ACTLR_EL3, Auxiliary Control Register (EL3)

The ACTLR_EL3 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for EL3.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

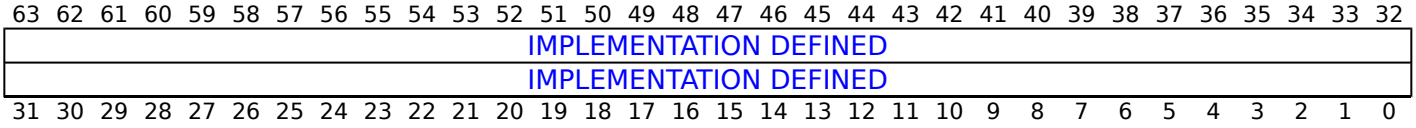
This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to ACTLR_EL3 are UNDEFINED.

Attributes

ACTLR_EL3 is a 64-bit register.

Field descriptions

The ACTLR_EL3 bit assignments are:



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the ACTLR_EL3

Accesses to this register use the following encodings:

```

AFSR0_EL1, Auxiliary Fault Status Register 0 (EL1)

The AFSR0_EL1 characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for exceptions taken to EL1.

Configuration

AArch64 System register AFSR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ADFSR[31:0] .

~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

AFSR0_EL1 is a 64-bit register.

Field descriptions

The AFSR0_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

AMAIR_EL1, Auxiliary Memory Attribute Indirection Register (EL1)

The AMAIR_EL1 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR_EL1.

Configuration

AArch64 System register AMAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register AMAIR0[31:0] .

AArch64 System register AMAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register AMAIR1[31:0] .

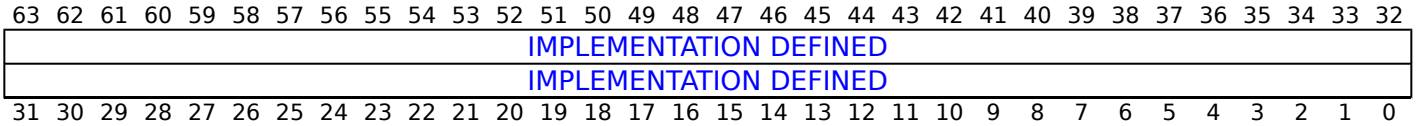
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

AMAIR_EL1 is a 64-bit register.

Field descriptions

The AMAIR_EL1 bit assignments are:



AMAIR_EL1 is permitted to be cached in a TLB.

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the AMAIR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic AMAIR_EL1 or AMAIR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, AMAIR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0011	0b000

```
if PSTATE.EL == EL0 then

AMCNTENCLR1_EL0, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1_EL0 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>_EL0.

Configuration

AArch64 System register AMCNTENCLR1_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR1[31:0] .

AArch64 System register AMCNTENCLR1_EL0 bits [31:0] are architecturally mapped to External register AMCNTENCLR1[31:0] .

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1_EL0 are UNDEFINED.

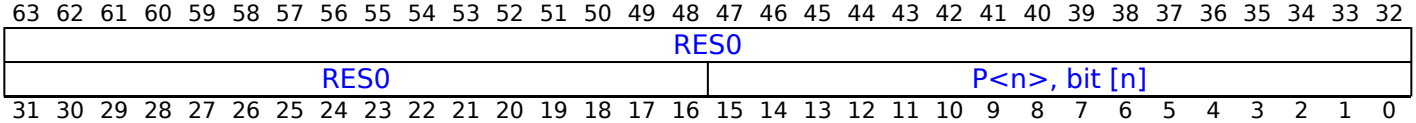
~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

AMCNTENCLR1_EL0 is a 64-bit register.

Field descriptions

The AMCNTENCLR1_EL0 bit assignments are:



Bits [63:16]

Reserved, RES0.

P<n>, bit [n], for n = 0 to 15

Activity monitor event counter disable bit for AMEVCNTR1<n>_EL0.

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR_EL0.CG1NC.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR1<n>_EL0 is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR1<n>_EL0 is enabled. When written, disables AMEVCNTR1<n>_EL0.

On a Cold reset, this field resets to 0.

Accessing the AMCNTENCLR1_EL0

- ~~Accesses to the register are UNDEFINED.~~
- ~~Accesses to the register behave as RAZ/WI.~~
- ~~Accesses to the register execute as a NOP.~~

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENCLR1_EL0 are UNDEFINED~~CONSTRAINED UNPREDICTABLE.~~~~, and the following behaviors are permitted:~~

Note

The number of auxiliary activity monitor event counters implemented is zero exactly when AMCFGR_EL0.NCG == 0b0000.

Accesses to this register use the following encodings:

MRS <Xt>, AMCNTENCLR1_EL0

AMEVCNTR0<n>_EL0, Activity Monitors Event Counter Registers 0, n = 0 - 15

The AMEVCNTR0<n>_EL0 characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configuration

AArch64 System register AMEVCNTR0<n>_EL0 bits [63:0] are architecturally mapped to AArch32 System register AMEVCNTR0<n>[63:0] .

AArch64 System register AMEVCNTR0<n>_EL0 bits [63:0] are architecturally mapped to External register AMEVCNTR0<n>[63:0] .

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n>_EL0 are UNDEFINED.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

AMEVCNTR0<n>_EL0 is a 64-bit register.

Field descriptions

The AMEVCNTR0<n>_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ACNT																															
ACNT																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If ARMv8.6-AMU is implemented, HCR_EL2.AMVOFFEN is 1, SCR_EL3.AMVOFFEN is 1~~0~~, HCR_EL2.{E2H, TGE} is not {1,1}, and EL2 is implemented in the current Security state, access to these registers at EL0 or EL1 return (PCount<63:0> - AMEVCNTVOFF0<n>_EL2<63:0>).

PCount is the physical count returned when AMEVCNTR0<n>_EL0 is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to `0`.

Accessing the AMEVCNTR0<n>_EL0

- ~~Accesses to the register are UNDEFINED.~~

- ~~Accesses to the register behave as RAZ/WI.~~
- ~~Accesses to the register execute as a NOP.~~

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n>_EL0 are UNDEFINED~~CONSTRAINED UNPREDICTABLE.~~, ~~and the following behaviors are permitted:~~

Note

AMCGCR_EL0.CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings:

MRS <Xt>, AMEVCNTR0<n>_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b010:n[3]	n[2:0]

AMEVCNTR1<n>_EL0, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n>_EL0 characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Configuration

AArch64 System register AMEVCNTR1<n>_EL0 bits [63:0] are architecturally mapped to AArch32 System register AMEVCNTR1<n>[63:0] .

AArch64 System register AMEVCNTR1<n>_EL0 bits [63:0] are architecturally mapped to External register AMEVCNTR1<n>[63:0] .

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n>_EL0 are UNDEFINED.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

AMEVCNTR1<n>_EL0 is a 64-bit register.

Field descriptions

The AMEVCNTR1<n>_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ACNT																															
ACNT																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If ARMv8.6-AMU is implemented, HCR_EL2.AMVOFFEN is 1, SCR_EL3.AMVOFFEN is 1~~0~~, HCR_EL2.{E2H, TGE} is not {1,1}, EL2 is implemented in the current Security state, and AMCR_EL0.CG1RZ is 0, reads to these registers at EL0 or EL1 return (PCount<63:0> - AMEVCNTVOFF1<n>_EL2<63:0>).

PCount is the physical count returned when AMEVCNTR1<n>_EL0 is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to `0`.

Accessing the AMEVCNTR1<n>_EL0

- ~~Accesses to the register are UNDEFINED.~~

- ~~Accesses to the register behave as RAZ/WI.~~
- ~~Accesses to the register execute as a NOP.~~

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<n>_EL0 are UNDEFINED~~CONSTRAINED UNPREDICTABLE., and the following behaviors are permitted:~~

Note

AMCGCR_EL0.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings:

MRS <Xt>, AMEVCNTR1<n>_EL0

op0	op1	CRn	CRm	op2

AMEVTYPER0<n>_EL0, Activity Monitors Event Type Registers 0, n = 0 - 15

The AMEVTYPER0<n>_EL0 characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter AMEVCNTR0<n>_EL0 counts.

Configuration

AArch64 System register AMEVTYPER0<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPER0<n>[31:0] .

AArch64 System register AMEVTYPER0<n>_EL0 bits [31:0] are architecturally mapped to External register AMEVTYPER0<n>[31:0] .

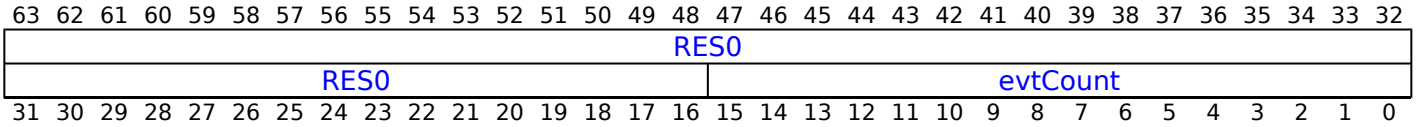
This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n>_EL0 are UNDEFINED.

Attributes

AMEVTYPER0<n>_EL0 is a 64-bit register.

Field descriptions

The AMEVTYPER0<n>_EL0 bit assignments are:



Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>_EL0. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

evtCount	Meaning	Applies when
0x0011	Processor frequency cycles	When n == 0
0x4004	Constant frequency cycles	When n == 1
0x0008	Instructions retired	When n == 2
0x4005	Memory stall cycles	When n == 3

Accessing the AMEVTYPER0<n>_EL0

- ~~Accesses to the register are UNDEFINED.~~
- ~~Accesses to the register behave as RAZ/WI.~~

AMUSERENR_EL0, Activity Monitors User Enable Register

The AMUSERENR_EL0 characteristics are:

Purpose

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR_EL0 is applicable to both the architected and the auxiliary counter groups.

Configuration

AArch64 System register AMUSERENR_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMUSERENR[31:0] .

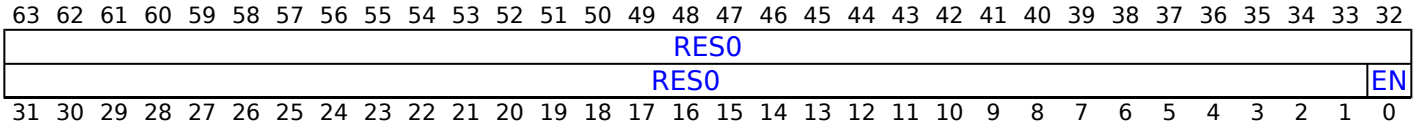
This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR_EL0 are UNDEFINED.

Attributes

AMUSERENR_EL0 is a 64-bit register.

Field descriptions

The AMUSERENR_EL0 bit assignments are:



Bits [63:1]

Reserved, RES0.

EN, bit [0]

Traps EL0 accesses to the activity monitors registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value 0x18:
  - AMCFGR_EL0, AMCGCR_EL0, AMCNTENCLR0_EL0, AMCNTENCLR1_EL0, AMCNTENSET0_EL0, AMCNTENSET1_EL0, AMCR_EL0, AMEVCNTR0<n>_EL0, AMEVCNTR1<n>_EL0, AMEVTYPER0<n>_EL0, and AMEVTYPER1<n>_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped and reported using EC syndrome value 0x04:
  - AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVCNTR0<n>, AMEVCNTR1<n>, AMEVTYPER0<n>, and AMEVTYPER1<n>.

EN	Meaning
0b0	EL0 accesses to the activity monitors registers are trapped.
0b1	This control does not cause any instructions to be trapped. Software can access all activity monitor registers at EL0.

Note

- AMUSERENR_EL0 can always be read at EL0 and is not governed by this bit.

Accessing the AMUSERENR_EL0

Accesses to this register use the following encodings:

```
MRS <Xt>, AMUSERENR_EL0

AT S12E0R, Address Translate Stages 1 and 2 EL0 Read

The AT S12E0R characteristics are:

Purpose

Performs stage 1 and 2 address translations from EL0, with permissions as if reading from the given virtual address from EL0, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime.
- Otherwise, the EL1&0 translation regime.

Configuration

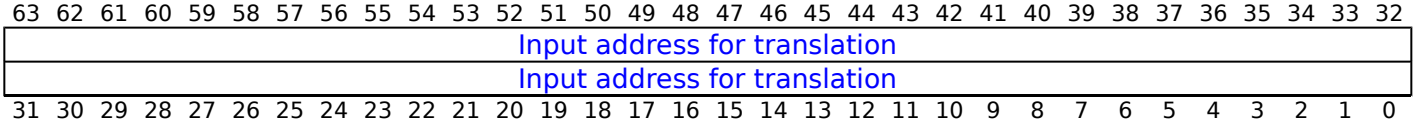
There are no configuration notes.

Attributes

AT S12E0R is a 64-bit System instruction.

Field descriptions

The AT S12E0R input value bit assignments are:



Bits [63:0]

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

Executing the AT S12E0R instruction

Accesses to this instruction use the following encodings:

AT S1E2R, Address Translate Stage 1 EL2 Read

The AT S1E2R characteristics are:

Purpose

Performs stage 1 address translation as defined for EL2, with permissions as if reading from the given virtual address.

Configuration

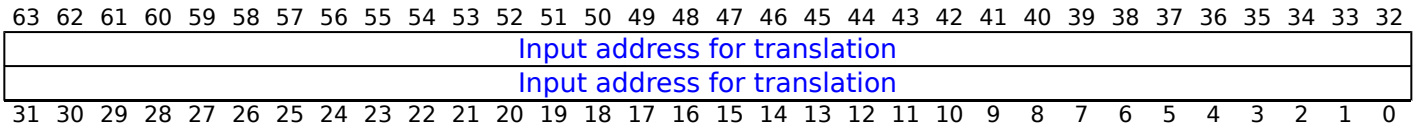
There are no configuration notes.

Attributes

AT S1E2R is a 64-bit System instruction.

Field descriptions

The AT S1E2R input value bit assignments are:



Bits [63:0]

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

Executing the AT S1E2R instruction

Accesses to this instruction use the following encodings:

```
AT S1E2R, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b0111	0b1000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

CCSIDR2_EL1, Current Cache Size ID Register 2

The CCSIDR2_EL1 characteristics are:

Purpose

When ARMv8.3-CCIDX is implemented, provides the information about the architecture of the currently selected cache from bits[63:32] of CCSIDR_EL1.

When ARMv8.3-CCIDX is not implemented, this register is not implemented.

Configuration

AArch64 System register CCSIDR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register CCSIDR2[31:0] .

This register is present only when ARMv8.3-CCIDX is implemented. Otherwise, direct accesses to CCSIDR2_EL1 are UNDEFINED.

InIf anAArch32 AArch64is onlynot implementationimplemented, it is IMPLEMENTATION DEFINED whether reading this register gives an UNKNOWN value or is UNDEFINED.

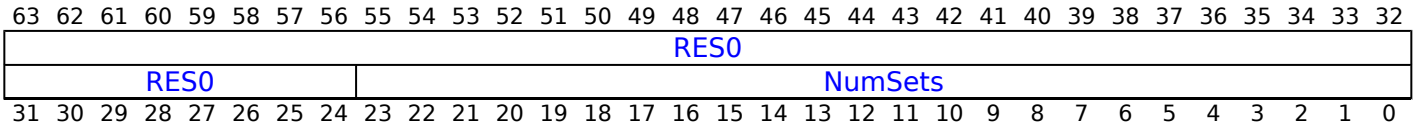
The implementation includes one CCSIDR2_EL1 for each cache that it can access. CSSELR_EL1 selects which Cache Size ID Register is accessible.

Attributes

CCSIDR2_EL1 is a 64-bit register.

Field descriptions

The CCSIDR2_EL1 bit assignments are:



Bits [63:24]

Reserved, RES0.

NumSets, bits [23:0]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Accessing the CCSIDR2_EL1

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR2_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR2_EL1 read is treated as NOP.
- The CCSIDR2_EL1 read is UNDEFINED.
- The CCSIDR2_EL1 read returns an UNKNOWN value.

Accesses to this register use the following encodings:

```
MRS <Xt>, CCSIDR2_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b010

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then

CCSIDR_EL1, Current Cache Size ID Register

The CCSIDR_EL1 characteristics are:

Purpose

Provides information about the architecture of the currently selected cache.

Configuration

AArch64 System register CCSIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CCSIDR[31:0] .

AArch64 System register CCSIDR_EL1 bits [63:32] are architecturally mapped to AArch32 System register CCSIDR2[31:0] .

The implementation includes one CCSIDR_EL1 for each cache that it can access. CSSELR_EL1 selects which Cache Size ID Register is accessible.

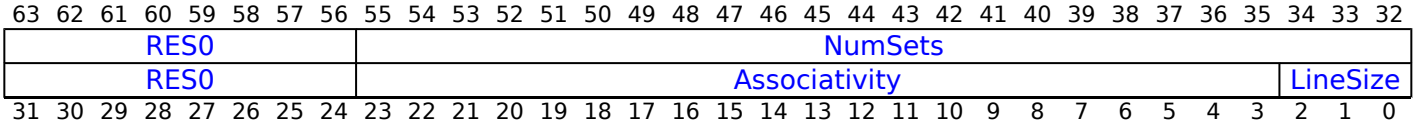
Attributes

CCSIDR_EL1 is a 64-bit register.

Field descriptions

The CCSIDR_EL1 bit assignments are:

When ARMv8.3-CCIDX is implemented:



Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [63:56]

Reserved, RES0.

NumSets, bits [55:32]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Bits [31:24]

Reserved, RES0.

Associativity, bits [23:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

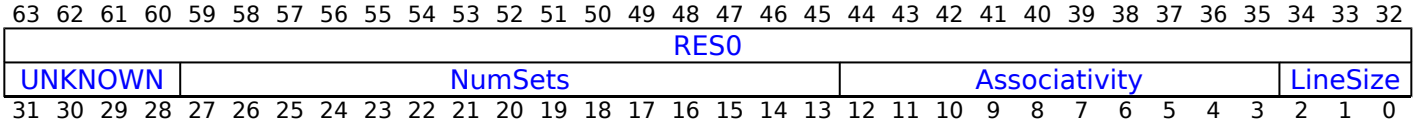
LineSize, bits [2:0]

(Log_2(Number of bytes in cache line)) - 4. For example:

- For a line length of 16 bytes: $Log_2(16) = 4$, LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes: $Log_2(32) = 5$, LineSize entry = 1.

When ARMv8.5-MemTag is implemented and enabled, where a cache only holds Allocation tags, this field is RES0.

Otherwise:



Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [63:32]

Reserved, RES0.

Bits [31:28]

Reserved, UNKNOWN.

NumSets, bits [27:13]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Associativity, bits [12:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log_2(Number of bytes in cache line)) - 4. For example:

- For a line length of 16 bytes: $Log_2(16) = 4$, LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes: $Log_2(32) = 5$, LineSize entry = 1.

Accessing the CCSIDR_EL1

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR_EL1 read is treated as NOP.

- The CCSIDR_EL1 read is UNDEFINED.
- The CCSIDR_EL1 read returns an UNKNOWN value.

Accesses to this register use the following encodings:

```
MRS <Xt>, CCSIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b000

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;

CLIDR_EL1, Cache Level ID Register

The CLIDR_EL1 characteristics are:

Purpose

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

Configuration

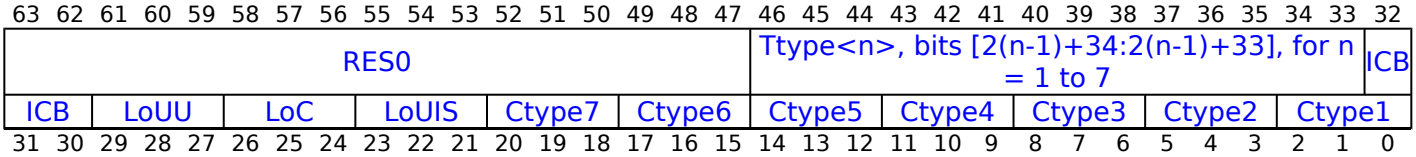
AArch64 System register CLIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CLIDR[31:0] .

Attributes

CLIDR_EL1 is a 64-bit register.

Field descriptions

The CLIDR_EL1 bit assignments are:



Bits [63:47]

Reserved, RES0.

Ttype<n>, bits [2(n-1)+34:2(n-1)+33], for n = 1 to 7

~~**When ARMv8.5-MemTag is implemented:**~~

Tag cache type. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy.

Ttype<n>	Meaning
0b00	No Tag Cache.
0b01	Separate Allocation Tag Cache.
0b10	Unified Allocation Tag and Data cache, Allocation Tags and Data in unified lines.
0b11	Unified Allocation Tag and Data cache, Allocation Tags and Data in separate lines.

~~**Otherwise:**~~

~~Reserved, RES0.~~

ICB, bits [32:30]

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

The possible values are:

ICB	Meaning
0b000	Not disclosed by this mechanism.
0b001	L1 cache is the highest Inner Cacheable level.
0b010	L2 cache is the highest Inner Cacheable level.
0b011	L3 cache is the highest Inner Cacheable level.
0b100	L4 cache is the highest Inner Cacheable level.
0b101	L5 cache is the highest Inner Cacheable level.
0b110	L6 cache is the highest Inner Cacheable level.
0b111	L7 cache is the highest Inner Cacheable level.

LoUU, bits [29:27]

Level of Unification Uniprocessor for the cache hierarchy.

LoC, bits [26:24]

Level of Coherence for the cache hierarchy.

LoUIS, bits [23:21]

Level of Unification Inner Shareable for the cache hierarchy.

Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 1 to 7

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

Ctype<n>	Meaning
0b000	No cache.
0b001	Instruction cache only.
0b010	Data cache only.
0b011	Separate instruction and data caches.
0b100	Unified cache.

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

Accessing the CLIDR_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, CLIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b001

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID2 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID4 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGRTR_EL2.CLIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return CLIDR_EL1;
elsif PSTATE.EL == EL2 then
    return CLIDR_EL1;
elsif PSTATE.EL == EL3 then
    return CLIDR_EL1;
```

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

CNTHCTL_EL2, Counter-timer Hypervisor Control register

The CNTHCTL_EL2 characteristics are:

Purpose

Controls the generation of an event stream from the physical counter, and access from EL1 to the physical counter and the EL1 physical timer.

Configuration

AArch64 System register CNTHCTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHCTL[31:0] .

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTHCTL_EL2 is a 64-bit register.

Field descriptions

The CNTHCTL_EL2 bit assignments are:

When ARMv8.1-VHE is implemented and HCR_EL2.E2H == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40
RES0																							

39	38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8
RES0																						EVNTIS	EL1NVVCT	EL1NVPCT	EL1TVCT	EL1TVT	ECV	EL1PTEN	EL1PCTEN	EL0PTEN	EL0VTE

Bits [63:18]

Reserved, RES0.

EVNTIS, bit [17]

When ARMv8.6-ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_EL0[15:0].
0b1	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_EL0[23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVVCT, bit [16]

When ARMv8.6-ECV is implemented:

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H==1 && HCR_EL2.TGE==1) || HCR_EL2.NV2==0 || HCR_EL2.NV1==1 || HCR_EL2.NV==0), this control does not cause any instructions to be trapped. If ((HCR_EL2.E2H==0 || HCR_EL2.TGE==0) && HCR_EL2.NV2==1 && HCR_EL2.NV1==0 && HCR_EL2.NV==1), then EL1 accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVPCT, bit [15]

When ARMv8.6-ECV is implemented:

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVPCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H==1 && HCR_EL2.TGE==1) || HCR_EL2.NV2==0 || HCR_EL2.NV1==1 || HCR_EL2.NV==0), this control does not cause any instructions to be trapped. If (HCR_EL2.E2H==0 || HCR_EL2.TGE==0) && HCR_EL2.NV2==1 && HCR_EL2.NV1==0 && HCR_EL2.NV==1, then EL1 accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02, are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVCT, bit [14]

When ARMv8.6-ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

EL1TVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then: • In AArch64 state, traps EL0 and EL1 accesses to CNTVCT_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN. • In AArch32 state, traps EL0 and EL1 accesses to CNTVCT to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN or CNTKCTL.PL0VCTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVT, bit [13]

When ARMv8.6-ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

EL1TVT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then: • In AArch64 state, traps EL0 and EL1 accesses to CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN. • In AArch32 state, traps EL0 and EL1 accesses to CNTV_CTL, CNTV_CVAL, and CNTV_TVAL to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN or CNTKCTL.PL0VTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECV, bit [12]

When ARMv8.6-ECV is implemented:

Enables the Enhanced Counter Virtualization functionality registers.

ECV	Meaning
0b0	Enhanced Counter Virtualization functionality is disabled.
0b1	When HCR_EL2.{E2H, TGE} == {1, 1} or SCR_EL3.{NS, EEL2} == {0, 0}, then Enhanced Counter Virtualization functionality is disabled. When SCR_EL3.NS or SCR_EL3.EEL2 are 1, and HCR_EL2.E2H or HCR_EL2.TGE are 0, then Enhanced Counter Virtualziation functionality is enabled when EL2 is enabled for the current Security state. This means that: • An MRS to CNTPCT_EL0 from either EL0 or EL1 that is not trapped will return the value (PCount<63:0> - CNTPOFF_EL2<63:0>). • The EL1 physical timer interrupt is triggered when ((PCount<63:0> - CNTPOFF_EL2<63:0>) - PCVal<63:0>) is greater than or equal to 0. PCount<63:0> is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3. PCVal<63:0> is the EL1 physical timer compare value for this timer.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1PTEN, bit [11]

When HCR_EL2.TGE is 0, traps EL0 and EL1 accesses to the E1 physical timer registers to EL2 when EL2 is enabled in the current Security state.

EL1PTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PTEN. From AArch32 state: EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PTEN or CNTKCTL.PL0PTEN.
0b1	This control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

EL1PCTEN, bit [10]

When HCR_EL2.TGE is 0, traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to CNTPCT_EL0 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRRC or MCRR accesses to CNTPCT are trapped to EL2, reported using EC syndrome value 0x04.

EL1PCTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTPCT_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN. From AArch32 state: EL0 and EL1 accesses to the CNTPCT are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN or CNTKCTL.PL0PCTEN.
0b1	This control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

EL0PTEN, bit [9]

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, traps EL0 accesses to the physical timer registers to EL2.

EL0PTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 registers are trapped to EL2. EL0 using AArch32: EL0 accesses to the CNTP_CTL, CNTP_CVAL and CNTP_TVAL registers are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, traps EL0 accesses to the virtual timer registers to EL2.

EL0VTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 registers are trapped to EL2. EL0 using AArch32: EL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register CNTPCT_EL0 is the trigger for the event stream generated from that counter, when that stream is enabled.

This field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register CNTPCT_EL0 trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

This field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from the counter register CNTPCT_EL0:

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

This field resets to an architecturally UNKNOWN value.

EL0VCTEN, bit [1]

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, traps EL0 accesses to the frequency register and virtual counter register to EL2.

EL0VCTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the CNTVCT_EL0 are trapped to EL2. EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 register are trapped to EL2, if CNTHCTL_EL2.EL0PCTEN is also 0. EL0 using AArch32: EL0 accesses to the CNTVCT are trapped to EL2. EL0 using AArch32: EL0 accesses to the CNTFRQ register are trapped to EL2, if CNTHCTL.EL0PCTEN is also 0.
0b1	This control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, traps EL0 accesses to the frequency register and physical counter register to EL2.

EL0PCTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the CNTPCT_EL0 are trapped to EL2. EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 register are trapped to EL2, if CNTHCTL_EL2.EL0VCTEN is also 0. EL0 using AArch32: EL0 accesses to the CNTPCT are trapped to EL2. EL0 using AArch32: EL0 accesses to the CNTFRQ and register are trapped to EL2, if CNTHCTL_EL2.EL0VCTEN is also 0.
0b1	This control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34

RES0														EVNTIS	EL1NVVCT	EL1NVPCT	EL1TVCT	EL1TVT	ECV	RES0				EVNTI				EVNTDIR	EVNTEN	EI

This format applies in all Armv8.0 implementations, and it also contains a description of the behavior when EL3 is implemented and EL2 is not implemented.

Bits [63:18]

Reserved, RES0.

EVNTIS, bit [17]

When ARMv8.6-ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_EL0[15:0].
0b1	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_EL0[23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVVCT, bit [16]

When ARMv8.6-ECV is implemented:

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H==1 && HCR_EL2.TGE==1) || HCR_EL2.NV2==0 || HCR_EL2.NV1==1 || HCR_EL2.NV==0), this control does not cause any instructions to be trapped. If ((HCR_EL2.E2H==0 || HCR_EL2.TGE==0) && HCR_EL2.NV2==1 && HCR_EL2.NV1==0 && HCR_EL2.NV==1), then EL1 accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVPCT, bit [15]

When ARMv8.6-ECV is implemented:

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVPCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H==1 && HCR_EL2.TGE==1) || HCR_EL2.NV2==0 || HCR_EL2.NV1==1 || HCR_EL2.NV==0), this control does not cause any instructions to be trapped. If (HCR_EL2.E2H==0 || HCR_EL2.TGE==0) && HCR_EL2.NV2==1 && HCR_EL2.NV1==0 && HCR_EL2.NV==1, then EL1 accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02, are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVCT, bit [14]

When ARMv8.6-ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

EL1TVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then: In AArch64 state, traps EL0 and EL1 accesses to CNTVCT_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN. In AArch32 state, traps EL0 and EL1 accesses to CNTVCT to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN or CNTKCTL.PL0VCTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVT, bit [13]

When ARMv8.6-ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

EL1TVT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then: • In AArch64 state, traps EL0 and EL1 accesses to CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN. • In AArch32 state, traps EL0 and EL1 accesses to CNTV_CTL, CNTV_CVAL, and CNTV_TVAL to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN or CNTKCTL.PL0VTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECV, bit [12]

When ARMv8.6-ECV is implemented:

Enables the Enhanced Counter Virtualization functionality registers.

ECV	Meaning
0b0	Enhanced Counter Virtualization functionality is disabled.
0b1	When HCR_EL2.{E2H, TGE} == {1, 1} or SCR_EL3.{NS, EEL2} == {0, 0}, then Enhanced Counter Virtualization functionality is disabled. When SCR_EL3.NS or SCR_EL3.EEL2 are 1, and HCR_EL2.E2H or HCR_EL2.TGE are 0, then Enhanced Counter Virtualziation functionality is enabled when EL2 is enabled for the current Security state. This means that: • An MRS to CNTPCT_EL0 from either EL0 or EL1 that is not trapped will return the value (PCount<63:0> - CNTPOFF_EL2<63:0>). • The EL1 physical timer interrupt is triggered when ((PCount<63:0> - CNTPOFF_EL2<63:0>) - PCVal<63:0>) is greater than or equal to 0. PCount is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3. PCVal<63:0> is the EL1 physical timer compare value for this timer.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [11:8]

Reserved, RES0.

EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register CNTPCT_EL0 is the trigger for the event stream generated from that counter, when that stream is enabled.

This field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register CNTPCT_EL0 trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

This field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from the counter register CNTPCT_EL0:

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

This field resets to 0.

EL1PCEN, bit [1]

Traps EL0 and EL1 accesses to the EL1 physical timer registers to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to CNTP_CTL_EL0, CNTP_CVAL_EL0, CNTP_TVAL_EL0 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x3 and MRRC and MCRR accesses are trapped to EL2, reported using EC syndrome value 0x04:
    - CNTP_CTL, CNTP_CVAL, CNTP_TVAL.

EL1PCEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PTEN. From AArch32 state: EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PTEN or CNTKCTL.PL0PTEN.
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to an architecturally UNKNOWN value.

EL1PCTEN, bit [0]

Traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to CNTPCT_EL0 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRRC or MCRR accesses to CNTPCT are trapped to EL2, reported using EC syndrome value 0x04.

EL1PCTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTPCT_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN. From AArch32 state: EL0 and EL1 accesses to the CNTPCT are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN or CNTKCTL.PL0PCTEN.
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHCTL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHCTL_EL2 or CNTKCTL_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, CNTHCTL_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return CNTHCTL_EL2;
elsif PSTATE.EL == EL3 then
    return CNTHCTL_EL2;
```

```
MSR CNTHCTL_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    CNTHCTL_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    CNTHCTL_EL2 = X[t];
```

```
MRS <Xt>, CNTKCTL_EL1
```

op0	op1	CRn	CRm	op2

CNTHP_CTL_EL2, Counter-timer Hypervisor Physical Timer Control register

The CNTHP_CTL_EL2 characteristics are:

Purpose

Control register for the EL2 physical timer.

Configuration

AArch64 System register CNTHP_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHP_CTL[31:0] .

If EL2 is not implemented, this register is RES0 from EL3.

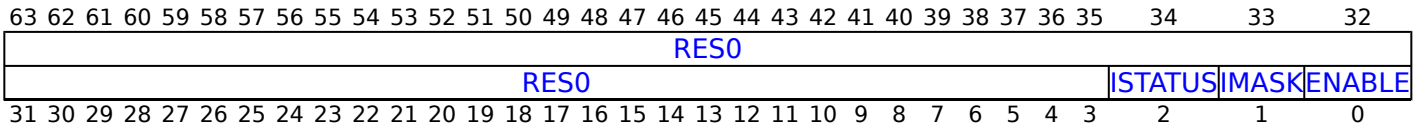
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTHP_CTL_EL2 is a 64-bit register.

Field descriptions

The CNTHP_CTL_EL2 bit assignments are:



Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHP_TVAL_EL2 continues to count down.

Note

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHP_CTL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP_CTL_EL2 or CNTP_CTL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, CNTHP_CTL_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0010	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return CNTHP_CTL_EL2;
elsif PSTATE.EL == EL3 then
    return CNTHP_CTL_EL2;
```

```
MSR CNTHP_CTL_EL2, <Xt>
```

CNTHP_CVAL_EL2, Counter-timer Physical Timer CompareValue register (EL2)

The CNTHP_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the EL2 physical timer.

Configuration

AArch64 System register CNTHP_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTHP_CVAL[63:0] .

If EL2 is not implemented, this register is RES0 from EL3.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTHP_CVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHP_CVAL_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When CNTHP_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHP_CTL_EL2.ISTATUS is set to 1.
- If CNTHP_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHP_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHP_CVAL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP_CVAL_EL2 or CNTP_CVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

CNTHP_TVAL_EL2, Counter-timer Physical Timer TimerValue register (EL2)

The CNTHP_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the EL2 physical timer.

Configuration

AArch64 System register CNTHP_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHP_TVAL[31:0] .

If EL2 is not implemented, this register is RES0 from EL3.

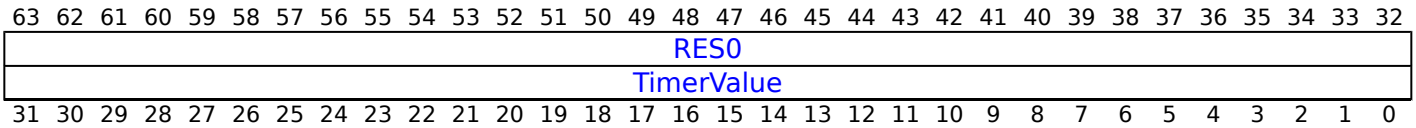
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTHP_TVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHP_TVAL_EL2 bit assignments are:



Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHP_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHP_CTL_EL2.ENABLE is 1, the value returned is (CNTHP_CVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHP_CVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHP_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHP_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHP_CTL_EL2.ISTATUS is set to 1.
- If CNTHP_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHP_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHP_TVAL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP_TVAL_EL2 or CNTP_TVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

CNTHPS_CTL_EL2, Counter-timer Secure Physical Timer Control register (EL2)

The CNTHPS_CTL_EL2 characteristics are:

Purpose

Control register for the Secure EL2 physical timer.

Configuration

AArch64 System register CNTHPS_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHPS_CTL[31:0] .

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL_EL2 are UNDEFINED.

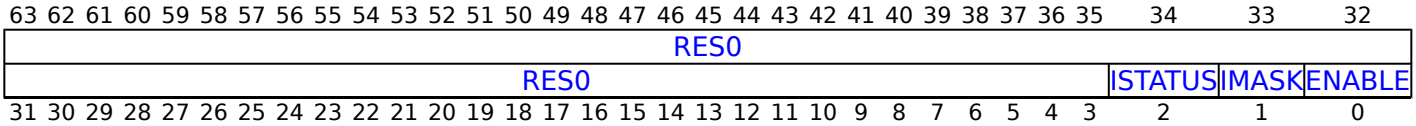
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTHPS_CTL_EL2 is a 64-bit register.

Field descriptions

The CNTHPS_CTL_EL2 bit assignments are:



Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the CNTHPS_CTL_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL_EL2.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHPS_TVAL_EL2 continues to count down.

Note

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

CNTHPS_CVAL_EL2, Counter-timer Secure Physical Timer CompareValue register (EL2)

The CNTHPS_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the Secure EL2 physical timer.

Configuration

AArch64 System register CNTHPS_CVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHPS_CVAL[31:0] .

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHPS_CVAL_EL2 are UNDEFINED.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTHPS_CVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHPS_CVAL_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

CNTHPS_TVAL_EL2, Counter-timer Secure Physical Timer TimerValue register (EL2)

The CNTHPS_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the Secure EL2 physical timer.

Configuration

AArch64 System register CNTHPS_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHPS_TVAL[31:0] .

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHPS_TVAL_EL2 are UNDEFINED.

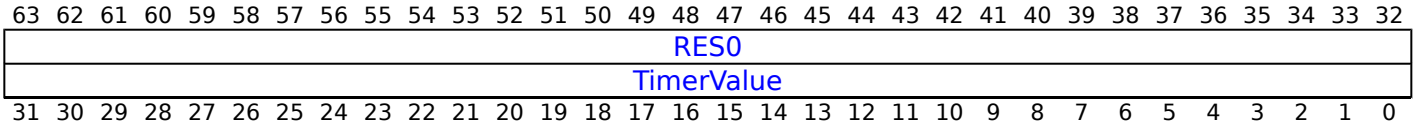
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTHPS_TVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHPS_TVAL_EL2 bit assignments are:



Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHPS_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHPS_CTL_EL2.ENABLE is 1, the value returned is (CNTHPS_CVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHPS_CVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHPS_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHPS_TVAL_EL2

Accesses to this register use the following encodings:

CNTHV_CTL_EL2, Counter-timer Virtual Timer Control register (EL2)

The CNTHV_CTL_EL2 characteristics are:

Purpose

Control register for the EL2 virtual timer.

Configuration

AArch64 System register CNTHV_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHV_CTL[31:0] .

This register is present only when ARMv8.1-VHE is implemented. Otherwise, direct accesses to CNTHV_CTL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

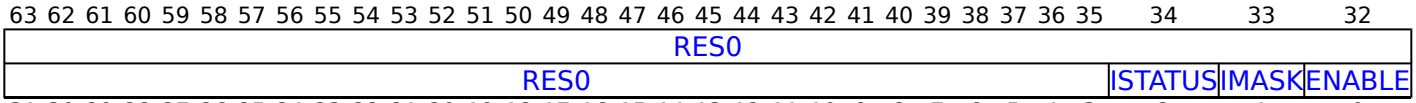
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTHV_CTL_EL2 is a 64-bit register.

Field descriptions

The CNTHV_CTL_EL2 bit assignments are:



Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHV_TVAL_EL2 continues to count down.

Note

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHV_CTL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV_CTL_EL2 or CNTV_CTL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

CNTHV_CVAL_EL2, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the EL2 virtual timer.

Configuration

AArch64 System register CNTHV_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTHV_CVAL[63:0] .

This register is present only when ARMv8.1-VHE is implemented. Otherwise, direct accesses to CNTHV_CVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

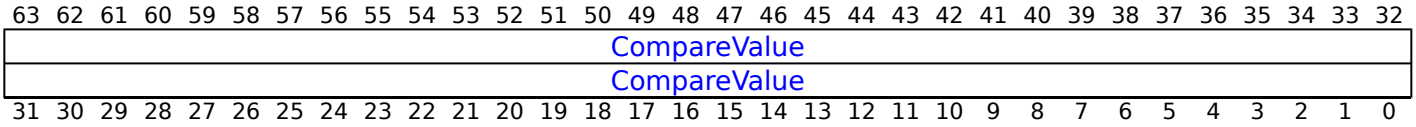
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTHV_CVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHV_CVAL_EL2 bit assignments are:



CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When CNTHV_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHV_CTL_EL2.ISTATUS is set to 1.
- If CNTHV_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHV_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHV_CVAL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV_CVAL_EL2 or CNTV_CVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```

CNTHV_TVAL_EL2, Counter-timer Virtual Timer TimerValue Register (EL2)

The CNTHV_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the EL2 virtual timer.

Configuration

AArch64 System register CNTHV_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHV_TVAL[31:0] .

This register is present only when ARMv8.1-VHE is implemented. Otherwise, direct accesses to CNTHV_TVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

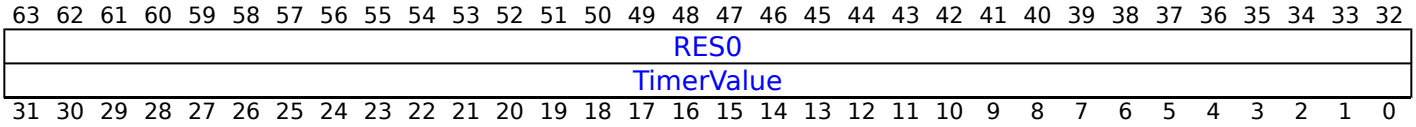
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTHV_TVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHV_TVAL_EL2 bit assignments are:



Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHV_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHV_CTL_EL2.ENABLE is 1, the value returned is (CNTHV_CVAL_EL2 - CNTVCT_EL0).

On a write of this register, CNTHV_CVAL_EL2 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHV_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CNTHV_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHV_CTL_EL2.ISTATUS is set to 1.
- If CNTHV_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHV_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHV_TVAL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV_TVAL_EL2 or CNTV_TVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, CNTHV_TVAL_EL2

CNTHVS_CTL_EL2, Counter-timer Secure Virtual Timer Control register (EL2)

The CNTHVS_CTL_EL2 characteristics are:

Purpose

Control register for the Secure EL2 virtual timer.

Configuration

AArch64 System register CNTHVS_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHVS_CTL[31:0] .

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHVS_CTL_EL2 are UNDEFINED.

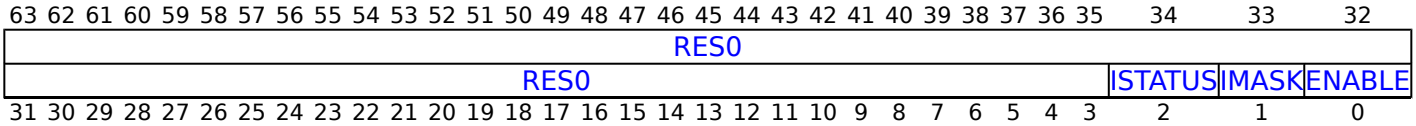
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTHVS_CTL_EL2 is a 64-bit register.

Field descriptions

The CNTHVS_CTL_EL2 bit assignments are:



Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the CNTHVS_CTL_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the CNTHVS_CTL_EL2.ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHVS_TVAL_EL2 continues to count down.

Note

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHVS_CTL_EL2

Accesses to this register use the following encodings:

```
MRS <Xt>, CNTHVS_CTL_EL2

CNTHVS_CVAL_EL2, Counter-timer Secure Virtual Timer CompareValue register (EL2)

The CNTHVS_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the Secure EL2 virtual timer.

Configuration

AArch64 System register CNTHVS_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTHVS_CVAL[63:0] .

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHVS_CVAL_EL2 are UNDEFINED.

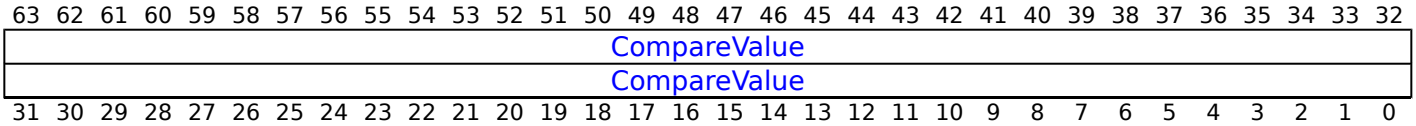
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTHVS_CVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHVS_CVAL_EL2 bit assignments are:



CompareValue, bits [63:0]

Holds the Secure EL2 virtual timer CompareValue.

When CNTHVS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHVS_CTL_EL2.ISTATUS is set to 1.
- If CNTHVS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHVS_CVAL_EL2

Accesses to this register use the following encodings:

CNTHVS_TVAL_EL2, Counter-timer Secure Virtual Timer TimerValue register (EL2)

The CNTHVS_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the Secure EL2 virtual timer.

Configuration

AArch64 System register CNTHVS_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHVS_TVAL[31:0] .

This register is present only when ARMv8.4-SecEL2 is implemented. Otherwise, direct accesses to CNTHVS_TVAL_EL2 are UNDEFINED.

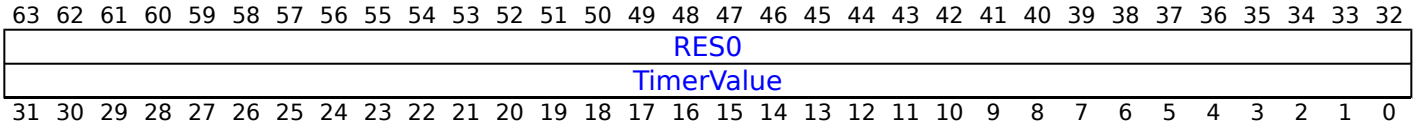
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTHVS_TVAL_EL2 is a 64-bit register.

Field descriptions

The CNTHVS_TVAL_EL2 bit assignments are:



Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHVS_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHVS_CTL_EL2.ENABLE is 1, the value returned is (CNTHVS_CVAL_EL2 - CNTVCT_EL0).

On a write of this register, CNTHVS_CVAL_EL2 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHVS_CTL_EL2.ENABLE is 1, the timer condition is met when ((CNTVCT_EL0 - CNTHVS_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHVS_CTL_EL2.ISTATUS is set to 1.
- If CNTHVS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

CNTKCTL_EL1, Counter-timer Kernel Control register

The CNTKCTL_EL1 characteristics are:

Purpose

When ARMv8.1-VHE is not implemented, or when HCR_EL2.{E2H, TGE} is not {1, 1}, this register controls the generation of an event stream from the virtual counter, and access from EL0 to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this register does not cause any event stream from the virtual counter to be generated, and does not control access to the counters and timers. The access to counters and timers at EL0 is controlled by CNTHCTL_EL2.

