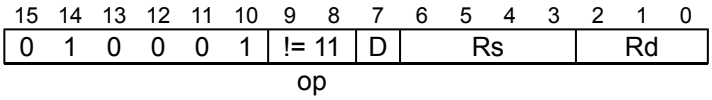
These instructions are under Special data instructions and branch and exchange.



Decode fields L	Instruction Details
0	BX
1	BLX (register)

Add, subtract, compare, move (two high registers)

These instructions are under Special data instructions and branch and exchange.

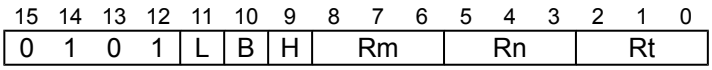


The following constraints also apply to this encoding: op != 11 && op != 11

Decode fields op	D:Rd	Rs	Instruction Details
00	!= 1101	!= 1101	ADD, ADDS (register)
00		1101	ADD, ADDS (SP plus register) — T1
00	1101	!= 1101	ADD, ADDS (SP plus register) — T2
01			CMP (register)
10			MOV, MOVS (register)

Load/store (register offset)

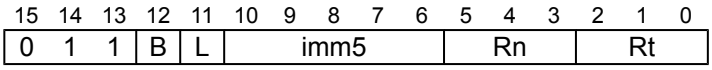
These instructions are under 16-bit.



Decode fields L	B	H	Instruction Details
0	0	0	STR (register)
0	0	1	STRH (register)
0	1	0	STRB (register)
0	1	1	LDRSB (register)
1	0	0	LDR (register)
1	0	1	LDRH (register)
1	1	0	LDRB (register)
1	1	1	LDRSH (register)

Load/store word/byte (immediate offset)

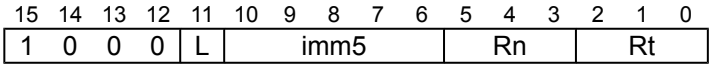
These instructions are under 16-bit.



Decode fields B	L	Instruction Details
0	0	STR (immediate)
0	1	LDR (immediate)
1	0	STRB (immediate)
1	1	LDRB (immediate)

Load/store halfword (immediate offset)

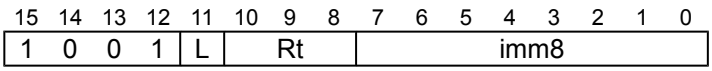
These instructions are under 16-bit.



Decode fields L	Instruction Details
0	STRH (immediate)
1	LDRH (immediate)

Load/store (SP-relative)

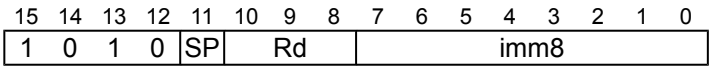
These instructions are under 16-bit.



Decode fields L	Instruction Details
0	STR (immediate)
1	LDR (immediate)

Add PC/SP (immediate)

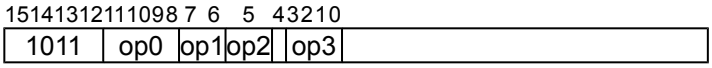
These instructions are under 16-bit.



Decode fields SP	Instruction Details
0	ADR
1	ADD, ADDS (SP plus immediate)

Miscellaneous 16-bit instructions

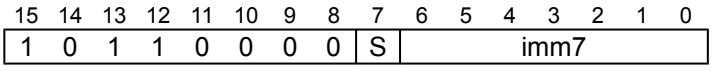
These instructions are under 16-bit.



Decode fields op0	op1	op2	op3	Instruction details	Architecture version
0000				Adjust SP (immediate)	-
0010				Extend	-
0110	00	0		SETPAN	Armv8.1
0110	00	1		UNALLOCATED	-
0110	01			Change Processor State	-
0110	1x			UNALLOCATED	-
0111				UNALLOCATED	-
1000				UNALLOCATED	-
1010	10			HLT	-
1010	!= 10			Reverse bytes	-
1110				BKPT	-
1111			0000	Hints	-
1111			!= 0000	IT	-
x0x1				CBNZ, CBZ	-
x10x				Push and Pop	-

Adjust SP (immediate)

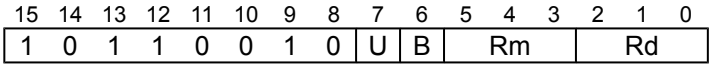
These instructions are under Miscellaneous 16-bit instructions.