Configuration

AArch64 System register CNTKCTL_EL1 bits [31:0] are architecturally mapped to AArch32 System register CNTKCTL[31:0] .

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTKCTL_EL1 is a 64-bit register.

Field descriptions

The CNTKCTL_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

RES0														EVNTIS	RES0							EL0PTEN	EL0VTEN	EVNTI				EVNTDIR	EVNTEN	EL0VCTEN	EL0PCTEN

Bits [63:18]

Reserved, RES0.

EVNTIS, bit [17]

When ARMv8.6-ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTKCTL_EL1.EVNTI field applies to CNTVCT_EL0[15:0].
0b1	The CNTKCTL_EL1.EVNTI field applies to CNTVCT_EL0[23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:10]

Reserved, RES0.

EL0PTEN, bit [9]

Traps EL0 accesses to the physical timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value `0x18`:
  - CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped, reported using EC syndrome value `0x03`, MRRC and MCRR accesses are trapped, reported using EC syndrome value `0x04`:
  - CNTP_CTL, CNTP_CVAL, CNTP_TVAL.

EL0PTEN	Meaning
`0b0`	EL0 accesses to the physical timer registers are trapped to EL1.
`0b1`	This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

Traps EL0 accesses to the virtual timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value `0x18`:
  - CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value `0x03`, MRRC and MCRR accesses are trapped using EC syndrome value `0x04`:
  - CNTV_CTL, CNTV_CVAL, and CNTV_TVAL.

EL0VTEN	Meaning
`0b0`	EL0 accesses to the virtual timer registers are trapped.
`0b1`	This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit (0 to 15) of the counter register CNTVCT_EL0 is the trigger for the event stream generated from that counter, when that stream is enabled.

This field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register CNTVCT_EL0 trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

This field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

When ARMv8.1-VHE is not implemented, or when HCR_EL2.{E2H, TGE} is not {1, 1}, enables the generation of an event stream from the counter register CNTVCT_EL0:

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not enable the event stream.

This field resets to 0.

EL0VCTEN, bit [1]

Traps EL0 accesses to the frequency register and virtual counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped and reported using EC syndrome value 0x18:
  - CNTVCT_EL0 and if CNTKCTL_EL1.EL0PCTEN is 0, CNTFRQ_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped and reported using EC syndrome value 0x04:
  - CNTVCT and if CNTKCTL_EL1.EL0PCTEN is 0, CNTFRQ.

EL0VCTEN	Meaning
0b0	EL0 accesses to the frequency register and virtual counter registers are trapped.
0b1	This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Traps EL0 accesses to the frequency register and physical counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value 0x18:
  - CNTPCT_EL0 and if CNTKCTL_EL1.EL0VCTEN is 0, CNTFRQ_EL0.
- In AArch32 state, MCR or MRC accesses the following registers are trapped, reported using EC syndrome value 0x03, MCRR or MRRC accesses are trapped and reported using EC syndrome value 0x04:
  - CNTPCT~~CNTCT~~ and if CNTKCTL_EL1.EL0VCTEN is 0, CNTFRQ.

EL0PCTEN	Meaning
0b0	EL0 accesses to the frequency register and physical counter register are trapped.
0b1	This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTKCTL_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTKCTL_EL1 or CNTKCTL_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, CNTKCTL_EL1
```

op0	op1	CRn	CRm	op2

CNTP_CTL_EL0, Counter-timer Physical Timer Control register

The CNTP_CTL_EL0 characteristics are:

Purpose

Control register for the EL1 physical timer.

Configuration

AArch64 System register CNTP_CTL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTP_CTL[31:0] .

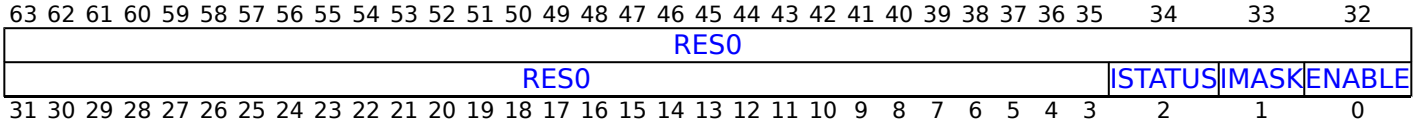
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTP_CTL_EL0 is a 64-bit register.

Field descriptions

The CNTP_CTL_EL0 bit assignments are:



Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL_EL0 continues to count down.

Note

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTP_CTL_EL0

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_CTL_EL0 or CNTP_CTL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```

CNTP_CVAL_EL0, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL_EL0 characteristics are:

Purpose

Holds the compare value for the EL1 physical timer.

Configuration

AArch64 System register CNTP_CVAL_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTP_CVAL[63:0] .

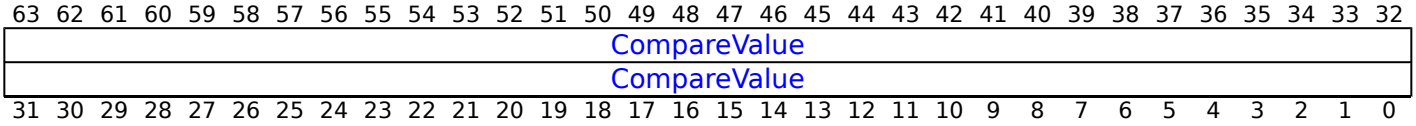
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTP_CVAL_EL0 is a 64-bit register.

Field descriptions

The CNTP_CVAL_EL0 bit assignments are:



CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When CNTP_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL_EL0.ISTATUS is set to 1.
- If CNTP_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTP_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTP_CVAL_EL0

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_CVAL_EL0 or CNTP_CVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTP_CVAL_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0010	0b010

```
if PSTATE.EL == EL0 then
    if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CNTKCTL_EL1.EL0PTEN
== '0' then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);

CNTP_TVAL_EL0, Counter-timer Physical Timer TimerValue register

The CNTP_TVAL_EL0 characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configuration

AArch64 System register CNTP_TVAL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTP_TVAL[31:0] .

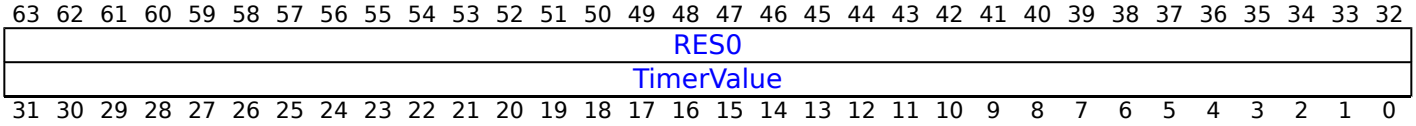
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTP_TVAL_EL0 is a 64-bit register.

Field descriptions

The CNTP_TVAL_EL0 bit assignments are:



Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL_EL0.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL_EL0.ENABLE is 1, the value returned is (CNTP_CVAL_EL0 - CNTPCT_EL0).

On a write of this register, CNTP_CVAL_EL0 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTP_CVAL_EL0) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL_EL0.ISTATUS is set to 1.
- If CNTP_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTP_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTP_TVAL_EL0

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_TVAL_EL0 or CNTP_TVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, CNTP_TVAL_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0010	0b000

CNTPOFF_EL2, Counter-timer Physical Offset register

The CNTPOFF_EL2 characteristics are:

Purpose

Holds the 64-bit physical offset. This is the offset for the AArch64 physical timers and counters when Enhanced Counter Virtualization is enabled.

Configuration

This register is present only when ARMv8.6-ECV is implemented. Otherwise, direct accesses to CNTPOFF_EL2 are UNDEFINED.

The offsetting of the timers and counters based on EL2 using AArch64 apply at:

- EL1 when EL1 is using AArch64 or AArch32.
- EL0 when EL0 is using AArch64 or AArch32.

When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true:

- CNTHCTL_EL2.ECV is 0.
- SCR_EL3.ECVEn is 0.
- HCR_EL2.{E2H, TGE} is {1, 1}.

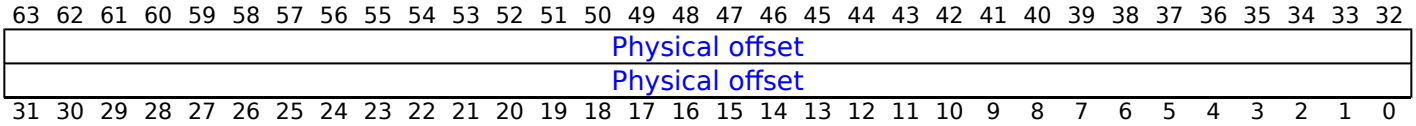
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTPOFF_EL2 is a 64-bit register.

Field descriptions

The CNTPOFF_EL2 bit assignments are:



Bits~~Physical offset, bits~~ [63:0]

Physical offset.

This field resets to an architecturally UNKNOWN value.

CNTPS_CTL_EL1, Counter-timer Physical Secure Timer Control register

The CNTPS_CTL_EL1 characteristics are:

Purpose

Control register for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configuration

There are no configuration notes.

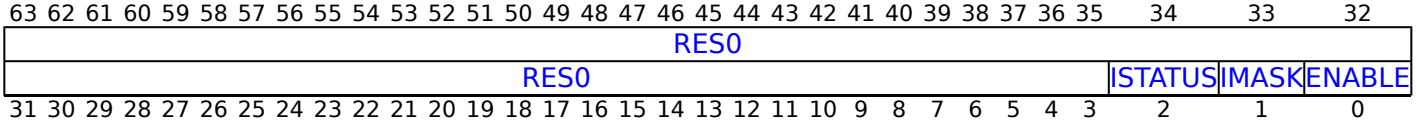
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTPS_CTL_EL1 is a 64-bit register.

Field descriptions

The CNTPS_CTL_EL1 bit assignments are:



Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTPS_TVAL_EL1 continues to count down.

Note

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTPS_CTL_EL1

Accesses to this register use the following encodings:

```

CNTPS_CVAL_EL1, Counter-timer Physical Secure Timer CompareValue register

The CNTPS_CVAL_EL1 characteristics are:

Purpose

Holds the compare value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configuration

There are no configuration notes.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTPS_CVAL_EL1 is a 64-bit register.

Field descriptions

The CNTPS_CVAL_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CompareValue, bits [63:0]

Holds the secure physical timer CompareValue.

When CNTPS_CTL_EL1.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTPS_CTL_EL1.ISTATUS is set to 1.
- If CNTPS_CTL_EL1.IMASK is 0, an interrupt is generated.

When CNTPS_CTL_EL1.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTPS_CVAL_EL1

Accesses to this register use the following encodings:

```

CNTPS_TVAL_EL1, Counter-timer Physical Secure Timer TimerValue register

The CNTPS_TVAL_EL1 characteristics are:

Purpose

Holds the timer value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configuration

There are no configuration notes.

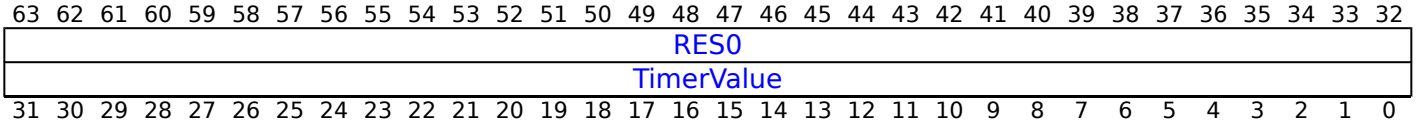
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTPS_TVAL_EL1 is a 64-bit register.

Field descriptions

The CNTPS_TVAL_EL1 bit assignments are:



Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the secure physical timer.

On a read of this register:

- If CNTPS_CTL_EL1.ENABLE is 0, the value returned is UNKNOWN.
- If CNTPS_CTL_EL1.ENABLE is 1, the value returned is (CNTPS_CVAL_EL1 - CNTPCT_EL0).

On a write of this register, CNTPS_CVAL_EL1 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTPS_CTL_EL1.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTPS_CVAL_EL1) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTPS_CTL_EL1.ISTATUS is set to 1.
- If CNTPS_CTL_EL1.IMASK is 0, an interrupt is generated.

When CNTPS_CTL_EL1.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTPS_TVAL_EL1

Accesses to this register use the following encodings:

MRS <Xt>, CNTPS_TVAL_EL1

op0	op1	CRn	CRm	op2
0b11	0b111	0b1110	0b0010	0b000

CNTV_CTL_EL0, Counter-timer Virtual Timer Control register

The CNTV_CTL_EL0 characteristics are:

Purpose

Control register for the virtual timer.

Configuration

AArch64 System register CNTV_CTL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTV_CTL[31:0] .

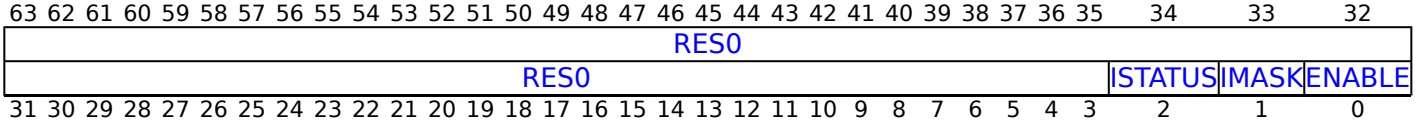
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTV_CTL_EL0 is a 64-bit register.

Field descriptions

The CNTV_CTL_EL0 bit assignments are:



Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL_EL0 continues to count down.

Note

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTV_CTL_EL0

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_CTL_EL0 or CNTV_CTL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, CNTV_CTL_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0011	0b001

```

CNTV_CVAL_EL0, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL_EL0 characteristics are:

Purpose

Holds the compare value for the virtual timer.

Configuration

AArch64 System register CNTV_CVAL_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTV_CVAL[63:0] .

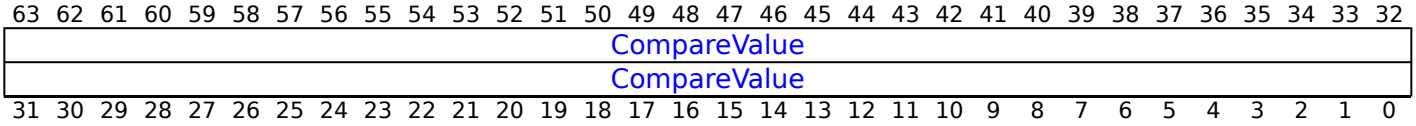
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTV_CVAL_EL0 is a 64-bit register.

Field descriptions

The CNTV_CVAL_EL0 bit assignments are:



CompareValue, bits [63:0]

Holds the EL1 virtual timer CompareValue.

When CNTV_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL_EL0.ISTATUS is set to 1.
- If CNTV_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTV_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTV_CVAL_EL0

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_CVAL_EL0 or CNTV_CVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTV_CVAL_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0011	0b010

CNTV_TVAL_EL0, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL_EL0 characteristics are:

Purpose

Holds the timer value for the EL1 virtual timer.

Configuration

AArch64 System register CNTV_TVAL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTV_TVAL[31:0] .

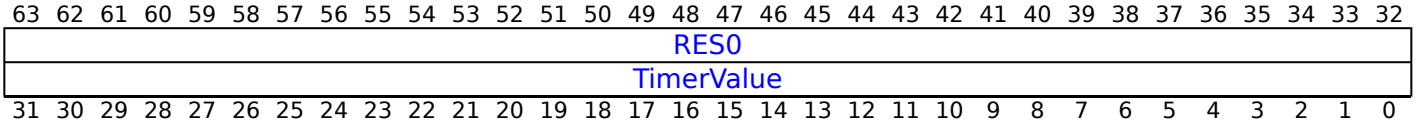
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CNTV_TVAL_EL0 is a 64-bit register.

Field descriptions

The CNTV_TVAL_EL0 bit assignments are:



Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL1 virtual timer.

On a read of this register:

- If CNTV_CTL_EL0.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL_EL0.ENABLE is 1, the value returned is (CNTV_CVAL_EL0 - CNTVCT_EL0).

On a write of this register, CNTV_CVAL_EL0 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTV_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CNTV_CVAL_EL0) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL_EL0.ISTATUS is set to 1.
- If CNTV_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTV_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTV_TVAL_EL0

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_TVAL_EL0 or CNTV_TVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```

CONTEXTIDR_EL1, Context ID Register (EL1)

The CONTEXTIDR_EL1 characteristics are:

Purpose

Identifies the current Process Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

This register is used when ARMv8.1-VHE is not implemented, or whenARMv8.1-VHE is implemented and HCR_EL2.E2H is set to 0.

Note

When ARMv8.1-VHE is implemented and HCR_EL2.E2H is set to 1, CONTEXTIDR_EL2 is used.

Configuration

AArch64 System register CONTEXTIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CONTEXTIDR[31:0] .

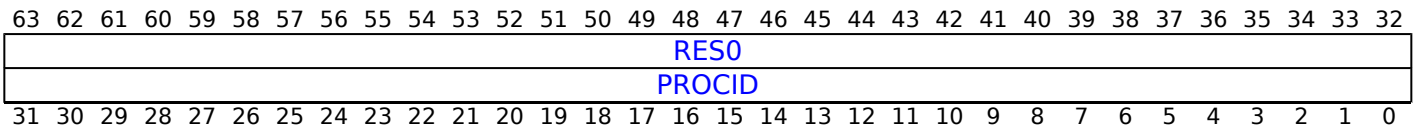
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CONTEXTIDR_EL1 is a 64-bit register.

Field descriptions

The CONTEXTIDR_EL1 bit assignments are:



Bits [63:32]

Reserved, RES0.

PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

Note

In AArch32 state, when TTBCR.EAE is set to 0, CONTEXTIDR.ASID holds the ASID.

In AArch64 state, CONTEXTIDR_EL1 is independent of the ASID, and for the EL1&0 translation regime either TTBR0_EL1 or TTBR1_EL1 holds the ASID.

This field resets to an architecturally UNKNOWN value.

Accessing the CONTEXTIDR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CONTEXTIDR_EL1 or CONTEXTIDR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

CONTEXTIDR_EL2, Context ID Register (EL2)

The CONTEXTIDR_EL2 characteristics are:

Purpose

When HCR_EL2.E2H is set to 1, identifies the current Process Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

Note

When HCR_EL2.E2H is 0, CONTEXTIDR_EL2 replaces CONTEXTIDR_EL1 where CONTEXTIDR_EL1 would usually be used.

Configuration

This register is present only when ARMv8.1-VHE is implemented or ARMv8.2-Debug is implemented. Otherwise, direct accesses to CONTEXTIDR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

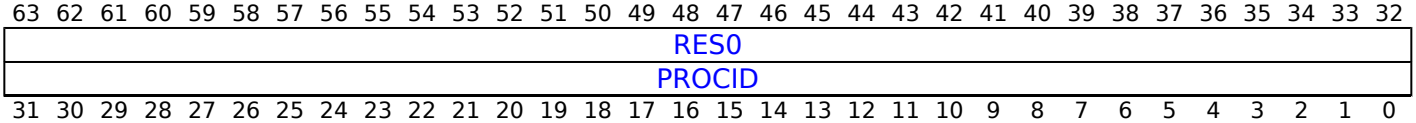
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CONTEXTIDR_EL2 is a 64-bit register.

Field descriptions

The CONTEXTIDR_EL2 bit assignments are:



Bits [63:32]

Reserved, RES0.

PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

Note

In AArch32 state, when TTBCR.EAE is set to 0, CONTEXTIDR.ASID holds the ASID.

In AArch64 state, CONTEXTIDR_EL2 is independent of the ASID, and for the EL2&0 translation regime either TTBR0_EL2 or TTBR1_EL2 holds the ASID.

This field resets to an architecturally UNKNOWN value.

Accessing the CONTEXTIDR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CONTEXTIDR_EL2 or CONTEXTIDR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, CONTEXTIDR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1101	0b0000	0b001

CPACR_EL1, Architectural Feature Access Control Register

The CPACR_EL1 characteristics are:

Purpose

Controls access to trace, SVE, Advanced SIMD and floating-point functionality.

Configuration

AArch64 System register CPACR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CPACR[31:0] .

When HCR_EL2.{E2H, TGE} == {1, 1}, the fields in this register have no effect on execution at EL0 and EL1. In this case, the controls provided by CPTR_EL2 are used.

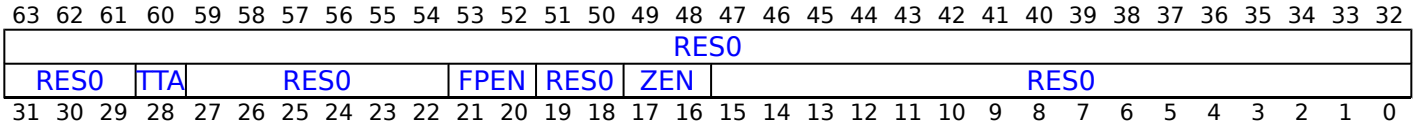
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CPACR_EL1 is a 64-bit register.

Field descriptions

The CPACR_EL1 bit assignments are:



Bits [63:29]

Reserved, RES0.

TTA, bit [28]

Traps EL0 and EL1 System register accesses to all implemented trace registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states as follows:

- In AArch64 state, accesses to trace registers are trapped, reported using EC syndrome value `0x18`.
- In AArch32 state, MRC and MCR accesses to trace registers are trapped, reported using EC syndrome value `0x05`.
- In AArch32 state, MRRC and MCRR accesses to trace registers are trapped, reported using EC syndrome value `0x0C`.

TTA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	This control causes EL0 and EL1 System register accesses to all implemented trace registers to be trapped.

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the Armv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR_EL1.TTA is 1.
- The Armv8-A architecture does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not implemented, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bits [27:22]

Reserved, RES0.

FPEN, bits [21:20]

Traps EL0 and EL1 accesses to the SVE, Advanced SIMD, and floating-point registers to EL1, reported using EC syndrome value `0x07`, or to EL2 reported using EC syndrome value `0x00`, when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states as follows:

- In AArch64 state, accesses to FPCR, FPSR, any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers. See 'The SIMD and floating-point registers, V0-V31' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
- FPCSR, and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers. See 'Advanced SIMD and floating-point System registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

FPEN	Meaning
`0b00`	This control causes any instructions at EL0 or EL1 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by CPACR_EL1.ZEN.
`0b01`	This control causes any instructions at EL0 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by CPACR_EL1.ZEN, but does not cause any instruction at EL1 to be trapped.
`0b10`	This control causes any instructions at EL0 or EL1 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by CPACR_EL1.ZEN.
`0b11`	This control does not cause any instructions to be trapped.

Writes to MVFR0, MVFR1 and MVFR2 from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

Note

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to FPSID, MVFR0, MVFR1, MVFR2, and FPEXC are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR_EL1.FPEN is not `0b11`.

This field resets to an architecturally UNKNOWN value.

Bits [19:18]

Reserved, RES0.

ZEN, bits [17:16]

When SVE is implemented:

Traps SVE instructions and instructions that access SVE System registers at EL0 and EL1 to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.

ZEN	Meaning
0b00	This control causes these instructions executed at EL0 or EL1 to be trapped.
0b01	This control causes these instructions executed at EL0 to be trapped, but does not cause any instruction at EL1 to be trapped.
0b10	This control causes these instructions executed at EL0 or EL1 to be trapped.
0b11	This control does not cause any instruction to be trapped.

If SVEis not implemented, this field is RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:0]

Reserved, RES0.

Accessing the CPACR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CPACR_EL1 or CPACR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, CPACR_EL1
```

CPTR_EL3, Architectural Feature Trap Register (EL3)

The CPTR_EL3 characteristics are:

Purpose

Controls trapping to EL3 of access to CPACR_EL1, CPTR_EL2, trace functionality and registers associated with SVE, Advanced SIMD and floating-point execution. Also controls EL3 access to trace functionality and registers associated with SVE, Advanced SIMD and floating-point execution.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

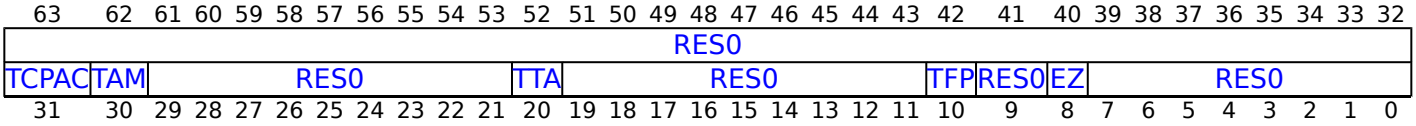
This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to CPTR_EL3 are UNDEFINED.

Attributes

CPTR_EL3 is a 64-bit register.

Field descriptions

The CPTR_EL3 bit assignments are:



Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

Traps all of the following to EL3, from both Security states and both Execution states.

- EL2 accesses to CPTR_EL2, reported using EC syndrome value `0x18`, or HCPTR, reported using EC syndrome value `0x03`.
- EL2 and EL1 accesses to CPACR_EL1 reported using EC syndrome value `0x18`, or CPACR reported using EC syndrome value `0x03`.

When CPTR_EL3.TCPAC is:

TCPAC	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL2 accesses to the CPTR_EL2 or HCPTR, and EL2 and EL1 accesses to the CPACR_EL1 or CPACR, are trapped to EL3, unless they are trapped by CPTR_EL2.TCPAC.

This field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When AMUv1 is implemented:

Trap Activity Monitor access. Traps EL2, EL1 and EL0 accesses to all Activity Monitor registers to EL3.

Accesses to the Activity Monitors registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported with EC syndrome value `0x18`:
  - AMUSERENR_EL0, AMCFGR_EL0, AMCGCR_EL0, AMCNTENCLR0_EL0, AMCNTENCLR1_EL0, AMCNTENSET0_EL0, AMCNTENSET1_EL0, AMCR_EL0, AMEVCNTR0<n>_EL0, AMEVCNTR1<n>_EL0, AMEVTYPER0<n>_EL0, and AMEVTYPER1<n>_EL0.
- In AArch32 state, accesses with MRC or MCR to the following registers reported with EC syndrome value `0x03`:
  - AMUSERENR, AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVTYPER0<n>, and AMEVTYPER1<n>.
- In AArch32 state, accesses with MRRC or MCRR to the following registers, reported with EC syndrome value `0x04`:
  - AMEVCNTR0<n>, AMEVCNTR1<n>.

TAM	Meaning
`0b0`	Accesses from EL2, EL1, and EL0 to Activity Monitor registers are not trapped.
`0b1`	Accesses from EL2, EL1, and EL0 to Activity Monitor registers are trapped to EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Traps System register accesses. Accesses to the trace registers, from all Exception levels, both Security states, and both Execution states are trapped to EL3 as follows:

- In AArch64 state, Trace registers with op0=2, op1=1, are trapped to EL3 and reported using EC syndrome value `0x18`.
- In AArch32 state, accesses using MCR or MRC to the Trace registers with cpnum=14 and opc1=1 are reported using EC syndrome value `0x05`.
- In AArch32 state, accesses using MCRR or MRRC to the Trace registers with cpnum=14 and opc1=1 are reported using EC syndrome value `0x0C`.

TTA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any System register access to the trace registers is trapped to EL3, subject to the exception prioritization rules, unless it is trapped by CPACR.TRCDIS, CPACR_EL1.TTA or CPTR_EL2.TTA.

If System register access to trace functionality is not supported, this bit is RES0.

Note

The ETMv4 architecture does not permit EL0 to access the trace registers. If the Armv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than this trap exception.

EL3 does not provide traps on trace register accesses through the Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, no side-effects occur before the exception is taken, see 'Register access instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

Bits [19:11]

Reserved, RES0.

TFP, bit [10]

Traps all accesses to SVE, Advanced SIMD and floating-point functionality, from all Exception levels, both Security states, and both Execution states, to EL3. Defined values are:

This includes the following registers, all reported using EC syndrome value `0x07`:

- FPCR, FPSR, FPEXC32_EL2, any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers. See 'The SIMD and floating-point registers, V0-V31' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
- MVFR0, MVFR1, MVFR2, FPCSR, FPEXC, and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers. See 'Advanced SIMD and floating-point System registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Permitted VMSR accesses to FPSID are ignored, but for the purposes of this trap the architecture define a VMSR access to the FPSID from EL1 or higher as an access to a SIMD and floating-point register.

TFP	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any attempt at any Exception level to execute an instruction that uses the registers associated with SVE, Advanced SIMD and floating-point is trapped to EL3, subject to the exception prioritization rules, unless it is trapped by CPTR_EL3.EZ.

Note

FPEXC32_EL2 is not accessible from EL0 using AArch64.

FPSID, MRFR0, MVFR1, and FPEXC are not accessible from EL0 using AArch32.

This field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

EZ, bit [8]

When SVE is implemented:

Traps all accesses to SVE functionality and registers from all Exception levels, and both Security states, to EL3.

EZ	Meaning
0b0	This control causes these instructions executed at any Exception level to be trapped, subject to the exception prioritization rules.
0b1	This control does not cause any instruction to be trapped.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [7:0]

Reserved, RES0.

CSSELR_EL1, Cache Size Selection Register

The CSSELR_EL1 characteristics are:

Purpose

Selects the current Cache Size ID Register, CCSIDR_EL1, by specifying the required cache level and the cache type (either instruction or data cache).

Configuration

AArch64 System register CSSELR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CSSELR[31:0] .

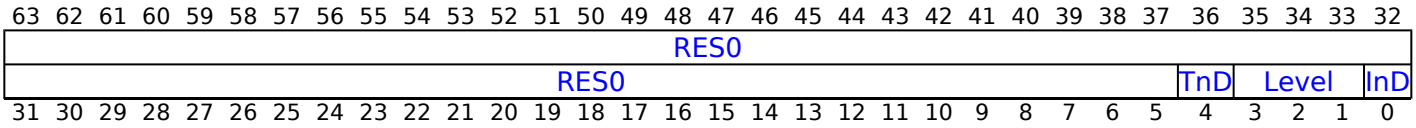
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CSSELR_EL1 is a 64-bit register.

Field descriptions

The CSSELR_EL1 bit assignments are:



Bits [63:5]

Reserved, RES0.

TnD, bit [4]

~~When ARMv8.5-MemTag is implemented:~~

Allocation Tag not Data bit.

TnD	Meaning
0b0	Data, Instruction or Unified cache.
0b1	Separate Allocation Tag cache.

When CSSELR_EL1.InD == 1, this bit is RES0.

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR_EL1 is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

~~Otherwise:~~

~~Reserved, RES0.~~

Level, bits [3:1]

Cache level of required cache.

Level	Meaning
0b000	Level 1 cache.
0b001	Level 2 cache.
0b010	Level 3 cache.
0b011	Level 4 cache.
0b100	Level 5 cache.
0b101	Level 6 cache.
0b110	Level 7 cache.

All other values are reserved.

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR_EL1 is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

InD, bit [0]

Instruction not Data bit.

InD	Meaning
0b0	Data or unified cache.
0b1	Instruction cache.

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then a read of CSSELR_EL1 is CONSTRAINED UNPREDICTABLE, and returns UNKNOWN values for CSSELR_EL1.{Level, InD}.

This field resets to an architecturally UNKNOWN value.

Accessing the CSSELR_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, CSSELR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b010	0b0000	0b0000	0b000

```
if PSTATE.EL == EL0 then

CTR_EL0, Cache Type Register

The CTR_EL0 characteristics are:

Purpose

Provides information about the architecture of the caches.

Configuration

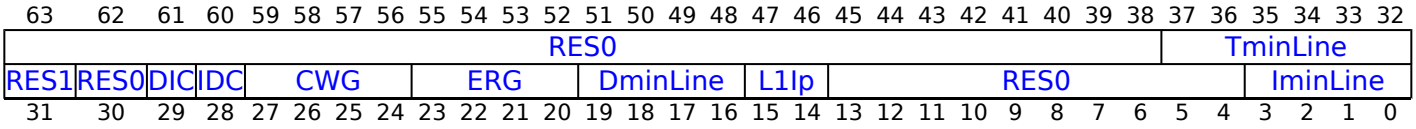
AArch64 System register CTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register CTR[31:0] .

Attributes

CTR_EL0 is a 64-bit register.

Field descriptions

The CTR_EL0 bit assignments are:



Bits [63:38]

Reserved, RES0.

TminLine, bits [37:32]

~~**When ARMv8.5-MemTag is implemented:**~~

Tag minimum Line. Log_2 of the number of words covered by Allocation Tags in the smallest cache line of all caches which can contain Allocation tags that are controlled by the PE.

~~**Otherwise:**~~

~~Reserved, RES0.~~

Note

~~For an implementation with cache lines containing 64 bytes of data and 4 Allocation Tags this will be log_2(64/4) = 4.~~

~~For an implementation with Allocations Tags in separate cache lines of 128 Allocation Tags per line this will be log_2(128*16/4) = 9.~~

- For an implementation with cache lines containing 64 bytes of data and 4 Allocation Tags, this will be log_2(64/4) = 4.
- For an implementation with Allocations Tags in separate cache lines of 128 Allocation Tags per line, this will be log_2(128*16/4) = 9.

Bit [31]

Reserved, RES1.

Bit [30]

Reserved, RES0.

DIC, bit [29]

Instruction cache invalidation requirements for data~~instruction~~ to instruction~~data~~ coherence. ~~The meaning of this bit is:~~

DIC	Meaning
0b0	Instruction cache invalidation to the Point of Unification is required for data~~instruction~~ to instruction~~data~~ coherence.
0b1	Instruction cache invalidation~~cleaning~~ to the Point of Unification is not required for data~~instruction~~ to instruction~~data~~ coherence.

IDC, bit [28]

Data cache clean requirements for instruction to data coherence. The meaning of this bit is:

IDC	Meaning
0b0	Data cache clean to the Point of Unification is required for instruction to data coherence, unless CLIDR_EL1.LoC == 0b000 or (CLIDR_EL1.LoUIS == 0b000 && CLIDR_EL1.LoUU == 0b000).
0b1	Data cache clean to the Point of Unification is not required for instruction to data coherence.

CWG, bits [27:24]

Cache writeback granule. Log_2 of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of 0b0000 indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than 0b1001 are reserved.

Arm recommends that an implementation that does not support cache write-back implements this field as 0b0001. This applies, for example, to an implementation that supports only write-through caches.

ERG, bits [23:20]

Exclusives reservation granule. Log_2 of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.

The use of the value 0b0000 is deprecated.

The value 0b0001 and values greater than 0b1001 are reserved.

DminLine, bits [19:16]

Log_2 of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

L1Ip, bits [15:14]

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache. Possible values of this field are:

L1Ip	Meaning
0b00	VMID aware Physical Index, Physical tag (VPIPT)
0b01	ASID-tagged Virtual Index, Virtual Tag (AIVIVT)
0b10	Virtual Index, Physical Tag (VIPT)
0b11	Physical Index, Physical Tag (PIPT)

The value 0b01 is reserved in Armv8.

The value 0b00 is permitted only in an implementation that includes ARMv8.2-PIPTV, otherwise the value is reserved.

Bits [13:4]

Reserved, RES0.

IminLine, bits [3:0]

Log_2 of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

Accessing the CTR_EL0

Accesses to this register use the following encodings:

```

CurrentEL, Current Exception Level

The CurrentEL characteristics are:

Purpose

Holds the current Exception level.

Configuration

There are no configuration notes.

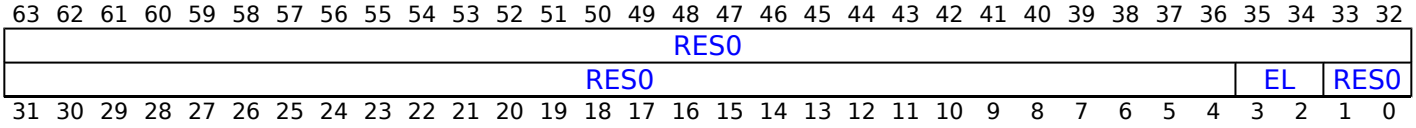
~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

CurrentEL is a 64-bit register.

Field descriptions

The CurrentEL bit assignments are:



Bits [63:4]

Reserved, RES0.

EL, bits [3:2]

Current Exception level. Possible values of this field are:

EL	Meaning
0b00	EL0
0b01	EL1
0b10	EL2
0b11	EL3

When the HCR_EL2.NV bit is 1, EL1 read accesses to the CurrentEL register return the value of 0b10 in this field.

This field resets to the highest implemented Exception Level.

Bits [1:0]

Reserved, RES0.

Accessing the CurrentEL

Accesses to this register use the following encodings:

MRS <Xt>, CurrentEL

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0010	0b010

DACR32_EL2, Domain Access Control Register

The DACR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 DACR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register DACR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register DACR[31:0] .

ThisIf registerEL1 isdoes presentnot only whensupport AArch32 is supported at any Exception level. Otherwise, directthis accessesregister to DACR32_EL2 areis UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

RW fields in this register reset to architecturally UNKNOWN values.

Attributes

DACR32_EL2 is a 64-bit register.

Field descriptions

The DACR32_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>_EL1.

Configuration

AArch64 System register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBCR<n>[31:0] .

AArch64 System register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to External register DBGBCR<n>_EL1[31:0] .

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

DBGBCR<n>_EL1 is a 64-bit register.

Field descriptions

The DBGBCR<n>_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0								BT				LBN				SSC		HMC	RES0								BAS				RES0		PMC	E
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

BT	Meaning
0b0000	Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.
0b0001	As 0b0000, but linked to a Context matching breakpoint.
0b0010	Unlinked Context ID match. When ARMv8.1-VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value
0b0011	As 0b0010, with linking enabled.
0b0110	Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1.
0b0111	As 0b0110, with linking enabled.
0b1000	Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.
0b1001	As 0b1000, with linking enabled.
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.
0b1011	As 0b1010, with linking enabled.
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBVR<n>_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2.
0b1101	As 0b1100, with linking enabled.
0b1110	Unlinked Full Context ID match. DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.ContextID2 is compared against CONTEXTIDR_EL2.
0b1111	As 0b1110, with linking enabled.

All other values are reserved. Constraints on breakpoint programming mean other values are reserved under some conditions.

For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug) and 'Reserved DBGBCR<n>_EL1.BT values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>_EL1.E is 0.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields.

For more information on the operation of the SSC, HMC, and PMC fields, and the effect of programming the fields to a reserved set of values, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug) and 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When AArch32 is supported at any Exception level:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

~~Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state. In an AArch64 only implementation, this field is reserved, RES1.~~

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions

All other values are reserved. For more information, see 'Reserved DBGBCR<n>_EL1.BAS values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

For more information on using the BAS field in address match breakpoints, see 'Using the BAS field in Address Match breakpoints' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

For Context matching breakpoints, this field is RES1 and ignored.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES1.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

E, bit [0]

Enable breakpoint DBGBVR<n>_EL1. Possible values are:

E	Meaning
0b0	Breakpoint disabled.
0b1	Breakpoint enabled.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Accessing the DBGBCR<n>_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, DBGBCR<n>_EL1

DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n>_EL1.

Configuration

AArch64 System register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBVR<n>[31:0] .

AArch64 System register DBGBVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register DBGBXVR<n>[31:0] .

AArch64 System register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to External register DBGBVR<n>_EL1[63:0] .

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

How this register is interpreted depends on the value of DBGBCR<n>_EL1.BT.

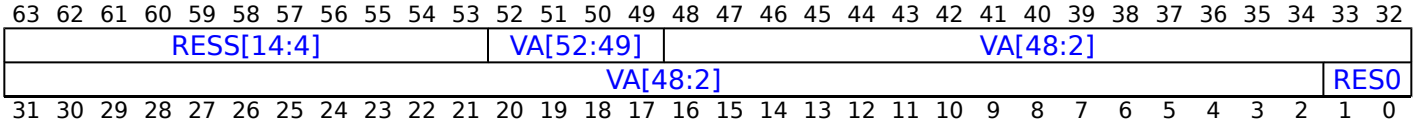
- When DBGBCR<n>_EL1.BT is 0b000x, this register holds a virtual address.
- When DBGBCR<n>_EL1.BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When DBGBCR<n>_EL1.BT is 0b100x, this register holds a VMID.
- When DBGBCR<n>_EL1.BT is 0b101x, this register holds a VMID and a Context ID.
- When DBGBCR<n>_EL1.BT is 0b111x, this register holds two Context ID values.

For other values of DBGBCR<n>_EL1.BT, this register is RES0.

Field descriptions

The DBGBVR<n>_EL1 bit assignments are:

When DBGBCR<n>_EL1.BT == 0b000x:



RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

It is IMPLEMENTATION DEFINED whether:

- Reads return the value of the most significant bit of the VA for every bit in this field.

- Reads return the last value written.

The PE ignores this field.

VA[52:49], bits [52:49]

When ARMv8.2-LVA is implemented:

Extension to VA[48:2]. See VA[48:2] for more details.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Otherwise:

Extension to RESS[14:4]. See RESS[14:4] for more details.

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When ARMv8.2-LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b001x:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
ContextID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when ARMv8.1-VHE is implemented, HCR_EL2.E2H is 1, and either:

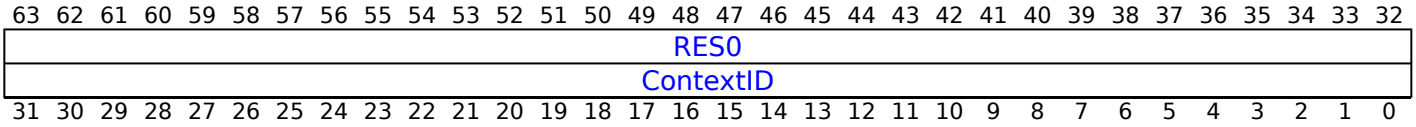
- The PE is executing at EL2.
- HCR_EL2.TGE is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against CONTEXTIDR_EL1.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

When DBGBCR<n>_EL1.BT == 0b011x:



Bits [63:32]

Reserved, RES0.

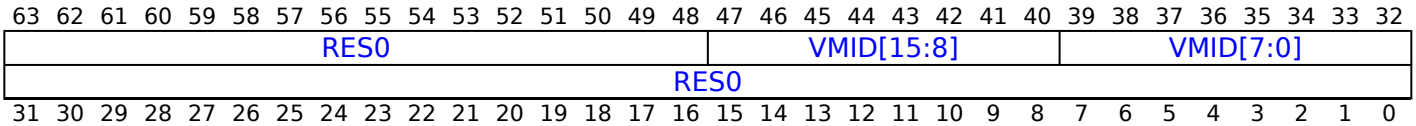
ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

When DBGBCR<n>_EL1.BT == 0b100x and ~~HaveEL(~~EL2 is implemented~~):~~



Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When ARMv8.1-VMID16 is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. See DBGBVR<n>_EL1.VMID~~VMID~~[7:0] for more details.

If EL2 is using AArch32, this field is RES0.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when~~in~~ any of the following are true:~~cases.~~

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- ARMv8.1-VMID16 is not implemented.

~~When ARMv8.1-VMID16 is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.~~

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
- VTCR_EL2.VS has a value of 0.
- EL2 is using AArch32.

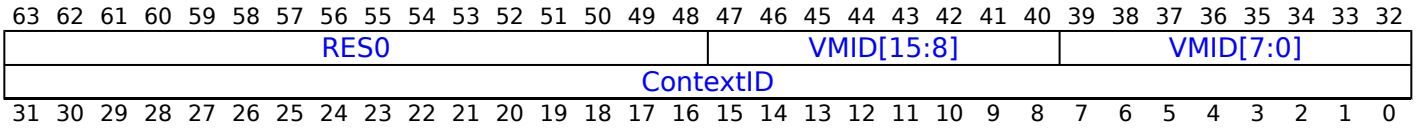
The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b101x and HaveEL(EL2 is implemented:):



Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When ARMv8.1-VMID16 is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. See DBGBVR<n>_EL1.VMIDVMID[7:0] for more details.

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits whenin any of the following are true:cases.

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- ARMv8.1-VMID16 is not implemented.

When ARMv8.1-VMID16 is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.

VMID[15:8] is RES0 if any of the following applies:

- The implementation has an 8-bit VMID.
- VTCR_EL2.VS has a value of 0.
- EL2 is using AArch32.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

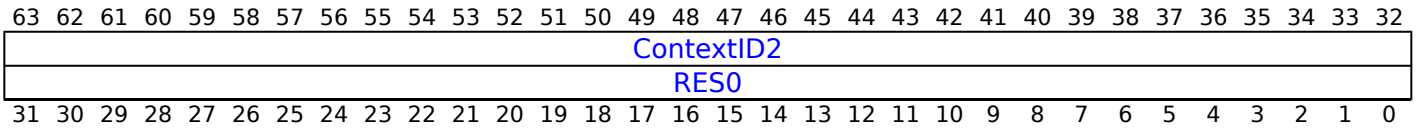
ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

When DBGBCR<n>_EL1.BT == 0b110x, EL2 is implemented and HaveEL(ARMv8.1-VHE is implemented or ARMv8.2-Debug is implementedEL2):



ContextID2, bits [63:32]

When ARMv8.1-VHE is implemented:

Context ID value for comparison against CONTEXTIDR_EL2.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

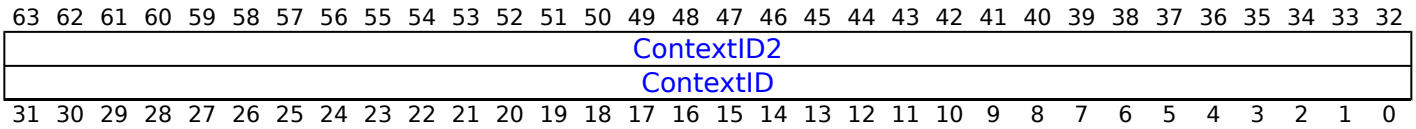
Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b111x, HaveEL(EL2) is implemented and (ARMv8.1-VHE is implemented or ARMv8.2-Debug is implemented)::



ContextID2, bits [63:32]

When ARMv8.1-VHE is implemented:

Context ID value for comparison against CONTEXTIDR_EL2.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMSET_EL1 register.

Configuration

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0] .

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0] .

An implementation must include eight CLAIM tag bits.

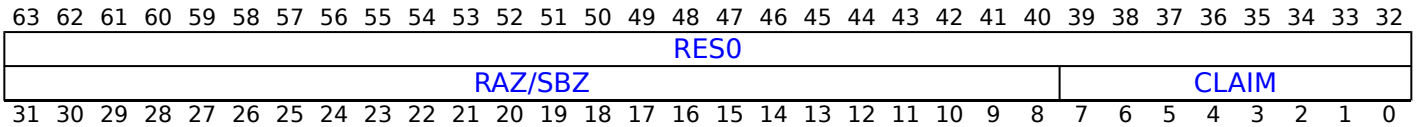
~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

DBGCLAIMCLR_EL1 is a 64-bit register.

Field descriptions

The DBGCLAIMCLR_EL1 bit assignments are:



Bits [63:32]

Reserved, RES0.

Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

The following resets apply:

~~On a Cold reset, this field resets to 0.~~

- On a Cold reset, this field resets to `0`.
- On a Warm reset, the value of this field is unchanged.

Accessing the DBGCLAIMCLR_EL1

Accesses to this register use the following encodings:

```

DBGDTR_EL0, Debug Data Transfer Register, half-duplex

The DBGDTR_EL0 characteristics are:

Purpose

Transfers 64 bits of data between the PE and an external debugger. Can transfer both ways using only a single register.

Configuration

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to External register DBGDTRRX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to External register DBGDTRTX_EL0[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0] when read.

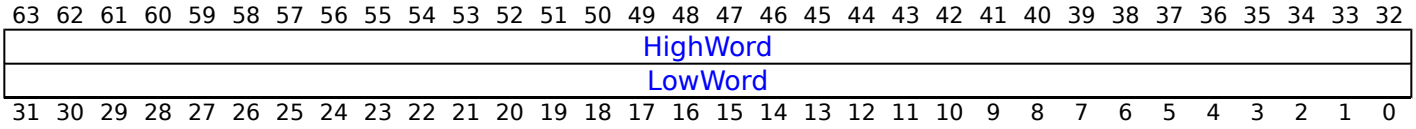
AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0] when read.

Attributes

DBGDTR_EL0 is a 64-bit register.

Field descriptions

The DBGDTR_EL0 bit assignments are:



HighWord, bits [63:32]

Writes to this register set DTRRX to the value in this field and do not change RXfull.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRTX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

LowWord, bits [31:0]

Writes to this register set DTRTX to the value in this field and set TXfull to 1.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

Accessing the DBGDTR_EL0

Accesses to this register use the following encodings:

```
MRS <Xt>, DBGDTR_EL0
```

op0	op1	CRn	CRm	op2
0b10	0b011	0b0000	0b0100	0b000

DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

Configuration

AArch64 System register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0] .

AArch64 System register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0] .

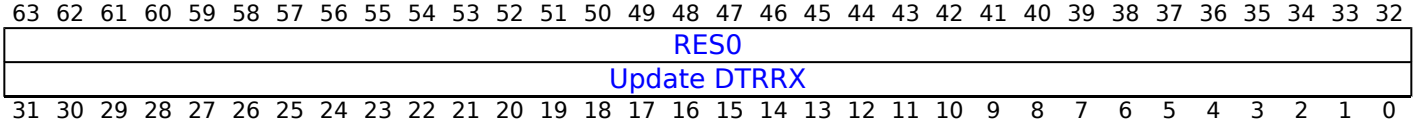
~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

DBGDTRRX_EL0 is a 64-bit register.

Field descriptions

The DBGDTRRX_EL0 bit assignments are:



Bits [63:32]

Reserved, RES0.

Bits [31:0]

Update DTRRX.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see The Debug Communication Channel and Instruction Transfer Register.

The following resets apply:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

- On a Warm reset, the value of this field is unchanged.

Accessing the DBGDTRRX_EL0

Accesses to this register use the following encodings:

```

DBGVCR32_EL2, Debug Vector Catch Register

The DBGVCR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register DBGVCR from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register DBGVCR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register DBGVCR[31:0] .

ThisIf registerEL1 isdoes presentnot only whensupport AArch32 is supported at any Exception level. Otherwise, directthis accessesregister to DBGVCR32_EL2 areis UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

~~This register has no effect if EL2 is not enabled in the current Security state.~~

~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

DBGVCR32_EL2 is a 64-bit register.

Field descriptions

The DBGVCR32_EL2 bit assignments are:

When ~~HaveEL(~~EL3~~)~~ isand implemented:~~!ELUsingAArch32(EL3):~~

63	62	61	60	59	58	57	56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38	37	36	35	34	33	32

DC CGDVADP, Data, Allocation Tag or unified Cache line Clean of Allocation Tags by VA to PoDP

The DC CGDVADP characteristics are:

Purpose

Clean Allocation Tags and data in data cache by address to Point of Deep Persistence.

If the memory system does not identify a Point of Deep Persistence, then this instruction behaves as a DC CGDVAP~~DC CGVAP~~.

Configuration

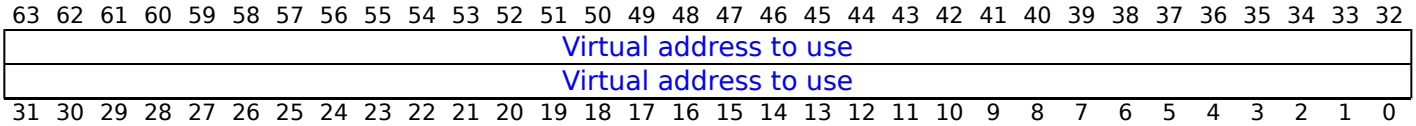
This instruction is present only when ARMv8.2-DCCVADP is implemented and ARMv8.5-MemTag is implemented. Otherwise, direct accesses to DC CGDVADP are UNDEFINED.

Attributes

DC CGDVADP is a 64-bit System instruction.

Field descriptions

The DC CGDVADP input value bit assignments are:



Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DC CGDVADP instruction

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, see 'Permission fault' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Accesses to this instruction use the following encodings:

```
DC CGDVADP, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b1101	0b101

```
if PSTATE.EL == EL0 then

DC ZVA, Data Cache Zero by VA

The DC ZVA characteristics are:

Purpose

Zero data cache by address. Zeroes a naturally aligned block of N bytes, where the size of N is identified in DCZID_EL0.

Configuration

There are no configuration notes.

Attributes

DC ZVA is a 64-bit System instruction.

Field descriptions

The DC ZVA input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual address to use																															
Virtual address to use																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

Executing the DC ZVA instruction

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 0.

If the memory region being zeroed is any type of Device memory, this instruction can give an Alignment fault which is prioritized in the same way as other Alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of Stores to each byte within the block being accessed, and so it:

- Generates a Permission Fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings:

```
DC ZVA, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0100	0b001

DCZID_EL0, Data Cache Zero ID register

The DCZID_EL0 characteristics are:

Purpose

Indicates the block size that is written with byte values of 0 by the DC ZVA (Data Cache Zero by Address) System instruction.

If ARMv8.5-MemTag is implemented, this register also indicates the granularity at which the DC GVA and DC GZVA instructions write.

Configuration

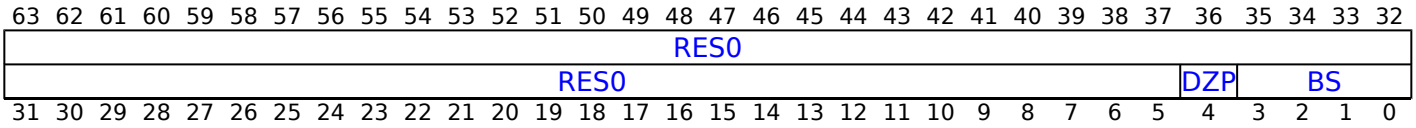
There are no configuration notes.

Attributes

DCZID_EL0 is a 64-bit register.

Field descriptions

The DCZID_EL0 bit assignments are:



Bits [63:5]

Reserved, RES0.

DZP, bit [4]

Data Zero Prohibited. This field indicates whether use of DC ZVA instructions is permitted or prohibited.

If ARMv8.5-MemTag is implemented, this field also indicates whether use of the DC GVA and DC GZVA instructions are permitted or prohibited.

DZP	Meaning
0b0	Instructions are permitted.
0b1	Instructions are prohibited.

The value read from this field is governed by the access state and the values of the HCR_EL2.TDZ and SCTLR_EL1.DZE bits.

BS, bits [3:0]

Log_2 of the block size in words. The maximum size supported is 2KB (value == 9).

Accessing the DCZID_EL0

Accesses to this register use the following encodings:

MRS <Xt>, DCZID_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b0000	0b0000	0b111

```

Bits [63:25]

Reserved, RES0.

DIT, bit [24]

Data Independent Timing.

DIT	Meaning
0b0	The architecture makes no statement about the timing properties of any instructions.
0b1	The architecture requires that: • The timing of every load and store instruction is insensitive to the value of the data being loaded or stored. • For certain data processing instructions, the instruction takes a time which is independent of: ◦ The values of the data supplied in any of its registers. ◦ The values of the NZCV flags. • For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on: ◦ The values of the data supplied in any of its registers. ◦ The values of the NZCV flags.

The data processing instructions affected by this bit are:

- All cryptographic instructions. These instructions are:

    - AESD, AESE, AESIMC, AESMC, SHA1C, SHA1H, SHA1M, SHA1P, SHA1SU0, SHA1SU1, SHA256H, SHA256H2, SHA256SU0, SHA256SU1, SHA512H, SHA512H2, SHA512SU0, SHA512SU1, EOR3, RAX1, XAR, BCAX, SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, SM3PARTW2, SM4E, and SM4EKEY.

- A subset of those instructions which use the general-purpose register file. These instructions are:

    - ADC, ADCS, ADD, ADDS, AND, ANDS, ASR, ASRV, BFC, BFI, BFM, BFXIL, BIC, BICS, CCMN, CCMP, CFINV, CINC, CINV, CLS, CLZ, CMN, CMP, CNEG, CSEL, CSET, CSETM, CSINC, CSINV, CSNEG, EON, EOR, EXTR, LSL, LSLV, LSR, LSRV, MADD, MNEG, MOV, MOVK, MOVN, MOVZ, MSUB, MUL, MVN, NEG, NEGS, NGC, NGCS, NOP, ORN, ORR, RBIT, RET, REV, REV16, REV32, REV64, RMIF, ROR, RORV, SBC, SBCS, SBFIZ, SBFM, SBFX, SETF8, SETF16, SMADDL, SMNEGL, SMSUBL, SMULH, SMULL, SUB, SUBS, SXTB, SXTH, SXTW, TST, UBFIZ, UBFM, UBFX, UMADDL, UMNEGL, UMSUBL, UMULH, UMULL, UXTB, and UXTH.

- A subset of those instuctions which use the SIMD&FP register file. These instructions are:

    - ABS, ADD, ADDHN, ADDHN2, ADDP, ADDV, AND, BIC, BIF, BIT, BSL, CLS, CLZ, CMEQ, CMGE, CMGT, CMHI, CMHS, CMLE, CMLT, CMTST, CNT, CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, CRC32CX, DUP, EOR, EXT, FCSEL, INS, MLA, MLS, MOV, MOVI, MUL, MVN, MVNI, NEG, NOT, ORN, ORR, PMUL, PMULL, PMULL2, RADDHN, RADDHN2, RBIT, REV16, REV32, RSHRN, RSHRN2, RSUBHN, RSUBHN2, SABA, SABD, SABAL, SABAL2, SABDL, SABDL2, SADALP, SADDL, SADDL2, SADDLP, SADDLV, SADDW, SADDW2, SHADD, SHL, SHLL, SHLL2, SHRN, SHRN2, SHSUB, SLI, SMAX, SMAXP, SMAXV, SMIN, SMINP, SMINV, SMLAL, SMLAL2, SMLSL, SMLSL2, SMOV, SMULL, SMULL2, SRI, SSHL, SSHLL, SSHLL2, SSHR, SSRA, SSUBL, SSUBL2, SSUBW, SSUBW2, SUB, SUBHN, SUBHN2, SXTL, SXTL2, TBL, TBX, TRN1, TRN2, UABA, UABAL, UABAL2, UABD, UABDL, UABDL2, UADALP, UADDL, UADDL2, UADDLP, UADDLV, UADDW, UADDW2, UHADD, UHSUB, UMAX, UMAXP, UMAXV, UMIN, UMINP, UMINV, UMLAL, UMLAL2, UMLSL, UMOV, UMLSL2, UMULL, UMULL2, USHL, USHLL, USHLL2, USHR, USRA, USUBL, USUBL2, USUBW, USUBW2, UXTL, UXTL2, UZP1, UZP2, XTN, XTN2, ZIP1, and ZIP2.

Note

The architecture makes no statement about the timing properties when the PSTATE.DIT bit is not set. However, it is likely that many of these instructions have timing that is invariant of the data in many situations.

In particular, Arm strongly recommends that the Armv8.3 pointer authentication instructions do not have their timing dependent on the key value used in the pointer authentication in all cases, regardless of the PSTATE.DIT bit.

This field resets to 0.

Bits [23:0]

Reserved, RES0.

Accessing the DIT

~~For details on the operation of the MSR (immediate) accessor, see MSR (immediate) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.~~

Accesses to this register use the following encodings:

```
MRS <Xt>, DIT
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b101

```
if PSTATE.EL == EL0 then
    return Zeros(39):PSTATE.DIT:Zeros(24);
elsif PSTATE.EL == EL1 then
    return Zeros(39):PSTATE.DIT:Zeros(24);
elsif PSTATE.EL == EL2 then
    return Zeros(39):PSTATE.DIT:Zeros(24);
elsif PSTATE.EL == EL3 then
    return Zeros(39):PSTATE.DIT:Zeros(24);
```

MSR DIT, <Xt>

DSPSR_EL0, Debug Saved Program Status Register

The DSPSR_EL0 characteristics are:

Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

Configuration

AArch64 System register DSPSR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DSPSR[31:0] .

~~RW fields in this register reset to architecturally UNKNOWN values.~~

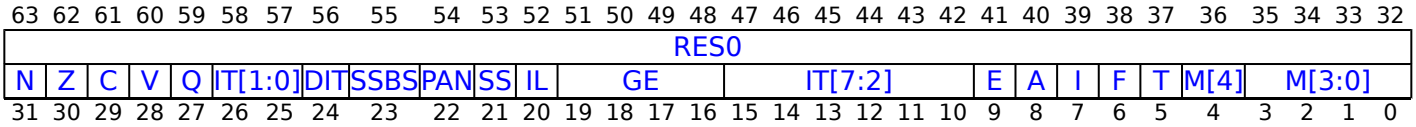
Attributes

DSPSR_EL0 is a 64-bit register.

Field descriptions

The DSPSR_EL0 bit assignments are:

When AArch32 is supported at any Exception level and exiting Debug state to AArch32 state:



Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Copied to PSTATE.N on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Copied to PSTATE.Z on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Copied to PSTATE.C on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Copied to PSTATE.V on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Copied to PSTATE.Q on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Copied to PSTATE.IT[1:0] on exiting Debug state.

On exiting Debug state DSPSR_EL0.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Copied to PSTATE.DIT on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Copied to PSTATE.SSBS on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Copied to PSTATE.PAN on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Copied to PSTATE.SS on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Copied to PSTATE.IL on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Copied to PSTATE.GE on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Copied to PSTATE.IT[7:2] on exiting Debug state.

DSPSR_EL0.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR_EL0.E is RES0. If the implementation does not support little-endian operation, DSPSR_EL0.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR_EL0.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR_EL0.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Copied to PSTATE.A on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Copied to PSTATE.I on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Copied to PSTATE.F on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Copied to PSTATE.T on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Copied to PSTATE.nRW on exiting Debug state.

M[4]	Meaning
0b1	AArch32 execution state.

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

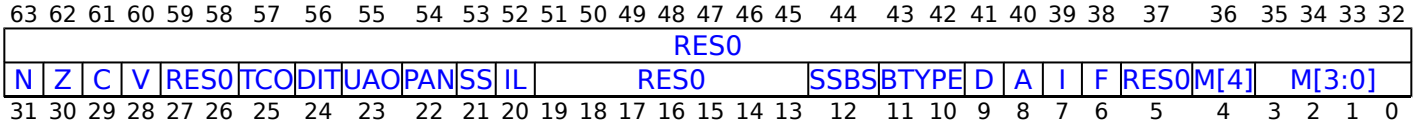
AArch32 Mode. Copied to PSTATE.M[3:0] on exiting Debug state.

M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0110	Monitor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If DSPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm®Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

When AArch64 is supported at any Exception level and entering Debug state from AArch64 state and exiting Debug state to AArch64 state:



Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When ARMv8.5-MemTag is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on entering Debug state, and copied to PSTATE.TCO on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When ARMv8.2-UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on entering Debug state, and copied to PSTATE.UAO on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Bits [19:13]

Reserved, RES0.

SSBS, bit [12]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When ARMv8.5-BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on entering Debug state, and copied to PSTATE.BTYPE on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on entering Debug state, and copied to PSTATE.D on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

When AArch32 is supported at any Exception level:

Execution state. Set to `0b0`, the value of PSTATE.nRW, on entering Debug state from AArch64 state, and copied to PSTATE.nRW on exiting Debug state.

M[4]	Meaning
`0b0`	AArch64 execution state.

~~If AArch32 is not supported at any Exception level, this bit is RES0.~~

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
`0b0000`	EL0t.
`0b0100`	EL1t.
`0b0101`	EL1h.
`0b1000`	EL2t.
`0b1001`	EL2h.
`0b1100`	EL3t.
`0b1101`	EL3h.

Other values are reserved. If DSPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm®Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on entering Debug state and copied to PSTATE.EL on exiting Debug state.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on entering Debug state and copied to PSTATE.SP on exiting Debug state

This field resets to an architecturally UNKNOWN value.

Accessing the DSPSR_EL0

Accesses to this register use the following encodings:

```
MRS <Xt>, DSPSR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    return DSPSR_EL0;
```

```
MSR DSPSR_EL0, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    DSPSR_EL0 = X[t];
```

ELR_EL1, Exception Link Register (EL1)

The ELR_EL1 characteristics are:

Purpose

When taking an exception to EL1, holds the address to return to.

Configuration

There are no configuration notes.

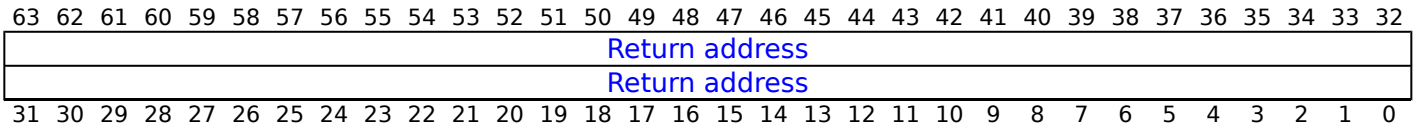
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

ELR_EL1 is a 64-bit register.

Field descriptions

The ELR_EL1 bit assignments are:



Bits [63:0]

Return address.

An exception return from EL1 using AArch64 makes ELR_EL1 become UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Accessing the ELR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic ELR_EL1 or ELR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, ELR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0000	0b001

```
if PSTATE.EL == EL0 then

ELR_EL3, Exception Link Register (EL3)

The ELR_EL3 characteristics are:

Purpose

When taking an exception to EL3, holds the address to return to.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

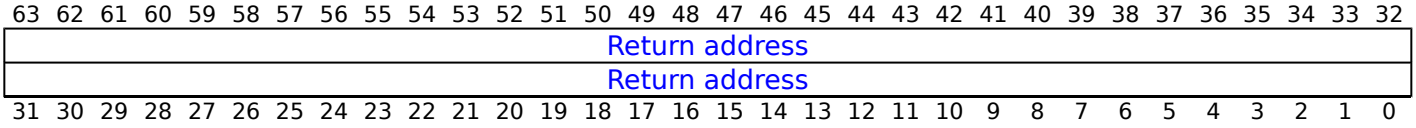
This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to ELR_EL3 are UNDEFINED.

Attributes

ELR_EL3 is a 64-bit register.

Field descriptions

The ELR_EL3 bit assignments are:



Bits [63:0]

Return address.

An exception return from EL3 using AArch64 makes ELR_EL3 become UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Accessing the ELR_EL3

Accesses to this register use the following encodings:

```
MRS <Xt>, ELR_EL3
```

ERRIDR_EL1, Error Record ID Register

The ERRIDR_EL1 characteristics are:

Purpose

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

Configuration

AArch64 System register ERRIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERRIDR[31:0] .

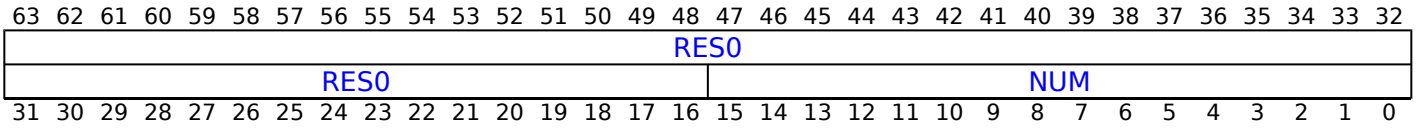
This register is present only when RAS is implemented. Otherwise, direct accesses to ERRIDR_EL1 are UNDEFINED.

Attributes

ERRIDR_EL1 is a 64-bit register.

Field descriptions

The ERRIDR_EL1 bit assignments are:



Bits [63:16]

Reserved, RES0.

NUM, bits [15:0]

Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates ~~that~~ no records can be accessed through the Error Record System registers.

Each implemented record is owned by a node. A node might own multiple records.

Accessing the ERRIDR_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ERRIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0011	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TERR == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGRTR_EL2.ERRIDR_EL1 == '1' then

ERRSELR_EL1, Error Record Select Register

The ERRSELR_EL1 characteristics are:

Purpose

Selects an error record to be accessed through the Error Record System registers.

Configuration

AArch64 System register ERRSELR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERRSELR[31:0] .

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRSELR_EL1 are UNDEFINED.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

If ERRIDR_EL1 indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR_EL1 is UNDEFINED or RES0.

Attributes

ERRSELR_EL1 is a 64-bit register.

Field descriptions

The ERRSELR_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																SEL															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:16]

Reserved, RES0.

SEL, bits [15:0]

Selects the error record accessed through the ERX registers.

For example, if ERRSELR_EL1.SEL is set to 0x0004~~0~~x4, then direct reads and writes of ERXSTATUS_EL1 ~~, then direct reads and writes of ERXSTATUS_EL1~~ access ERR4STATUS.

If ERRSELR_EL1.SEL is set to a value greater than or equal to ERRIDR_EL1.NUM, then all of the following apply:

- The value read back from ERRSELR_EL1.SEL is UNKNOWN.
- ~~The value read back from ERRSELR_EL1.SEL is UNKNOWN.~~
- ~~One of the following occurs:~~

One of the following occurs:

- An UNKNOWN error record is selected.
- ~~An UNKNOWN error record is selected.~~
- ~~The ERX* registers are RAZ/WI.~~

The ERX*_EL1 registers are RAZ/WI.

- ~~ERX* register reads and writes are NOPs.~~

ERX*_EL1 register reads and writes are NOPs.

- ERX*_EL1 register reads and writes are UNDEFINED.
- ~~ERX* register reads and writes are UNDEFINED.~~

This field resets to an architecturally UNKNOWN value.

Accessing the ERRSELR_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ERRSELR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0011	0b001

ERXCTLR_EL1, Selected Error Record Control Register

The ERXCTLR_EL1 characteristics are:

Purpose

Accesses ERR<n>CTLR for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

AArch64 System register ERXCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERXCTLR[31:0] .

AArch64 System register ERXCTLR_EL1 bits [63:32] are architecturally mapped to AArch32 System register ERXCTLR2[31:0] .

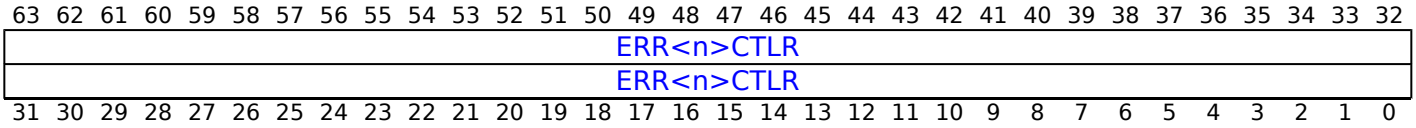
This register is present only when RAS is implemented. Otherwise, direct accesses to ERXCTLR_EL1 are UNDEFINED.

Attributes

ERXCTLR_EL1 is a 64-bit register.

Field descriptions

The ERXCTLR_EL1 bit assignments are:



Bits [63:0]

ERXCTLR_EL1 accesses ERR<n>CTLR, where <n> is the value in ERRSELR_EL1.SEL.

Accessing the ERXCTLR_EL1

If ERRIDR_EL1.NUM == ~~0 or~~ 0x0000 or ERRSELR_EL1.SEL is set to a value greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ~~An UNKNOWN record is selected.~~
- ~~ERXCTLR_EL1 is RAZ/WI.~~

  ERXCTLR_EL1 is RAZ/WI.
- ~~Direct reads and writes of ERXCTLR_EL1 are NOPs.~~

  Direct reads and writes of ERXCTLR_EL1 are NOPs.
- Direct reads and writes of ERXCTLR_EL1 are UNDEFINED.
- ~~Direct reads and writes of ERXCTLR_EL1 are UNDEFINED.~~

If ERRSELR_EL1.SEL is not the index of the first error record owned by a node, then ERR<n>CTLR is not present, meaning reads and writes of ERXCTLR_EL1 are RES0.

Accesses to this register use the following encodings:

ERXMISC0_EL1, Selected Error Record Miscellaneous Register 0

The ERXMISC0_EL1 characteristics are:

Purpose

Accesses ERR<n>MISC0 for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

AArch64 System register ERXMISC0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERXMISC0[31:0] .

AArch64 System register ERXMISC0_EL1 bits [63:32] are architecturally mapped to AArch32 System register ERXMISC1[31:0] .

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXMISC0_EL1 are UNDEFINED.

~~For IMPLEMENTATION DEFINED fields in this register, writing zero must always be supported to return the error record to an initial state.~~

~~In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.~~

~~Fields that are read-only, non-zero and ignore writes are compliant with this requirement.~~

~~Note~~

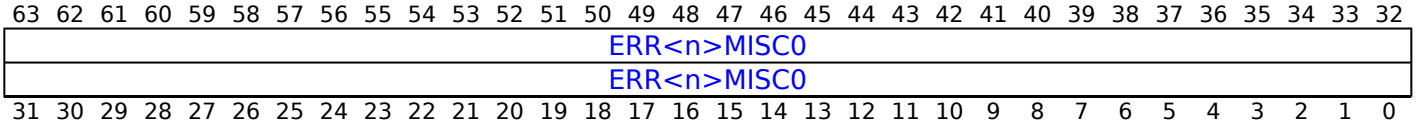
~~Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL, where q is the index of the first error record owned by the same node as error record n. If the node owns a single record then q = n.~~

Attributes

ERXMISC0_EL1 is a 64-bit register.

Field descriptions

The ERXMISC0_EL1 bit assignments are:



Bits [63:0]

ERXMISC0_EL1 accesses ERR<n>MISC0, where <n> is the value in ERRSELR_EL1.SEL.

Accessing the ERXMISC0_EL1

If ERRIDR_EL1.NUM == ~~0 or~~ 0x0000 or ERRSELR_EL1.SEL is set to a value greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
  - ~~An UNKNOWN record is selected.~~

ERXMISC1_EL1, Selected Error Record Miscellaneous Register 1

The ERXMISC1_EL1 characteristics are:

Purpose

Accesses ERR<n>MISC1 for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

AArch64 System register ERXMISC1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERXMISC2[31:0] .

AArch64 System register ERXMISC1_EL1 bits [63:32] are architecturally mapped to AArch32 System register ERXMISC3[31:0] .

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXMISC1_EL1 are UNDEFINED.

~~For IMPLEMENTATION DEFINED fields in this register, writing zero must always be supported to return the error record to an initial state.~~

~~In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.~~

~~Fields that are read-only, non-zero and ignore writes are compliant with this requirement.~~

~~Note~~

~~Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL, where q is the index of the first error record owned by the same node as error record n. If the node owns a single record then q = n.~~

Attributes

ERXMISC1_EL1 is a 64-bit register.

Field descriptions

The ERXMISC1_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ERXPFGCDN_EL1, Selected Pseudo-fault Generation Countdown register

The ERXPFGCDN_EL1 characteristics are:

Purpose

Accesses the ERR<n>PFGCDN register for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERXPFGCDN_EL1 are UNDEFINED.

Attributes

ERXPFGCDN_EL1 is a 64-bit register.

Field descriptions

The ERXPFGCDN_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ERR<n>PFGCDN																															
ERR<n>PFGCDN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

ERXPFGCDN_EL1 accesses ERR<n>PFGCDN, where <n> is the value in ERRSELR_EL1.SEL.

Accessing the ERXPFGCDN_EL1

If ERRIDR_EL1.NUM == 0 or 0x0000 or ERRSELR_EL1.SEL is set to a value greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- An UNKNOWN record is selected.
- ERXPFGCDN_EL1 is RAZ/WI.

ERXPFGCDN_EL1 is RAZ/WI.

- Direct reads and writes of ERXPFGCDN_EL1 are NOPs.

Direct reads and writes of ERXPFGCDN_EL1 are NOPs.

- Direct reads and writes of ERXPFGCDN_EL1 are UNDEFINED.
- Direct reads and writes of ERXPFGCDN_EL1 are UNDEFINED.

If ERRSELR_EL1.SEL selects an error record owned by a node that does not implement the RAS Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGCDN_EL1 is RAZ/WI.

ERXPFGCDN_EL1 is RAZ/WI.

- ~~Direct reads and writes of ERXPFGCDN_EL1 are NOPs.~~

Direct reads and writes of ERXPFGCDN_EL1 are NOPs.

- Direct reads and writes of ERXPFGCDN_EL1 are UNDEFINED.

- ~~Direct reads and writes of ERXPFGCDN_EL1 are UNDEFINED.~~

Note

A~~A~~n node~~error record~~ does not implement the RAS Common Fault Injection Model Extension when ERR<q~~n~~>FR.INJ == 0b00. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in ERRSELR_EL1.SEL. If the node owns a single record, then q = n.

If ERRSELR_EL1.SEL is not the index of the first error record owned by a node, then ERR<n>PFGCDN is not present, meaning reads and writes of ERXPFGCDN_EL1 are RES0.

ERR<n>PFGCDN describes additional constraints that also apply when ERR<n>PFGCDN is accessed through ERXPFGCDN_EL1.

Accesses to this register use the following encodings:

```
MRS <Xt>, ERXPFGCDN_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0100	0b110

```
if PSTATE.EL == EL0 then

ERXPFGCTL_EL1, Selected Pseudo-fault Generation Control register

The ERXPFGCTL_EL1 characteristics are:

Purpose

Accesses the ERR<n>PFGCTL register for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

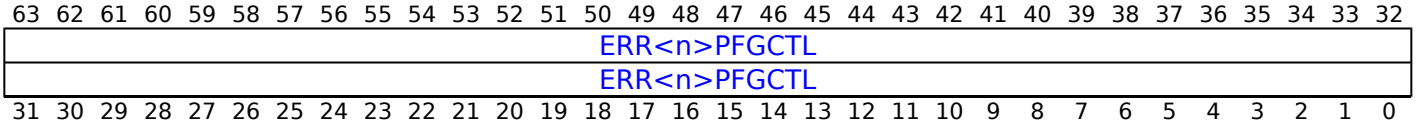
This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERXPFGCTL_EL1 are UNDEFINED.

Attributes

ERXPFGCTL_EL1 is a 64-bit register.

Field descriptions

The ERXPFGCTL_EL1 bit assignments are:



Bits [63:0]

ERXPFGCTL_EL1 accesses ERR<n>PFGCTL, where <n> is the value in ERRSELR_EL1.SEL.

Accessing the ERXPFGCTL_EL1

If ERRIDR_EL1.NUM == 0 or 0x0000 or ERRSELR_EL1.SEL is set to a value greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- An UNKNOWN record is selected.
- ERXPFGCTL_EL1 is RAZ/WI.

ERXPFGCTL_EL1 is RAZ/WI.

- Direct reads and writes of ERXPFGCTL_EL1 are NOPs.

Direct reads and writes of ERXPFGCTL_EL1 are NOPs.

- Direct reads and writes of ERXPFGCTL_EL1 are UNDEFINED.
- Direct reads and writes of ERXPFGCTL_EL1 are UNDEFINED.

If ERRSELR_EL1.SEL selects an error record owned by a node that does not implement the RAS Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGCTL_EL1 is RAZ/WI.

ERXPFGCTL_EL1 is RAZ/WI.

- ~~Direct reads and writes of ERXPFGCTL_EL1 are NOPs.~~

Direct reads and writes of ERXPFGCTL_EL1 are NOPs.

- Direct reads and writes of ERXPFGCTL_EL1 are UNDEFINED.

- ~~Direct reads and writes of ERXPFGCTL_EL1 are UNDEFINED.~~

Note

A~~An~~ node~~error record~~ does not implement the RAS Common Fault Injection Model Extension when ERR<q~~n~~>FR.INJ == 0b00. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in ERRSELR_EL1.SEL. If the node owns a single record, then q = n.

If ERRSELR_EL1.SEL is not the index of the first error record owned by a node, then ERR<n>PFGCTL is not present, meaning reads and writes of ERXPFGCTL_EL1 are RES0.

ERXSTATUS_EL1, Selected Error Record Primary Status Register

The ERXSTATUS_EL1 characteristics are:

Purpose

Accesses ERR<n>STATUS for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

AArch64 System register ERXSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERXSTATUS[31:0] .

This register is present only when RAS is implemented. Otherwise, direct accesses to ERXSTATUS_EL1 are UNDEFINED.

~~For IMPLEMENTATION DEFINED fields in this register, writing zero must always be supported to return the error record to an initial state.~~

~~In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.~~

~~Fields that are read-only, non-zero and ignore writes are compliant with this requirement.~~

~~Note~~

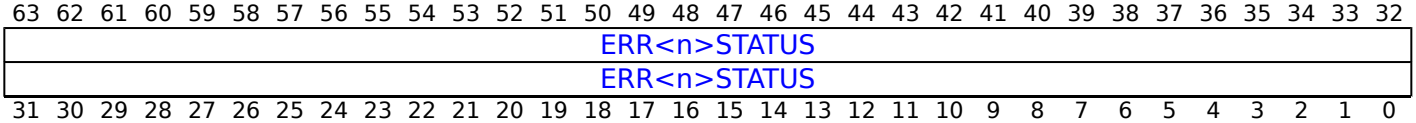
~~Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL, where q is the index of the first error record owned by the same node as error record n. If the node owns a single record then q = n.~~

Attributes

ERXSTATUS_EL1 is a 64-bit register.

Field descriptions

The ERXSTATUS_EL1 bit assignments are:



Bits [63:0]

ERXSTATUS_EL1 accesses ERR<n>STATUS, where <n> is the value in ERRSELR_EL1.SEL.

Accessing the ERXSTATUS_EL1

If ERRIDR_EL1.NUM == ~~0 or~~ 0x0000 or ERRSELR_EL1.SEL is set to a value greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
  - ~~An UNKNOWN record is selected.~~
  - ~~ERXSTATUS_EL1 is RAZ/WI.~~

    ERXSTATUS_EL1 is RAZ/WI.
  - ~~Direct reads and writes of ERXSTATUS_EL1 are NOPs.~~

ESR_EL1, Exception Syndrome Register (EL1)

The ESR_EL1 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL1.

Configuration

AArch64 System register ESR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DFSR[31:0] .

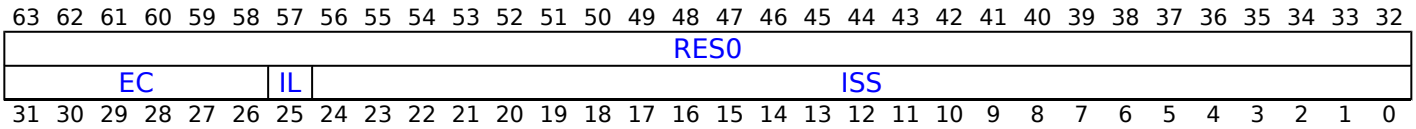
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

ESR_EL1 is a 64-bit register.

Field descriptions

The ESR_EL1 bit assignments are:



ESR_EL1 is made UNKNOWN as a result of an exception return from EL1.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL1, the value of ESR_EL1 is UNKNOWN. The value written to ESR_EL1 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:32]

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	
0b000001	Trapped WFI or WFE instruction execution. Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WFI or WFE instruction	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported at any Exception level
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported at any Exception level
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported at any Exception level
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: • An STC to write data to memory from DBGDTRRXint. • An LDC to read data from memory to DBGDTRTXint.	ISS encoding for an exception from an LDC or STC instruction	When AArch32 is supported at any Exception level
0b000111	Access to SVE, Advanced SIMD, or floating-point functionality trapped by CPACR_EL1.FPEN, CPTR_EL2.FPEN, CPTR_EL2.TFP, or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'EC encodings when routing exceptions to EL2' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP	

	architecture profile, section D1.10.4.		
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported at any Exception level
0b001101	Branch Target Exception.	ISS encoding for an exception from Branch Target Identification instruction	When ARMv8.5-BTI is implemented
0b001110	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b010001	SVC instruction execution in AArch32 state. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TGE is 1.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch32 is supported at any Exception level
0b010101	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported at any Exception level
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111. ~~If ARMv8.4-IDST is implemented, also exceptions generated by a read access to the feature ID space. If ARMv8.0-CSV2 is implemented, also Cache Speculation Variant exceptions. If ARMv8.2-EVT is implemented, also traps for EL1 and EL0 Cache controls.~~ This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section C5.2.2, except for those exceptions reported	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	When AArch64 is supported at any Exception level

	using EC values 0b000000, 0b000001, or 0b000111.		
0b011001	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000. ~~This EC is defined only if SVEis implemented.~~	ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ	When SVE is implemented
0b011100	Exception from a Pointer Authentication instruction authentication failure	ISS encoding for an exception from a Pointer Authentication instruction authentication failure	When ARMv8.3-FPAC is implemented
0b100000	Instruction Abort from a lower Exception level.~~level, that might be using AArch32 or AArch64.~~ Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.	ISS encoding for an exception from an Instruction Abort	
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.	ISS encoding for an exception from an Instruction Abort	
0b100010	PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b100100	Data Abort from a lower Exception level.~~level, that might be using AArch32 or AArch64.~~ Used for MMU faults generated by data accesses, alignment faults other than those	ISS encoding for an exception from a Data Abort	

	caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.		
0b100101	Data Abort taken without a change in Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.	ISS encoding for an exception from a Data Abort	
0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b101000	Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	When AArch32 is supported at any Exception level
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is	ISS encoding for an exception from a trapped floating-point exception	When AArch64 is supported at any Exception level

	IMPLEMENTATION DEFINED.		
0b101111	SError interrupt.	ISS encoding for an SError interrupt	
0b110000	Breakpoint exception from a lower Exception level.~~level, that might be using AArch32 or AArch64.~~	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110001	Breakpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110010	Software Step exception from a lower Exception level.~~level, that might be using AArch32 or AArch64.~~	ISS encoding for an exception from a Software Step exception	
0b110011	Software Step exception taken without a change in Exception level.	ISS encoding for an exception from a Software Step exception	
0b110100	Watchpoint exception from a lower Exception level.~~level, that might be using AArch32 or AArch64.~~	ISS encoding for an exception from a Watchpoint exception	
0b110101	Watchpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Watchpoint exception	
0b111000	BKPT instruction execution in AArch32 state.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch32 is supported at any Exception level
0b111100	BRK instruction execution in AArch64 state. This is reported in ESR_EL3 only if a BRK instruction is executed.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch64 is supported at any Exception level

All other EC values are reserved by Arm, and:

- Unused values in the range `0b000000` - `0b101100` (`0x00` - `0x2C`) are reserved for future use for synchronous exceptions.
- Unused values in the range `0b101101` - `0b111111` (`0x2D` - `0x3F`) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.1.11.

This field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: • An SError interrupt. • An Instruction Abort exception. • A PC alignment fault exception. • An SP alignment fault exception. • A Data Abort exception for which the value of the ISV bit is 0. • An Illegal Execution state exception. • Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning: ◦ 0b0: 16-bit T32 BKPT instruction. ◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction. • An exception reported using EC value 0b000000.

This field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

~~Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number. For an exception taken from AArch32 state, 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.~~

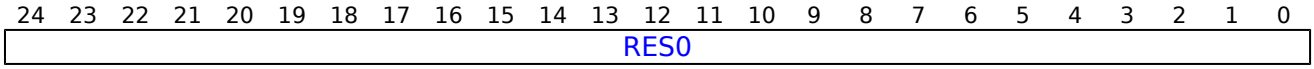
For an exception taken from AArch32 state, 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value 0b11111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

ISS encoding for exceptions with an unknown reason



Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.

    - Instruction encodings that are unallocated.
    - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR_EL1.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
    - An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
    - An SMC instruction when disabled by SCR_EL3.SMD.
    - An HLT instruction when disabled by EDSCR.HDE.
- Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSel.SP is 0.
- Attempted execution, in Debug state, of:
    - A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
    - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
    - A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon. See 'Traps to EL3 of monitor functionality from Secure EL1 using AArch32' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.
- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
- An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1 that, if the value of HCR_EL2.TGE was 0 would have been reported with an ESR_ELx.EC value of `0b000111`.
- ~~When SVE is not implemented, attempted execution of:~~
    - ~~An SVE instruction.~~
    - ~~An MSR or MRS instruction to access ZCR_EL1, ZCR_EL2, or ZCR_EL3.~~

ISS encoding for an exception from a WFI or WFE instruction

24	23 22 21 20	19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1	0
CV	COND	RES0	TI

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Bits [19:1]

Reserved, RES0.

TI, bit [0]

Trapped instruction. Possible values of this bit are:

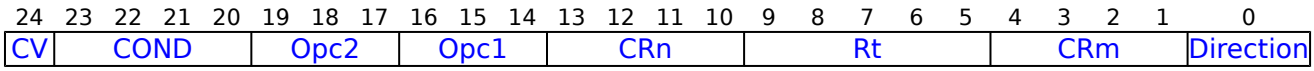
TI	Meaning
0b0	WFI trapped.
0b1	WFE trapped.

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- SCTLR_EL1.{nTWE, nTWI}.
- HCR_EL2.{TWE, TWI}.
- SCR_EL3.{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value `0b000`.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value `0b111`.

This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'~~ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value `0b0000`.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
`0b0`	Write to System register space. MCR instruction.
`0b1`	Read from System register space. MRC or VMRS instruction.

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value `0b000011`:

- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- HCR_EL2.TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- HCR_EL2.{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1 or CPACR using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- CNTHCTL_EL2.EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- CPTR_EL3.TCPAC, for accesses to CPACR from EL1 and EL2, and accesses to HCPTR from EL2 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL3.
- See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ for information on other traps using EC value `0b000011`.
- If ARMv8.6-FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value `0b000101`:

- CPACR_EL1.TTA for accesses to trace registers, MCR or MRC access (coproc == `0b1110`) trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1110`) trapped to EL1 or EL2.

- If ARMv8.6-FGT is implemented, MDCR_EL2.TDCC and MDCR_EL3.TDCC, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.
- HCR_EL2.TID0, for accesses to the JIDR register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == `0b1110`) trapped to EL2.
- CPTR_EL2.TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and AArch-DBGDSAR using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL2.
- MDCR_EL2.TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == `0b1110`) trapped to EL2.
- MDCR_EL2.TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == `0b1110`) trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL3.
- MDCR_EL3.TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value `0b001000`:

- HCR_EL2.TID0, for accesses to the FPSID register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- HCR_EL2.TID3, for accesses to registers in ID group 3 including MVFR0, MVFR1 and MVFR2, VMRS access trapped to EL2.

ISS encoding for an exception from an MCRR or MRRC access

24	23 22 21 20	19 18 17 16	15	14 13 12 11 10	9 8 7 6 5	4 3 2 1	0
CV	COND	Opc1	RES0	Rt2	Rt	CRm	Direction

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:

        - With COND set to `0b1110`, the value for unconditional.
        - With the COND value held in the instruction.
    - When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
        - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
        - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
    - For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
`0b0`	Write to System register space. MCRR instruction.
`0b1`	Read from System register space. MRRC instruction.

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value `0b000100`:

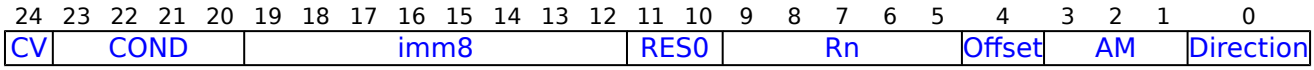
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- PMUSERENR_EL0.{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL1 or EL2.

- AMUSERENR_EL0.{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If ARMv8.6-FGT is implemented, HDFGRTR_EL2.PMCCNTR_EL0 for MRRC access and HDFGWTR_EL2.PMCCNTR_EL0 for MCRR access to PMCCNTR at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- CPACR_EL1.TTA for accesses to trace registers using MCR or MRC instructions, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- CPTR_EL2.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- MDCR_EL3.TDOSA, for traps to powerdown debug registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- MDCR_EL3.TDA, for accesses to other debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

ISS encoding for an exception from an LDC or STC instruction



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
`0b0`	Subtract offset.
`0b1`	Add offset.

This bit corresponds to the U bit in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

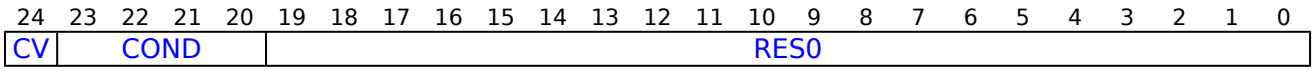
Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

This field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- MDSCR_EL1.TDCC, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint trapped to EL1 or EL2.
- MDCR_EL2.TDA, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL2.
- MDCR_EL3.TDA, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL3.
- If ARMv8.6-FGT is implemented, MDCR_EL2.TDCC and MDCR_EL3.TDCC, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP



The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

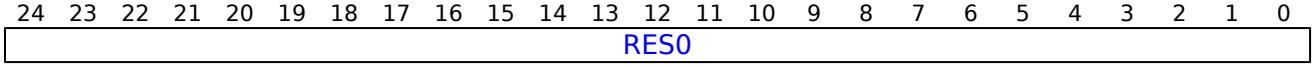
Bits [19:0]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value `0b000111`:

- CPACR_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.
- CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.
- CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ



Bits [24:0]

When SVE is implemented:

Reserved, RES0.