Decode fields S	Instruction Details
0	ADD, ADDS (SP plus immediate)
1	SUB, SUBS (SP minus immediate)

Extend

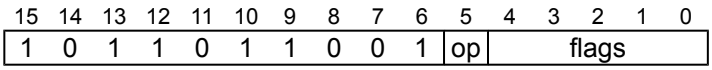
These instructions are under Miscellaneous 16-bit instructions.



Decode fields U	B	Instruction Details
0	0	SXTH
0	1	SXTB
1	0	UXTH
1	1	UXTB

Change Processor State

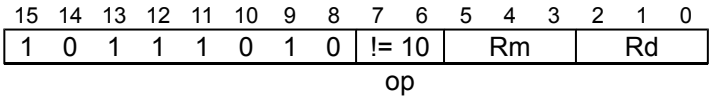
These instructions are under Miscellaneous 16-bit instructions.



Decode fields op	flags	Instruction Details
0		SETEND
1		CPS, CPSID, CPSIE

Reverse bytes

These instructions are under Miscellaneous 16-bit instructions.

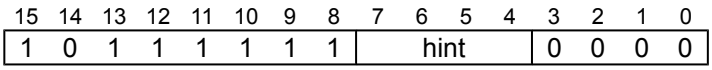


The following constraints also apply to this encoding: op != 10 && op != 10

Decode fields op	Instruction Details
00	REV
01	REV16
11	REVSH

Hints

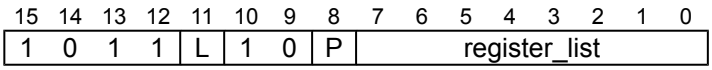
These instructions are under Miscellaneous 16-bit instructions.



Decode fields hint	Instruction Details
0000	NOP
0001	YIELD
0010	WFE
0011	WFI
0100	SEV
0101	SEVL
011x	Reserved hint, behaves as NOP
1xxx	Reserved hint, behaves as NOP

Push and Pop

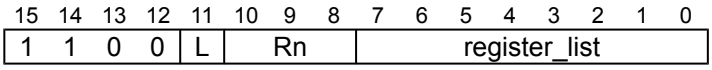
These instructions are under Miscellaneous 16-bit instructions.



Decode fields L	Instruction Details
0	PUSH
1	POP

Load/store multiple

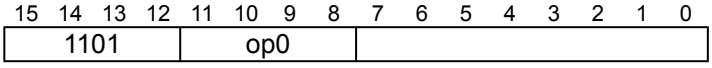
These instructions are under 16-bit.



Decode fields L	Instruction Details
0	STM, STMIA, STMEA
1	LDM, LDMIA, LDMFD

Conditional branch, and Supervisor Call

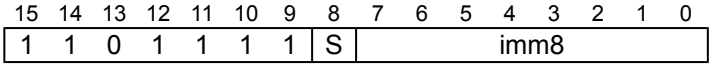
These instructions are under 16-bit.



Decode fields op0	Instruction details
111x	Exception generation
!= 111x	B — T1

Exception generation

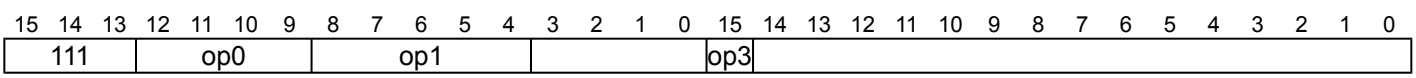
These instructions are under Conditional branch, and Supervisor Call.



Decode fields S	Instruction Details
0	UDF
1	SVC

32-bit

These instructions are under the top-level.

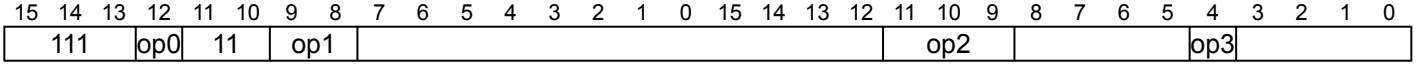


The following constraints also apply to this encoding: op0<3:2> != 00

Decode fields op0	op1	op3	Instruction details
x11x			System register access, Advanced SIMD, and floating-point
0100	xx0xx		Load/store multiple
0100	xx1xx		Load/store dual, load/store exclusive, load-acquire/store-release, and table branch
0101			Data-processing (shifted register)
10xx		1	Branches and miscellaneous control
10x0		0	Data-processing (modified immediate)
10x1		0	Data-processing (plain binary immediate)
1100	1xxx0		Advanced SIMD element or structure load/store
1100	!= 1xxx0		Load/store single
1101	0xxxx		Data-processing (register)
1101	10xxx		Multiply, multiply accumulate, and absolute difference
1101	11xxx		Long multiply and divide

System register access, Advanced SIMD, and floating-point

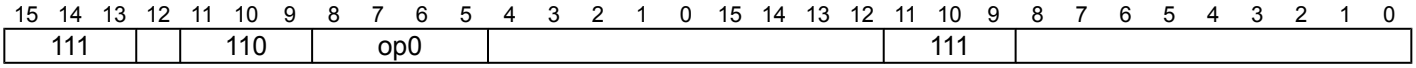
These instructions are under 32-bit.