Otherwise:

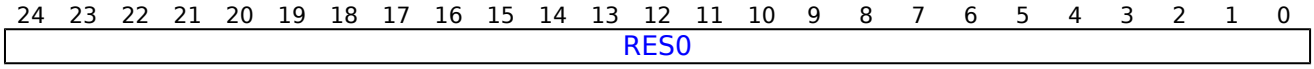
Reserved, RES0.

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE system registers, ZCR_ELx and ID_AA64ZFR0_EL1.

For an implementation that does not include SVE, the exception is reported using the EC value `0b000000`.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault



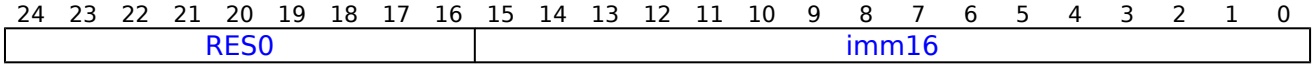
Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions see 'The Illegal Execution state exception' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ and 'PC alignment checking' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

'Stack pointer alignment checking' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from HVC or SVC instruction execution



Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

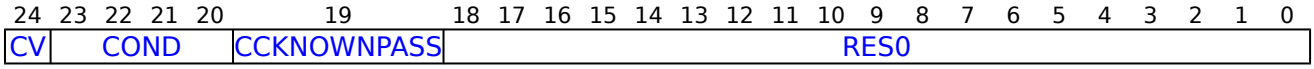
In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ and 'HVC' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

For A64 instructions, see 'SVC' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ and 'HVC' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

If ARMv8.6-FGT is implemented, HFGITR_EL2.{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state



For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because HCR_EL2.TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

Note

In an implementation in which an SMC instruction that fails it code check is not trapped, this field can always return the value 0.

This field resets to an architecturally UNKNOWN value.

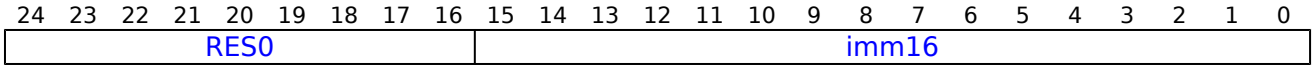
Bits [18:0]

Reserved, RES0.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

See 'System calls' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from SMC instruction execution in AArch64 state



Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

This field resets to an architecturally UNKNOWN value.

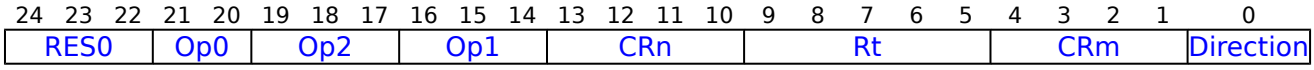
The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state



Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

This field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System' subsection of 'Branches, exception generating and System instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for the encoding values returned by an instruction.

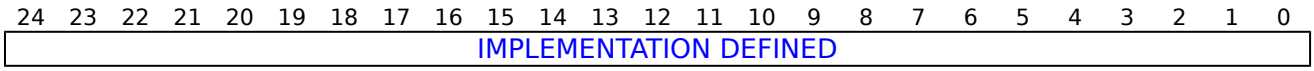
The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- SCTLR_EL1.UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.UCT, for accesses to CTR_EL0 using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- SCTLR_EL1.UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- CPACR_EL1.TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If ARMv8.6-FGT is implemented, MDCR_EL2.TDCC and MDCR_EL3.TDCC, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register, ACTLR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TTRF, for accesses to the trace filter register, TRFCR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.AT, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- SCR_EL3.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TCPAC, for accesses to CPTR_EL2 and CPACR_EL1 using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TTRF, for accesses to the filter trace control registers, TRFCR_EL1 and TRFCR_EL2, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.

- MDCR_EL3.TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If ARMv8.2-EVT is implemented the following registers control traps for EL1 and EL0 Cache controls that use this EC value:~~,HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4} and HCR2.{TTLBIS, TICAB, TOCU, TID4} control traps for EL1 and EL0 Cache controls that use this EC value.~~
  - HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - HCR2.{TTLBIS, TICAB, TOCU, TID4}.
- If ARMv8.6-FGT is implemented:
  - SCR_EL3.FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - HFGRTR_EL2 for reads and HFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - HFGITR_EL2 for execution of system instructions, MSR or MRS access trapped to EL2
  - HDFGRTR_EL2 for reads and HDFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - HAFGRTR_EL2 for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

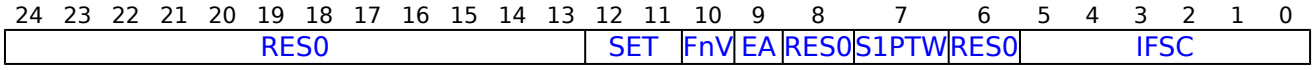


IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Instruction Abort



Bits [24:13]

Reserved, RES0.

SET, bits [12:11]

Synchronous Error Type. When the RAS Extension is implemented and IFSC is `0b010000`, describes the state of the PE after taking the Instruction Abort exception. The possible values of this field are:

SET	Meaning
`0b00`	Recoverable error (UER).
`0b10`	Uncontainable error (UC).
`0b11`	Restartable error (UEO) or Corrected error (CE).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the IFSC field is not `0b010000`.

This field resets to an architecturally UNKNOWN value.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is only valid if the IFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. ~~Possible values of this field are:~~

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010100	Synchronous External abort, on translation table walk or hardware update of translation table, level 0.~~0~~	
0b010101	Synchronous External abort, on translation table walk or hardware update of translation table, level 1.~~1~~	
0b010110	Synchronous External abort, on translation table walk or hardware update of translation table, level 2.~~2~~	
0b010111	Synchronous External abort, on translation table walk or hardware update of translation table, level 3.~~3~~	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.~~0~~	When RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.~~1~~	When RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.~~2~~	When RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.~~3~~	When RAS is not implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault. ~~Unsupported atomic hardware update fault, if the implementation includes ARMv8.1-TTHM].~~ ~~Otherwise reserved.~~	When ARMv8.1-TTHM is implemented

All other values are reserved.

~~When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.~~

Note

Armv8.2 requires the implementation of the RAS Extension.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

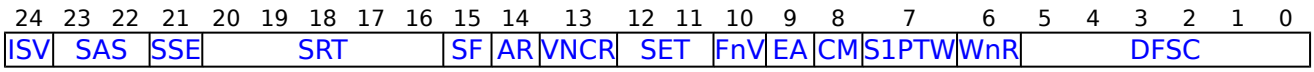
Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort



ISV, bit [24]

Instruction Syndromesyndrome Valid.valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults reported in ESR_EL2 except the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback.
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

ISV is 0 for all faults reported in ESR_EL1 or ESR_EL3.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When the RAS Extension is not implemented, the value of ISV on a synchronous External abort on a stage 2 translation table walk is IMPLEMENTATION DEFINED.

When ARMv8.5-MemTag is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR_ELx.FNV is 0 and FAR_ELx is valid.

This field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SRT, bits [20:16]

Syndrome Register Transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

~~Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction. If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.~~

If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SF, bit [15]

Width of the register accessed by the instruction is Sixty-Four. When ISV is 1, the possible values of this bit are:

SF	Meaning
0b0	Instruction loads/stores a 32-bit wide register.
0b1	Instruction loads/stores a 64-bit wide register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

AR, bit [14]

Acquire/Release. When ISV is 1, the possible values of this bit are:

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

VNCR, bit [13]

When ARMv8.4-NV is implemented:

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SET, bits [12:11]

Synchronous Error Type. When the RAS Extension is implemented and DFSC is 0b010000, describes the state of the PE after taking the Data Abort exception. The possible values of this field are:

SET	Meaning
0b00	Recoverable error (UER).
0b10	Uncontainable error (UC).
0b11	Restartable error (UEO) or Corrected error (CE).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010000.

This field resets to an architecturally UNKNOWN value.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.

This field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of `0b110101` or `0b110001`, indicating an unsupported Exclusive or atomic access.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. ~~Possible values of this field are:~~

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.~~walk.~~	
0b010001	Synchronous Tag Check Fault.~~fail~~	When ARMv8.5-MemTag is implemented
0b010100	Synchronous External abort, on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort, on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort, on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort, on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When RAS is not implemented
0b100001	Alignment fault.	
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault. ~~Unsupported atomic hardware update fault, if the implementation includes ARMv8.1-TTHM]. Otherwise reserved.~~	When ARMv8.1-TTHM is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	

0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).
0b111101	Section Domain Fault, used only for faults reported in the PAR_EL1.
0b111110	Page Domain Fault, used only for faults reported in the PAR_EL1.

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

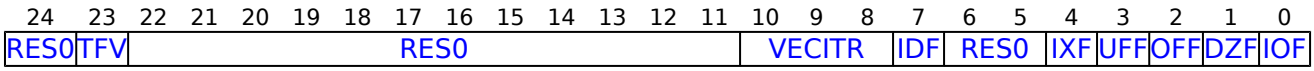
Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception



Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions. The possible values of this bit are:

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information see 'Floating-point exception traps' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

This field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

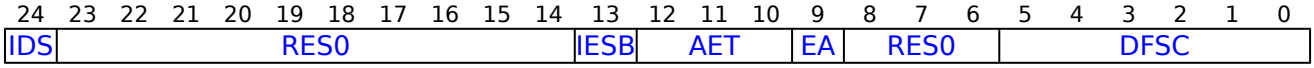
In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the FPCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt



IDS, bit [24]

IMPLEMENTATION DEFINED syndrome. Possible values of this bit are:

IDS	Meaning
0b0	Bits[23:0] of the ISS field holds the fields described in this encoding. **Note** If the RAS Extension is not implemented, this means that bits[23:0] of the ISS field are RES0.
0b1	Bits[23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

This field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]

When ARMv8.2-IESB is implemented:

Implicit error synchronization event.

IESB	Meaning
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is RES0 if the value returned in the DFSC field is not 0b010001.

Note

Armv8.2 requires the implementation of the RAS Extension and ARMv8.2-IESB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]

When RAS is implemented:

Asynchronous Error Type.

When the RAS Extension is implemented and DFSC is 0b010001, describes the state of the PE after taking the SError interrupt exception. The possible values of this field are:

AET	Meaning
0b000	Uncontainable error (UC).
0b001	Unrecoverable error (UEU).
0b010	Restartable error (UEO).
0b011	Recoverable error (UER).
0b110	Corrected error (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall state of the PE is reported. For example, if both a Recoverable and Unrecoverable error occurred, the state is Unrecoverable.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

Note

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

Otherwise:

Reserved, RES0.

EA, bit [9]

When RAS is implemented:

External abort type. When the RAS Extension is implemented, this bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not `0b010001`.

~~Note~~

~~Armv8.2 requires the implementation of the RAS Extension.~~

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

When RAS is implemented:

Data Fault Status Code. ~~When the RAS Extension is implemented, possible values of this field are:~~

DFSC	Meaning
`0b000000`	Uncategorized.
`0b010001`	Asynchronous SError interrupt.

All other values are reserved.

~~If the RAS Extension is not implemented, this field is RES0.~~

~~Note~~

~~Armv8.2 requires the implementation of the RAS Extension.~~

This field resets to an architecturally UNKNOWN value.

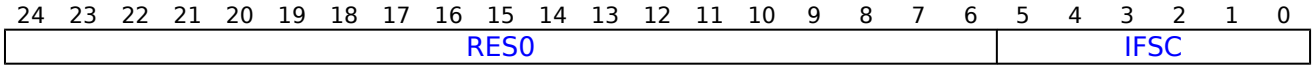
Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception



Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

~~Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.~~

IFSC	Meaning
0b100010	Debug exception.

This field resets to an architecturally UNKNOWN value.

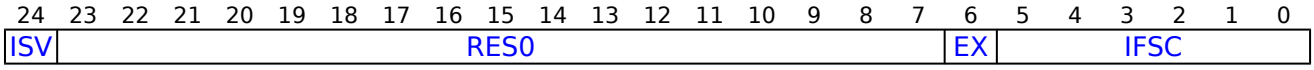
For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.
- For exceptions from AArch32, see 'Breakpoint exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ and 'Vector Catch exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

ISS encoding for an exception from a Software Step exception



ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

This field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

This field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code.

~~Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.~~

IFSC	Meaning
0b100010	Debug exception.

This field resets to an architecturally UNKNOWN value.

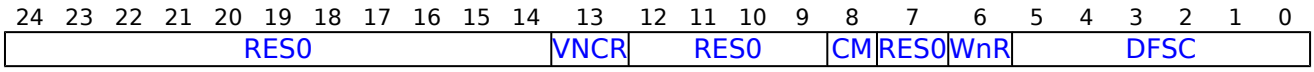
For more information about generating these exceptions, see 'Software Step exceptions'~~ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile,~~.

ISS encoding for an exception from a Watchpoint exception



Bits [24:14]

Reserved, RES0.

VNCR, bit [13]

When ARMv8.4-NV is implemented:

Indicates that the watchpoint came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR_EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.

This field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

~~Data Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.~~

DFSC	Meaning
0b100010	Debug exception.

This field resets to an architecturally UNKNOWN value.

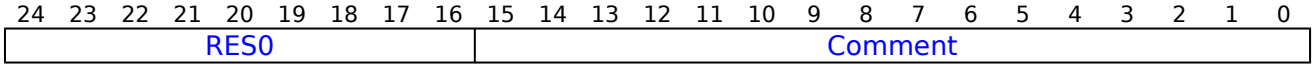
For more information about generating these exceptions, see 'Watchpoint exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

ISS encoding for an exception from execution of a Breakpoint instruction



Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary. ~~For the AArch32 BKPT instructions, the comment field is described as the immediate field.~~

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

This field resets to an architecturally UNKNOWN value.

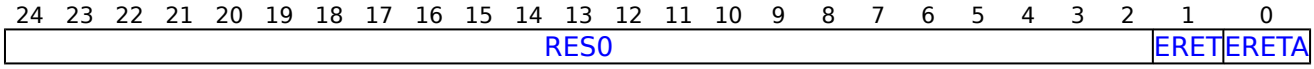
For more information about generating these exceptions, see 'Breakpoint instruction exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

ISS encoding for an exception from ERET, ERETAA or ERETAB instruction



This EC value applies when ARMv8.6-FGT is implemented, or when HCR_EL2.NV is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2. Possible values are:

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

This field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2. Possible values are:

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

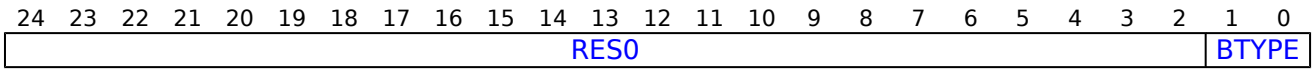
For more information about generating these exceptions, see HCR_EL2.NV.

If ARMv8.6-FGT is implemented, HFGITR_EL2.ERET controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

ISS encoding for an exception from Branch Target Identification instruction



Bits [24:2]

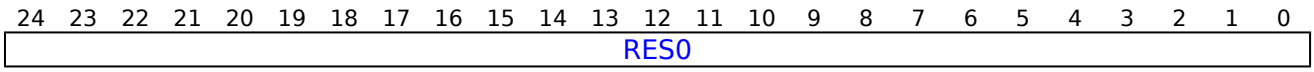
Reserved, RES0.

BTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section B1~~.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0



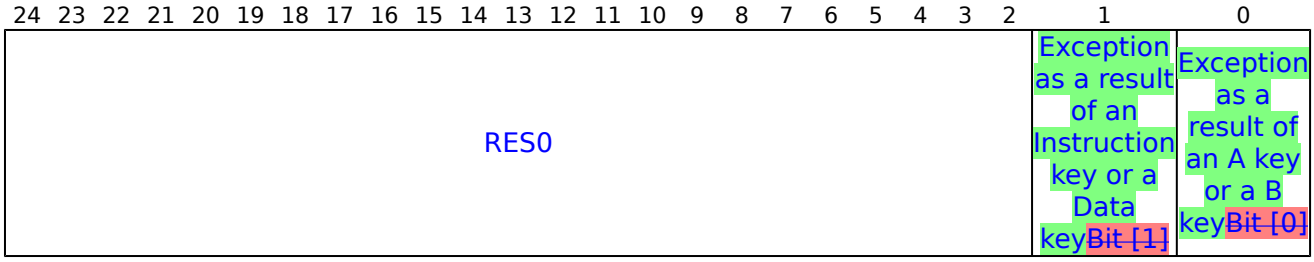
Bits [24:0]

Reserved, RES0.

For more information about generating these exceptions, see:

- HCR_EL2.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- SCR_EL3.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure



Bits [24:2]

Reserved, RES0.

Bit [1], bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

	Meaning
0b0	Instruction Key.
0b1	Data Key.

This field resets to an architecturally UNKNOWN value.

Bit [0], bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

This field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

Accessing the ESR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic ESR_EL1 or ESR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, ESR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGRTR_EL2.ESR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<NV2,NV1,NV> == '111' then
        return NVMem[0x138];
    else
        return ESR_EL1;
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        return ESR_EL2;
    else
        return ESR_EL1;
elsif PSTATE.EL == EL3 then
    return ESR_EL1;
```

```
MSR ESR_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGWTR_EL2.ESR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<NV2,NV1,NV> == '111' then
        NVMem[0x138] = X[t];
    else
        ESR_EL1 = X[t];
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        ESR_EL2 = X[t];
    else
        ESR_EL1 = X[t];
elsif PSTATE.EL == EL3 then
    ESR_EL1 = X[t];
```

```
MRS <Xt>, ESR_EL12
```

ESR_EL2, Exception Syndrome Register (EL2)

The ESR_EL2 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL2.

Configuration

AArch64 System register ESR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSR[31:0] .

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

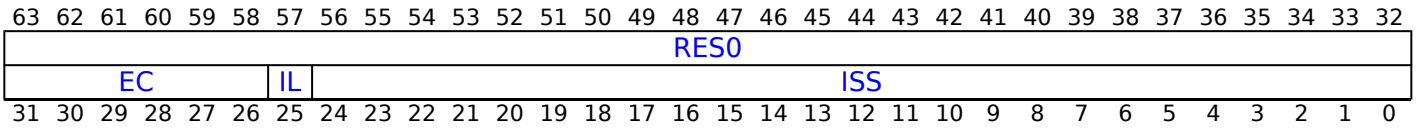
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

ESR_EL2 is a 64-bit register.

Field descriptions

The ESR_EL2 bit assignments are:



ESR_EL2 is made UNKNOWN as a result of an exception return from EL2.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of ESR_EL2 is UNKNOWN. The value written to ESR_EL2 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:32]

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	
0b000001	Trapped WFI or WFE instruction execution. Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WFI or WFE instruction	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported at any Exception level
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported at any Exception level
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported at any Exception level
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: • An STC to write data to memory from DBGDTRRXint. • An LDC to read data from memory to DBGDTRTXint.	ISS encoding for an exception from an LDC or STC instruction	When AArch32 is supported at any Exception level
0b000111	Access to SVE, Advanced SIMD, or floating-point functionality trapped by CPACR_EL1.FPEN, CPTR_EL2.FPEN, CPTR_EL2.TFP, or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'EC encodings when routing exceptions to EL2' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP	

	architecture profile, section D1.10.4.		
0b001000	Trapped VMRS access, from ID group trap, that is not reported using EC 0b000111.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported at any Exception level
0b001001	Trapped use of a Pointer authentication instruction because HCR_EL2.API == 0 || SCR_EL3.API == 0.	ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0	When ARMv8.3-PAuth is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported at any Exception level
0b001101	Branch Target Exception.	ISS encoding for an exception from Branch Target Identification instruction	When ARMv8.5-BTI is implemented
0b001110	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b010001	SVC instruction execution in AArch32 state. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TGE is 1.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch32 is supported at any Exception level
0b010010	HVC instruction execution in AArch32 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch32 is supported at any Exception level
0b010011	SMC instruction execution in AArch32 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.	ISS encoding for an exception from SMC instruction execution in AArch32 state	When AArch32 is supported at any Exception level
0b010101	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported at any Exception level
0b010110	HVC instruction execution in AArch64 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported at any Exception level
0b010111	SMC instruction execution in AArch64 state, when SMC is not disabled. This is reported in ESR_EL2 only when	ISS encoding for an exception from SMC instruction execution in AArch64 state	When AArch64 is supported at any Exception level

	the exception is generated because the value of HCR_EL2.TSC is 1.		
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111. ~~If ARMv8.4-IDST is implemented, also exceptions generated by a read access to the feature ID space.~~ ~~If ARMv8.0-CSV2 is implemented, also Cache Speculation Variant exceptions.~~ ~~If ARMv8.2-EVT is implemented, also traps for EL1 and EL0 Cache controls.~~ This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section C5.2.2, except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	When AArch64 is supported at any Exception level
0b011001	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000. ~~This EC is defined only if SVEis implemented.~~	ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ	When SVE is implemented
0b011010	Trapped ERET, ERETAA, or ERETAB instruction execution.	ISS encoding for an exception from ERET, ERETAA or ERETAB instruction	When ARMv8.3-PAuth is implemented and ARMv8.3-NV is implemented
0b011100	Exception from a Pointer Authentication instruction authentication failure	ISS encoding for an exception from a Pointer Authentication instruction	When ARMv8.3-FPAC is implemented

		authentication failure
0b100000	Instruction Abort from a lower Exception level.~~level, that might be using AArch32 or AArch64.~~ Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.	ISS encoding for an exception from an Instruction Abort
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.	ISS encoding for an exception from an Instruction Abort
0b100010	PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault
0b100100	Data Abort from a lower Exception level, excluding Data Aborts taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. These Data Aborts might be generated from Exception levels in~~using~~ anyAArch32 Execution~~or~~ state.~~AArch64.~~ Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not	ISS encoding for an exception from a Data Abort

	used for debug related exceptions.		
0b100101	Data Abort without a change in Exception level, or Data Aborts taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.	ISS encoding for an exception from a Data Abort	
0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b101000	Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	When AArch32 is supported at any Exception level
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is	ISS encoding for an exception from a trapped floating-point exception	When AArch64 is supported at any Exception level

	IMPLEMENTATION DEFINED.		
0b101111	SError interrupt.	ISS encoding for an SError interrupt	
0b110000	Breakpoint exception from a lower Exception level.~~level, that might be using AArch32 or AArch64.~~	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110001	Breakpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110010	Software Step exception from a lower Exception level.~~level, that might be using AArch32 or AArch64.~~	ISS encoding for an exception from a Software Step exception	
0b110011	Software Step exception taken without a change in Exception level.	ISS encoding for an exception from a Software Step exception	
0b110100	Watchpoint from a lower Exception level, excluding Watchpoint Exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. These Watchpoint Exceptions might be generated from Exception levels using any~~AArch32 Execution or~~ state.~~AArch64~~	ISS encoding for an exception from a Watchpoint exception	
0b110101	Watchpoint exceptions without a change in Exception level, or Watchpoint exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support.	ISS encoding for an exception from a Watchpoint exception	
0b111000	BKPT instruction execution in AArch32 state.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch32 is supported at any Exception level
0b111010	Vector Catch exception from AArch32 state. The only case where a Vector Catch exception is taken to	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	When AArch32 is supported at any Exception level

	an Exception level that is using AArch64 is when the exception is routed to EL2 and EL2 is using AArch64.		
0b111100	BRK instruction execution in AArch64 state. This is reported in ESR_EL3 only if a BRK instruction is executed.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch64 is supported at any Exception level

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.1.11.

This field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: • An SError interrupt. • An Instruction Abort exception. • A PC alignment fault exception. • An SP alignment fault exception. • A Data Abort exception for which the value of the ISV bit is 0. • An Illegal Execution state exception. • Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning: ◦ 0b0: 16-bit T32 BKPT instruction. ◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction. • An exception reported using EC value 0b000000.

This field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

~~Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number. For an exception taken from AArch32 state, 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.~~

For an exception taken from AArch32 state, 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value `0b11111`.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value `0b11111`.

When the EC field is `0b000000`, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

ISS encoding for exceptions with an unknown reason

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

Bits [24:0]

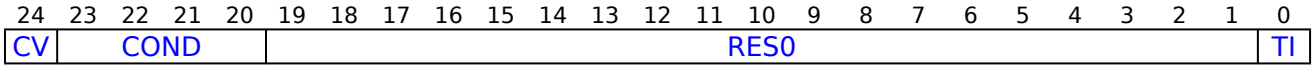
Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR_EL1.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
  - An SMC instruction when disabled by SCR_EL3.SMD.
  - An HLT instruction when disabled by EDSCR.HDE.
- Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSel.SP is 0.
- Attempted execution, in Debug state, of:
  - A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  - A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon. See 'Traps to EL3 of monitor functionality from Secure EL1 using AArch32' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.
- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
- An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1 that, if the value of HCR_EL2.TGE was 0 would have been reported with an ESR_ELx.EC value of `0b000111`.
- ~~When SVE is not implemented, attempted execution of:~~
  - ~~An SVE instruction.~~
  - ~~An MSR or MRS instruction to access ZCR_EL1, ZCR_EL2, or ZCR_EL3.~~

ISS encoding for an exception from a WFI or WFE instruction



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Bits [19:1]

Reserved, RES0.

TI, bit [0]

Trapped instruction. Possible values of this bit are:

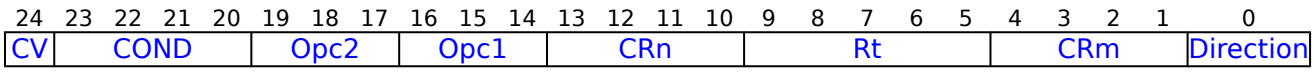
TI	Meaning
0b0	WFI trapped.
0b1	WFE trapped.

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- SCTLR_EL1.{nTWE, nTWI}.
- HCR_EL2.{TWE, TWI}.
- SCR_EL3.{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1 or CPACR using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CNTHCTL_EL2.EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL3.TCPAC, for accesses to CPACR from EL1 and EL2, and accesses to HCPTR from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ for information on other traps using EC value 0b000011.
- If ARMv8.6-FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

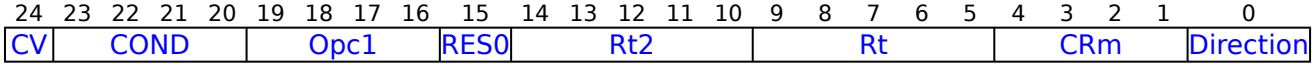
The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- CPACR_EL1.TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If ARMv8.6-FGT is implemented, MDCR_EL2.TDCC and MDCR_EL3.TDCC, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.
- HCR_EL2.TID0, for accesses to the JIDR register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- CPTR_EL2.TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and AArch-DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- MDCR_EL2.TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- MDCR_EL2.TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- MDCR_EL3.TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- HCR_EL2.TID0, for accesses to the FPSID register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- HCR_EL2.TID3, for accesses to registers in ID group 3 including MVFR0, MVFR1 and MVFR2, VMRS access trapped to EL2.

ISS encoding for an exception from an MCRR or MRRC access



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'~~ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

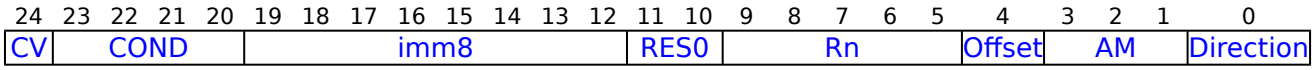
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- PMUSERENR_EL0.{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- AMUSERENR_EL0.{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If ARMv8.6-FGT is implemented, HDFGRTR_EL2.PMCCNTR_EL0 for MRRC access and HDFGWTR_EL2.PMCCNTR_EL0 for MCRR access to PMCCNTR at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- CPACR_EL1.TTA for accesses to trace registers using MCR or MRC instructions, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- CPTR_EL2.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

- MDCR_EL3.TDOSA, for traps to powerdown debug registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- MDCR_EL3.TDA, for accesses to other debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

ISS encoding for an exception from an LDC or STC instruction



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

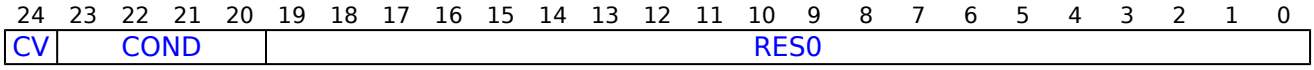
This field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- MDSCR_EL1.TDCC, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint trapped to EL1 or EL2.

- MDCR_EL2.TDA, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL2.
- MDCR_EL3.TDA, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL3.
- If ARMv8.6-FGT is implemented, MDCR_EL2.TDCC and MDCR_EL3.TDCC, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP



The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value `0b000000`.

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean

that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

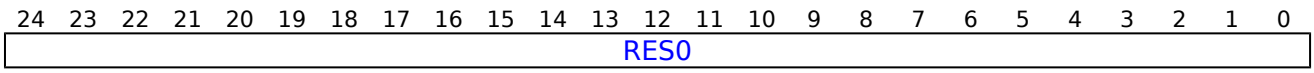
Bits [19:0]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value `0b000111`:

- CPACR_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.
- CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.
- CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ



Bits [24:0]

When SVE is implemented:

Reserved, RES0.

Otherwise:

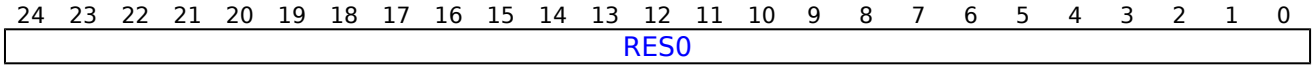
Reserved, RES0.

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE system registers, ZCR_ELx and ID_AA64ZFR0_EL1.

For an implementation that does not include SVE, the exception is reported using the EC value `0b000000`.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault



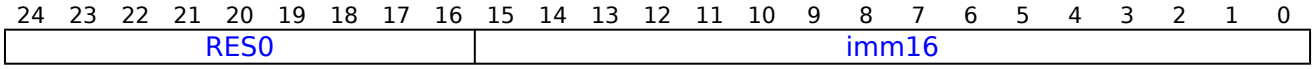
Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions see 'The Illegal Execution state exception' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ and 'PC alignment checking' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

'Stack pointer alignment checking' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from HVC or SVC instruction execution



Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

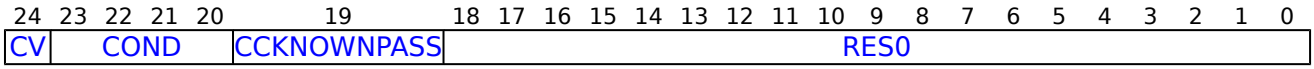
In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ and 'HVC' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

For A64 instructions, see 'SVC' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ and 'HVC' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

If ARMv8.6-FGT is implemented, HFGITR_EL2.{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state



For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because HCR_EL2.TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
`0b0`	The instruction was unconditional, or was conditional and passed its condition code check.
`0b1`	The instruction was conditional, and might have failed its condition code check.

Note

In an implementation in which an SMC instruction that fails it code check is not trapped, this field can always return the value 0.

This field resets to an architecturally UNKNOWN value.

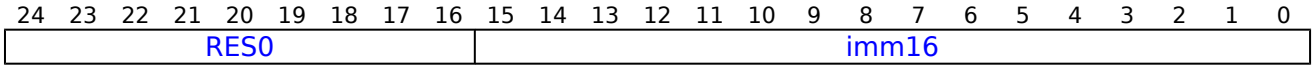
Bits [18:0]

Reserved, RES0.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

See 'System calls' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from SMC instruction execution in AArch64 state



Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

This field resets to an architecturally UNKNOWN value.

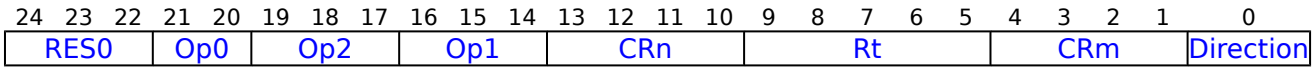
The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state



Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

This field resets to an architecturally UNKNOWN value.

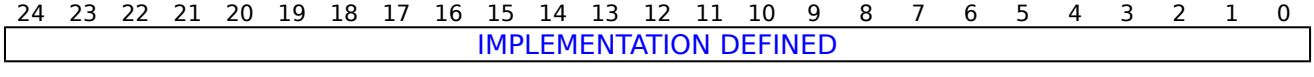
For exceptions caused by System instructions, see 'System' subsection of 'Branches, exception generating and System instructions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- SCTLR_EL1.UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.UCT, for accesses to CTR_EL0 using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- CPACR_EL1.TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If ARMv8.6-FGT is implemented, MDCR_EL2.TDCC and MDCR_EL3.TDCC, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register, ACTLR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TTRF, for accesses to the trace filter register, TRFCR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.

- MDCR_EL2.TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.AT, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- SCR_EL3.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TCPAC, for accesses to CPTR_EL2 and CPACR_EL1 using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TTRF, for accesses to the filter trace control registers, TRFCR_EL1 and TRFCR_EL2, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If ARMv8.2-EVT is implemented the following registers control traps for EL1 and EL0 Cache controls that use this EC value:~~,HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4} and HCR2.{TTLBIS, TICAB, TOCU, TID4} control traps for EL1 and EL0 Cache controls that use this EC value.~~
  - HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - HCR2.{TTLBIS, TICAB, TOCU, TID4}.
- If ARMv8.6-FGT is implemented:
  - SCR_EL3.FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - HFGRTR_EL2 for reads and HFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - HFGITR_EL2 for execution of system instructions, MSR or MRS access trapped to EL2
  - HDFGRTR_EL2 for reads and HDFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - HAFGRTR_EL2 for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

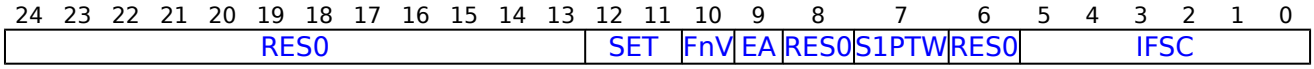


IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Instruction Abort



Bits [24:13]

Reserved, RES0.

SET, bits [12:11]

Synchronous Error Type. When the RAS Extension is implemented and IFSC is `0b010000`, describes the state of the PE after taking the Instruction Abort exception. The possible values of this field are:

SET	Meaning
`0b00`	Recoverable error (UER).
`0b10`	Uncontainable error (UC).
`0b11`	Restartable error (UEO) or Corrected error (CE).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the IFSC field is not `0b010000`.

This field resets to an architecturally UNKNOWN value.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
`0b0`	FAR is valid.
`0b1`	FAR is not valid, and holds an UNKNOWN value.

This field is only valid if the IFSC code is `0b010000`. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. ~~Possible values of this field are:~~

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010100	Synchronous External abort, on translation table walk or hardware update of translation table, level 0.~~0~~	
0b010101	Synchronous External abort, on translation table walk or hardware update of translation table, level 1.~~1~~	
0b010110	Synchronous External abort, on translation table walk or hardware update of translation table, level 2.~~2~~	
0b010111	Synchronous External abort, on translation table walk or hardware update of translation table, level 3.~~3~~	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.~~0~~	When RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.~~1~~	When RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.~~2~~	When RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.~~3~~	When RAS is not implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault. ~~Unsupported atomic hardware update fault, if the implementation includes ARMv8.1-TTHM].~~ ~~Otherwise reserved.~~	When ARMv8.1-TTHM is implemented

All other values are reserved.

~~When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.~~

Note

Armv8.2 requires the implementation of the RAS Extension.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

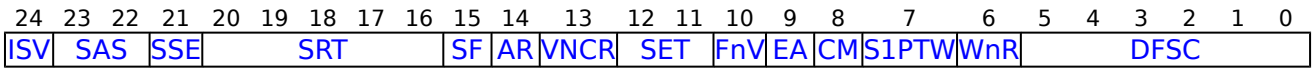
Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort



ISV, bit [24]

Instruction Syndromesyndrome Valid.valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults reported in ESR_EL2 except the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback.
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

ISV is 0 for all faults reported in ESR_EL1 or ESR_EL3.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When the RAS Extension is not implemented, the value of ISV on a synchronous External abort on a stage 2 translation table walk is IMPLEMENTATION DEFINED.

When ARMv8.5-MemTag is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR_ELx.FNV is 0 and FAR_ELx is valid.

This field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SRT, bits [20:16]

Syndrome Register Transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

~~Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction. If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.~~

If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SF, bit [15]

Width of the register accessed by the instruction is Sixty-Four. When ISV is 1, the possible values of this bit are:

SF	Meaning
0b0	Instruction loads/stores a 32-bit wide register.
0b1	Instruction loads/stores a 64-bit wide register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

AR, bit [14]

Acquire/Release. When ISV is 1, the possible values of this bit are:

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

VNCR, bit [13]

When ARMv8.4-NV is implemented:

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SET, bits [12:11]

Synchronous Error Type. When the RAS Extension is implemented and DFSC is 0b010000, describes the state of the PE after taking the Data Abort exception. The possible values of this field are:

SET	Meaning
0b00	Recoverable error (UER).
0b10	Uncontainable error (UC).
0b11	Restartable error (UEO) or Corrected error (CE).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010000.

This field resets to an architecturally UNKNOWN value.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.

This field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of `0b110101` or `0b110001`, indicating an unsupported Exclusive or atomic access.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. ~~Possible values of this field are:~~

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.~~walk.~~	
0b010001	Synchronous Tag Check Fault.~~fail~~	When ARMv8.5-MemTag is implemented
0b010100	Synchronous External abort, on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort, on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort, on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort, on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When RAS is not implemented
0b100001	Alignment fault.	
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault. ~~Unsupported atomic hardware update fault, if the implementation includes ARMv8.1-TTHM]. Otherwise reserved.~~	When ARMv8.1-TTHM is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	

0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).
0b111101	Section Domain Fault, used only for faults reported in the PAR_EL1.
0b111110	Page Domain Fault, used only for faults reported in the PAR_EL1.

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

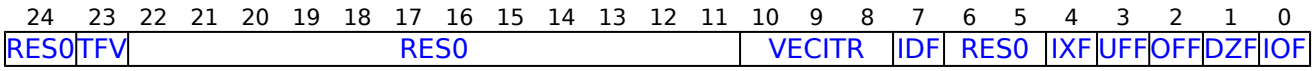
Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception



Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions. The possible values of this bit are:

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information see 'Floating-point exception traps' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

This field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

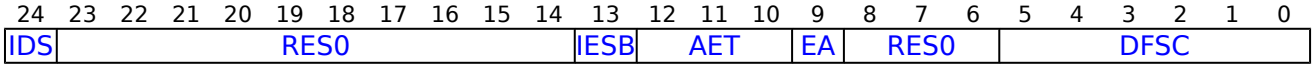
In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the FPCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt



IDS, bit [24]

IMPLEMENTATION DEFINED syndrome. Possible values of this bit are:

IDS	Meaning
0b0	Bits[23:0] of the ISS field holds the fields described in this encoding. **Note** If the RAS Extension is not implemented, this means that bits[23:0] of the ISS field are RES0.
0b1	Bits[23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

This field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]

When ARMv8.2-IESB is implemented:

Implicit error synchronization event.

IESB	Meaning
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is RES0 if the value returned in the DFSC field is not 0b010001.

Note

Armv8.2 requires the implementation of the RAS Extension and ARMv8.2-IESB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]

When RAS is implemented:

Asynchronous Error Type.

When the RAS Extension is implemented and DFSC is 0b010001, describes the state of the PE after taking the SError interrupt exception. The possible values of this field are:

AET	Meaning
0b000	Uncontainable error (UC).
0b001	Unrecoverable error (UEU).
0b010	Restartable error (UEO).
0b011	Recoverable error (UER).
0b110	Corrected error (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall state of the PE is reported. For example, if both a Recoverable and Unrecoverable error occurred, the state is Unrecoverable.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

Note

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

Otherwise:

Reserved, RES0.

EA, bit [9]

When RAS is implemented:

External abort type. When the RAS Extension is implemented, this bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not `0b010001`.

~~Note~~

~~Armv8.2 requires the implementation of the RAS Extension.~~

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

When RAS is implemented:

Data Fault Status Code. ~~When the RAS Extension is implemented, possible values of this field are:~~

DFSC	Meaning
`0b000000`	Uncategorized.
`0b010001`	Asynchronous SError interrupt.

All other values are reserved.

~~If the RAS Extension is not implemented, this field is RES0.~~

~~Note~~

~~Armv8.2 requires the implementation of the RAS Extension.~~

This field resets to an architecturally UNKNOWN value.

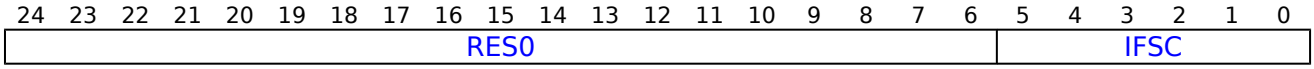
Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception



Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

~~Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.~~

IFSC	Meaning
0b100010	Debug exception.

This field resets to an architecturally UNKNOWN value.

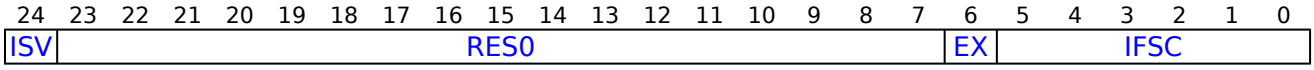
For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.
- For exceptions from AArch32, see 'Breakpoint exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ and 'Vector Catch exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

ISS encoding for an exception from a Software Step exception



ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

This field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

This field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code.

~~Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.~~

IFSC	Meaning
0b100010	Debug exception.

This field resets to an architecturally UNKNOWN value.

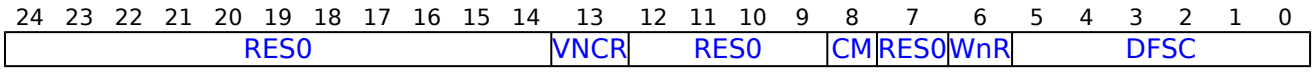
For more information about generating these exceptions, see 'Software Step exceptions'~~ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile,~~.

ISS encoding for an exception from a Watchpoint exception



Bits [24:14]

Reserved, RES0.

VNCR, bit [13]

When ARMv8.4-NV is implemented:

Indicates that the watchpoint came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR_EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.

This field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

~~Data Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.~~

DFSC	Meaning
0b100010	Debug exception.

This field resets to an architecturally UNKNOWN value.

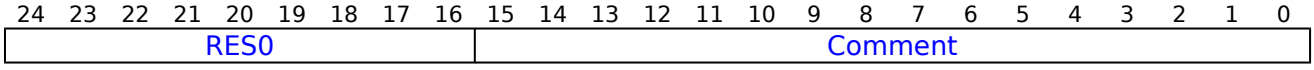
For more information about generating these exceptions, see 'Watchpoint exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

ISS encoding for an exception from execution of a Breakpoint instruction



Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary. ~~For the AArch32 BKPT instructions, the comment field is described as the immediate field.~~

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

This field resets to an architecturally UNKNOWN value.

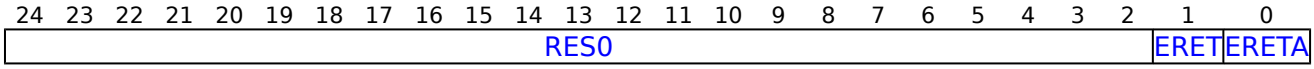
For more information about generating these exceptions, see 'Breakpoint instruction exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

ISS encoding for an exception from ERET, ERETAA or ERETAB instruction



This EC value applies when ARMv8.6-FGT is implemented, or when HCR_EL2.NV is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2. Possible values are:

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

This field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2. Possible values are:

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

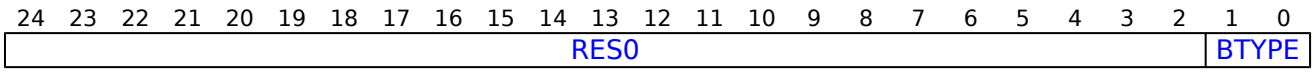
For more information about generating these exceptions, see HCR_EL2.NV.

If ARMv8.6-FGT is implemented, HFGITR_EL2.ERET controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

ISS encoding for an exception from Branch Target Identification instruction



Bits [24:2]

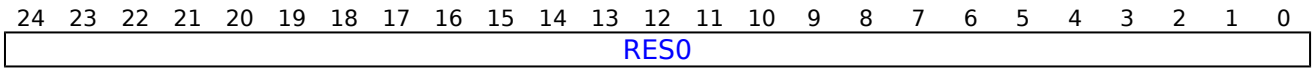
Reserved, RES0.

BTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section B1.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0



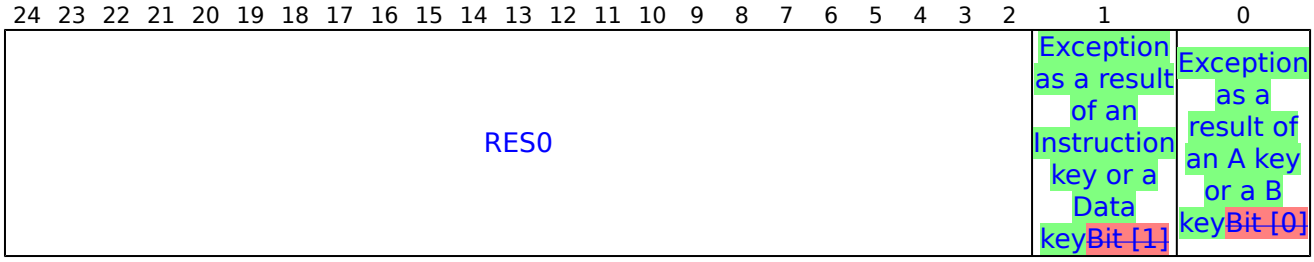
Bits [24:0]

Reserved, RES0.

For more information about generating these exceptions, see:

- HCR_EL2.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- SCR_EL3.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure



Bits [24:2]

Reserved, RES0.

Bit [1], bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

	Meaning
0b0	Instruction Key.
0b1	Data Key.

This field resets to an architecturally UNKNOWN value.

Bit [0], bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

This field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

Accessing the ESR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic ESR_EL2 or ESR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, ESR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return ESR_EL1;
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return ESR_EL2;
elsif PSTATE.EL == EL3 then
    return ESR_EL2;
```

```
MSR ESR_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        ESR_EL1 = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    ESR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    ESR_EL2 = X[t];
```

```

ESR_EL3, Exception Syndrome Register (EL3)

The ESR_EL3 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL3.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

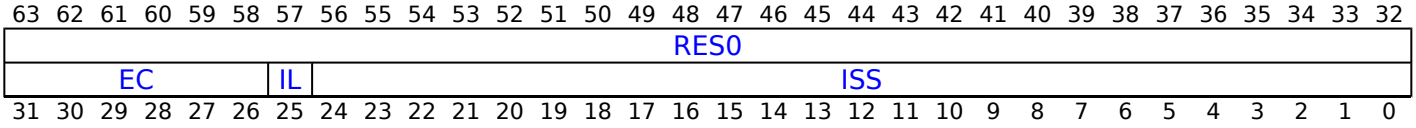
This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to ESR_EL3 are UNDEFINED.

Attributes

ESR_EL3 is a 64-bit register.

Field descriptions

The ESR_EL3 bit assignments are:



ESR_EL3 is made UNKNOWN as a result of an exception return from EL3.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL3, the value of ESR_EL3 is UNKNOWN. The value written to ESR_EL3 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:32]

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	
0b000001	Trapped WFI or WFE instruction execution. Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WFI or WFE instruction	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported at any Exception level
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported at any Exception level
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported at any Exception level
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: • An STC to write data to memory from DBGDTRRXint. • An LDC to read data from memory to DBGDTRTXint.	ISS encoding for an exception from an LDC or STC instruction	When AArch32 is supported at any Exception level
0b000111	Access to SVE, Advanced SIMD, or floating-point functionality trapped by CPACR_EL1.FPEN, CPTR_EL2.FPEN, CPTR_EL2.TFP, or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'EC encodings when routing exceptions to EL2' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP	

	architecture profile, section D1.10.4.		
0b001001	Trapped use of a Pointer authentication instruction because HCR_EL2.API == 0 || SCR_EL3.API == 0.	ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0	When ARMv8.3-PAuth is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported at any Exception level
0b001101	Branch Target Exception.	ISS encoding for an exception from Branch Target Identification instruction	When ARMv8.5-BTI is implemented
0b001110	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b010011	SMC instruction execution in AArch32 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.	ISS encoding for an exception from SMC instruction execution in AArch32 state	When AArch32 is supported at any Exception level
0b010101	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported at any Exception level
0b010110	HVC instruction execution in AArch64 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported at any Exception level
0b010111	SMC instruction execution in AArch64 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.	ISS encoding for an exception from SMC instruction execution in AArch64 state	When AArch64 is supported at any Exception level
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111. ~~If ARMv8.4-IDST is implemented, also exceptions generated by a read access to the feature ID space.~~	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	When AArch64 is supported at any Exception level

	If ARMv8.0-CSV2 is implemented, also Cache Speculation Variant exceptions. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section C5.2.2, except for those exceptions reported using EC values `0b000000`, `0b000001`, or `0b000111`.		
`0b011001`	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC `0b000000`. This EC is defined only if SVEis implemented.	ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ	When SVE is implemented
`0b011100`	Exception from a Pointer Authentication instruction authentication failure	ISS encoding for an exception from a Pointer Authentication instruction authentication failure	When ARMv8.3-FPAC is implemented
`0b011111`	IMPLEMENTATION DEFINED exception to EL3.	ISS encoding for an IMPLEMENTATION DEFINED exception to EL3	
`0b100000`	Instruction Abort from a lower Exception level.level, that might be using AArch32 or AArch64. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.	ISS encoding for an exception from an Instruction Abort	
`0b100001`	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses	ISS encoding for an exception from an Instruction Abort	

	and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.		
0b100010	PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b100100	Data Abort from a lower Exception level.~~level, that might be using AArch32 or AArch64.~~ Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.	ISS encoding for an exception from a Data Abort	
0b100101	Data Abort taken without a change in Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug related exceptions.	ISS encoding for an exception from a Data Abort	
0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation	ISS encoding for an exception from a trapped floating-point exception	When AArch64 is supported at any Exception level

	supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.		
0b101111	SError interrupt.	ISS encoding for an SError interrupt	
0b111100	BRK instruction execution in AArch64 state. This is reported in ESR_EL3 only if a BRK instruction is executed.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch64 is supported at any Exception level

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.1.11.

This field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: • An SError interrupt. • An Instruction Abort exception. • A PC alignment fault exception. • An SP alignment fault exception. • A Data Abort exception for which the value of the ISV bit is 0. • An Illegal Execution state exception. • Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning: ◦ 0b0: 16-bit T32 BKPT instruction. ◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction. • An exception reported using EC value 0b000000.

This field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

~~Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number. For an exception taken from AArch32 state, 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.~~

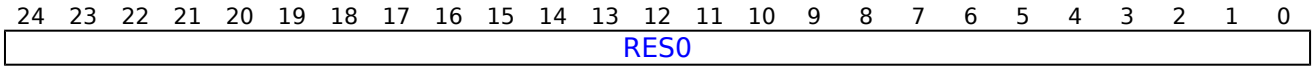
For an exception taken from AArch32 state, 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is `0b1111`, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value `0b11111`.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value `0b11111`.

When the EC field is `0b000000`, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

ISS encoding for exceptions with an unknown reason



Bits [24:0]

Reserved, RES0.

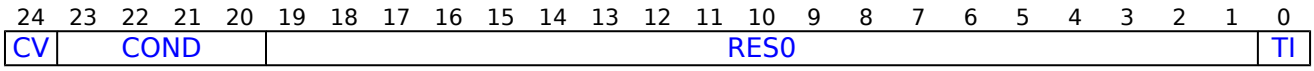
When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR_EL1.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
  - An SMC instruction when disabled by SCR_EL3.SMD.
  - An HLT instruction when disabled by EDSCR.HDE.
- Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSel.SP is 0.
- Attempted execution, in Debug state, of:
  - A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  - A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon. See 'Traps to EL3 of monitor functionality from Secure EL1 using AArch32' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.
- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
- An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1 that, if the value of HCR_EL2.TGE was 0 would have been reported with an ESR_ELx.EC value of `0b000111`.
- ~~When SVE is not implemented, attempted execution of:~~
  - ~~An SVE instruction.~~

- An MSR or MRS instruction to access ZCR_EL1, ZCR_EL2, or ZCR_EL3.

ISS encoding for an exception from a WFI or WFE instruction



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Bits [19:1]

Reserved, RES0.

TI, bit [0]

Trapped instruction. Possible values of this bit are:

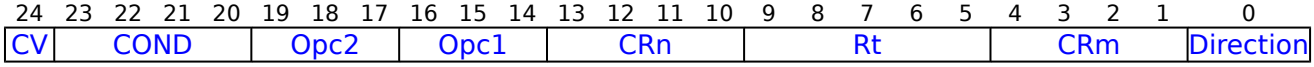
TI	Meaning
0b0	WFI trapped.
0b1	WFE trapped.

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- SCTLR_EL1.{nTWE, nTWI}.
- HCR_EL2.{TWE, TWI}.
- SCR_EL3.{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value `0b000`.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value `0b111`.

This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value `0b0000`.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
`0b0`	Write to System register space. MCR instruction.
`0b1`	Read from System register space. MRC or VMRS instruction.

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value `0b000011`:

- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- HCR_EL2.TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.

- HCR_EL2.{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1 or CPACR using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CNTHCTL_EL2.EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL3.TCPAC, for accesses to CPACR from EL1 and EL2, and accesses to HCPTR from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ for information on other traps using EC value 0b000011.
- If ARMv8.6-FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

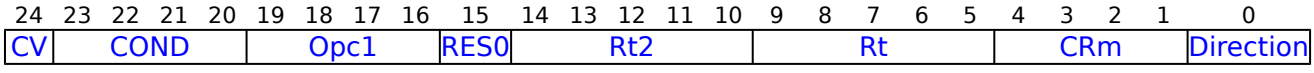
The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- CPACR_EL1.TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If ARMv8.6-FGT is implemented, MDCR_EL2.TDCC and MDCR_EL3.TDCC, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.
- HCR_EL2.TID0, for accesses to the JIDR register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- CPTR_EL2.TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and AArch-DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- MDCR_EL2.TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- MDCR_EL2.TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- MDCR_EL3.TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- HCR_EL2.TID0, for accesses to the FPSID register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- HCR_EL2.TID3, for accesses to registers in ID group 3 including MVFR0, MVFR1 and MVFR2, VMRS access trapped to EL2.

ISS encoding for an exception from an MCRR or MRRC access



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'~~ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

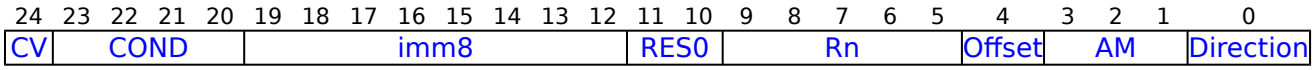
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- PMUSERENR_EL0.{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- AMUSERENR_EL0.{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If ARMv8.6-FGT is implemented, HDFGRTR_EL2.PMCCNTR_EL0 for MRRC access and HDFGWTR_EL2.PMCCNTR_EL0 for MCRR access to PMCCNTR at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- CPACR_EL1.TTA for accesses to trace registers using MCR or MRC instructions, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- CPTR_EL2.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

- MDCR_EL3.TDOSA, for traps to powerdown debug registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- MDCR_EL3.TDA, for accesses to other debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

ISS encoding for an exception from an LDC or STC instruction



CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

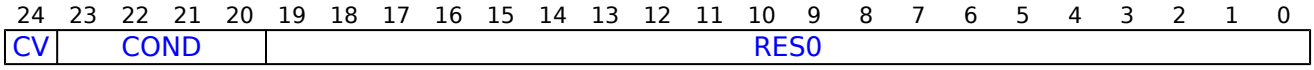
This field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- MDSCR_EL1.TDCC, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint trapped to EL1 or EL2.

- MDCR_EL2.TDA, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL2.
- MDCR_EL3.TDA, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL3.
- If ARMv8.6-FGT is implemented, MDCR_EL2.TDCC and MDCR_EL3.TDCC, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from CPACR_EL1.FPEN, CPTR_EL2.FPEN or CPTR_ELx.TFP



The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value `0b000000`.

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean

that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

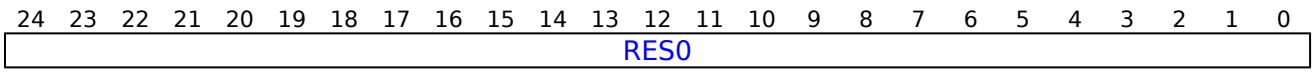
Bits [19:0]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value `0b000111`:

- CPACR_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.
- CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.
- CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ



Bits [24:0]

When SVE is implemented:

Reserved, RES0.

Otherwise:

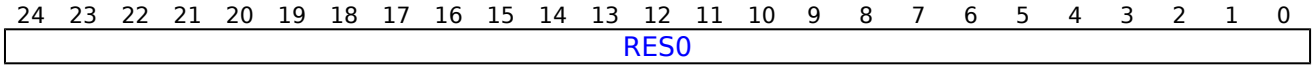
Reserved, RES0.

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE system registers, ZCR_ELx and ID_AA64ZFR0_EL1.

For an implementation that does not include SVE, the exception is reported using the EC value `0b000000`.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault



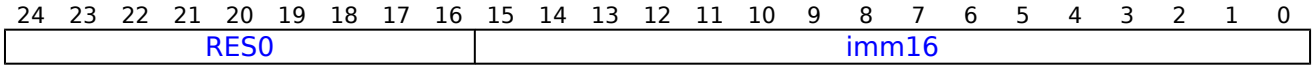
Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions see 'The Illegal Execution state exception' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ and 'PC alignment checking' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

'Stack pointer alignment checking' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from HVC or SVC instruction execution



Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

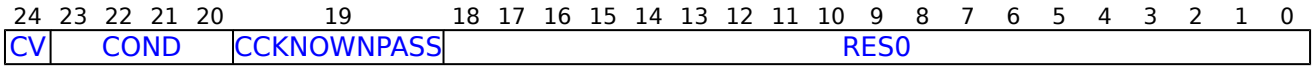
In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile and 'HVC' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

For A64 instructions, see 'SVC' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile and 'HVC' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If ARMv8.6-FGT is implemented, HFGITR_EL2.{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state



For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because HCR_EL2.TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

~~The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.~~

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
`0b0`	The instruction was unconditional, or was conditional and passed its condition code check.
`0b1`	The instruction was conditional, and might have failed its condition code check.

Note

In an implementation in which an SMC instruction that fails it code check is not trapped, this field can always return the value 0.

This field resets to an architecturally UNKNOWN value.

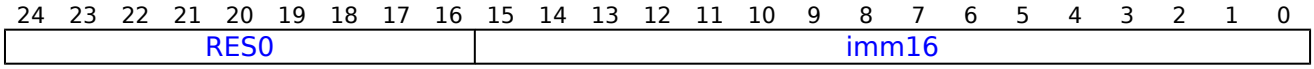
Bits [18:0]

Reserved, RES0.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

See 'System calls' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from SMC instruction execution in AArch64 state



Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

This field resets to an architecturally UNKNOWN value.

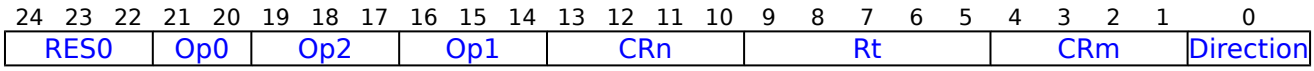
The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state



Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

This field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

This field resets to an architecturally UNKNOWN value.

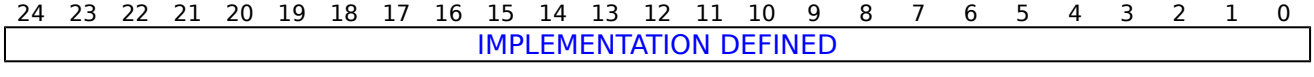
For exceptions caused by System instructions, see 'System' subsection of 'Branches, exception generating and System instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- SCTLR_EL1.UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.UCT, for accesses to CTR_EL0 using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- CPACR_EL1.TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If ARMv8.6-FGT is implemented, MDCR_EL2.TDCC and MDCR_EL3.TDCC, for accesses to the DCC registers at EL0 and EL1, trapped to EL2.
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register, ACTLR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TTRF, for accesses to the trace filter register, TRFCR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.

- MDCR_EL2.TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.AT, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- SCR_EL3.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TCPAC, for accesses to CPTR_EL2 and CPACR_EL1 using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TTRF, for accesses to the filter trace control registers, TRFCR_EL1 and TRFCR_EL2, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If ARMv8.2-EVT is implemented the following registers control traps for EL1 and EL0 Cache controls that use this EC value:~~,HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4} and HCR2.{TTLBIS, TICAB, TOCU, TID4} control traps for EL1 and EL0 Cache controls that use this EC value.~~
  - HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - HCR2.{TTLBIS, TICAB, TOCU, TID4}.
- If ARMv8.6-FGT is implemented:
  - SCR_EL3.FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - HFGRTR_EL2 for reads and HFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - HFGITR_EL2 for execution of system instructions, MSR or MRS access trapped to EL2
  - HDFGRTR_EL2 for reads and HDFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - HAFGRTR_EL2 for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

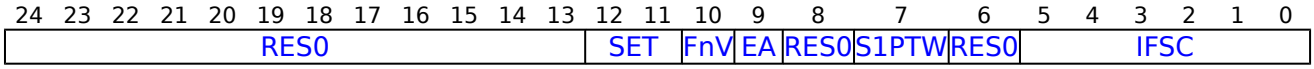


IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Instruction Abort



Bits [24:13]

Reserved, RES0.

SET, bits [12:11]

Synchronous Error Type. When the RAS Extension is implemented and IFSC is `0b010000`, describes the state of the PE after taking the Instruction Abort exception. The possible values of this field are:

SET	Meaning
`0b00`	Recoverable error (UER).
`0b10`	Uncontainable error (UC).
`0b11`	Restartable error (UEO) or Corrected error (CE).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the IFSC field is not `0b010000`.

This field resets to an architecturally UNKNOWN value.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
`0b0`	FAR is valid.
`0b1`	FAR is not valid, and holds an UNKNOWN value.

This field is only valid if the IFSC code is `0b010000`. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. ~~Possible values of this field are:~~

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010100	Synchronous External abort, on translation table walk or hardware update of translation table, level 0.~~0~~	
0b010101	Synchronous External abort, on translation table walk or hardware update of translation table, level 1.~~1~~	
0b010110	Synchronous External abort, on translation table walk or hardware update of translation table, level 2.~~2~~	
0b010111	Synchronous External abort, on translation table walk or hardware update of translation table, level 3.~~3~~	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.~~0~~	When RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.~~1~~	When RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.~~2~~	When RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.~~3~~	When RAS is not implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault. ~~Unsupported atomic hardware update fault, if the implementation includes ARMv8.1-TTHM].~~ ~~Otherwise reserved.~~	When ARMv8.1-TTHM is implemented

All other values are reserved.

~~When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.~~

Note

Armv8.2 requires the implementation of the RAS Extension.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

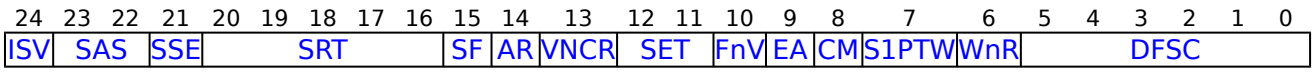
Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort



ISV, bit [24]

Instruction Syndromesyndrome Valid.valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults reported in ESR_EL2 except the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback.
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

ISV is 0 for all faults reported in ESR_EL1 or ESR_EL3.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When the RAS Extension is not implemented, the value of ISV on a synchronous External abort on a stage 2 translation table walk is IMPLEMENTATION DEFINED.

When ARMv8.5-MemTag is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR_ELx.FNV is 0 and FAR_ELx is valid.

This field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SRT, bits [20:16]

Syndrome Register Transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

~~Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction. If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.~~

If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

SF, bit [15]

Width of the register accessed by the instruction is Sixty-Four. When ISV is 1, the possible values of this bit are:

SF	Meaning
0b0	Instruction loads/stores a 32-bit wide register.
0b1	Instruction loads/stores a 64-bit wide register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

AR, bit [14]

Acquire/Release. When ISV is 1, the possible values of this bit are:

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

VNCR, bit [13]

When ARMv8.4-NV is implemented:

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SET, bits [12:11]

Synchronous Error Type. When the RAS Extension is implemented and DFSC is 0b010000, describes the state of the PE after taking the Data Abort exception. The possible values of this field are:

SET	Meaning
0b00	Recoverable error (UER).
0b10	Uncontainable error (UC).
0b11	Restartable error (UEO) or Corrected error (CE).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in an unrecoverable PE state.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010000.

This field resets to an architecturally UNKNOWN value.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.

This field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of `0b110101` or `0b110001`, indicating an unsupported Exclusive or atomic access.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. ~~Possible values of this field are:~~

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.~~walk.~~	
0b010001	Synchronous Tag Check Fault.~~fail~~	When ARMv8.5-MemTag is implemented
0b010100	Synchronous External abort, on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort, on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort, on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort, on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When RAS is not implemented
0b100001	Alignment fault.	
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault. ~~Unsupported atomic hardware update fault, if the implementation includes ARMv8.1-TTHM]. Otherwise reserved.~~	When ARMv8.1-TTHM is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	

0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).
0b111101	Section Domain Fault, used only for faults reported in the PAR_EL1.
0b111110	Page Domain Fault, used only for faults reported in the PAR_EL1.

All other values are reserved.

When the RAS Extension is implemented, 0b011000, 0b011100, 0b011101, 0b011110, and 0b011111, are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

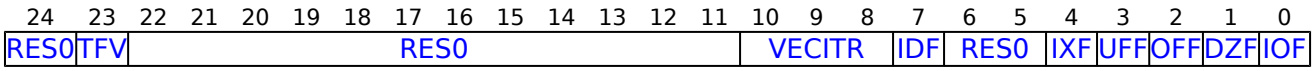
ISS encoding for an exception from a trapped floating-point exception



Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions. The possible values of this bit are:

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information see 'Floating-point exception traps' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

This field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

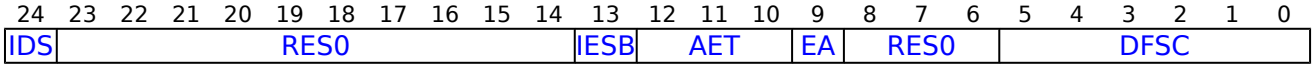
In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the FPCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt



IDS, bit [24]

IMPLEMENTATION DEFINED syndrome. Possible values of this bit are:

IDS	Meaning
0b0	Bits[23:0] of the ISS field holds the fields described in this encoding. **Note** If the RAS Extension is not implemented, this means that bits[23:0] of the ISS field are RES0.
0b1	Bits[23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

This field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]

When ARMv8.2-IESB is implemented:

Implicit error synchronization event.

IESB	Meaning
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is RES0 if the value returned in the DFSC field is not 0b010001.

Note

Armv8.2 requires the implementation of the RAS Extension and ARMv8.2-IESB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]

When RAS is implemented:

Asynchronous Error Type.

When the RAS Extension is implemented and DFSC is 0b010001, describes the state of the PE after taking the SError interrupt exception. The possible values of this field are:

AET	Meaning
0b000	Uncontainable error (UC).
0b001	Unrecoverable error (UEU).
0b010	Restartable error (UEO).
0b011	Recoverable error (UER).
0b110	Corrected error (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall state of the PE is reported. For example, if both a Recoverable and Unrecoverable error occurred, the state is Unrecoverable.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not 0b010001.

Note

Armv8.2 requires the implementation of the RAS Extension.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]

Otherwise:

Reserved, RES0.

EA, bit [9]

When RAS is implemented:

External abort type. When the RAS Extension is implemented, this bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field is RES0 if either:

- The RAS Extension is not implemented.
- The value returned in the DFSC field is not `0b010001`.

~~Note~~

~~Armv8.2 requires the implementation of the RAS Extension.~~

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

When RAS is implemented:

Data Fault Status Code. ~~When the RAS Extension is implemented, possible values of this field are:~~

DFSC	Meaning
`0b000000`	Uncategorized.
`0b010001`	Asynchronous SError interrupt.

All other values are reserved.

~~If the RAS Extension is not implemented, this field is RES0.~~

~~Note~~

~~Armv8.2 requires the implementation of the RAS Extension.~~

This field resets to an architecturally UNKNOWN value.

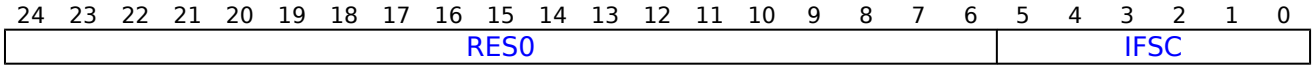
Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception



Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

~~Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.~~

IFSC	Meaning
0b100010	Debug exception.

This field resets to an architecturally UNKNOWN value.

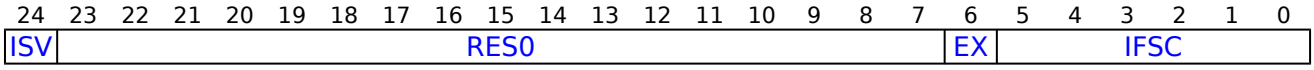
For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.
- For exceptions from AArch32, see 'Breakpoint exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~ and 'Vector Catch exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

ISS encoding for an exception from a Software Step exception



ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

This field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

This field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code.

~~Instruction Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.~~

IFSC	Meaning
0b100010	Debug exception.

This field resets to an architecturally UNKNOWN value.

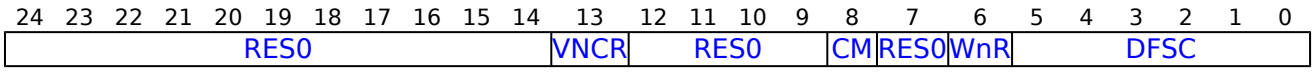
For more information about generating these exceptions, see 'Software Step exceptions'~~ in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile,~~.

ISS encoding for an exception from a Watchpoint exception



Bits [24:14]

Reserved, RES0.

VNCR, bit [13]

When ARMv8.4-NV is implemented:

Indicates that the watchpoint came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR_EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA instruction is not classified as a cache maintenance instruction, and therefore its execution cannot cause this field to be set to 1.

This field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

This field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

~~Data Fault Status Code. This field is set to 0b100010, to indicate a Debug exception.~~

DFSC	Meaning
0b100010	Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

ISS encoding for an exception from execution of a Breakpoint instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0									Comment															

Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

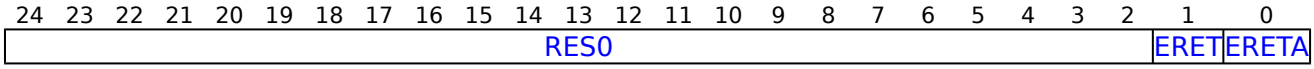
Set to the instruction comment field value, zero extended as necessary. ~~For the AArch32 BKPT instructions, the comment field is described as the immediate field.~~

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile~~.

ISS encoding for an exception from ERET, ERETAA or ERETAB instruction



This EC value applies when ARMv8.6-FGT is implemented, or when HCR_EL2.NV is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2. Possible values are:

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

This field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2. Possible values are:

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

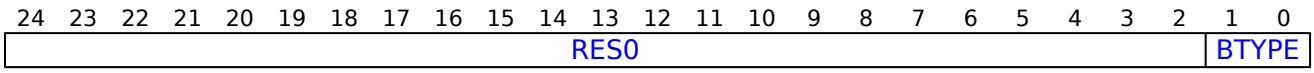
When the ERET field is 0, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see HCR_EL2.NV.

If ARMv8.6-FGT is implemented, HFGITR_EL2.ERET controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

ISS encoding for an exception from Branch Target Identification instruction



Bits [24:2]

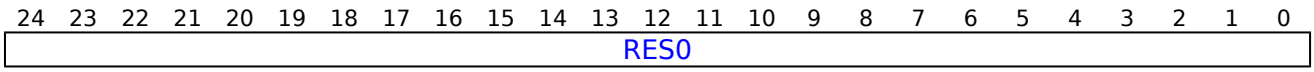
Reserved, RES0.

BTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model' ~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section B1~~.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0



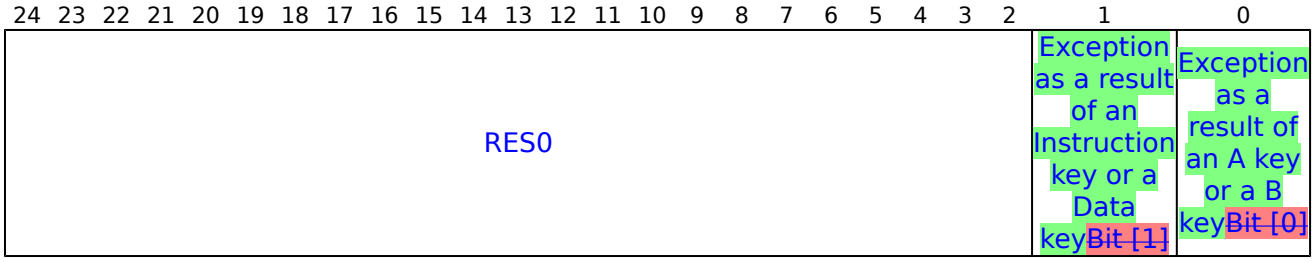
Bits [24:0]

Reserved, RES0.

For more information about generating these exceptions, see:

- HCR_EL2.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- SCR_EL3.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure



Bits [24:2]

Reserved, RES0.

Bit [1], ~~bit [1]~~

This field indicates whether the exception is as a result of an Instruction key or a Data key.

	Meaning
0b0	Instruction Key.
0b1	Data Key.

This field resets to an architecturally UNKNOWN value.

Bit [0], ~~bit [0]~~

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

This field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

Accessing the ESR_EL3

Accesses to this register use the following encodings:

```
MRS <Xt>, ESR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return ESR_EL3;
```

```
MSR ESR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    ESR_EL3 = X[t];
```

FAR_EL1, Fault Address Register (EL1)

The FAR_EL1 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL1.

Configuration

AArch64 System register FAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DFAR[31:0] (NS) .

AArch64 System register FAR_EL1 bits [63:32] are architecturally mapped to AArch32 System register IFAR[31:0] (NS) .

~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

FAR_EL1 is a 64-bit register.

Field descriptions

The FAR_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Faulting Virtual Address for synchronous exceptions taken to EL1																															
Faulting Virtual Address for synchronous exceptions taken to EL1																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL1. Exceptions that set the FAR_EL1 are Instruction Aborts (EC `0x20` or `0x21`), Data Aborts (EC `0x24` or `0x25`), PC alignment faults (EC `0x22`), and Watchpoints (EC `0x34` or `0x35`). ESR_EL1.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL1 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL1.FnV is 0, and the FAR_EL1 is UNKNOWN if ESR_EL1.FnV is 1.

For all other exceptions taken to EL1, the FAR_EL1 is UNKNOWN.

If a memory fault that sets FAR_EL1 is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL1 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are `0x00000001`:

- The faulting address was generated by a load or store instruction that sequentially incremented from address `0xFFFFFFFF`. Such a load or store is CONSTRAINED UNPREDICTABLE. See 'Out of range VA' in Appendix K1 Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL0 makes FAR_EL1 become UNKNOWN.

Note

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL1 is made UNKNOWN on an exception return from EL1.

This field resets to an architecturally UNKNOWN value.

Accessing the FAR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic FAR_EL1 or FAR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, FAR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0110	0b0000	0b000

```
if PSTATE.EL == EL0 then

FAR_EL2, Fault Address Register (EL2)

The FAR_EL2 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL2.

Configuration

AArch64 System register FAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HDFAR[31:0] .

AArch64 System register FAR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HIFAR[31:0] .

AArch64 System register FAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register DFAR[31:0] (S) when ~~HaveEL(~~EL2 is implemented.~~)~~.

AArch64 System register FAR_EL2 bits [63:32] are architecturally mapped to AArch32 System register IFAR[31:0] (S) when ~~HaveEL(~~EL2 is implemented.~~)~~.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

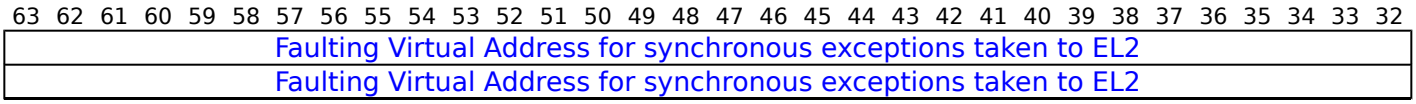
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

FAR_EL2 is a 64-bit register.

Field descriptions

The FAR_EL2 bit assignments are:



Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL2. Exceptions that set the FAR_EL2 are Instruction Aborts (EC `0x20` or `0x21`), Data Aborts (EC `0x24` or `0x25`), PC alignment faults (EC `0x22`), and Watchpoints (EC `0x34` or `0x35`). ESR_EL2.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL2 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL2.FnV is 0, and the FAR_EL2 is UNKNOWN if ESR_EL2.FnV is 1.

For all other exceptions taken to EL2, the FAR_EL2 is UNKNOWN.

If a memory fault that sets FAR_EL2 is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL2 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are `0x00000001`:

- The faulting address was generated by a load or store instruction that sequentially incremented from address `0xFFFFFFFF`. Such a load or store instruction is CONSTRAINED UNPREDICTABLE. See 'Out of range VA' in Appendix K1 Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL1 or EL0 makes FAR_EL2 become UNKNOWN.

Note

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL2 is made UNKNOWN on an exception return from EL2.

This field resets to an architecturally UNKNOWN value.

Accessing the FAR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic FAR_EL2 or FAR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```

FAR_EL3, Fault Address Register (EL3)

The FAR_EL3 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort and PC alignment fault exceptions that are taken to EL3.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

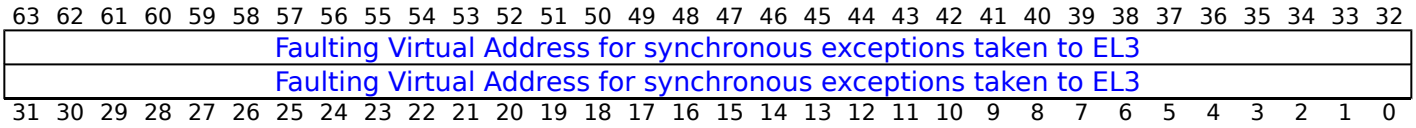
This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to FAR_EL3 are UNDEFINED.

Attributes

FAR_EL3 is a 64-bit register.

Field descriptions

The FAR_EL3 bit assignments are:



Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL3. Exceptions that set the FAR_EL3 are Instruction Aborts (EC `0x20` or `0x21`), Data Aborts (EC `0x24` or `0x25`), and PC alignment faults (EC `0x22`). ESR_EL3.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL3 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL3.FnV is 0, and the FAR_EL3 is UNKNOWN if ESR_EL3.FnV is 1.

For all other exceptions taken to EL3, the FAR_EL3 is UNKNOWN.

If a memory fault that sets FAR_EL3 is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

If the exception that updates FAR_EL3 is taken from an Exception Level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are `0x00000001`:

- The faulting address was generated by a load or store instruction that sequentially incremented from address `0xFFFFFFFF`. Such a load or store instruction is CONSTRAINED UNPREDICTABLE. See 'Out of range VA' in Appendix K1 Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL2, EL1 or EL0 makes FAR_EL3 become UNKNOWN.

Note

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL3 is made UNKNOWN on an exception return from EL3.

This field resets to an architecturally UNKNOWN value.

Accessing the FAR_EL3

Accesses to this register use the following encodings:

```
MRS <Xt>, FAR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0110	0b0000	0b000

FPCR, Floating-point Control Register

The FPCR characteristics are:

Purpose

Controls floating-point behavior.

Configuration

The named fields in this register map to the equivalent fields in the AArch32 FPSCR.

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

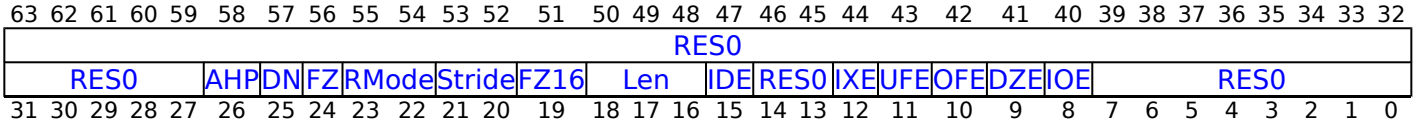
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

FPCR is a 64-bit register.

Field descriptions

The FPCR bit assignments are:



Bits [63:27]

Reserved, RES0.

AHP, bit [26]

Alternative half-precision control bit:

AHP	Meaning
0b0	IEEE half-precision format selected.
0b1	Alternative half-precision format selected.

This bit is only used for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the ARMv8.2-FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

This field resets to an architecturally UNKNOWN value.

DN, bit [25]

Default NaN mode control bit:

DN	Meaning
0b0	NaN operands propagate through to the output of a floating-point operation.
0b1	Any operation involving one or more NaNs returns the Default NaN.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

This field resets to an architecturally UNKNOWN value.

FZ, bit [24]

Flush-to-zero mode control bit:

FZ	Meaning
0b0	Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
0b1	Flush-to-zero mode enabled.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

This bit has no effect on half-precision calculations.

This field resets to an architecturally UNKNOWN value.

RMode, bits [23:22]

Rounding Mode control field. The encoding of this field is:

RMode	Meaning
0b00	Round to Nearest (RN) mode.
0b01	Round towards Plus Infinity (RP) mode.
0b10	Round towards Minus Infinity (RM) mode.
0b11	Round towards Zero (RZ) mode.

The specified rounding mode is used by both scalar and Advanced SIMD floating-point instructions.

This field resets to an architecturally UNKNOWN value.

Stride, bits [21:20]

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64~~ state.~~ state.~~It is included only for context saving and restoration of the AArch32~~FPSCR.Stride field.~~

This field is included only for context saving and restoration of the AArch32 FPSCR.Stride field.

This field resets to an architecturally UNKNOWN value.

FZ16, bit [19]

When ARMv8.2-FP16 is implemented:

Flush-to-zero mode control bit on half-precision data-processing instructions:

FZ16	Meaning
0b0	Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
0b1	Flush-to-zero mode enabled.

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations. A half-precision floating-point number that is flushed to zero as a result of the value of the FZ16 bit does not generate an Input Denormal exception.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Len, bits [18:16]

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 ~~state.~~ state. ~~It is included only for context saving and restoration of the AArch32~~FPSCR.Len field.

This field is included only for context saving and restoration of the AArch32 FPSCR.Len field.

This field resets to an architecturally UNKNOWN value.

IDE, bit [15]

Input Denormal floating-point exception trap enable. Possible values are:

IDE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.IDC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IDC bit. The trap handling software can decide whether to set the FPSR.IDC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

IXE, bit [12]

Inexact floating-point exception trap enable. Possible values are:

IXE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.IXC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IXC bit. The trap handling software can decide whether to set the FPSR.IXC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

UFE, bit [11]

Underflow floating-point exception trap enable. Possible values are:

UFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.UFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.UFC bit. The trap handling software can decide whether to set the FPSR.UFC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

OFE, bit [10]

Overflow floating-point exception trap enable. Possible values are:

OFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.OFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.OFC bit. The trap handling software can decide whether to set the FPSR.OFC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

DZE, bit [9]

Divide by Zero floating-point exception trap enable. Possible values are:

DZE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.DZC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.DZC bit. The trap handling software can decide whether to set the FPSR.DZC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

IOE, bit [8]

Invalid Operation floating-point exception trap enable. Possible values are:

IOE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs then the FPSR.IOC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IOC bit. The trap handling software can decide whether to set the FPSR.IOC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

Bits [7:0]

Reserved, RES0.

Accessing the FPCR

Accesses to this register use the following encodings:

MRS <Xt>, FPCR

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0100	0b000

```
if PSTATE.EL == EL0 then
    if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CPACR_EL1.FPEN !=

FPEXC32_EL2, Floating-Point Exception Control register

The FPEXC32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register FPEXC from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register FPEXC32_EL2 bits [31:0] are architecturally mapped to AArch32 System register FPEXC[31:0] .

ThisIf registerEL1 iscannot presentuse only when AArch32 is supported at any Exception level. Otherwise, directthis accessesregister to FPEXC32_EL2 areis UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

This register has no effect if EL2 is not enabled in the current Security state.

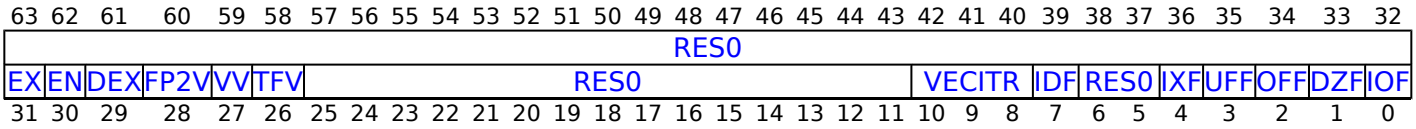
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

FPEXC32_EL2 is a 64-bit register.

Field descriptions

The FPEXC32_EL2 bit assignments are:



Bits [63:32]

Reserved, RES0.

EX, bit [31]

Exception bit. From Armv8, this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

EN, bit [30]

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the FPEXC or FPSID.
- VMRS accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.

EN	Meaning
0b0	Accesses to the FPSCR, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.
0b1	This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - HCPTR.TCP10, or if EL2 is using AArch64, CPTR_EL2.TFP.
  - NSACR.cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
- For Advanced SIMD instructions only:
  - CPACR.ASEDIS.
  - If executing in Non-secure state, HCPTR.TASE and NSACR.NSTRCDIS.

See the descriptions of the controls for more information.

Note

When executing at EL0 using AArch32:

- If EL1 is using AArch64 then behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of HCR_EL2.{RW, TGE} is {1, 1} then behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of HCR_EL2.{RW, TGE} is {0, 1} then it is IMPLEMENTATION DEFINED whether the behavior is:
  - As if the value of FPEXC.EN is 1.
  - Determined by the value of FPEXC32_EL2.EN, as described in this field description. However, Arm deprecates using the value of FPEXC32_EL2.EN to determine behavior.

This field resets to an architecturally UNKNOWN value.

DEX, bit [29]

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC32_EL2.TFV field is valid.

The meaning of this bit is:

DEX	Meaning
0b0	The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC32_EL2.TFV is RW then it is invalid and UNKNOWN. If FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
0b1	The exception was generated during the execution of an unallocated encoding. FPEXC32_EL2.TFV is valid and indicates the cause of the exception.

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the AArch32 FPSCR.{Stride, Len} fields as RAZ, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

FP2V, bit [28]

FPINST2 instruction valid bit. From Armv8, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

VV, bit [27]

VECITR valid bit. From Armv8, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

TFV	Meaning
0b0	The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of FPSCR.{Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.
0b1	FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements FPSCR.{Stride, Len} as RAZ, this bit is RAO/WI.

This field resets to an architecturally UNKNOWN value.

Bits [25:11]

Reserved, RES0.

VECITR, bits [10:8]

Vector iteration count. From Armv8, this field is RES1.

This field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while FPSCR.IDE was 1:

IDF	Meaning
0b0	Input Denormal exception has not occurred.
0b1	Input Denormal exception has occurred.

Input Denormal exceptions can occur only when FPSCR.FZ is 1.

Note

A half-precision floating-point value that is flushed to zero because the value of FPSCR.FZ16 is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while FPSCR.IXE was 1:

IXF	Meaning
0b0	Inexact exception has not occurred.
0b1	Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while FPSCR.UFE was 1:

UFF	Meaning
0b0	Underflow exception has not occurred.
0b1	Underflow exception has occurred.

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when FPSCR.FZ16 is 0.
- Otherwise only when FPSCR.FZ is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while FPSCR.OFE was 1:

OFF	Meaning
0b0	Overflow exception has not occurred.
0b1	Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while FPSCR.DZE was 1:

DZF	Meaning
0b0	Divide by Zero exception has not occurred.
0b1	Divide by Zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while FPSCR.IOE was 1:

IOF	Meaning
0b0	Invalid Operation exception has not occurred.
0b1	Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

FPSR, Floating-point Status Register

The FPSR characteristics are:

Purpose

Provides floating-point system status information.

Configuration

The named fields in this register map to the equivalent fields in the AArch32 FPSCR.

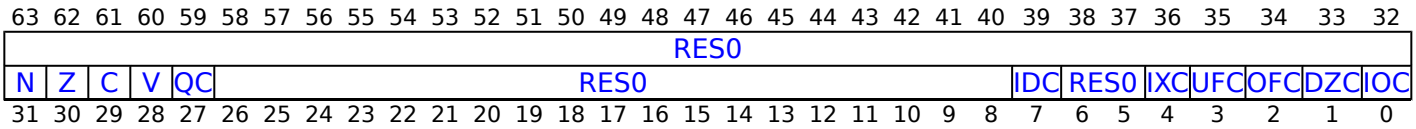
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

FPSR is a 64-bit register.

Field descriptions

The FPSR bit assignments are:



Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.N flag instead.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.Z flag instead.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.C flag instead.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow condition flag for AArch32 floating-point comparison operations. AArch64 floating-point comparisons set the PSTATE.V flag instead.

This field resets to an architecturally UNKNOWN value.

QC, bit [27]

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

This field resets to an architecturally UNKNOWN value.

Bits [26:8]

Reserved, RES0.

IDC, bit [7]

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IDE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.IDE is 0, or if trapping software sets it.

This field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXC, bit [4]

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact exception floating-point has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IXE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.IXE is 0, or if trapping software sets it.

The criteria for the Inexact floating-point exception to occur are different in Flush-to-zero mode. For details, see 'Flush-to-zero'.

This field resets to an architecturally UNKNOWN value.

UFC, bit [3]

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.UFE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.UFE is 0, or if trapping software sets it.

The criteria for the Underflow floating-point exception to occur are different in Flush-to-zero mode. For details, see 'Flush-to-zero'.

This field resets to an architecturally UNKNOWN value.

OFC, bit [2]

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.OFE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.OFE is 0, or if trapping software sets it.

This field resets to an architecturally UNKNOWN value.

DZC, bit [1]

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.DZE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.DZE is 0, or if trapping software sets it.

This field resets to an architecturally UNKNOWN value.

IOC, bit [0]

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IOE bit. This bit is only set to 1 to indicate a floating-point exception if FPCR.IOE is 0, or if trapping software sets it.

This field resets to an architecturally UNKNOWN value.

Accessing the FPSR

Accesses to this register use the following encodings:

```
MRS <Xt>, FPSR
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0100	0b001

```
if PSTATE.EL == EL0 then
    if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CPACR_EL1.FPEN !=

GCR_EL1, Tag Control Register.

The GCR_EL1 characteristics are:

Purpose

Tag Control Register.

Configuration

This register is present only when ARMv8.5-MemTag is implemented and ID_AA64PFR1_EL1.MTE != 0b0001. Otherwise, direct accesses to GCR_EL1 are UNDEFINED.

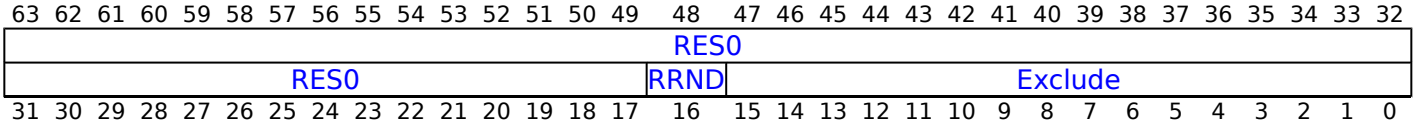
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

GCR_EL1 is a 64-bit register.

Field descriptions

The GCR_EL1 bit assignments are:



Bits [63:17]

Reserved, RES0.

RRND, bit [16]

Controls generation of tag values by the IRG instruction.

~~Controls whether RandomTag() generates a deterministic value solely based on the contents of RGSR_EL1, or a non-deterministic value.~~

RRND	Meaning
0b0	IRG generates a tag value as defined by RandomTag(). ~~Generate a deterministic value based on RGSR_EL1.~~
0b1	IRG generates an implementation-specific tag value with a distribution of tag values no worse than generated with GCR_EL1.RRND == 0. ~~Generate an IMPLEMENTATION DEFINED non-deterministic value.~~

~~**Note**~~

~~When the value of GCR_EL1.RRND is 1, the value generated does not need to be cryptographically random.~~

~~A similar algorithm to that used when RRND=0 but with free running clock is sufficient.~~

This field resets to an architecturally UNKNOWN value.

Exclude, bits [15:0]

Allocation Tag values excluded from selection by ChooseNonExcludedTag().

This field resets to an architecturally UNKNOWN value.

Accessing the GCR_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, GCR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b110

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.ATA == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif HaveEL(EL3) && !ELUsingAArch32(EL3) && SCR_EL3.ATA == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return GCR_EL1;
elsif PSTATE.EL == EL2 then

HAFGRTR_EL2, Hypervisor Activity Monitors Fine-Grained Read Trap Register

The HAFGRTR_EL2 characteristics are:

Purpose

Provides controls for traps of MRS reads of Activity Monitors System registers.

Configuration

This register is present only when AMUv1 is implemented and ARMv8.6-FGT is implemented. Otherwise, direct accesses to HAFGRTR_EL2 are UNDEFINED.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

HAFGRTR_EL2 is a 64-bit register.

Field descriptions

The HAFGRTR_EL2 bit assignments are:

63	62	61	60	59	58
AMEVTYPER16_EL0	AMEVCNTR16_EL0	AMEVTYPER15_EL0	AMEVCNTR15_EL0	AMEVTYPER14_EL0	AMEVCNTR14_EL0
31	30	29	28	27	26

Bits [63:50]

Reserved, RES0.

AMEVTYPER115_EL0, bit [49]

Trap MRS reads of AMEVTYPER115_EL0~~AMEVTYPER1<15>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER115~~AMEVTYPER1<15>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER115_EL0	Meaning
0b0	MRS reads of AMEVTYPER115_EL0~~AMEVTYPER1<15>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER115~~AMEVTYPER1<15>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER115_EL0~~AMEVTYPER1<15>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER115~~AMEVTYPER1<15>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR115_EL0, bit [48]

Trap MRS reads of AMEVCNTR115_EL0~~AMEVCNTR1<15>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR115~~AMEVCNTR1<15>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR115_EL0	Meaning
0b0	MRS reads of AMEVCNTR115_EL0~~AMEVCNTR1<15>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR115~~AMEVCNTR1<15>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR115_EL0~~AMEVCNTR1<15>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR115~~AMEVCNTR1<15>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER114_EL0, bit [47]

Trap MRS reads of AMEVTYPER114_EL0~~AMEVTYPER1<14>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER114~~AMEVTYPER1<14>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER114_EL0	Meaning
0b0	MRS reads of AMEVTYPER114_EL0~~AMEVTYPER1<14>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER114~~AMEVTYPER1<14>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER114_EL0~~AMEVTYPER1<14>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER114~~AMEVTYPER1<14>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR114_EL0, bit [46]

Trap MRS reads of AMEVCNTR114_EL0~~AMEVCNTR1<14>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR114~~AMEVCNTR1<14>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR114_EL0	Meaning
0b0	MRS reads of AMEVCNTR114_EL0~~AMEVCNTR1<14>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR114~~AMEVCNTR1<14>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR114_EL0~~AMEVCNTR1<14>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR114~~AMEVCNTR1<14>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER113_EL0, bit [45]

Trap MRS reads of AMEVTYPER113_EL0~~AMEVTYPER1<13>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER113~~AMEVTYPER1<13>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER113_EL0	Meaning
0b0	MRS reads of AMEVTYPER113_EL0~~AMEVTYPER1<13>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER113~~AMEVTYPER1<13>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER113_EL0~~AMEVTYPER1<13>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER113~~AMEVTYPER1<13>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR113_EL0, bit [44]

Trap MRS reads of AMEVCNTR113_EL0~~AMEVCNTR1<13>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR113~~AMEVCNTR1<13>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR113_EL0	Meaning
0b0	MRS reads of AMEVCNTR113_EL0~~AMEVCNTR1<13>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR113~~AMEVCNTR1<13>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR113_EL0~~AMEVCNTR1<13>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR113~~AMEVCNTR1<13>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER112_EL0, bit [43]

Trap MRS reads of AMEVTYPER112_EL0~~AMEVTYPER1<12>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER112~~AMEVTYPER1<12>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER112_EL0	Meaning
0b0	MRS reads of AMEVTYPER112_EL0AMEVTYPER1<12>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER112AMEVTYPER1<12> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER112_EL0AMEVTYPER1<12>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER112AMEVTYPER1<12> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR112_EL0, bit [42]

Trap MRS reads of AMEVCNTR112_EL0AMEVCNTR1<12>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR112AMEVCNTR1<12> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR112_EL0	Meaning
0b0	MRS reads of AMEVCNTR112_EL0AMEVCNTR1<12>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR112AMEVCNTR1<12> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR112_EL0AMEVCNTR1<12>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR112AMEVCNTR1<12> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER111_EL0, bit [41]

Trap MRS reads of AMEVTYPER111_EL0AMEVTYPER1<11>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER111AMEVTYPER1<11> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER111_EL0	Meaning
0b0	MRS reads of AMEVTYPER111_EL0~~AMEVTYPER1<11>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER111~~AMEVTYPER1<11>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER111_EL0~~AMEVTYPER1<11>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER111~~AMEVTYPER1<11>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR111_EL0, bit [40]

Trap MRS reads of AMEVCNTR111_EL0~~AMEVCNTR1<11>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR111~~AMEVCNTR1<11>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR111_EL0	Meaning
0b0	MRS reads of AMEVCNTR111_EL0~~AMEVCNTR1<11>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR111~~AMEVCNTR1<11>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR111_EL0~~AMEVCNTR1<11>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR111~~AMEVCNTR1<11>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER110_EL0, bit [39]

Trap MRS reads of AMEVTYPER110_EL0~~AMEVTYPER1<10>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER110~~AMEVTYPER1<10>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER110_EL0	Meaning
0b0	MRS reads of AMEVTYPER110_EL0~~AMEVTYPER1<10>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER110~~AMEVTYPER1<10>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER110_EL0~~AMEVTYPER1<10>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER110~~AMEVTYPER1<10>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR110_EL0, bit [38]

Trap MRS reads of AMEVCNTR110_EL0~~AMEVCNTR1<10>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR110~~AMEVCNTR1<10>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR110_EL0	Meaning
0b0	MRS reads of AMEVCNTR110_EL0~~AMEVCNTR1<10>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR110~~AMEVCNTR1<10>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR110_EL0~~AMEVCNTR1<10>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR110~~AMEVCNTR1<10>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER19_EL0, bit [37]

Trap MRS reads of AMEVTYPER19_EL0~~AMEVTYPER1<9>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER19~~AMEVTYPER1<9>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER19_EL0	Meaning
0b0	MRS reads of AMEVTYPER19_EL0~~AMEVTYPER1<9>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER19~~AMEVTYPER1<9>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER19_EL0~~AMEVTYPER1<9>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER19~~AMEVTYPER1<9>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR19_EL0, bit [36]

Trap MRS reads of AMEVCNTR19_EL0~~AMEVCNTR1<9>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR19~~AMEVCNTR1<9>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR19_EL0	Meaning
0b0	MRS reads of AMEVCNTR19_EL0~~AMEVCNTR1<9>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR19~~AMEVCNTR1<9>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR19_EL0~~AMEVCNTR1<9>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR19~~AMEVCNTR1<9>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER18_EL0, bit [35]

Trap MRS reads of AMEVTYPER18_EL0~~AMEVTYPER1<8>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER18~~AMEVTYPER1<8>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER18_EL0	Meaning
0b0	MRS reads of AMEVTYPER18_EL0~~AMEVTYPER1<8>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER18~~AMEVTYPER1<8>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER18_EL0~~AMEVTYPER1<8>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER18~~AMEVTYPER1<8>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR18_EL0, bit [34]

Trap MRS reads of AMEVCNTR18_EL0~~AMEVCNTR1<8>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR18~~AMEVCNTR1<8>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR18_EL0	Meaning
0b0	MRS reads of AMEVCNTR18_EL0~~AMEVCNTR1<8>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR18~~AMEVCNTR1<8>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR18_EL0~~AMEVCNTR1<8>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR18~~AMEVCNTR1<8>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER17_EL0, bit [33]

Trap MRS reads of AMEVTYPER17_EL0~~AMEVTYPER1<7>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER17~~AMEVTYPER1<7>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER17_EL0	Meaning
0b0	MRS reads of AMEVTYPER17_EL0AMEVTYPER1<7>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER17AMEVTYPER1<7> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER17_EL0AMEVTYPER1<7>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER17AMEVTYPER1<7> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR17_EL0, bit [32]

Trap MRS reads of AMEVCNTR17_EL0AMEVCNTR1<7>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR17AMEVCNTR1<7> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR17_EL0	Meaning
0b0	MRS reads of AMEVCNTR17_EL0AMEVCNTR1<7>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR17AMEVCNTR1<7> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR17_EL0AMEVCNTR1<7>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR17AMEVCNTR1<7> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER16_EL0, bit [31]

Trap MRS reads of AMEVTYPER16_EL0AMEVTYPER1<6>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER16AMEVTYPER1<6> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER16_EL0	Meaning
0b0	MRS reads of AMEVTYPER16_EL0~~AMEVTYPER1<6>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER16~~AMEVTYPER1<6>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER16_EL0~~AMEVTYPER1<6>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER16~~AMEVTYPER1<6>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR16_EL0, bit [30]

Trap MRS reads of AMEVCNTR16_EL0~~AMEVCNTR1<6>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR16~~AMEVCNTR1<6>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR16_EL0	Meaning
0b0	MRS reads of AMEVCNTR16_EL0~~AMEVCNTR1<6>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR16~~AMEVCNTR1<6>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR16_EL0~~AMEVCNTR1<6>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR16~~AMEVCNTR1<6>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER15_EL0, bit [29]

Trap MRS reads of AMEVTYPER15_EL0~~AMEVTYPER1<5>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER15~~AMEVTYPER1<5>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER15_EL0	Meaning
0b0	MRS reads of AMEVTYPER15_EL0~~AMEVTYPER1<5>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER15~~AMEVTYPER1<5>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER15_EL0~~AMEVTYPER1<5>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER15~~AMEVTYPER1<5>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR15_EL0, bit [28]

Trap MRS reads of AMEVCNTR15_EL0~~AMEVCNTR1<5>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR15~~AMEVCNTR1<5>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR15_EL0	Meaning
0b0	MRS reads of AMEVCNTR15_EL0~~AMEVCNTR1<5>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR15~~AMEVCNTR1<5>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR15_EL0~~AMEVCNTR1<5>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR15~~AMEVCNTR1<5>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER14_EL0, bit [27]

Trap MRS reads of AMEVTYPER14_EL0~~AMEVTYPER1<4>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER14~~AMEVTYPER1<4>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER14_EL0	Meaning
0b0	MRS reads of AMEVTYPER14_EL0~~AMEVTYPER1<4>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER14~~AMEVTYPER1<4>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER14_EL0~~AMEVTYPER1<4>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER14~~AMEVTYPER1<4>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR14_EL0, bit [26]

Trap MRS reads of AMEVCNTR14_EL0~~AMEVCNTR1<4>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR14~~AMEVCNTR1<4>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR14_EL0	Meaning
0b0	MRS reads of AMEVCNTR14_EL0~~AMEVCNTR1<4>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR14~~AMEVCNTR1<4>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR14_EL0~~AMEVCNTR1<4>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR14~~AMEVCNTR1<4>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER13_EL0, bit [25]

Trap MRS reads of AMEVTYPER13_EL0~~AMEVTYPER1<3>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER13~~AMEVTYPER1<3>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER13_EL0	Meaning
0b0	MRS reads of AMEVTYPER13_EL0~~AMEVTYPER1<3>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER13~~AMEVTYPER1<3>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER13_EL0~~AMEVTYPER1<3>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER13~~AMEVTYPER1<3>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR13_EL0, bit [24]

Trap MRS reads of AMEVCNTR13_EL0~~AMEVCNTR1<3>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR13~~AMEVCNTR1<3>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR13_EL0	Meaning
0b0	MRS reads of AMEVCNTR13_EL0~~AMEVCNTR1<3>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR13~~AMEVCNTR1<3>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR13_EL0~~AMEVCNTR1<3>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR13~~AMEVCNTR1<3>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER12_EL0, bit [23]

Trap MRS reads of AMEVTYPER12_EL0~~AMEVTYPER1<2>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER12~~AMEVTYPER1<2>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER12_EL0	Meaning
0b0	MRS reads of AMEVTYPER12_EL0~~AMEVTYPER1<2>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER12~~AMEVTYPER1<2>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER12_EL0~~AMEVTYPER1<2>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER12~~AMEVTYPER1<2>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR12_EL0, bit [22]

Trap MRS reads of AMEVCNTR12_EL0~~AMEVCNTR1<2>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR12~~AMEVCNTR1<2>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR12_EL0	Meaning
0b0	MRS reads of AMEVCNTR12_EL0~~AMEVCNTR1<2>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR12~~AMEVCNTR1<2>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR12_EL0~~AMEVCNTR1<2>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR12~~AMEVCNTR1<2>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER11_EL0, bit [21]

Trap MRS reads of AMEVTYPER11_EL0~~AMEVTYPER1<1>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER11~~AMEVTYPER1<1>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER11_EL0	Meaning
0b0	MRS reads of AMEVTYPER11_EL0~~AMEVTYPER1<1>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER11~~AMEVTYPER1<1>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER11_EL0~~AMEVTYPER1<1>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER11~~AMEVTYPER1<1>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR11_EL0, bit [20]

Trap MRS reads of AMEVCNTR11_EL0~~AMEVCNTR1<1>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR11~~AMEVCNTR1<1>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR11_EL0	Meaning
0b0	MRS reads of AMEVCNTR11_EL0~~AMEVCNTR1<1>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR11~~AMEVCNTR1<1>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR11_EL0~~AMEVCNTR1<1>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR11~~AMEVCNTR1<1>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVTYPER10_EL0, bit [19]

Trap MRS reads of AMEVTYPER10_EL0~~AMEVTYPER1<0>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER10~~AMEVTYPER1<0>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER10_EL0	Meaning
0b0	MRS reads of AMEVTYPER10_EL0~~AMEVTYPER1<0>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER10~~AMEVTYPER1<0>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER10_EL0~~AMEVTYPER1<0>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER10~~AMEVTYPER1<0>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR10_EL0, bit [18]

Trap MRS reads of AMEVCNTR10_EL0~~AMEVCNTR1<0>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR10~~AMEVCNTR1<0>~~ at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR10_EL0	Meaning
0b0	MRS reads of AMEVCNTR10_EL0~~AMEVCNTR1<0>_EL0~~ at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR10~~AMEVCNTR1<0>~~ at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR10_EL0~~AMEVCNTR1<0>_EL0~~ at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR10~~AMEVCNTR1<0>~~ at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMCNTEN1, bit [17]

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of AMCNTENCLR1_EL0 and AMCNTENSET1_EL0.
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of AMCNTENCLR1 and AMCNTENSET1.

AMCNTEN1	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of AMCNTENCLR1_EL0 and AMCNTENSET1_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 of AMCNTENCLR1 and AMCNTENSET1 are trapped to EL2 and reported with EC syndrome value 0x03, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Bits [16:5]

Reserved, RES0.

AMEVCNTR0<x>_EL0~~AMEVCNTR03_EL0~~, bit [x+1], for x = 0 to 3~~4~~]

Trap MRS reads of AMEVCNTR0<x~~3~~>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR0<x~~3~~> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR0<x>_EL0~~AMEVCNTR03_EL0~~	Meaning
0b0	MRS reads of AMEVCNTR0<x~~3~~>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR0<x~~3~~> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR0<x~~3~~>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR0<x~~3~~> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

~~AMEVCNTR02_EL0, bit [3]~~

~~Trap MRS reads of AMEVCNTR0<2>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR0<2> at EL0 using AArch32 when EL1 is using AArch64 to EL2.~~

AMEVCNTR02_EL0	Meaning
0b0	MRS reads of AMEVCNTR0<2>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR0<2> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR0<2>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR0<2> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR01_EL0, bit [2]

Trap MRS reads of AMEVCNTR0<1>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR0<1> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR01_EL0	Meaning
0b0	MRS reads of AMEVCNTR0<1>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR0<1> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR0<1>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR0<1> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

AMEVCNTR00_EL0, bit [1]

Trap MRS reads of AMEVCNTR0<0>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR0<0> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR00_EL0	Meaning
0b0	MRS reads of AMEVCNTR0<0>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR0<0> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR0<0>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR0<0> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

~~In a system where the PE resets into EL2, this field resets to 0.~~

AMCNTEN0, bit [0]

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of AMCNTENCLR0_EL0 and AMCNTENSET0_EL0.
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of AMCNTENCLR0 and AMCNTENSET0.

AMCNTEN0	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of AMCNTENCLR0_EL0 and AMCNTENSET0_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 of AMCNTENCLR0 and AMCNTENSET0 are trapped to EL2 and reported with EC syndrome value 0x03, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Accessing the HAFGRTR_EL2

Accesses to this register use the following encodings:

```
MRS <Xt>, HAFGRTR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b110

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x1E8];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if HaveEL(EL3) && !ELUsingAArch32(EL3) && SCR_EL3.FGTEn == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return HAFGRTR_EL2;
elsif PSTATE.EL == EL3 then
    return HAFGRTR_EL2;
```

```
MSR HAFGRTR_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b110

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x1E8] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if HaveEL(EL3) && !ELUsingAArch32(EL3) && SCR_EL3.FGTEn == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        HAFGRTR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    HAFGRTR_EL2 = X[t];
```

HCR_EL2, Hypervisor Configuration Register

The HCR_EL2 characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

Configuration

AArch64 System register HCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HCR[31:0] .

AArch64 System register HCR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HCR2[31:0] .

If EL2 is not implemented, this register is RES0 from EL3.

The bits in this register behave as if they are 0 for all purposes other than direct reads of the register if EL2 is not enabled in the current Security state.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

HCR_EL2 is a 64-bit register.

Field descriptions

The HCR_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	
TWEDEL				TWEDEn	TID5	DCT	ATA	TTLBOS	TTLBIS	EnSCXT	TOCU	AMVOFFEN	TICAB	TID4	RES0	FIEN	FWB	NV2	AT	N
RW	TRVM	HCD	TDZ	TGE	TVM	TTLB	TPU	TPCP	TSW	TACR	TIDCP	TSC	TID3	TID2	TID1	TID0	TWE	TWI	DC	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	

TWEDEL, bits [63:60]

When ARMv8.6-TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when HCR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by HCR_EL2.TWE as 2^(TWEDEL + 8) cycles.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [59]

When ARMv8.6-TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by HCR_EL2.TWE.

TWEDEn	Meaning
0b0	The delay for taking a WFE trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking a WFE trap is at least the number of cycles defined in HCR_EL2.TWEDEL.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID5, bit [58]

When ARMv8.5-MemTag is implemented:

Trap ID group 5. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- GMID_EL1.

TID5	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 5 registers are trapped to EL2.

When the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has an Effective value of 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DCT, bit [57]

When ARMv8.5-MemTag is implemented:

Default Cacheability Tagging. When HCR_EL2.DC is in effect, controls whether stage 1 translations are treated as Tagged or Untagged.

DCT	Meaning
0b0	Stage 1 translations are treated as Untagged.
0b1	Stage 1 translations are treated as Tagged.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [56]

When ARMv8.5-MemTag is implemented:

Allocation Tag Access. When SCR_EL3.ATA=1 and HCR_EL2.{E2H,TGE} != {1,1}, controls EL1 and EL0 access to Allocation Tags.

When access is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.

- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
- MRS and MSR instructions at EL1 using GCR_EL1, RGSR_EL1, TFSR_EL1, TFSR_EL2, or TFSRE0_EL1 that are not UNDEFINED are trapped to EL2.

ATA	Meaning
0b0	Access is prevented.
0b1	Access is not prevented.

This field is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBOS, bit [55]

When ARMv8.2-EVT is implemented:

Trap TLB maintenance instructions that operate on the Outer Shareable domain. Traps execution of those TLB maintenance instructions at EL1 ~~using AArch64~~ to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

TLBI VMALLE1OS, TLBI VAE1OS, TLBI ASIDE1OS,TLBI VAAE1OS, TLBI VALE1OS, TLBI VAALE1OS,TLBI RVAE1OS, TLBI RVAAE1OS,TLBI RVALE1OS, and TLBI RVAALE1OS.

TTLBOS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

~~If ARMv8.2-EVT is not implemented, this field is RES0.~~

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBIS, bit [54]

When ARMv8.2-EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of those TLB maintenance instructions at EL1 ~~using AArch64, and at EL1 using AArch32,~~ to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, TLBI VMALLE1IS, TLBI VAE1IS, TLBI ASIDE1IS,TLBI VAAE1IS, TLBI VALE1IS, TLBI VAALE1IS,TLBI RVAE1IS, TLBI RVAAE1IS,TLBI RVALE1IS, and TLBI RVAALE1IS.
- When EL1 is using AArch32, TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, and TLBIMVAALIS.

TTLBIS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

~~If ARMv8.2-EVT is not implemented, this field is RES0.~~

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [53]

When ARMv8.0-CSV2 is implemented:

Enable Access to the SCXTNUM_EL1 and SCXTNUM_EL0 registers. The defined values are:

EnSCXT	Meaning
0b0	When (HCR_EL2.TGE==0 or HCR_EL2.E2H==0) and EL2 is enabled in the current Security state, EL1 and EL0 access to SCXTNUM_EL0 and EL1 access to SCXTNUM_EL1 is disabled by this mechanism, causing an exception to EL2, and the values of these registers to be treated as 0. When ((HCR_EL2.TGE==1 and HCR_EL2.E2H==1) and EL2 is enabled in the current Security state, EL0 access to SCXTNUM_EL0 is disabled by this mechanism, causing an exception to EL2, and the value of this register to be treated as 0.
0b1	This control does not cause accesses to SCXTNUM_EL0 or SCXTNUM_EL1 to be trapped.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TOCU, bit [52]

When ARMv8.2-EVT is implemented:

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions ~~at EL1 or EL0 using AArch64, and at EL1 using AArch32,~~ to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When SCTLR_EL1.UCI is 1, HCR_EL2.{TGE, E2H} is not {1, 1}, and EL0 is using AArch64, IC IVAU, DC CVAU.
- When EL1 is using AArch64, IC IVAU, IC IALLU, DC CVAU.
- When EL1 is using AArch32, ICIMVAU, ICIALLU, DCCMVAU.

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- IC IALLUIS and IC IALLU are always UNDEFINED at EL0 using AArch64.
- ICIMVAU, ICIALLU, ICIALLUIS, and DCCMVAU are always UNDEFINED at EL0 using AArch32.

TOCU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [51]

When ARMv8.6-AMU is implemented:

Activity Monitors Virtual Offsets Enable.

AMVOFFEN	Meaning
0b0	Virtualization of the Activity Monitors is disabled. Indirect reads of the virtual offset registers are zero.
0b1	Virtualization of the Activity Monitors is enabled.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TICAB, bit [50]

When ARMv8.2-EVT is implemented:

Trap ICIALLUIS/IC IALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 ~~using AArch64, and at EL1 using AArch32,~~ to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, IC IALLUIS.
- When EL1 is using AArch32, ICIALLUIS.

TICAB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified instructions is trapped to EL2.

~~If ARMv8.2-EVT is not implemented, this field is RES0.~~

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID4, bit [49]

When ARMv8.2-EVT is implemented:

Trap ID group 4. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- EL1 reads of CCSIDR_EL1, CCSIDR2_EL1, CLIDR_EL1, and CSSELR_EL1.
- EL1 writes to CSSELR_EL1.

AArch32:

- EL1 reads of CCSIDR, CCSIDR2, CLIDR, and CSSELR.
- EL1 writes to CSSELR.

TID4	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.

~~If ARMv8.2-EVT is not implemented, this field is RES0.~~

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [48]

Reserved, RES0.

FIEN, bit [47]

When ARMv8.4-RAS is implemented:

Fault Injection Enable. Unless this bit is set to 1, accesses to the ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18.

FIEN	Meaning
0b0	Accesses to the specified registers from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

If EL2 is disabled in the current Security state, the Effective value of HCR_EL2.FIEN is 0b1.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FWB, bit [46]

When ARMv8.4-S2FWB is implemented:

Defines the combined cacheability attributes in a 2 stage translation regime.

FWB	Meaning
0b0	When this bit is 0, then: • The combination of stage 1 and stage 2 translations on memory type and cacheability attributes are as described in the Armv8.0 architecture. For more information see D4.5.4 Combining the stage 1 and stage 2 attributes • The encoding of the stage 2 memory type and cacheability attributes in bits[5:2] of the stage 2 page or block descriptors are as described in the Armv8.0 architecture.
0b1	When this bit is 1, then: • Bit[5] of stage 2 page or block descriptor is RES0. • When bit[4] of stage 2 page or block descriptor is 1 and when: ◦ Bits[3:2] of stage 2 page or block descriptor are 0b11, the resultant memory type and inner or outer cacheability~~cachebility~~ attribute is the same as the stage 1 memory type and inner or outer cacheability attribute. ◦ Bits[3:2] of stage 2 page or block descriptor are 0b10, the resultant memory type and attribute is Normal Write-Back. ◦ Bits[3:2] of stage 2 page or block descriptor are 0b0x, the resultant memory type will be Normal Non-cacheable except where the stage 1 memory type was Device->attr< the resultant memory type will be Device->attr< • When bit[4] of stage 2 page or block descriptor is 0 the memory type is Device, and when: ◦ Bits[3:2] of stage 2 page or block descriptor are 0b00, the stage 2 memory type is Device-nGnRnE. ◦ Bits[3:2] of stage 2 page or block descriptor are 0b01, the stage 2 memory type is Device-nGnRE. ◦ Bits[3:2] of stage 2 page or block descriptor are 0b10, the stage 2 memory type is Device-nGRE. ◦ Bits[3:2] of stage 2 page or block descriptor are 0b11, the stage 2 memory type is Device-GRE. • If the stage 1 translation specifies a cacheable memory type, then the stage 1 cache allocation hint is applied to the final cache allocation hint where the final memory type is cacheable. • If the stage 1 translation does not specify a cacheable memory type, then if the final memory type is cacheable, it is treated as read allocate, write allocate. The stage 1 and stage 2 memory types are combined in the manner described in D4.5.4 Combining the stage 1 and stage 2 attributes

In Secure state, this bit applies to both the Secure stage 2 translation and the Non-secure stage 2 translation.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV2, bit [45]

When ARMv8.4-NV is implemented:

Nested Virtualization. Changes the behaviors of HCR_EL2.{NV, NV1} to provide a mechanism for hardware to transform reads and writes from System registers into reads and writes from memory.

NV2	Meaning
0b0	This bit has no effect on the behavior of HCR_EL2.{NV, NV1}. The behavior of HCR_EL2.{NV, NV1} is as defined for ARMv8.3-NV.
0b1	Redefines behavior of HCR_EL2{NV, NV1} to enable: • Transformation of read/writes to registers into read/writes to memory. • Redirection of EL2 registers to EL1 registers. Any exception taken from EL1 and taken to EL1 causes SPSR_EL1.M[3:2] to be set to 0b10 and not 0b01.

~~When this bit is 0, the behavior of HCR_EL2.{NV, NV1} is as defined for ARMv8.3-NV.~~

~~When this is bit is 1, then any exception taken from EL1 and taken to EL1 causes SPSR_EL1.M[3:2] to be set to 0b10 and not 0b01~~

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AT, bit [44]

When ARMv8.3-NV is implemented:

Address Translation. EL1 execution of the following address translation instructions is trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- AT S1E0R, AT S1E0W, AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP.

AT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified instructions is trapped to EL2.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV1, bit [43]

When ARMv8.4-NV is implemented:

Nested Virtualization.

NV1	Meaning
0b0	If HCR_EL2.{NV, NV2} are both 1, accesses executed from EL1 to implemented EL12, EL02, or EL2 registers are transformed to loads and stores. If HCR_EL2.NV2 is 0 or HCR_EL2.{NV, NV2} == {0, 1}, this control does not cause any instructions to be trapped.
0b1	If HCR_EL2.NV2 is 1, accesses executed from EL1 to implemented EL2 registers are transformed to loads and stores. If HCR_EL2.NV2 is 0, EL1 accesses to VBAR_EL1, ELR_EL1, and SPSR_EL1, are trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18.

If HCR_EL2.NV2 is 1, the value of HCR_EL2.NV1 defines which EL1 register accesses are transformed to loads and stores. These transformed accesses have priority over the trapping of registers.

The trapping of EL1 registers caused by other control bits has priority over the transformation of these accesses.

If a register is specified that is not implemented by an implementation, then access to that register are UNDEFINED.

For the list of registers affected, see Enhanced support for nested virtualization.

If HCR_EL2.{NV, NV1, NV2} are {1, 0, 0},any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to `0b10`, and not `0b01`.

If HCR_EL2.{NV, NV1, NV2} are {1, 1, 0}, then:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.{NV, NV1, NV2} are {0, 1, 0}, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading than reading back the value of the HCR_EL2.NV bit.
- Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

When ARMv8.3-NV is implemented:

Nested Virtualization. EL1 accesses to certain registers are trapped to EL2, when EL2 is enabled in the current Security state.

NV1	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 accesses to VBAR_EL1, ELR_EL1, SPSR_EL1 are trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value `0x18`.

If HCR_EL2.NV is 1 and HCR_EL2.NV1 is 0 then the following effects also apply:

- Any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to `0b10`, and not `0b01`.

If the bits HCR_EL2.NV and HCR_EL2.NV1 are both set to 1 then following effects also apply:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.NV is 0 and HCR_EL2.NV1 is 1 then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading than reading back the value of the HCR_EL2.NV bit.
- Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV, bit [42]

When ARMv8.4-NV is implemented:

Nested Virtualization.

When HCR_EL2.NV2 is 1, redefines register accesses so that:

- Instructions accessing the Special purpose registers SPSR_EL2 and ELR_EL2 instead access SPSR_EL1 and ELR_EL1 respectively.
- Instructions accessing the System registers ESR_EL2 and FAR_EL2 instead access ESR_EL1 and FAR_EL1.

When HCR_EL2.NV2 is 0, or if ARMv8.4-NV is not implemented, traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

NV	Meaning
0b0	When this bit is set to 0, HCR_EL2.NV2 == 0 for all purposes other than reading this register. This control does not cause any instructions to be trapped. When HCR_EL2.NV2 is 1, no ARMv8.4-NV functionality is implemented.
0b1	When HCR_EL2.NV2 is 0, or if ARMv8.4-NV is not implemented, EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the CurrentEL register return a value of 0x2. When HCR_EL2.NV2 is 1, this control redefines EL1 register accesses so that instructions accessing SPSR_EL2, ELR_EL2, ESR_EL2, and FAR_EL2 instead access SPSR_EL1, ELR_EL1, ESR_EL1, and FAR_EL1 respectively.

When HCR_EL2.NV2 is 0, or if ARMv8.4-NV is not implemented, then:

- The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:
  - Registers accessed using MRS or MSR with a name ending in _EL2, except SP_EL2.
  - Registers accessed using MRS or MSR with a name ending in _EL12.
  - Registers accessed using MRS or MSR with a name ending in _EL02.
  - Special-purpose registers SPSR_irq, SPSR_abt, SPSR_und and SPSR_fiq, accessed using MRS or MSR.
  - Special-purpose register SP_EL1 accessed using the dedicated MRS or MSR instruction.
- The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:
  - EL2 translation regime Address Translation instructions and TLB maintenance instructions.
  - EL1 translation regime Address Translation instructions and TLB maintenance instructions that are only accessible from EL2 and EL3.
- The instructions for which the execution is trapped as follows:

    - SMC in an implementation that does not include EL3 and when HCR_EL2.TSC is 1. HCR_EL2.TSC bit is not RES0 in this case. This is reported using EC syndrome value 0x17.
    - The ERET, ERETAA, and ERETAB instructions, reported using EC syndrome value 0x1A.

Note

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

This field resets to an architecturally UNKNOWN value.

When ARMv8.3-NV is implemented:

Nested Virtualization. Traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

The possible values are:

NV	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the CurrentEL register return a value of 0x2.

The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:

- Registers accessed using MRS or MSR with a name ending in _EL2, except SP_EL2.
- Registers accessed using MRS or MSR with a name ending in _EL12.
- Registers accessed using MRS or MSR with a name ending in _EL02.
- Special-purpose registers SPSR_irq, SPSR_abt, SPSR_und and SPSR_fiq, accessed using MRS or MSR.
- Special-purpose register SP_EL1 accessed using the dedicated MRS or MSR instruction.

The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:

- EL2 translation regime Address Translation instructions and TLB maintenance instructions.
- EL1 translation regime Address Translation instructions and TLB maintenance instructions that are only accessible from EL2 and EL3.

The execution of the ERET, ERETAA, and ERETAB instructions are trapped and reported using EC syndrome value 0x1A

Note

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

The execution of the SMC instructions in an implementation that does not include EL3 and when HCR_EL2.TSC is 1 are trapped and reported using EC syndrome value 0x17. HCR_EL2.TSC bit is not RES0 in this case.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [41]

When ARMv8.3-PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- In EL0, when HCR_EL2.TGE==0 or HCR_EL2.E2H==0, and the associated SCTLR_EL1.En<N><M>==1.
- In EL1, the associated SCTLR_EL1.En<N><M>==1.

Traps are reported using EC syndrome value `0x09`. The Pointer Authentication instructions trapped are:

- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB.
- PACGA, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB.
- RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB, LDRAA and LDRAB.

API	Meaning
`0b0`	The instructions related to Pointer Authentication are trapped to EL2, when EL2 is enabled in the current Security state and the instructions are enabled for the EL1&0 translation regime, from: • EL0 when HCR_EL2.TGE==0 or HCR_EL2.E2H==0. • EL1. If HCR_EL2.NV is 1, the HCR_EL2.NV trap takes precedence over the HCR_EL2.API trap for the ERETAA and ERETAB instructions.
`0b1`	This control does not cause any instructions to be trapped.

If ARMv8.3-PAuth is implemented but EL2 is not implemented or disabled in the current Security state, the system behaves as if this bit is 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [40]

When ARMv8.3-PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers from EL1 to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value `0x18`:

- APIAKeyLo_EL1, APIAKeyHi_EL1, APIBKeyLo_EL1, APIBKeyHi_EL1, APDAKeyLo_EL1, APDAKeyHi_EL1, APDBKeyLo_EL1, APDBKeyHi_EL1, APGAKeyLo_EL1, and APGAKeyHi_EL1.

APK	Meaning
`0b0`	Access to the registers holding "key" values for pointer authentication from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
`0b1`	This control does not cause any instructions to be trapped.

Note

If ARMv8.3-PAuth is implemented but EL2 is not implemented or is disabled in the current Security state, the system behaves as if this bit is 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [39]

Reserved, RES0.

MIOCNCE, bit [38]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the EL1&0 translation regimes.

MIOCNCE	Meaning
0b0	For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.
0b1	For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

For more information see 'Mismatched memory attributes' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section B2 (The AArch64 Application Level Memory Model).

This field can be implemented as RAZ/WI.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TEA, bit [37]

Route synchronous External abort exceptions to EL2. If the RAS Extension is implemented, the possible values of this bit are:

TEA	Meaning
0b0	This control does not cause exceptions to be routed from EL0 and EL1 to EL2.
0b1	Route synchronous External abort exceptions from EL0 and EL1 to EL2, when EL2 is enabled in the current Security state, if not routed to EL3.

When the RAS Extension is not implemented, this field is RES0.

This field resets to an architecturally UNKNOWN value.

TERR, bit [36]

When RAS is implemented:

Trap Error record accesses. Trap accesses to the RAS error registers from EL1 to EL2 as follows:

- If EL1 is using AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - ERRIDR_EL1, ERRSELR_EL1, ERXADDR_EL1, ERXCTLR_EL1, ERXFR_EL1, ERXMISC0_EL1, ERXMISC1_EL1, and ERXSTATUS_EL1.
  - When ARMv8.4-RAS is implemented, ERXMISC2_EL1, and ERXMISC3_EL1.
- If EL1 is using AArch32 state, MCR or MRC accesses are trapped to EL2, reported using EC syndrome value 0x03, MCRR or MRRC accesses are trapped to EL2, reported using EC syndrome value 0x04:
  - ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXFR, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS.
  - When ARMv8.4-RAS is implemented, ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

TERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses to the specified registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [35]

When ARMv8.1-LOR is implemented:

Trap LOR registers. Traps accesses to the LORSA_EL1, LOREA_EL1, LORN_EL1, LORC_EL1, and LORID_EL1 registers from EL1 to EL2, when EL2 is enabled in the current Security state.

TLOR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the LOR registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2H, bit [34]

When ARMv8.1-VHE is implemented:

EL2 Host. Enables a configuration where a Host Operating System is running in EL2, and the Host Operating System's applications are running in EL0.

E2H	Meaning
0b0	The facilities to support a Host Operating System at EL2 are disabled.
0b1	The facilities to support a Host Operating System at EL2 are enabled.

For information on the behavior of this bit see Behavior of HCR_EL2.E2H.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ID, bit [33]

Stage 2 Instruction access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

ID	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime.
0b1	Forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

CD, bit [32]

Stage 2 Data access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

CD	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime for data accesses and translation table walks.
0b1	Forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

RW, bit [31]

When AArch32 is supported at any Exception level:

Execution state control for lower Exception levels:

RW	Meaning
0b0	Lower levels are all AArch32.
0b1	The Execution state for EL1 is AArch64. The Execution state for EL0 is determined by the current value of PSTATE.nRW when executing at EL0.

If AArch32 state is not supported by the implementation at EL1, then this bit is RAO/WI.

In an implementation that includes EL3, when EL2 is not enabled in Secure state, the PE behaves as if this bit has the same value as the SCR_EL3.RW bit for all purposes other than a direct read or write access of HCR_EL2.

The RW bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 1 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.

TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, ~~from both Execution states~~ as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value `0x18`.
    - SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, CONTEXTIDR_EL1.
- If EL1 is using AArch32 state, accesses using MRC to the following registers are trapped to EL2 and reported using EC syndrome value `0x03`, accesses using MRRC are trapped to EL2 and reported using EC syndrome value `0x04`:
    - SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

TRVM	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 read accesses to the specified Virtual Memory controls are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

EL2 provides a second stage of address translation, that a hypervisor can use to remap the address map defined by a Guest OS. In addition, a hypervisor can trap attempts by a Guest OS to write to the registers that control the memory system. A hypervisor might use this trap as part of its virtualization of memory management.

This field resets to an architecturally UNKNOWN value.

HCD, bit [29]

When EL3 is not implemented:

HVC instruction disable. Disables EL1 execution of HVC instructions, from both Execution states, when EL2 is enabled in the current Security state, reported using EC syndrome value `0x00`.

HCD	Meaning
`0b0`	HVC instruction execution is enabled at EL2 and EL1.
`0b1`	HVC instructions are UNDEFINED at EL2 and EL1. Any resulting exception is taken to the Exception level at which the HVC instruction is executed.

Note

HVC instructions are always UNDEFINED at EL0.

~~This bit is only implemented if EL3 is not implemented. Otherwise, it is RES0.~~

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDZ, bit [28]

Trap DC ZVA instructions. Traps EL0 and EL1 execution of DC ZVA instructions to EL2, when EL2 is enabled in the current Security state, from AArch64 state only, reported using EC syndrome value `0x18`.

If ARMv8.5-MemTag is implemented, this trap also applies to DC GVA and DC GZVA.

TDZ	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	In AArch64 state, any attempt to execute an instruction this trap applies to at EL1, or at EL0 when the instruction is not UNDEFINED at EL0, is trapped to EL2 when EL2 is enabled in the current Security state. Reading the DCZID_EL0 returns a value that indicates that the instructions this trap applies to are not supported.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

TGE, bit [27]

Trap General Exceptions, from EL0.

TGE	Meaning
0b0	This control has no effect on execution at EL0.
0b1	When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0. When EL2 is enabled in the current Security state, in all cases: • All exceptions that would be routed to EL1 are routed to EL2. • If EL1 is using AArch64, the~~The~~ SCTLR_EL1.M field~~,~~ is~~or~~ treated as being 0 for all purposes other than returning the result of a direct read of SCTLR~~.M field if EL1 is using AArch32, is treated as being 0 for all purposes other than returning the result of a direct read of~~ SCTLR_EL1 ~~or~~ SCTLR~~.~~. • If EL1 is using AArch32, the SCTLR.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR. • All virtual interrupts are disabled. • Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled. • An exception return to EL1 is treated as an illegal exception return. • The MDCR_EL2.{TDRA, TDOSA, TDA, TDE} fields are treated as being 1 for all purposes other than returning the result of a direct read of MDCR_EL2. In addition, when EL2 is enabled in the current Security state, if: • HCR_EL2.E2H is 0, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 1. • HCR_EL2.E2H is 1, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 0. For further information on the behavior of this bit when E2H is 1, see Behavior of HCR_EL2.E2H.

HCR_EL2.TGE must not be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

TVM, bit [26]

Trap Virtual Memory controls. Traps EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, ~~from both Execution states~~ as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18:
  - SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, CONTEXTIDR_EL1.
- If EL1 is using AArch32 state, accesses using MCR to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MCRR are trapped to EL2 and reported using EC syndrome value 0x04:

    - SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

TVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 write accesses to the specified EL1 virtual memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TTLB, bit [25]

When ARMv8.4-TLBI is implemented:

Trap TLB maintenance instructions. Traps EL1 execution of TLB maintenance instructions to EL2, when EL2 is enabled in the current Security state, ~~from both Execution states~~ as follows:

- When EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
    - TLBI VMALLE1, TLBI VAE1, TLBI ASIDE1, TLBI VAAE1, TLBI VALE1, TLBI VAALE1.
    - TLBI VMALLE1IS, TLBI VAE1IS, TLBI ASIDE1IS, TLBI VAAE1IS, TLBI VALE1IS, TLBI VAALE1IS.
    - TLBI VMALLE1OS, TLBI VAE1OS, TLBI ASIDE1OS, TLBI VAAE1OS, TLBI VALE1OS, TLBI VAALE1OS.
    - TLBI RVAE1, TLBI RVAAE1, TLBI RVALE1, TLBI RVAALE1.
    - TLBI RVAE1IS, TLBI RVAAE1IS, TLBI RVALE1IS, TLBI RVAALE1IS.
    - TLBI RVAE1OS, TLBI RVAAE1OS, TLBI RVALE1OS, TLBI RVAALE1OS.
- When EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
    - TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, TLBIMVAALIS.
    - TLBIALL, TLBIMVA, TLBIASID, TLBIMVAA, TLBIMVAL, TLBIMVAAL
    - ITLBIALL, ITLBIMVA, ITLBIASID.
    - DTLBIALL, DTLBIMVA, DTLBIASID.

TTLB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

The TLB maintenance instructions are UNDEFINED at EL0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Trap TLB maintenance instructions. Traps EL1 execution of TLB maintenance instructions to EL2, when EL2 is enabled in the current Security state.~~state, from both Execution states.~~ This applies to the following instructions:

- When EL1 is using AArch64, TLBI VMALLE1IS, TLBI VAE1IS, TLBI ASIDE1IS, TLBI VAAE1IS, TLBI VALE1IS, TLBI VAALE1IS, TLBI VMALLE1, TLBI VAE1, TLBI ASIDE1, TLBI VAAE1, TLBI VALE1, TLBI VAALE1.
- When EL1 is using AArch32, TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, TLBIMVAALIS, ITLBIALL, ITLBIMVA, ITLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, TLBIALL, TLBIMVA, TLBIASID, TLBIMVAA, TLBIMVAL, TLBIMVAAL

TTLB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions ~~at EL1 or EL0 using AArch64, and at EL1 using AArch32,~~ to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of SCTLR_EL1.UCI is not 0, the following instructions are trapped to EL2 and reported with EC syndrome value `0x18`:
  - IC IVAU, DC CVAU. If the value of SCTLR_EL1.UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported with EC syndrome value `0x18`:
  - IC IVAU, IC IALLU, IC IALLUIS, DC CVAU.
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported with EC syndrome value `0x18`:
  - ICIMVAU, ICIALLU, ICIALLUIS, DCCMVAU.

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- IC IALLUIS and IC IALLU are always UNDEFINED at EL0 using AArch64.
- ICIMVAU, ICIALLU, ICIALLUIS, and DCCMVAU are always UNDEFINED at EL0 using AArch32.

TPU	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

TPCP, bit [23]

When ARMv8.2-DCPoP is implemented:

Trap data or unified cache maintenance instructions that operate to the Point of Coherency or Persistence. Traps execution of those cache maintenance instructions ~~at EL1 or EL0 using AArch64, and at EL1 using AArch32,~~ to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of SCTLR_EL1.UCI is not 0, the following instructions are trapped to EL2 and reported using EC syndrome value `0x18`:
  - DC CIVAC, DC CVAC, DC CVAP. If the value of SCTLR_EL1.UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value `0x18`:
  - DC IVAC, DC CIVAC, DC CVAC, DC CVAP.
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value `0x03`:
  - DCIMVAC, DCCIMVAC, DCCMVAC.

If ARMv8.2-DCCVADP is implemented, this trap also applies to DC CVADP.

If ARMv8.5-MemTag is implemented, this trap also applies to DC CIGVAC, DC CIGDVAC, DC IGVAC, DC IGDVAC, DC CGVAC, DC CGDVAC, DC CGVAP and DC CGDVAP.

If ARMv8.2-DCCVADP and ARMv8.5-MemTag are implemented, this trap also applies to DC CGVADP and DC CGDVADP.

Note

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
  - AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
  - DCIMVAC, DCCIMVAC, and DCCMVAC are always UNDEFINED at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2 it is named TPCP.

TPCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If HCR_EL2.{E2H, TGE} is set to {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps execution of those cache maintenance instructions ~~at EL1 or EL0 using AArch64, and at EL1 using AArch32,~~ to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of SCTLR_EL1.UCI is not 0, accesses to the following registers are trapped and reported using EC syndrome value 0x18:
  - DC CIVAC, DC CVAC. However, if the value of SCTLR_EL1.UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, accesses to DC IVAC, DC CIVAC, DC CVAC are trapped and reported using EC syndrome value 0x18.
- When EL1 is using AArch32, accesses to DCIMVAC, DCCIMVAC, and DCCMVAC are trapped and reported using EC syndrome value 0x03.

Note

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
  - AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
  - DCIMVAC, DCCIMVAC, and DCCMVAC are always UNDEFINED at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2 it is named TPCP.

TPC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps execution of those cache maintenance instructions at EL1 ~~using AArch64, and at EL1 using AArch32,~~ to EL2, when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to DC ISW, DC CSW, DC CISW are trapped to EL2, reported using EC syndrome value `0x18`.
- If EL1 is using AArch32 state, accesses to DCISW, DCCSW, DCCISW are trapped to EL2, reported using EC syndrome value `0x03`.

If ARMv8.5-MemTag is implemented, this trap also applies to DC IGSW, DC IGDSW, DC CGSW, DC CGDW, DC CIGSW, and DC CIGDSW.

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TSW	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TACR, bit [21]

Trap Auxiliary Control Registers. Traps EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, ~~from both Execution states~~ as follows:

- If EL1 is using AArch64 state, accesses to ACTLR_EL1 to EL2, are trapped to EL2 and reported using EC syndrome value `0x18`.
- If EL1 is using AArch32 state, accesses to ACTLR and, if implemented, ACTLR2 are trapped to EL2 and reported using EC syndrome value `0x03`.

TACR	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 accesses to the specified registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

ACTLR_EL1 is not accessible at EL0,~~ACTLR, and ACTLR2 are not accessible at EL0.~~

ACTLR, and ACTLR2 are not accessible at EL0.

The Auxiliary Control Registers are IMPLEMENTATION DEFINED registers that might implement global control bits for the PE.

This field resets to an architecturally UNKNOWN value.

TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps EL1 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, access to any of the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome `0x18`:

    - IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}.
    - IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name.
- In AArch32 state, MCR and MRC access to instructions with the following encodings are trapped and reported using EC syndrome 0x03:
    - All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}.
    - All coproc==p15, CRn==c10, opc1 =={0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}.
    - All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

When the value of HCR_EL2.TIDCP is 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from EL0 is trapped to EL2. If it is not, then it is UNDEFINED, and any attempt to access it from EL0 generates an exception that is taken to EL1.

TIDCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to or execution of the specified encodings reserved for IMPLEMENTATION DEFINED functionality are trapped to EL2, when EL2 is enabled in the current Security state.

An implementation can also include IMPLEMENTATION DEFINED registers that provide additional controls, to give finer-grained control of the trapping of IMPLEMENTATION DEFINED features.

Note

Arm expects the trapping of EL0 accesses to these functions to EL2 to be unusual, and used only when the hypervisor is virtualizing EL0 operation. Arm strongly recommends that unless the hypervisor must virtualize EL0 operation, an EL0 access to any of these functions is UNDEFINED, as it would be if the implementation did not include EL2. The PE then takes any resulting exception to EL1.

The trapping of accesses to these registers from EL1 is higher priority than an exception resulting from the register access being UNDEFINED.

This field resets to an architecturally UNKNOWN value.

TSC, bit [19]

Trap SMC instructions. Traps EL1 execution of SMC instructions to EL2, when EL2 is enabled in the current Security state.~~state, from both Execution states.~~

If execution is in AArch64 state the trap is reported using EC syndrome value 0x17.

~~If execution is in AArch64 state the trap is reported using EC syndrome value 0x17 and if execution is in AArch32 state, the trap is reported using EC syndrome value 0x13.~~

If execution is in AArch32 state, the trap is reported using EC syndrome value 0x13.

Note

HCR_EL2.TSC traps execution of the SMC instruction. It is not a routing control for the SMC exception. Trap exceptions and SMC exceptions have different preferred return addresses.

TSC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If EL3 is implemented, then any attempt to execute an SMC instruction at EL1 ~~using AArch64 or EL1 using AArch32~~ is trapped to EL2, when EL2 is enabled in the current Security state, regardless of the value of SCR_EL3.SMD. If EL3 is not implemented, ARMv8.3-NV is implemented, and HCR_EL2.NV is 1, then any attempt to execute an SMC instruction at EL1 using AArch64 is trapped to EL2, when EL2 is enabled in the current Security state. If EL3 is not implemented, and either ARMv8.3-NV is not implemented or HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether: • Any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state. • Any attempt to execute an SMC instruction is UNDEFINED.

In AArch32 state, the Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

SMC instructions are UNDEFINED at EL0.

If EL3 is not implemented and HCR_EL2.NV is 0, it is IMPLEMENTATION DEFINED whether this bit is:

- RES0.
- Implemented with the functionality as described in HCR_EL2.TSC.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TID3, bit [18]

Trap ID group 3. Traps EL1 reads of group 3 ID registers to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, reads of the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - ID_PFR0_EL1, ID_PFR1_EL1, ID_DFR0_EL1, ID_AFR0_EL1, ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, ID_ISAR5_EL1, ID_ISAR6_EL1, MVFR0_EL1, MVFR1_EL1, MVFR2_EL1.
  - ID_AA64PFR0_EL1, ID_AA64PFR1_EL1, ID_AA64DFR0_EL1, ID_AA64DFR1_EL1, ID_AA64ISAR0_EL1, ID_AA64ISAR1_EL1, ID_AA64MMFR0_EL1, ID_AA64MMFR1_EL1, ID_AA64MMFR2_EL1, ID_AA64AFR0_EL1, ID_AA64AFR1_EL1, ID_AA64ZFR0_EL1 (where SVE is implemented), and ID_MMFR4_EL1
- In AArch64 state, ID_MMFR4_EL1 and ID_MMFR5_EL1 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4_EL1 or ID_MMFR5_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch64 state, ID_AA64MMFR2_EL1 and ID_ISAR6_EL1 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_AA64MMFR2_EL1 or ID_ISAR6_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch64 state, ID_DFR1_EL1 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_DFR1_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch64 state, ID_AA64ZFR0_EL1 is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to ID_AA64ZFR0_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch64 state, if~~it is~~ ARMv8.6-FGT~~IMPLEMENTATION DEFINED~~ is~~whether~~ implemented, this field traps all MRS accesses to encodings in the following range that are not already mentioned in this field description, reported using EC syndrome value 0x18:
  - Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7~~c2-c7~~}, op2 == {0-7}.

- OtherwiseIn AArch32 state, inMRC AArch64access statето the following registers are trapped to EL2, itreported isusing EC syndrome value IMPLEMENTATION DEFINED0x03 whether this field traps MRS accesses to encodings in the following range that are not already mentioned in this field description, reported using EC syndrome value 0x18:
    - ID_PFR0, ID_PFR1, ID_DFR0, ID_AFR0, ID_MMFR0, ID_MMFR1, ID_MMFR2, ID_MMFR3, ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, ID_ISAR5, MVFR0, MVFR1, MVFR2, and ID_MMFR4Op0 == 3, op1 == 0, CRn == c0, CRm == {c2-c7}, op2 == {0-7}..
- In AArch32 state, MRC access to the following registers are trapped to EL2, reported using EC syndrome value 0x03:

  In AArch32 state, VMRS access to MVFR0, MVFR1, and MVFR2, reported using EC syndrome value 0x08.
    - ID_PFR0, ID_PFR1, ID_DFR0, ID_AFR0, ID_MMFR0, ID_MMFR1, ID_MMFR2, ID_MMFR3, ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, ID_ISAR5, MVFR0, MVFR1, MVFR2, and ID_MMFR4.
- In AArch32 state, VMRS access to MVFR0, MVFR1, and MVFR2, reported using EC syndrome value 0x08.

  In AArch32 state, ID_MMFR4 and ID_MMFR5 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4 or ID_MMFR5 are trapped to EL2, reported using EC syndrome value 0x03.
- In AArch32 state, ID_MMFR4ID_ISAR6 andis trapped to EL2, unless implemented as RAZ, when it is ID_MMFR5 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4ID_ISAR6 or ID_MMFR5 are trapped to EL2, reported using EC syndrome value 0x03.
- In AArch32 state, ID_ISAR6ID_DFR1 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_ISAR6ID_DFR1 are trapped to EL2, reported using EC syndrome value 0x03.
- In AArch32 state, it is ID_DFR1 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_DFR1 are trapped to EL2, reported using EC syndrome value 0x03.whether this bit traps MRC accesses to encodings that are not already mentioned, with coproc==p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.
- In AArch32 state, if ARMv8.6-FGT is implemented, this field traps all MRC accesses to encodings in the following range that are not already mentioned in this field description, reported using EC syndrome value 0x03:
    - coproc==p15, opc1 == 0, CRn == c0, CRm == {c1-c7}, opc2 == {0-7}.
- Otherwise, in AArch32 state, it is IMPLEMENTATION DEFINED whether this bit traps MRC accesses to encodings that are not already mentioned, with coproc==p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

TID3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 3 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, reads of CTR_EL0, CCSIDR_EL1, CCSIDR2_EL1, CLIDR_EL1, and CSSELR_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 is using AArch64 and the value of SCTLR_EL1.UCT is not 0, reads of CTR_EL0 are trapped to EL2, reported using EC syndrome value 0x18. If the value of SCTLR_EL1.UCT is 0 then EL0 reads of CTR_EL0 are UNDEFINED and any resulting exception takes precedence over this trap.
- If EL1 is using AArch64, writes to CSSELR_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- If EL1 is using AArch32, reads of CTR, CCSIDR, CCSIDR2, CLIDR, and CSSELR are trapped to EL2, reported using EC syndrome value 0x03.

- If EL1 is using AArch32, writes to CSSELR are trapped to EL2, reported using EC syndrome value 0x03.

TID2	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 2 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

TID1, bit [16]

Trap ID group 1. Traps EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, accesses of REVIDR_EL1, AIDR_EL1, reported using EC syndrome value 0x18.
- In AArch32 state, accesses of TCMTR, TLBTR, REVIDR, AIDR, reported using EC syndrome value 0x03.

TID1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 1 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

TID0, bit [15]

When AArch32 is supported at any Exception level:

Trap ID group 0. Traps the following register accesses to EL2:

- EL1 reads of the JIDR, reported using EC syndrome value 0x05.
- If the JIDR is RAZ from EL0, EL0 reads of the JIDR, reported using EC syndrome value 0x05.
- EL1 accesses using VMRS of the FPSID, reported using EC syndrome value 0x08.

Note

- It is IMPLEMENTATION DEFINED whether the JIDR is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then any resulting exception takes precedence over this trap.
- The FPSID is not accessible at EL0 using AArch32.
- Writes to the FPSID are ignored, and not trapped by this control.

TID0	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 0 registers are trapped to EL2, when EL2 is enabled in the current Security state.

~~In an AArch64 only implementation, this bit is RES0.~~

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [14]

Traps EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value `0x01`.

TWE	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any attempt to execute a WFE instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE or SCTLR_EL1.nTWE.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

TWI, bit [13]

Traps EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value `0x01`.

TWI	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any attempt to execute a WFI instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI or SCTLR_EL1.nTWI.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

DC, bit [12]

Default Cacheability.

DC	Meaning
0b0	This control has no effect on the EL1&0 translation regime.
0b1	In both Security states: • When EL1 is using AArch64, the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of SCTLR_EL1. • When EL1 is using AArch32, the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of SCTLR. • The PE behaves as if the value of the HCR_EL2.VM field is 1 for all purposes other than returning the value of a direct read of HCR_EL2. • The memory type produced by stage 1 of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.

This field has no effect on the EL2, EL2&0, and EL3 translation regimes.

This field is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this field.

This field resets to an architecturally UNKNOWN value.

BSU, bits [11:10]

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from EL1 or EL0:

BSU	Meaning
0b00	No effect.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0b00 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

FB, bit [9]

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from EL1:

AArch32: BPIALL, TLBIALL, TLBIMVA, TLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, ITLBIALL, ITLBIMVA, ITLBIASID, TLBIMVAA, ICIALLU, TLBIMVAL, TLBIMVAAL.

AArch64: TLBI VMALLE1, TLBI VAE1, TLBI ASIDE1, TLBI VAAE1, TLBI VALE1, TLBI VAALE1, IC IALLU, TLBI RVAE1, TLBI RVAAE1, TLBI RVALE1, TLBI RVAALE1.

FB	Meaning
0b0	This field has no effect on the operation of the specified instructions.
0b1	When one of the specified instruction is executed at EL1, the instruction is broadcast within the Inner Shareable shareability domain.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

VSE, bit [8]

Virtual SError interrupt.

VSE	Meaning
0b0	This mechanism is not making a virtual SError interrupt pending.
0b1	A virtual SError interrupt is pending because of this mechanism.

The virtual SError interrupt is only enabled when the value of HCR_EL2.{TGE, AMO} is {0, 1}.

This field resets to an architecturally UNKNOWN value.

VI, bit [7]

Virtual IRQ Interrupt.

VI	Meaning
0b0	This mechanism is not making a virtual IRQ pending.
0b1	A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of HCR_EL2.{TGE, IMO} is {0, 1}.

This field resets to an architecturally UNKNOWN value.

VF, bit [6]

Virtual FIQ Interrupt.

VF	Meaning
0b0	This mechanism is not making a virtual FIQ pending.
0b1	A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR_EL2.{TGE, FMO} is {0, 1}.

This field resets to an architecturally UNKNOWN value.

AMO, bit [5]

Physical SError interrupt routing.

AMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: • Physical SError interrupts are not taken to EL2. • When the value of HCR_EL2.TGE is 0, if the PE is executing at EL2 using AArch64, physical SError interrupts are not taken unless they are routed to EL3 by the SCR_EL3.EA bit. • Virtual SError interrupts are disabled.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: • Physical SError interrupts are taken to EL2, unless they are routed to EL3. • When the value of HCR_EL2.TGE is 0, then virtual SError interrupts are enabled.

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the AMO bit physical asynchronous External aborts and SError interrupts target EL2 unless they are routed to EL3.
- When ARMv8.1-VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When ARMv8.1-VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers' Model).

This field resets to an architecturally UNKNOWN value.

IMO, bit [4]

Physical IRQ Routing.

IMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: • Physical IRQ interrupts are not taken to EL2. • When the value of HCR_EL2.TGE is 0, if the PE is executing at EL2 using AArch64, physical IRQ interrupts are not taken unless they are routed to EL3 by the SCR_EL3.IRQ bit. • Virtual IRQ interrupts are disabled.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: • Physical IRQ interrupts are taken to EL2, unless they are routed to EL3. • When the value of HCR_EL2.TGE is 0, then Virtual IRQ interrupts are enabled.

If EL2 is enabled in the current Security state, and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the IMO bit, physical IRQ Interrupts target EL2 unless they are routed to EL3.
- When ARMv8.1-VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When ARMv8.1-VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1.

This field resets to an architecturally UNKNOWN value.

FMO, bit [3]

Physical FIQ Routing.

FMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: • Physical FIQ interrupts are not taken to EL2. • When the value of HCR_EL2.TGE is 0, if the PE is executing at EL2 using AArch64, physical FIQ interrupts are not taken unless they are routed to EL3 by the SCR_EL3.FIQ bit. • Virtual FIQ interrupts are disabled.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: • Physical FIQ interrupts are taken to EL2, unless they are routed to EL3. • When HCR_EL2.TGE is 0, then Virtual FIQ interrupts are enabled.

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the FMO bit, physical FIQ Interrupts target EL2 unless they are routed to EL3.
- When ARMv8.1-VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When ARMv8.1-VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1.

This field resets to an architecturally UNKNOWN value.

PTW, bit [2]

Protected Table Walk. In the EL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs, then the value of this bit determines the behavior:

PTW	Meaning
0b0	The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.
0b1	The memory access generates a stage 2 Permission fault.

This field is permitted to be cached in a TLB.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

SWIO, bit [1]

Set/Way Invalidation Override. Causes EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way:

SWIO	Meaning
0b0	This control has no effect on the operation of data cache invalidate by set/way instructions.
0b1	Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When the value of this bit is 1:

AArch32: DCISW performs the same invalidation as a DCCISW instruction.

AArch64: DC ISW performs the same invalidation as a DC CISW instruction.

This bit can be implemented as RES1.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

This field resets to an architecturally UNKNOWN value.

VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the EL1&0 translation regime, when EL2 is enabled in the current Security state.

VM	Meaning
0b0	EL1&0 stage 2 address translation disabled.
0b1	EL1&0 stage 2 address translation enabled.

When the value of this bit is 1, data cache invalidate instructions executed at EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR_EL2.SWIO bit.

This bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Accessing the HCR_EL2

Accesses to this register use the following encodings:

MRS <Xt>, HCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x078];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HCR_EL2;
elsif PSTATE.EL == EL3 then
    return HCR_EL2;
```

MSR HCR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x078] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HCR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    HCR_EL2 = X[t];
```

HDFGRTR_EL2, Hypervisor Debug Fine-Grained Read Trap Register

The HDFGRTR_EL2 characteristics are:

Purpose

Provides controls for traps of MRS and MRC reads of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

This register is present only when ARMv8.6-FGT is implemented. Otherwise, direct accesses to HDFGRTR_EL2 are UNDEFINED.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

HDFGRTR_EL2 is a 64-bit register.

Field descriptions

The HDFGRTR_EL2 bit assignments are:

63	62	61	60	59	58	57
RES0					PMCEIDn_EL0~~PMUSERENR_EL0~~	PMUSERENR_EL0~~RE~~
PMSIRR_EL1	PMSIDR_EL1	PMSICR_EL1	PMSFCR_EL1	PMSEVFR_EL1	PMSCR_EL1	PMBSR_EL1
31	30	29	28	27	26	25

Bits [63:59~~58~~]

Reserved, RES0.

PMCEIDn_EL0, bit [58]

When PMUv3 is implemented:

Trap MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCEIDn_EL0	Meaning
0b0	MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMCEID<n> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMUSERENR_EL0, bit [57]

When PMUv3 is implemented:

Trap MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMUSERENR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMUSERENR_EL0	Meaning
0b0	MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMUSERENR at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMUSERENR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [56:49]

Reserved, RES0.

TRCVICTLR, bit [48]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCVICTLR at EL1 using AArch64 to EL2.

TRCVICTLR	Meaning
0b0	MRS reads of TRCVICTLR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of TRCVICTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCSTATR, bit [47]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCSTATR at EL1 using AArch64 to EL2.

TRCSTATR	Meaning
0b0	MRS reads of TRCSTATR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of TRCSTATR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCSSCSRn, bit [46]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCSSCSR<n> at EL1 using AArch64 to EL2.

TRCSSCSRn	Meaning
0b0	MRS reads of TRCSSCSR<n> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of TRCSSCSR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Single-shot Comparator n is not implementented, a read of TRCSSCSR<n> is UNDEFINED.

This bit is RES0 if TRCSSCSR<n> are not implemented.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCSEQSTR, bit [45]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCSEQSTR at EL1 using AArch64 to EL2.

TRCSEQSTR	Meaning
0b0	MRS reads of TRCSEQSTR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of TRCSEQSTR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

This bit is RES0 if TRCSEQSTR is not implemented.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCPRGCTLR, bit [44]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCPRGCTLR at EL1 using AArch64 to EL2.

TRCPRGCTLR	Meaning
0b0	MRS reads of TRCPRGCTLR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of TRCPRGCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCOSLSR, bit [43]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCOSLSR at EL1 using AArch64 to EL2.

TRCOSLSR	Meaning
0b0	MRS reads of TRCOSLSR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of TRCOSLSR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TRCIMSPECn, bit [41]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCIMSPEC<n> at EL1 using AArch64 to EL2.

TRCIMSPECn	Meaning
0b0	MRS reads of TRCIMSPEC<n> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of TRCIMSPEC<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If TRCIMSPEC<n> is not implemented, a read of TRCIMSPEC<n> is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCID, bit [40]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TRCDEVARCH.
- TRCDEVID.
- TRCIDR<n>.

TRCID	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

TRCCNTVRn, bit [37]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCCNTVR<n> at EL1 using AArch64 to EL2.

TRCCNTVRn	Meaning
0b0	MRS reads of TRCCNTVR<n> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of TRCCNTVR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Counter n is not implemented, a read of TRCCNTVR<n> is UNDEFINED.

This bit is RES0 if TRCCNTVR<n> are not implemented.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCCLAIM, bit [36]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TRCCLAIMCLR.
- TRCCLAIMSET.

TRCCLAIM	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCAUXCTLR, bit [35]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCAUXCTLR at EL1 using AArch64 to EL2.

TRCAUXCTLR	Meaning
0b0	MRS reads of TRCAUXCTLR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of TRCAUXCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCAUTHSTATUS, bit [34]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCAUTHSTATUS at EL1 using AArch64 to EL2.

TRCAUTHSTATUS	Meaning
0b0	MRS reads of TRCAUTHSTATUS are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of TRCAUTHSTATUS at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRC, bit [33]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TRCACATR<n>.
- TRCACVR<n>.
- TRCBBCTLR.
- TRCCCCTLR.
- TRCCIDCCTLR<n>.
- TRCCIDCVR<n>.
- TRCCNTCTLR<n>.
- TRCCNTRLDVR<n>.
- TRCCONFIGR.
- TRCEVENTCTL0R.
- TRCEVENTCTL1R.
- TRCEXTINSELR.
- TRCQCTLR.
- TRCRSCTLR<n>.
- TRCSEQEVR<n>.
- TRCSEQRSTEVR.
- TRCSSCCR<n>.
- TRCSSPCICR<n>.
- TRCSTALLCTLR.
- TRCSYNCPR.
- TRCTRACEIDR.
- TRCTSCTLR.
- TRCVIIECTLR.
- TRCVIPCSSCTLR.
- TRCVISSCTLR.
- TRCVMIDCCTLR<n>.
- TRCVMIDCVR<n>.

TRC	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

A read of an unimplemented register is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSLATFR_EL1, bit [32]

When SPE is implemented:

Trap MRS reads of PMSLATFR_EL1 at EL1 using AArch64 to EL2.

PMSLATFR_EL1	Meaning
0b0	MRS reads of PMSLATFR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of PMSLATFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSIRR_EL1, bit [31]

When SPE is implemented:

Trap MRS reads of PMSIRR_EL1 at EL1 using AArch64 to EL2.

PMSIRR_EL1	Meaning
0b0	MRS reads of PMSIRR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of PMSIRR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSIDR_EL1, bit [30]

When SPE is implemented:

Trap MRS reads of PMSIDR_EL1 at EL1 using AArch64 to EL2.

PMSIDR_EL1	Meaning
0b0	MRS reads of PMSIDR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of PMSIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSICR_EL1, bit [29]

When SPE is implemented:

Trap MRS reads of PMSICR_EL1 at EL1 using AArch64 to EL2.

PMSICR_EL1	Meaning
0b0	MRS reads of PMSICR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of PMSICR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSFCR_EL1, bit [28]

When SPE is implemented:

Trap MRS reads of PMSFCR_EL1 at EL1 using AArch64 to EL2.

PMSFCR_EL1	Meaning
0b0	MRS reads of PMSFCR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of PMSFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSEVFR_EL1, bit [27]

When SPE is implemented:

Trap MRS reads of PMSEVFR_EL1 at EL1 using AArch64 to EL2.

PMSEVFR_EL1	Meaning
0b0	MRS reads of PMSEVFR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of PMSEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSCR_EL1, bit [26]

When SPE is implemented:

Trap MRS reads of PMSCR_EL1 at EL1 using AArch64 to EL2.

PMSCR_EL1	Meaning
0b0	MRS reads of PMSCR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of PMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBSR_EL1, bit [25]

When SPE is implemented:

Trap MRS reads of PMBSR_EL1 at EL1 using AArch64 to EL2.

PMBSR_EL1	Meaning
0b0	MRS reads of PMBSR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of PMBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBPTR_EL1, bit [24]

When SPE is implemented:

Trap MRS reads of PMBPTR_EL1 at EL1 using AArch64 to EL2.

PMBPTR_EL1	Meaning
0b0	MRS reads of PMBPTR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of PMBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBLIMITR_EL1, bit [23]

When SPE is implemented:

Trap MRS reads of PMBLIMITR_EL1 at EL1 using AArch64 to EL2.

PMBLIMITR_EL1	Meaning
0b0	MRS reads of PMBLIMITR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of PMBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMMIR_EL1, bit [22]

When PMUv3 is implemented:

Trap MRS reads of PMMIR_EL1 at EL1 using AArch64 to EL2.

PMMIR_EL1	Meaning
0b0	MRS reads of PMMIR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of PMMIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [21:20]

Reserved, RES0.

PMSELR_EL0, bit [19]

When PMUv3 is implemented:

Trap MRS reads of PMSELR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMSELR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSELR_EL0	Meaning
0b0	MRS reads of PMSELR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMSELR at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of PMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMSELR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMOVS, bit [18]

When PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of PMOVSCLR_EL0 and PMOVSSET_EL0.
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of PMOVSR and PMOVSSET.

PMOVS	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of PMOVSCLR_EL0 and PMOVSSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 of PMOVSR and PMOVSSET are trapped to EL2 and reported with EC syndrome value 0x03, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMINTEN, bit [17]

When PMUv3 is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- PMINTENCLR_EL1.
- PMINTENSET_EL1.

PMINTEN	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCNTEN, bit [16]

When PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of PMCNTENCLR_EL0 and PMCNTENSET_EL0.
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of PMCNTENCLR and PMCNTENSET.

PMCNTEN	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of PMCNTENCLR_EL0 and PMCNTENSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 of PMCNTENCLR and PMCNTENSET are trapped to EL2 and reported with EC syndrome value 0x03, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCNTR_EL0, bit [15]

When PMUv3 is implemented:

Trap MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MRC and MRRC reads of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCNTR_EL0	Meaning
0b0	MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MRC and MRRC reads of PMCCNTR at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC and MRRC reads of PMCCNTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03 (for MRC) or 0x04 (for MRRC).

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCFILTR_EL0, bit [14]

When PMUv3 is implemented:

Trap MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCFILTR_EL0	Meaning
0b0	MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCCFILTR at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMCCFILTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

PMCCFILTR_EL0 can also be accessed in AArch64 state using PMXEVTYPER_EL0 when PMSELR_EL0.SEL == 31, and PMCCFILTR can also be accessed in AArch32 state using PMXEVTYPER when PMSELR.SEL == 31.

Setting this bit to 1 has no effect on accesses to PMXEVTYPER_EL0 and PMXEVTYPER, regardless of the value of PMSELR_EL0.SEL or PMSELR.SEL.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMEVTYPERn_EL0, bit [13]

When PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of PMEVTYPER<n>_EL0 and PMXEVTYPER_EL0.
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of PMEVTYPER<n> and PMXEVTYPER.

PMEVTYPERn_EL0	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of PMEVTYPER<n>_EL0 and PMXEVTYPER_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 of PMEVTYPER<n> and PMXEVTYPER are trapped to EL2 and reported with EC syndrome value 0x03, unless the read generates a higher priority exception.

WhenIf ARMv8.6-FGT is implemented, ~~EL2 is implemented and enabled in the current Security state,~~ then, regardless of the value of this bit, for each value n ~~in the range UInt(MDCR_EL2.HPMN) to 30~~:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of PMEVTYPER<n>_EL0, or, if n is not 31, a read of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n.
  - In AArch32 state, a read of PMEVTYPER<n>, or, if n is not 31, a read of PMXEVTYPER when PMSELR.SEL == n.
- If event counter n is implemented and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - InAt ~~EL0 or EL1 using~~ AArch64 state, a read of PMEVTYPER<n>_EL0, or a read of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n, reported with EC syndrome value 0x18.
  - InAt ~~EL0 using~~ AArch32 state, a read of PMEVTYPER<n>, or a read of PMXEVTYPER when PMSELR.SEL == n, reported with EC syndrome value 0x03.

See also HDFGRTR_EL2.PMCCFILTR_EL0.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMEVCNTRn_EL0, bit [12]

When PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0.
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of PMEVCNTR<n> and PMXEVCNTR.

PMEVCNTRn_EL0	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 of PMEVCNTR<n> and PMXEVCNTR are trapped to EL2 and reported with EC syndrome value 0x03, unless the read generates a higher priority exception.

WhenIf ARMv8.6-FGT is implemented, ~~EL2 is implemented and enabled in the current Security state,~~ then, regardless of the value of this bit, for each value n ~~in the range UInt(MDCR_EL2.HPMN) to 30~~:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of PMEVCNTR<n>_EL0, or a read of PMXEVCNTR_EL0 when PMSELR_EL0.SEL == n.
  - In AArch32 state, a read of PMEVCNTR<n> , or a read of PMXEVCNTR when PMSELR.SEL == n.
- If event counter n is implemented, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - InAt ~~EL0 or EL1 using~~ AArch64 state, a read of PMEVCNTR<n>_EL0, or a read of PMXEVCNTR_EL0 when PMSELR_EL0.SEL == n, reported with EC syndrome value 0x18.
  - InAt ~~EL0 using~~ AArch32 state, a read of PMEVCNTR<n>, or a read of PMXEVCNTR when PMSELR.SEL == n, reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

OSDLR_EL1, bit [11]

When ARMv8.0-DoubleLock is implemented:

Trap MRS reads of OSDLR_EL1 at EL1 using AArch64 to EL2.

OSDLR_EL1	Meaning
0b0	MRS reads of OSDLR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of OSDLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

OSECCR_EL1, bit [10]

Trap MRS reads of OSECCR_EL1 at EL1 using AArch64 to EL2.

OSECCR_EL1	Meaning
0b0	MRS reads of OSECCR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of OSECCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

OSLSR_EL1, bit [9]

Trap MRS reads of OSLSR_EL1 at EL1 using AArch64 to EL2.

OSLSR_EL1	Meaning
0b0	MRS reads of OSLSR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of OSLSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Bit [8]

Reserved, RES0.

DBGPRCR_EL1, bit [7]

Trap MRS reads of DBGPRCR_EL1 at EL1 using AArch64 to EL2.

DBGPRCR_EL1	Meaning
0b0	MRS reads of DBGPRCR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of DBGPRCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

DBGAUTHSTATUS_EL1, bit [6]

Trap MRS reads of DBGAUTHSTATUS_EL1 at EL1 using AArch64 to EL2.

DBGAUTHSTATUS_EL1	Meaning
0b0	MRS reads of DBGAUTHSTATUS_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of DBGAUTHSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

DBGCLAIM, bit [5]

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- DBGCLAIMCLR_EL1.
- DBGCLAIMSET_EL1.

DBGCLAIM	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

MDSCR_EL1, bit [4]

Trap MRS reads of MDSCR_EL1 at EL1 using AArch64 to EL2.

MDSCR_EL1	Meaning
0b0	MRS reads of MDSCR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of MDSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

DBGWVRn_EL1, bit [3]

Trap MRS reads of DBGWVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWVRn_EL1	Meaning
0b0	MRS reads of DBGWVR<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of DBGWVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint n is not implemented, a read of DBGWVR<n>_EL1 is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

DBGWCRn_EL1, bit [2]

Trap MRS reads of DBGWCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWCRn_EL1	Meaning
0b0	MRS reads of DBGWCR<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of DBGWCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint n is not implemented, a read of DBGWCR<n>_EL1 is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

DBGBVRn_EL1, bit [1]

Trap MRS reads of DBGBVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBVRn_EL1	Meaning
0b0	MRS reads of DBGBVR<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of DBGBVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint n is not implemented, a read of DBGBVR<n>_EL1 is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

DBGBCRn_EL1, bit [0]

Trap MRS reads of DBGBCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBCRn_EL1	Meaning
0b0	MRS reads of DBGBCR<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of DBGBCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint n is not implemented, a read of DBGBCR<n>_EL1 is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

Accessing the HDFGRTR_EL2

Accesses to this register use the following encodings:

```
MRS <Xt>, HDFGRTR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b100

```

HDFGWTR_EL2, Hypervisor Debug Fine-Grained Write Trap Register

The HDFGWTR_EL2 characteristics are:

Purpose

Provides controls for traps of MSR and MCR writes of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

This register is present only when ARMv8.6-FGT is implemented. Otherwise, direct accesses to HDFGWTR_EL2 are UNDEFINED.

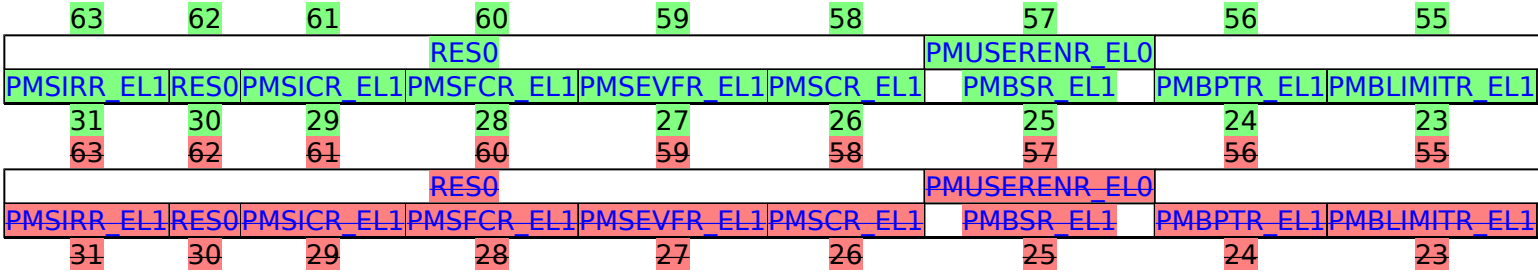
~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

HDFGWTR_EL2 is a 64-bit register.

Field descriptions

The HDFGWTR_EL2 bit assignments are:



Bits [63:58]

Reserved, RES0.

PMUSERENR_EL0, bit [57]

When PMUv3 is implemented:

Trap MSR writes of PMUSERENR_EL0 at EL1 using AArch64 to EL2.

PMUSERENR_EL0	Meaning
0b0	MSR writes of PMUSERENR_EL0 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of PMUSERENR_EL0 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [56:50]

Reserved, RES0.

TRFCR_EL1, bit [49]

When ARMv8.4-Trace is implemented:

Trap MSR writes of TRFCR_EL1 at EL1 using AArch64 to EL2.

TRFCR_EL1	Meaning
0b0	MSR writes of TRFCR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of TRFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCVICTLR, bit [48]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCVICTLR at EL1 using AArch64 to EL2.

TRCVICTLR	Meaning
0b0	MSR writes of TRCVICTLR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of TRCVICTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [47]

Reserved, RES0.

TRCSSCSRn, bit [46]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCSSCSR<n> at EL1 using AArch64 to EL2.

TRCSSCSRn	Meaning
0b0	MSR writes of TRCSSCSR<n> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of TRCSSCSR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Single-shot Comparator n is not implementented, a write of TRCSSCSR<n> is UNDEFINED.

This bit is RES0 if TRCSSCSR<n> are not implemented.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCSEQSTR, bit [45]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCSEQSTR at EL1 using AArch64 to EL2.

TRCSEQSTR	Meaning
0b0	MSR writes of TRCSEQSTR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of TRCSEQSTR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

This bit is RES0 if TRCSEQSTR is not implemented.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCPRGCTLR, bit [44]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCPRGCTLR at EL1 using AArch64 to EL2.

TRCPRGCTLR	Meaning
0b0	MSR writes of TRCPRGCTLR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of TRCPRGCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [43]

Reserved, RES0.

TRCOSLAR, bit [42]

When the Trace Extension is implemented, System register access to the PE Trace Unit registers is implemented and ETMv4 is implemented:

Trap MSR writes of TRCOSLAR at EL1 using AArch64 to EL2.

TRCOSLAR	Meaning
0b0	MSR writes of TRCOSLAR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of TRCOSLAR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCIMSPECn, bit [41]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCIMSPEC<n> at EL1 using AArch64 to EL2.

TRCIMSPECn	Meaning
0b0	MSR writes of TRCIMSPEC<n> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of TRCIMSPEC<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If TRCIMSPEC<n> is not implemented, a write of TRCIMSPEC<n> is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

~~Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:~~

- ~~TRCDEVARCH.~~
- ~~TRCDEVID.~~
- ~~TRCIDR<n>.~~

~~TRCID~~	~~Meaning~~
~~0b0~~	~~MSR writes of the System registers listed above are not affected by this bit.~~
~~0b1~~	~~If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.~~

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

BitsTRCID, bit [40:38]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

TRCCNTVRn, bit [37]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCCNTVR<n> at EL1 using AArch64 to EL2.

TRCCNTVRn	Meaning
0b0	MSR writes of TRCCNTVR<n> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of TRCCNTVR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Counter n is not implemented, a write of TRCCNTVR<n> is UNDEFINED.

This bit is RES0 if TRCCNTVR<n> are not implemented.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCCLAIM, bit [36]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TRCCLAIMCLR.
- TRCCLAIMSET.

TRCCLAIM	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCAUXCTLR, bit [35]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCAUXCTLR at EL1 using AArch64 to EL2.

TRCAUXCTLR	Meaning
0b0	MSR writes of TRCAUXCTLR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of TRCAUXCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [34]

Reserved, RES0.

TRC, bit [33]

When the Trace Extension is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TRCACATR<n>.
- TRCACVR<n>.
- TRCBBCTLR.
- TRCCCCTLR.
- TRCCIDCCTLR<n>.
- TRCCIDCVR<n>.
- TRCCNTCTLR<n>.
- TRCCNTRLDVR<n>.
- TRCCONFIGR.
- TRCEVENTCTL0R.
- TRCEVENTCTL1R.
- TRCEXTINSELR, if ETMv4 is implemented.
- TRCRSCTLR<n>.
- TRCSEQEVR<n>.
- TRCSEQRSTEVR.
- TRCSSCCR<n>.
- TRCSSPCICR<n>.
- TRCSTALLCTLR.
- TRCSYNCPR.
- TRCTRACEIDR.
- TRCTSCTLR.
- TRCVIIECTLR.
- TRCVIPCSSCTLR.
- TRCVISSCTLR.
- TRCVMIDCCTLR<n>.
- TRCVMIDCVR<n>.

TRC	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

A write of an unimplemented register is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSLATFR_EL1, bit [32]

When SPE is implemented:

Trap MSR writes of PMSLATFR_EL1 at EL1 using AArch64 to EL2.

PMSLATFR_EL1	Meaning
0b0	MSR writes of PMSLATFR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of PMSLATFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSIRR_EL1, bit [31]

When SPE is implemented:

Trap MSR writes of PMSIRR_EL1 at EL1 using AArch64 to EL2.

PMSIRR_EL1	Meaning
0b0	MSR writes of PMSIRR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of PMSIRR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [30]

Reserved, RES0.

PMSICR_EL1, bit [29]

When SPE is implemented:

Trap MSR writes of PMSICR_EL1 at EL1 using AArch64 to EL2.

PMSICR_EL1	Meaning
0b0	MSR writes of PMSICR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of PMSICR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSFCR_EL1, bit [28]

When SPE is implemented:

Trap MSR writes of PMSFCR_EL1 at EL1 using AArch64 to EL2.

PMSFCR_EL1	Meaning
0b0	MSR writes of PMSFCR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of PMSFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSEVFR_EL1, bit [27]

When SPE is implemented:

Trap MSR writes of PMSEVFR_EL1 at EL1 using AArch64 to EL2.

PMSEVFR_EL1	Meaning
0b0	MSR writes of PMSEVFR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of PMSEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSCR_EL1, bit [26]

When SPE is implemented:

Trap MSR writes of PMSCR_EL1 at EL1 using AArch64 to EL2.

PMSCR_EL1	Meaning
0b0	MSR writes of PMSCR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of PMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBSR_EL1, bit [25]

When SPE is implemented:

Trap MSR writes of PMBSR_EL1 at EL1 using AArch64 to EL2.

PMBSR_EL1	Meaning
0b0	MSR writes of PMBSR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of PMBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBPTR_EL1, bit [24]

When SPE is implemented:

Trap MSR writes of PMBPTR_EL1 at EL1 using AArch64 to EL2.

PMBPTR_EL1	Meaning
0b0	MSR writes of PMBPTR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of PMBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBLIMITR_EL1, bit [23]

When SPE is implemented:

Trap MSR writes of PMBLIMITR_EL1 at EL1 using AArch64 to EL2.

PMBLIMITR_EL1	Meaning
0b0	MSR writes of PMBLIMITR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of PMBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [22]

Reserved, RES0.

PMCR_EL0, bit [21]

When PMUv3 is implemented:

Trap MSR writes of PMCR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCR_EL0	Meaning
0b0	MSR writes of PMCR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCR at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes of PMCR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMCR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSWINC_EL0, bit [20]

When PMUv3 is implemented:

Trap MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSWINC at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSWINC_EL0	Meaning
0b0	MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSWINC at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMSWINC at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSELR_EL0, bit [19]

When PMUv3 is implemented:

Trap MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSELR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSELR_EL0	Meaning
0b0	MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSELR at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMSELR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMOVS, bit [18]

When PMUv3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of PMOVSCLR_EL0 and PMOVSSET_EL0.
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of PMOVSR and PMOVSSET.

PMOVS	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes at EL1 and EL0 using AArch64 of PMOVSCLR_EL0 and PMOVSSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 of PMOVSR and PMOVSSET are trapped to EL2 and reported with EC syndrome value 0x03, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMINTEN, bit [17]

When PMUv3 is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- PMINTENCLR_EL1.
- PMINTENSET_EL1.

PMINTEN	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCNTEN, bit [16]

When PMUv3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of PMCNTENCLR_EL0 and PMCNTENSET_EL0.
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of PMCNTENCLR and PMCNTENSET.

PMCNTEN	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes at EL1 and EL0 using AArch64 of PMCNTENCLR_EL0 and PMCNTENSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 of PMCNTENCLR and PMCNTENSET are trapped to EL2 and reported with EC syndrome value 0x03, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCNTR_EL0, bit [15]

When PMUv3 is implemented:

Trap MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MCR and MCRR writes of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCNTR_EL0	Meaning
0b0	MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MCR and MCRR writes of PMCCNTR at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR and MCRR writes of PMCCNTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03 (for MCR) or 0x04 (for MCRR).

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCFILTR_EL0, bit [14]

When PMUv3 is implemented:

Trap MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCFILTR_EL0	Meaning
0b0	MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCCFILTR at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMCCFILTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

PMCCFILTR_EL0 can also be accessed in AArch64 state using PMXEVTYPER_EL0 when PMSELR_EL0.SEL == 31, and PMCCFILTR can also be accessed in AArch32 state using PMXEVTYPER when PMSELR.SEL == 31.

Setting this bit to 1 has no effect on accesses to PMXEVTYPER_EL0 and PMXEVTYPER, regardless of the value of PMSELR_EL0.SEL or PMSELR.SEL.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMEVTYPERn_EL0, bit [13]

When PMUv3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of PMEVTYPER<n>_EL0 and PMXEVTYPER_EL0.
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of PMEVTYPER<n> and PMXEVTYPER.

PMEVTYPERn_EL0	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes at EL1 and EL0 using AArch64 of PMEVTYPER<n>_EL0 and PMXEVTYPER_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 of PMEVTYPER<n> and PMXEVTYPER are trapped to EL2 and reported with EC syndrome value 0x03, unless the write generates a higher priority exception.

WhenIf ARMv8.6-FGT is implemented, ~~EL2 is implemented and enabled in the current Security state,~~ then, regardless of the value of this bit, for each value n ~~in the range UInt(MDCR_EL2.HPMN) to 30~~:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a write of PMEVTYPER<n>_EL0, or, if n is not 31, a write of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n.

    - In AArch32 state, a write of PMEVTYPER<n>, or, if n is not 31, a write of PMXEVTYPER when PMSELR.SEL == n.

- If event counter n is implemented and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:

    - InAt ~~EL0 or EL1 using~~ AArch64 state, a write of PMEVTYPER<n>_EL0, or a write of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n, reported with EC syndrome value `0x18`.

    - InAt ~~EL0 using~~ AArch32 state, a write of PMEVTYPER<n>, or a write of PMXEVTYPER when PMSELR.SEL == n, reported with EC syndrome value `0x03`.

See also HDFGWTR_EL2.PMCCFILTR_EL0.

In a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

PMEVCNTRn_EL0, bit [12]

When PMUv3 is implemented:

Trap `MSR` writes and `MCR` writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: `MSR` writes of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0.
- At EL0 using Arch32 when EL1 is using AArch64: `MCR` writes of PMEVCNTR<n> and PMXEVCNTR.

PMEVCNTRn_EL0	Meaning
`0b0`	The operations listed above are not affected by this bit.
`0b1`	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • `MSR` writes at EL1 and EL0 using AArch64 of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0 are trapped to EL2 and reported with EC syndrome value `0x18`. • `MCR` writes at EL0 using AArch32 of PMEVCNTR<n> and PMXEVCNTR are trapped to EL2 and reported with EC syndrome value `0x03`, unless the write generates a higher priority exception.

WhenIf ARMv8.6-FGT is implemented, ~~EL2 is implemented and enabled in the current Security state,~~ then, regardless of the value of this bit, for each value n ~~in the range UInt(MDCR_EL2.HPMN) to 30~~:

- If event counter n is not implemented, the following accesses are UNDEFINED:

    - In AArch64 state, a write of PMEVCNTR<n>_EL0, or a write of PMXEVCNTR_EL0 when PMSELR_EL0.SEL == n.

    - In AArch32 state, a write of PMEVCNTR<n> , or a write of PMXEVCNTR when PMSELR.SEL == n.

- If event counter n is implemented, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:

    - InAt ~~EL0 or EL1 using~~ AArch64 state, a write of PMEVCNTR<n>_EL0, or a write of PMXEVCNTR_EL0 when PMSELR_EL0.SEL == n, reported with EC syndrome value `0x18`.

- InAt EL0 using AArch32 state, a write of PMEVCNTR<n>, or a write of PMXEVCNTR when PMSELR.SEL == n, reported with EC syndrome value 0x03.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

OSDLR_EL1, bit [11]

When ARMv8.0-DoubleLock is implemented:

Trap MSR writes of OSDLR_EL1 at EL1 using AArch64 to EL2.

OSDLR_EL1	Meaning
0b0	MSR writes of OSDLR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of OSDLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

OSECCR_EL1, bit [10]

Trap MSR writes of OSECCR_EL1 at EL1 using AArch64 to EL2.