Decode fields op0	op1	op2	op3	Instruction details
	0x	111		System register load/store and 64-bit move
	10	10x	0	Floating-point data-processing
	10	111	1	System register 32-bit move
	11			Advanced SIMD data-processing
0	0x	10x		Advanced SIMD load/store and 64-bit move
0	10	10x	1	Advanced SIMD and floating-point 32-bit move
1	0x	1x0		Advanced SIMD three registers of the same length extension
1	10	1x0		Advanced SIMD two registers and a scalar extension

System register load/store and 64-bit move

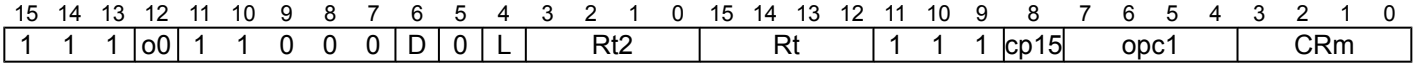
These instructions are under System register access, Advanced SIMD, and floating-point.



Decode fields op0	Instruction details
00x0	System register 64-bit move
!= 00x0	System register Load/Store

System register 64-bit move

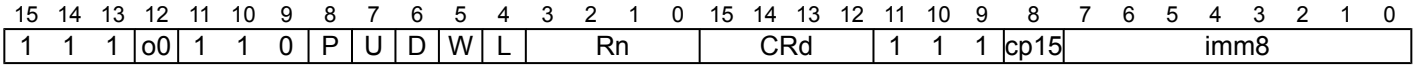
These instructions are under System register load/store and 64-bit move.



Decode fields o0	D	L	Instruction Details
0	0		UNALLOCATED
0	1	0	MCRR
0	1	1	MRRC
1	0		UNALLOCATED
1	1		UNALLOCATED

System register Load/Store

These instructions are under System register load/store and 64-bit move.

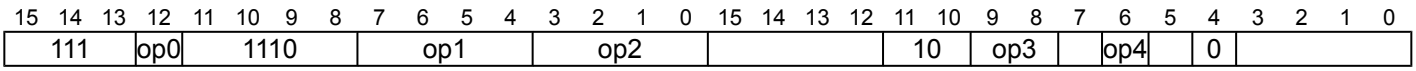


The following constraints also apply to this encoding: P:U:D:W != 00x0

Decode fields o0	P:U:W	D	L	Rn	CRd	cp15	Instruction Details
	!= 000				!= 0101	0	UNALLOCATED
	!= 000					1	UNALLOCATED
	!= 000	1			0101	0	UNALLOCATED
0	!= 000	0	1	1111	0101	0	LDC (literal)
0	0x1	0	0		0101	0	STC — post-indexed
0	0x1	0	1	!= 1111	0101	0	LDC (immediate) — post-indexed
0	010	0	0		0101	0	STC — unindexed
0	010	0	1	!= 1111	0101	0	LDC (immediate) — unindexed
0	1x0	0	0		0101	0	STC — offset
0	1x0	0	1	!= 1111	0101	0	LDC (immediate) — offset
0	1x1	0	0		0101	0	STC — pre-indexed
0	1x1	0	1	!= 1111	0101	0	LDC (immediate) — pre-indexed
1	!= 000	0			0101	0	UNALLOCATED

Floating-point data-processing

These instructions are under System register access, Advanced SIMD, and floating-point.



Decode fields op0	op1	op2	op3	op4	Instruction details
0	1x11			1	Floating-point data-processing (two registers)
0	1x11			0	Floating-point move immediate
0	!= 1x11				Floating-point data-processing (three registers)
1	0xxx		!= 00	0	Floating-point conditional select
1	1x00		!= 00		Floating-point minNum/maxNum
1	1x11	0000	!= 00	1	Floating-point extraction and insertion
1	1x11	1xxx	!= 00	1	Floating-point directed convert to integer

Floating-point data-processing (two registers)

These instructions are under Floating-point data-processing.