OSECCR_EL1	Meaning
0b0	MSR writes of OSECCR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of OSECCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Bit [9]

Reserved, RES0.

OSLAR_EL1, bit [8]

Trap MSR writes of OSLAR_EL1 at EL1 using AArch64 to EL2.

OSLAR_EL1	Meaning
0b0	MSR writes of OSLAR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of OSLAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

DBGPRCR_EL1, bit [7]

Trap MSR writes of DBGPRCR_EL1 at EL1 using AArch64 to EL2.

DBGPRCR_EL1	Meaning
0b0	MSR writes of DBGPRCR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of DBGPRCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

Bit [6]

Reserved, RES0.

DBGCLAIM, bit [5]

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- DBGCLAIMCLR_EL1.
- DBGCLAIMSET_EL1.

DBGCLAIM	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

MDSCR_EL1, bit [4]

Trap MSR writes of MDSCR_EL1 at EL1 using AArch64 to EL2.

MDSCR_EL1	Meaning
0b0	MSR writes of MDSCR_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of MDSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

DBGWVRn_EL1, bit [3]

Trap MSR writes of DBGWVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWVRn_EL1	Meaning
0b0	MSR writes of DBGWVR<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of DBGWVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of DBGWVR<n>_EL1 is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

DBGWCRn_EL1, bit [2]

Trap MSR writes of DBGWCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWCRn_EL1	Meaning
0b0	MSR writes of DBGWCR<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of DBGWCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of DBGWCR<n>_EL1 is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

DBGBVRn_EL1, bit [1]

Trap MSR writes of DBGBVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBVRn_EL1	Meaning
0b0	MSR writes of DBGBVR<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of DBGBVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of DBGBVR<n>_EL1 is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

DBGBCRn_EL1, bit [0]

Trap MSR writes of DBGBCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBCRn_EL1	Meaning
0b0	MSR writes of DBGBCR<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of DBGBCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of DBGBCR<n>_EL1 is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

Accessing the HDFGWTR_EL2

Accesses to this register use the following encodings:

MRS <Xt>, HDFGWTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;

HSTR_EL2, Hypervisor System Trap Register

The HSTR_EL2 characteristics are:

Purpose

Controls trapping to EL2 of EL1 or lower AArch32 accesses to the System register in the coproc == 0b1111 encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCRR or MRRC instruction, this is the CRm value used to access the register.

Configuration

AArch64 System register HSTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSTR[31:0] .

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HSTR_EL2 are RES0.

If EL2 is not implemented, this register is RES0 from EL3.

~~If no Exception level can use AArch32, then this register is RES0.~~

This register has no effect if EL2 is not enabled in the current Security state.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

HSTR_EL2 is a 64-bit register.

Field descriptions

The HSTR_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																T15	T14	T13	T12	T11	T10	T9	T8	T7	T6	T5	T4	T3	T2	T1	T0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:16]

Reserved, RES0.

T<n>, bit [n], for n = 0 to 15

Fields T14 and T4 are RES0.

The remaining fields control whether EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 0b1111 encoding space are trapped to EL2 as follows:

- MCR or MRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x03, unless the access is UNDEFINED.
- MCRR or MRRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x04, unless the access is UNDEFINED.

T<n>	Meaning
0b0	This control has no effect on EL0 or EL1 accesses to System registers.
0b1	Any EL1 MCR or MRC access with coproc == 0b1111 and CRn == <n> is trapped to EL2. An EL0 MCR or MRC access with these values is trapped to EL2 only if the access is not UNDEFINED when the value of this field is 0. Any EL1 MCRR or MRRC access with coproc == 0b1111 and CRm == <n> is trapped to EL2. An EL0 MCRR or MRRC access with these values is trapped to EL2 only if the access is not UNDEFINED when the value of this field is 0. It is IMPLEMENTATION DEFINED whether a Non-secure EL0 access using AArch32 to these registers is trapped to EL2, or is UNDEFINED and generates an exception that is taken to Non-secure EL1. If the access is UNDEFINED, and generates an exception that is taken to Non-secure EL1 using AArch64, this is reported with EC syndrome value 0x00. **Note** Arm expects that trapping to EL2 of Non-secure EL0 accesses to these registers is unusual and used only when the hypervisor must virtualize EL0 operation. Arm recommends that, whenever possible, Non-secure EL0 accesses to these registers behave as they would if the implementation did not include EL2. This means that, if the architecture does not support the Non-secure EL0 access, then the register access instruction is treated as UNDEFINED and generates an exception that is taken to Non-secure EL1.

For example, when HSTR_EL2.T7 is 1, for instructions executed at EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to EL2.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to EL2.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Accessing the HSTR_EL2

Accesses to this register use the following encodings:

```
MRS <Xt>, HSTR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x080];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HSTR_EL2;
elsif PSTATE.EL == EL3 then
    return HSTR_EL2;
```

```
MSR HSTR_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x080] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HSTR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    HSTR_EL2 = X[t];
```

ICC_CTLR_EL1, Interrupt Controller Control Register (EL1)

The ICC_CTLR_EL1 characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Configuration

AArch64 System register ICC_CTLR_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register ICC_CTLR[31:0] (S) .

AArch64 System register ICC_CTLR_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register ICC_CTLR[31:0] (NS) .

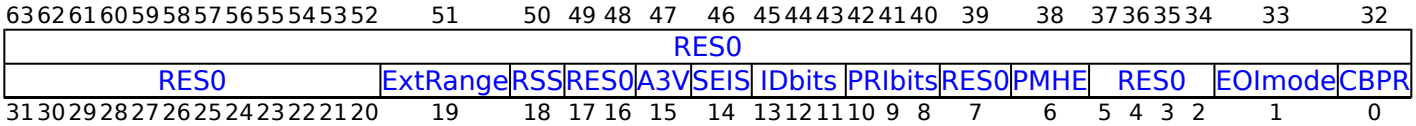
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

ICC_CTLR_EL1 is a 64-bit register.

Field descriptions

The ICC_CTLR_EL1 bit assignments are:



Bits [63:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. • Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. **Note** Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191 • All INTIDs in the range 1024..8191 are treated as requiring deactivation.

If EL3 is implemented, ICC_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL3.ExtRange.

RSS, bit [18]

Range Selector Support. Possible values are:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

A3V	Meaning
0b0	The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.A3V.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

SEIS	Meaning
0b0	The CPU interface logic does not support local generation of SEIs.
0b1	The CPU interface logic supports local generation of SEIs.

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.SEIS.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is implemented, this field is an alias of ICC_CTLR_EL3.IDbits.

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of GICD_CTLR.DS.

For physical accesses, this field determines the minimum value of ICC_BPR0_EL1.

If EL3 is implemented, physical accesses return the value from ICC_CTLR_EL3.PRIbits.

If EL3 is not implemented, physical accesses return the value from this field.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

PMHE	Meaning
0b0	Disables use of ICC_PMR_EL1 as a hint for interrupt distribution.
0b1	Enables use of ICC_PMR_EL1 as a hint for interrupt distribution.

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.PMHE. Whether this bit can be written as part of an access to this register depends on the value of GICD_CTLR.DS:

- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

Bits [5:2]

Reserved, RES0.

EOImode, bit [1]

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

EOImode	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

The Secure ICC_CTLR_EL1.EOImode~~EOIMode~~ is an alias of ICC_CTLR_EL3.EOImode_EL1S.

The Non-secure ICC_CTLR_EL1.EOImode~~EOIMode~~ is an alias of ICC_CTLR_EL3.EOImode_EL1NS

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Group 1 interrupts.
0b1	ICC_BPR0_EL1 determines the preemption group for both Group 0 and Group 1 interrupts.

If EL3 is implemented:

- This bit is an alias of ICC_CTLR_EL3.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, this bit is read/write.

This field resets to an architecturally UNKNOWN value.

Accessing the ICC_CTLR_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ICC_CTLR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if ICC_SRE_EL1.SRE == '0' then
        AArch64.SystemAccessTrap(EL1, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && ICH_HCR_EL2.TC == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.FMO == '1' then
        return ICV_CTLR_EL1;
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.IMO == '1' then

ICC_CTLR_EL3, Interrupt Controller Control Register (EL3)

The ICC_CTLR_EL3 characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Configuration

AArch64 System register ICC_CTLR_EL3 bits [31:0] can be mapped to AArch32 System register ICC_MCTLR[31:0] , but this is not architecturally mandated.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to ICC_CTLR_EL3 are UNDEFINED.

Attributes

ICC_CTLR_EL3 is a 64-bit register.

Field descriptions

The ICC_CTLR_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35
RES0																												
RES0												ExtRange	RSS	nDS	RES0	A3V	SEIS	IDbits			PRIbits			RES0		PMHE	RM	EOImode_EL1NS	EOImode_EL
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3

Bits [63:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. • Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. **Note** Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191 • All INTIDs in the range 1024..8191 are treated as requiring deactivation.

RSS, bit [18]

Range Selector Support. ~~Possible values are:~~

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0-150~~ - 15~~ are supported.
0b1	Targeted SGIs with affinity level 0 values of 0-2550~~ - 255~~ are supported.

This bit is read-only.

nDS, bit [17]

Disable Security not supported. Read-only and writes are ignored. ~~Possible values are:~~

nDS	Meaning
0b0	The CPU interface logic supports disabling of security.
0b1	The CPU interface logic does not support disabling of security, and requires that security is not disabled.

Bit [16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. ~~Possible values are:~~

A3V	Meaning
0b0	The CPU interface logic does not support non-zero values of the Aff3 field in SGI generation System registers.
0b1	The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers.

If EL3 is present, ICC_CTLR_EL1.A3V~~AV3~~ is an alias of ICC_CTLR_EL3.A3V

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The CPU interface logic does not support generation of SEIs.
0b1	The CPU interface logic supports generation of SEIs.

If EL3 is present, ICC_CTLR_EL1.SEIS is an alias of ICC_CTLR_EL3.SEIS

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. Indicates~~The~~ the number of physical interrupt identifier bits supported.~~supported:~~

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is present, ICC_CTLR_EL1.IDbits is an alias of ICC_CTLR_EL3.IDbits

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the value of SCR_EL3.NS or the value of GICD_CTLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0_EL1 and ICC_BPR1_EL1.

This field determines the minimum value of ICC_BPR0_EL1.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable.

PMHE	Meaning
0b0	Disables use of the priority mask register as a hint for interrupt distribution.
0b1	Enables use of the priority mask register as a hint for interrupt distribution.

Software must write ICC_PMR_EL1 to 0xFF before clearing this field to 0.

- An implementation might choose to make this field RAO/WI if priority-based routing is always used
- An implementation might choose to make this field RAZ/WI if priority-based routing is never used

If EL3 is present, ICC_CTLR_EL1.PMHE is an alias of ICC_CTLR_EL3.PMHE.

This field resets to 0.

RM, bit [5]

Routing Modifier. For legacy operation of EL1 software with GICC_CTLR.FIQEn~~FIQen~~ set to 1, this bit indicates whether interrupts can be acknowledged or observed as the Highest Priority Pending Interrupt, or whether a special INTID value is returned.

Possible values of this bit are:

RM	Meaning
0b0	Secure Group 0 and Non-secure Group 1 interrupts can be acknowledged and observed as the highest priority interrupt at the Secure Exception level where the interrupt is taken.
0b1	When accessed at EL3 in AArch64 state: • Secure Group 0 interrupts return a special INTID value of 1020. This affects accesses to ICC_IAR0_EL1 and ICC_HPPIR0_EL1. • Non-secure Group 1 interrupts return a special INTID value of 1021. This affects accesses to ICC_IAR1_EL1 and ICC_HPPIR1_EL1.

Note

The Routing Modifier bit is supported in AArch64 only. In systems without EL3 the behavior is as if the value is 0. Software must ensure this bit is 0 when the Secure copy of ICC_SRE_EL1.SRE is 1, otherwise system behavior is

UNPREDICTABLE. In systems without EL3 or where the Secure copy of ICC_SRE_EL1.SRE is RAO/WI, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

EOImode_EL1NS, bit [4]

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.~~interrupt.~~

EOImode_EL1NS	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

If EL3 is present, ICC_CTLR_EL1(NS).EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1NS.

This field resets to an architecturally UNKNOWN value.

EOImode_EL1S, bit [3]

EOI mode for interrupts handled at Secure EL1. Controls whether a write to an End of Interrupt register also deactivates the interrupt.~~interrupt.~~

EOImode_EL1S	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

If EL3 is present, ICC_CTLR_EL1(S).EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1S.

This field resets to an architecturally UNKNOWN value.

EOImode_EL3, bit [2]

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt.~~interrupt.~~

EOImode_EL3	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

This field resets to an architecturally UNKNOWN value.

CBPR_EL1NS, bit [1]

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.~~EL2.~~

CBPR_EL1NS	Meaning
0b0	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Non-secure Group 1 interrupts.
0b1	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1_EL1 access the state of ICC_BPR0_EL1.

If EL3 is present, ICC_CTLR_EL1(NS).CBPR is an alias of ICC_CTLR_EL3.CBPR_EL1NS.

This field resets to an architecturally UNKNOWN value.

CBPR_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts at EL1.~~EL1.~~

CBPR_EL1S	Meaning
0b0	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Secure Group 1 interrupts.
0b1	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 accesses to ICC_BPR1_EL1 access the state of ICC_BPR0_EL1.

If EL3 is present, ICC_CTLR_EL1(S).CBPR is an alias of ICC_CTLR_EL3.CBPR_EL1S.

This field resets to an architecturally UNKNOWN value.

ICC_EOIR0_EL1, Interrupt Controller End Of Interrupt Register 0

The ICC_EOIR0_EL1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

Configuration

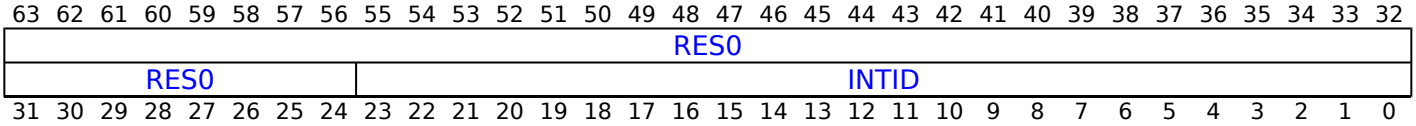
AArch64 System register ICC_EOIR0_EL1 performs the same function as AArch32 System register ICC_EOIR0.

Attributes

ICC_EOIR0_EL1 is a 64-bit register.

Field descriptions

The ICC_EOIR0_EL1 bit assignments are:



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICC_IAR0_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR_EL1 to deactivate the interrupt.

The EOImode bit for the current Exception level and Security state is determined as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR_EL1.EOIMode.~~EOImode.~~
- If EL3 is implemented and the software is executing at EL3, the appropriate bit is ICC_CTLR_EL3.EOImode_EL3.
- If EL3 is implemented and the software is not executing at EL3, the bit depends on the current Security state:
    - If the software is executing in Secure state, the bit is ICC_CTLR_EL3.EOImode_EL1S.
    - If the software is executing in Non-secure state, the bit is ICC_CTLR_EL3.EOImode_EL1NS.

Accessing the ICC_EOIR0_EL1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR0_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. See Special INTIDs, for more information.

Accesses to this register use the following encodings:

```
MSR ICC_EOIR0_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b001

ICC_EOIR1_EL1, Interrupt Controller End Of Interrupt Register 1

The ICC_EOIR1_EL1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 1 interrupt.

Configuration

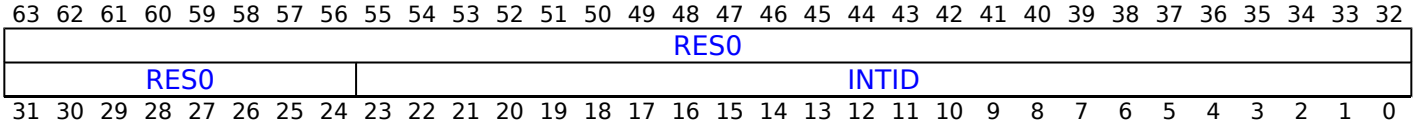
AArch64 System register ICC_EOIR1_EL1 performs the same function as AArch32 System register ICC_EOIR1.

Attributes

ICC_EOIR1_EL1 is a 64-bit register.

Field descriptions

The ICC_EOIR1_EL1 bit assignments are:



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICC_IAR1_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR_EL1 to deactivate the interrupt.

The EOImode bit for the current Exception level and Security state is determined as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR_EL1.EOIMode.~~EOImode.~~
- If EL3 is implemented and the software is executing at EL3, the appropriate bit is ICC_CTLR_EL3.EOImode_EL3.
- If EL3 is implemented and the software is not executing at EL3, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is ICC_CTLR_EL3.EOImode_EL1S.
  - If the software is executing in Non-secure state, the bit is ICC_CTLR_EL3.EOImode_EL1NS.

Accessing the ICC_EOIR1_EL1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR1_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. See Special INTIDs, for more information.

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2	1	0

Bits [63:2]

Reserved, RES0.

EnableGrp1S, bit [1]

Enables Group 1 interrupts for the Secure state.

EnableGrp1S	Meaning
0b0	Secure Group 1 interrupts are disabled.
0b1	Secure Group 1 interrupts are enabled.

The Secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1S bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

This field resets to 0.

EnableGrp1NS, bit [0]

Enables Group 1 interrupts for the Non-secure state.

EnableGrp1NS	Meaning
0b0	Non-secure Group 1 interrupts are disabled.
0b1	Non-secure Group 1 interrupts are enabled.

The Non-secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

This field resets to 0.

Accessing the ICC_IGRPEN1_EL3

Accesses to this register use the following encodings:

MRS <Xt>, ICC_IGRPEN1_EL3

ICC_SRE_EL1, Interrupt Controller System Register Enable register (EL1)

The ICC_SRE_EL1 characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL1.

Configuration

AArch64 System register ICC_SRE_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register ICC_SRE[31:0] (S) .

AArch64 System register ICC_SRE_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register ICC_SRE[31:0] (NS) .

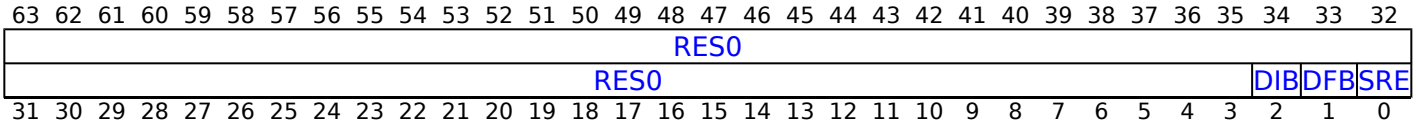
~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

ICC_SRE_EL1 is a 64-bit register.

Field descriptions

The ICC_SRE_EL1 bit assignments are:



Bits [63:3]

Reserved, RES0.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS == 0, this field is a read-only alias of ICC_SRE_EL3.DIB.

If EL3 is implemented and GICD_CTLR.DS == 1, and EL2 is not implemented, this field is a read-write alias of ICC_SRE_EL3.DIB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of ~~or~~ ~~GICD_CTLR.DS == 1, and EL2 is implemented, this field is a read-only alias of~~ ICC_SRE_EL2.DIB.

If GICD_CTLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DIB.

In systems that do not support IRQ bypass, this field is RAO/WI.

This field resets to 0.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS == 0, this field is a read-only alias of ICC_SRE_EL3.DFB.

If EL3 is implemented and GICD_CTLR.DS == 1, and EL2 is not implemented, this field is a read-write alias of ICC_SRE_EL3.DFB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of~~or GICD_CTLR.DS == 1, and EL2 is implemented, this field is a read-only alias of~~ ICC_SRE_EL2.DFB.

If GICD_CTLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DFB.

In systems that do not support FIQ bypass, this field is RAO/WI.

This field resets to 0.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL1 to any ICC_* System register other than ICC_SRE_EL1 is trapped to EL1.
0b1	The System register interface for the current Security state is enabled.

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and ICC_SRE_EL3.SRE==0 the Secure copy of this bit is RAZ/WI. If ICC_SRE_EL3.SRE is changed from zero to one, the Secure copy of this bit becomes UNKNOWN.

If EL2 is implemented and ICC_SRE_EL2.SRE==0 the Non-secure copy of this bit is RAZ/WI. If ICC_SRE_EL2.SRE is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

If EL3 is implemented and ICC_SRE_EL3.SRE==0 the Non-secure copy of this bit is RAZ/WI. If ICC_SRE_EL3.SRE is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI. The following options are supported:

- The Non-secure copy of ICC_SRE_EL1.SRE can be RAO/WI if ICC_SRE_EL2.SRE is also RAO/WI. This means all Non-secure software, including VMs using only virtual interrupts, must access the GIC using System registers.
- The Secure copy of ICC_SRE_EL1.SRE can be RAO/WI if ICC_SRE_EL3.SRE and ICC_SRE_EL2.SRE are also RAO/WI. This means that all Secure software must access the GIC using System registers and all Non-secure accesses to registers for physical interrupts must use System registers.

Note

A VM using only virtual interrupts might still use memory-mapped access if the Non-secure copy of ICC_SRE_EL1.SRE is not RAO/WI.

This field resets to 0.

Accessing the ICC_SRE_EL1

Execution with ICC_SRE_EL1.SRE set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings:

```
MRS <Xt>, ICC_SRE_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && ICC_SRE_EL2.Enable == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif HaveEL(EL3) && !ELUsingAArch32(EL3) && ICC_SRE_EL3.Enable == '0' then

ICC_SRE_EL3, Interrupt Controller System Register Enable register (EL3)

The ICC_SRE_EL3 characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

Configuration

AArch64 System register ICC_SRE_EL3 bits [31:0] can be mapped to AArch32 System register ICC_MSRE[31:0] , but this is not architecturally mandated.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to ICC_SRE_EL3 are UNDEFINED.

Attributes

ICC_SRE_EL3 is a 64-bit register.

Field descriptions

The ICC_SRE_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																												Enable	DIB	DFB	SRE
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to ICC_SRE_EL1 and ICC_SRE_EL2.

Enable	Meaning
0b0	EL1 accesses to ICC_SRE_EL1 trap to EL3, unless these accesses are trapped to EL2 as a result of ICC_SRE_EL2.Enable == 0. EL2 accesses to ICC_SRE_EL1 and ICC_SRE_EL2 trap to EL3.
0b1	EL1 accesses to ICC_SRE_EL1 do not trap to EL3. EL2 accesses to ICC_SRE_EL1 and ICC_SRE_EL2 do not trap to EL3.

If ICC_SRE_EL3.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_SRE_EL3.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

This field resets to an architecturally UNKNOWN value.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

In systems that do not support IRQ bypass, this bit is RAO/WI.

This field resets to 0.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

In systems that do not support FIQ bypass, this bit is RAO/WI.

This field resets to 0.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL3 to any ICH_* or ICC_* register other than ICC_SRE_EL1, ICC_SRE_EL2, or ICC_SRE_EL3 is trapped to EL3
0b1	The System register interface to the ICH_* registers and the EL1, EL2, and EL3 ICC_* registers is enabled for EL3.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI.

This field resets to 0.

Accessing the ICC_SRE_EL3

This register is always System register accessible.

Accesses to this register use the following encodings:

```
MRS <Xt>, ICC_SRE_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return ICC_SRE_EL3;
```

```
MSR ICC_SRE_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    ICC_SRE_EL3 = X[t];
```

ICH_HCR_EL2, Interrupt Controller Hyp Control Register

The ICH_HCR_EL2 characteristics are:

Purpose

Controls the environment for VMs.

Configuration

AArch64 System register ICH_HCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_HCR[31:0] .

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

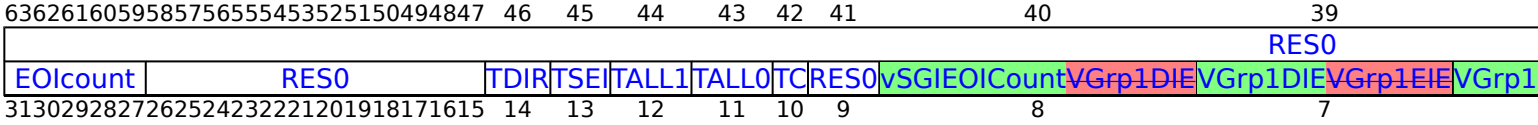
~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

ICH_HCR_EL2 is a 64-bit register.

Field descriptions

The ICH_HCR_EL2 bit assignments are:



Bits [63:32]

Reserved, RES0.

EOIcount, bits [31:27]

This field is incremented whenever a successful write to a virtual EOIR or DIR register would have resulted in a virtual interrupt deactivation. That is either:

- A virtual write to EOIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is zero and no List Register was found.
- A virtual write to DIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is one and no List Register was found.

This allows software to manage more active interrupts than there are implemented List Registers.

It is CONSTRAINED UNPREDICTABLE whether a virtual write to EOIR that does not clear a bit in the Active Priorities registers (ICH_AP0R<n>_EL2/ICH_AP1R<n>_EL2) increments EOIcount. Permitted behaviors are:

- Increment EOIcount.
- Leave EOIcount unchanged.

This field resets to 0.

Bits [26:15]

Reserved, RES0.

TDIR, bit [14]

Trap EL1 writes to ICC_DIR_EL1 and ICV_DIR_EL1.

TDIR	Meaning
0b0	EL1 writes of ICC_DIR_EL1 and ICV_DIR_EL1 are not trapped to EL2, unless trapped by other mechanisms.
0b1	EL1 writes of ICV_DIR_EL1 are trapped to EL2. It is IMPLEMENTATION DEFINED whether writes of ICC_DIR_EL1 are trapped. Not trapping ICC_DIR_EL1 writes is DEPRECATED.

Support for this bit is OPTIONAL, with support indicated by ICH_VTR_EL2.

If the implementation does not support this trap, this bit is RES0.

Arm deprecates not including this trap bit.

This field resets to 0.

TSEI, bit [13]

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at EL1.

TSEI	Meaning
0b0	Locally generated SEIs do not cause a trap to EL2.
0b1	Locally generated SEIs trap to EL2.

If ICH_VTR_EL2.SEIS is 0, this bit is RES0.

This field resets to 0.

TALL1, bit [12]

Trap all EL1 accesses to ICC_* and ICV_* System registers for Group 1 interrupts to EL2.

TALL1	Meaning
0b0	EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal.
0b1	EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2.

This field resets to 0.

TALL0, bit [11]

Trap all EL1 accesses to ICC_* and ICV_* System registers for Group 0 interrupts to EL2.

TALL0	Meaning
0b0	EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal.
0b1	EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2.

This field resets to 0.

TC, bit [10]

Trap all EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.

TC	Meaning
0b0	EL1 accesses to common registers proceed as normal.
0b1	EL1 accesses to common registers trap to EL2.

This affects accesses to ICC_SGI0R_EL1, ICC_SGI1R_EL1, ICC_ASGI1R_EL1, ICC_CTLR_EL1, ICC_DIR_EL1, ICC_PMR_EL1, ICC_RPR_EL1, ICV_CTLR_EL1, ICV_DIR_EL1, ICV_PMR_EL1, and ICV_RPR_EL1.

This field resets to 0.

BitBits [9:8]

Reserved, RES0.

vSGIEOICount, bit [8]

When GICv4.1 is implemented:

Controls whether deactivation of virtual SGIs can increment ICH_HCR_EL2.EOIcount

vSGIEOICount	Meaning
0b0	Deactivation of virtual SGIs can increment ICH_HCR_EL2.EOIcount.
0b1	Deactivation of virtual SGIs does not increment ICH_HCR_EL2.EOIcount.

This field resets to 0.

Otherwise:

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp1DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG1 is 0.

This field resets to 0.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp1EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG1 is 1.

This field resets to 0.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp0DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG0 is 0.

This field resets to 0.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp0EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG0 is 1.

This field resets to 0.

NPIE, bit [3]

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to 0b01 (pending):

NPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

This field resets to 0.

LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

LRENPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted while the EOIcount field is not 0.

This field resets to 0.

UIE, bit [1]

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

UIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.

This field resets to 0.

En, bit [0]

Enable. Global enable bit for the virtual CPU interface:

En	Meaning
0b0	Virtual CPU interface operation disabled.
0b1	Virtual CPU interface operation enabled.

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of ICV_IAR0_EL1, ICV_IAR1_EL1, GICV_IAR or GICV_AIAR returns a spurious interrupt ID.

Note

This field is RES0 when SCR_EL3.{NS,EEL2}=={0,0}

This field resets to 0.

Accessing the ICH_HCR_EL2

Accesses to this register use the following encodings:

ID_AA64AFR0_EL1, AArch64 Auxiliary Feature Register 0

The ID_AA64AFR0_EL1 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

There are no configuration notes.

Attributes

ID_AA64AFR0_EL1 is a 64-bit register.

Field descriptions

The ID_AA64AFR0_EL1 bit assignments are:

ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0

The ID_AA64DFR0_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

The external register EDDFR gives information from this register.

Attributes

ID_AA64DFR0_EL1 is a 64-bit register.

Field descriptions

The ID_AA64DFR0_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0												MTPMU				RES0				TraceFilt				DoubleLock				PMSVer			
CTX_CMPs				RES0				WRPs				RES0				BRPs				PMUVer				TraceVer				DebugVer			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:52]

Reserved, RES0.

MTPMU, bits [51:48]

From Armv8.6:

Multi-threaded PMU extension. Defined values are:

MTPMU	Meaning
0b0000	ARMv8.6-MTPMU not implemented. If PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>_EL0.MT are read/write or RES0.
0b0001	ARMv8.6-MTPMU implemented and PMEVTYPER<n>_EL0.MT are read/write. When ARMv8.6-MTPMU is disabled, the Effective values of PMEVTYPER<n>_EL0.MT are 0.
0b1111	ARMv8.6-MTPMU not implemented. If PMUv3 is implemented, PMEVTYPER<n>_EL0.MT are RES0.

All other values are reserved.

ARMv8.6-MTPMU implements the functionality identified by the value 0b0001.

In an Armv8.6-compliant implementation that includes PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include PMUv3, the value 0b0001 is not permitted.

Otherwise:

Reserved, RES0.

Bits [47:44]

Reserved, RES0.

TraceFilt, bits [43:40]

From Armv8.4:

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

ARMv8.4-Trace implements the functionality identified by the value 0b0001.

Otherwise:

Reserved, RES0.

DoubleLock, bits [39:36]

OS Double Lock implemented. Defined values are:

DoubleLock	Meaning
0b0000	OS Double Lock implemented. OSDLR_EL1 is RW.
0b1111	OS Double Lock not implemented. OSDLR_EL1 is RAZ/WI.

All other values are reserved.

ARMv8.0-DoubleLock implements the functionality identified by the value 0b0000.

PMSVer, bits [35:32]

From Armv8.2:

Statistical Profiling Extension version. Defined values are:

PMSVer	Meaning
0b0000	Statistical Profiling Extension not implemented.
0b0001	Statistical Profiling Extension implemented.
0b0010	As 0b0001 and also includes support for: • The Event packet Alignment flag. • If SVE is implemented, the Scalable Vector extensions to Statistical Profiling.

All other values are reserved.

SPE implements the functionality identified by the value 0b0001.

ARMv8.3-SPE implements the functionality added by the value 0b0010.

ARMv8.3-SPE implements the functionality added by the value 0b0010. If ARMv8.3-SPE is implemented, then ID_AA64DFR0_EL1.PMSVer is not permitted to read as 0b0000 or 0b0001.

~~Otherwise:~~

~~Reserved, RES0.~~

If ARMv8.3-SPE is implemented, the values `0b0000` and `0b0001` are not permitted.

CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of `0b0000` is reserved.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of `0b0000` is reserved.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the Alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Defined values are:

PMUVer	Meaning
`0b0000`	Performance Monitors Extension not implemented.
`0b0001`	Performance Monitors Extension implemented, PMUv3.
`0b0100`	PMUv3 for Armv8.1. As `0b0001`, and also includes support for: • Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. • If EL2 is implemented, the MDCR_EL2.HPMD control bit.
`0b0101`	PMUv3 for Armv8.4. As `0b0100` and also includes support for the PMMIR_EL1 register.
`0b0110`	PMUv3 for Armv8.5. As `0b0101` and also includes support for: • 64-bit event counters. • If EL2 is implemented, the MDCR_EL2.HCCD control bit. • If EL3 is implemented, the MDCR_EL3.SCCD control bit.
`0b1111`	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value in new implementations.

All other values are reserved.

ARMv8.1-PMU implements the functionality identified by the value `0b0100`.

ARMv8.4-PMU implements the functionality identified by the value `0b0101`.

ARMv8.5-PMU implements the functionality identified by the value `0b0110`.

In an Armv8.1-compliant implementation that includes PMUv3, the value `0b0001` is not permitted.

In an Armv8.4-compliant implementation that includes PMUv3, the value `0b0100` is not permitted.

In an Armv8.5-compliant implementation that includes PMUv3, the value `0b0101` is not permitted.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

TraceVer	Meaning
`0b0000`	PE trace unit System registers not implemented.
`0b0001`	PE trace unit System registers implemented.

All other values are reserved.

See the ETM Architecture Specification for more information.

A value of `0b0000` only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.

DebugVer, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

DebugVer	Meaning
`0b0110`	Armv8 debug architecture.
`0b0111`	Armv8 debug architecture with Virtualization Host Extensions.
`0b1000`	Armv8.2 debug architecture.
`0b1001`	Armv8.4 debug architecture.

All other values are reserved.

ARMv8.2-Debug adds the functionality identified by the value `0b1000`.

- If ARMv8.1-VHE is not implemented the only permitted value is `0b0110`.
- In an Armv8.0 implementation the value `0b1000` is not permitted.

Accessing the ID_AA64DFR0_EL1

Accesses to this register use the following encodings:

```

ID_AA64ISAR0_EL1, AArch64 Instruction Set Attribute Register 0

The ID_AA64ISAR0_EL1 characteristics are:

Purpose

Provides information about the instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

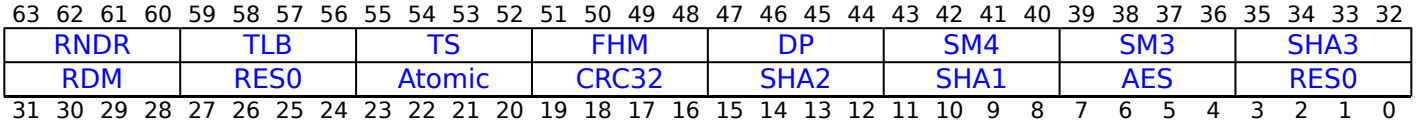
There are no configuration notes.

Attributes

ID_AA64ISAR0_EL1 is a 64-bit register.

Field descriptions

The ID_AA64ISAR0_EL1 bit assignments are:



RNDR, bits [63:60]

From Armv8.5:

Indicates support for Random Number instructions in AArch64 state. Defined values are:

RNDR	Meaning
0b0000	No Random Number instructions are implemented.
0b0001	RNDR and RNDRRS registers are implemented.

All other values are reserved.

ARMv8.5-RNG implements the functionality identified by the value 0b0001.

From Armv8.5, the permitted values are 0b0000 and 0b0001.

Reserved, RES0.

TLB, bits [59:56]

From Armv8.4:

Otherwise:
TLB, bits [59:56]

Indicates support for Outer shareable and TLB range maintenance instructions. Defined values are:

TLB	Meaning
0b0000	Outer shareable and TLB range maintenance instructions are not implemented.
0b0001	Outer shareable TLB maintenance instructions are implemented.
0b0010	Outer shareable and TLB range maintenance instructions are implemented.

All other values are reserved.

ARMv8.4-TLBI implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.4, the only permitted value is 0b0010.

~~**Otherwise:**~~

~~Reserved, RES0.~~

TS, bits [55:52]

Indicates support for flag manipulation instructions. Defined values are:

TS	Meaning
0b0000	No flag manipulation instructions are implemented.
0b0001	CFINV, RMIF, SETF16, and SETF8 instructions are implemented.
0b0010	CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented.

All other values are reserved.

ARMv8.4-CondM implements the functionality identified by the value 0b0001.

ARMv8.5-CondM implements the functionality identified by the value 0b0010.

From Armv8.4, the only permitted value is 0b0001.

From Armv8.5, the only permitted value is 0b0010.

FHM, bits [51:48]

~~**From Armv8.2:**~~

Indicates support~~whether~~ for FMLAL and FMLSL instructions.~~instructions~~ Defined~~are~~ values are:~~implemented.~~

FHM	Meaning
0b0000	FMLAL and FMLSL instructions are not implemented.
0b0001	FMLAL and FMLSL instructions are implemented.

All other values are reserved.

ARMv8.2-FHM implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

~~**DP, bits [47:44]**~~

~~**From Armv8.2:**~~

~~Dot Product instructions implemented in AArch64 state. Defined values are:~~

~~**Otherwise:**~~
DP, bits [47:44]

Indicates support for Dot Product instructions in AArch64 state. Defined values are:

Reserved, RES0.

DP	Meaning
0b0000	No Dot Product instructions implemented.
0b0001	UDOT and SDOT instructions implemented.

All other values are reserved.

ARMv8.2-DotProd implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

SM4, bits [43:40]

From Armv8.2:

SM4 instructions implemented in AArch64 state. Defined values are:

Otherwise:
SM4, bits [43:40]

Indicates support for SM4 instructions in AArch64 state. Defined values are:

Reserved, RES0.

SM4	Meaning
0b0000	No SM4 instructions implemented.
0b0001	SM4E and SM4EKEY instructions implemented.

All other values are reserved.

If ARMv8.2-SM is not implemented, the value 0b0001 is reserved.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM3.

SM3, bits [39:36]

From Armv8.2:

SM3 instructions implemented in AArch64 state. Defined values are:

Otherwise:
SM3, bits [39:36]

Indicates support for SM3 instructions in AArch64 state. Defined values are:

Reserved, RES0.

SM3	Meaning
0b0000	No SM3 instructions implemented.
0b0001	SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 instructions implemented.

All other values are reserved.

If ARMv8.2-SM is not implemented, the value 0b0001 is reserved.

ARMv8.2-SM implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM4.

SHA3, bits [35:32]

From Armv8.2:

SHA3 instructions implemented in AArch64 state. Defined values are:

Otherwise:

SHA3, bits [35:32]

Indicates support for SHA3 instructions in AArch64 state. Defined values are:

Reserved, RES0.

SHA3	Meaning
0b0000	No SHA3 instructions implemented.
0b0001	EOR3, RAX1, XAR, and BCAX instructions implemented.

All other values are reserved.

If ARMv8.2-SHA is not implemented, the value 0b0001 is reserved.

ARMv8.2-SHA implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, then this field must have the value 0b0000.

If the value of this field is 0b0001, then ID_AA64ISAR0_EL1.SHA2 must have the value 0b0010.

RDM, bits [31:28]

From Armv8.1:

SQRDMLAH and SQRDMLSH instructions implemented in AArch64 state. Defined values are:

Otherwise:

RDM, bits [31:28]

Indicates support for SQRDMLAH and SQRDMLSH instructions in AArch64 state. Defined values are:

Reserved, RES0.

RDM	Meaning
0b0000	No RDMASQRDMLAH and SQRDMLSH instructions implemented.
0b0001	SQRDMLAH and SQRDMLSH instructions implemented.

All other values are reserved.

ARMv8.1-RDMA implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

Bits [27:24]

Reserved, RES0.

Atomic, bits [23:20]

~~From Armv8.1:~~

Indicates support for Atomic instructions ~~implemented~~ in AArch64 state. Defined values are:

Atomic	Meaning
0b0000	No Atomic instructions implemented.
0b0010	LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.

All other values are reserved.

ARMv8.1-LSE implements the functionality identified by the value 0b0010.

From Armv8.1, the only permitted value is 0b0010.

~~Otherwise:~~

~~Reserved, RES0.~~

CRC32, bits [19:16]

CRC32 instructions implemented in AArch64 state. Defined values are:

CRC32	Meaning
0b0000	No CRC32 instructions implemented.
0b0001	CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

SHA2 instructions implemented in AArch64 state. Defined values are:

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 instructions implemented.
0b0010	As 0b0001, plus SHA512H, SHA512H2, SHA512SU0, and SHA512SU1 instructions implemented.

All other values are reserved.

If ARMv8.2-SHA is not implemented the value 0b0010 is reserved.

From Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, then this field must have the value 0b0000.

If the value of this field is 0b0010, then ID_AA64ISAR0_EL1.SHA3 must have the value 0b0001.

SHA1, bits [11:8]

SHA1 instructions implemented in AArch64 state. Defined values are:

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented.

All other values are reserved.

From Armv8, the permitted values are `0b0000` and `0b0001`.

If the value of ID_AA64ISAR0_EL1.SHA2 is `0b0000`, then this field must have the value `0b0000`.

AES, bits [7:4]

AES instructions implemented in AArch64 state. Defined values are:

AES	Meaning
`0b0000`	No AES instructions implemented.
`0b0001`	AESE, AESD, AESMC, and AESIMC instructions implemented.
`0b0010`	As for `0b0001`, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.

All other values are reserved.

From Armv8, the permitted values are `0b0000`, `0b0001`, and `0b0010`.

Bits [3:0]

Reserved, RES0.

Accessing the ID_AA64ISAR0_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_AA64ISAR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b000

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);

ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1

The ID_AA64ISAR1_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

If ID_AA64ISAR1_EL1.{API, APA} == {0000, 0000}, then:

- The TCR_EL1.{TBID,TBID0}, TCR_EL2.{TBID0,TBID1}, TCR_EL2.TBID and TCR_EL3.TBID bits are RES0.
- APIAKeyHi_EL1, APIAKeyLo_EL1, APIBKeyHi_EL1, APIBKeyLo_EL1, APDAKeyHi_EL1, APDAKeyLo_EL1, APDBKeyHi_EL1, APDBKeyLo_EL1 are not allocated.
- SCTLR_ELx.EnIA, SCTLR_ELx.EnIB, SCTLR_ELx.EnDA, SCTLR_ELx.EnDB are all RES0.

If ID_AA64ISAR1_EL1.{GPI, GPA, API, APA} == {0000, 0000, 0000, 0000}, then:

- HCR_EL2.APK and HCR_EL2.API are RES0.
- SCR_EL3.APK and SCR_EL3.API are RES0.

Attributes

ID_AA64ISAR1_EL1 is a 64-bit register.

Field descriptions

The ID_AA64ISAR1_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								I8MM				DGH				BF16				SPECRES				SB				FRINTTS			
GPI				GPA				LRCPC				FCMA				JSCVT				API				APA				DPB			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:56]

Reserved, RES0.

I8MM, bits [55:52]

~~From Armv8.2:~~

Indicates support for Floating-point~~Advanced~~ ~~SIMD~~ and Advanced SIMD~~floating-point~~ Int8 matrix multiplication instructions in AArch64 state. Defined values of this field are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.

All other values are reserved.

ARMv8.2-I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ZFR0_EL1.I8MM.

From Armv8.6, the only permitted value is 0b0001.

DGH, bits [51:48]

From Armv8.6:

Indicates presence of the Data Gathering Hint instruction. Defined values are:

Otherwise:
DGH, bits [51:48]

Indicates support for the Data Gathering Hint instruction. Defined values are:

Reserved, RES0.

DGH	Meaning
0b0000	Data Gathering Hint is not implemented.
0b0001	Data Gathering Hint is implemented.

All other values are reserved.

ARMv8.0-DGH implements the functionality identified by 0b0001.

From ARMv8.0, the permitted values are 0b0000 and 0b0001.

If the DGH instruction has no effect in preventing the merging of memory accesses, the value of this field is 0.

BF16, bits [47:44]

From Armv8.2:

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch64 state. Defined values are:

Otherwise:
BF16, bits [47:44]

Indicates support for Advanced SIMD and Floating-point BFloat16 instructions in AArch64 state. Defined values are:

Reserved, RES0.

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	BFDOT, BFMLAL, BFMLAL2, BFMMLA, BFCVT, and BFCVT2 instructions are implemented.

All other values are reserved.

ARMv8.2-BF16 implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ZFR0_EL1.BF16.

From ARMv8.6, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

SPECRES, bits [43:40]

IndicatesSpeculation supportinvalidation forinstruction prediction invalidation instructionssupport in AArch64 state. Defined values are:

SPECRES	Meaning
0b0000	CFP RCTX, DVP RCTX, and CPP RCTX instructions are not implemented.
0b0001	CFP RCTX, DVP RCTX, and CPP RCTX instructions are implemented.

All other values are reserved.

ARMv8.0-PredInv implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [39:36]

Indicates support for SB instruction support in AArch64 state. Defined values are:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

ARMv8.0-SB implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

FRINTTS, bits [35:32]

From Armv8.5:

Indicates support for thewhether FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented. Defined values are:

FRINTTS	Meaning
0b0000	FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are not implemented.
0b0001	FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented.

All other values are reserved.

ARMv8.5-FRINT implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

GPI, bits [31:28]

From Armv8.3:

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication, in AArch64 state. Defined values are:

Otherwise:

GPI, bits [31:28]

Indicates support for anReserved, IMPLEMENTATION DEFINEDRES0 algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:.

GPI	Meaning
0b0000	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This includesinvolves the PACGA instruction.

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPA is non-zero, this field must have the value 0b0000.

GPA, bits [27:24]

From Armv8.3:

Indicates whether QARMA or Architected algorithm is implemented in the PE for generic code authentication, in AArch64 state. Defined values are:

Otherwise:
GPA, bits [27:24]

Indicates whether QARMA or Architected algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

Reserved, RES0.

GPA	Meaning
0b0000	Generic Authentication using an Architected algorithm is not implemented.
0b0001	Generic Authentication using the QARMA algorithm is implemented. This includesinvolves the PACGA instruction.

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPI is non-zero, this field must have the value 0b0000.

LRCPC, bits [23:20]

From Armv8.4:

Indicates support for weaker release consistency, RCpc based model. Defined values are:

Otherwise:
LRCPC, bits [23:20]

Indicates support for weaker release consistency, RCpc, based model. Defined values are:

Reserved, RES0.

LRCPC	Meaning
0b0000	The LDAPRLDAPUR*, LDAPURSTLUR*, and STLURLDAPR* instructions are not implemented.
0b0001	The LDAPR* instructions are implemented.
0b0010	The LDAPRLDAPUR*, LDAPURSTLUR*, and STLURLDAPR* instructions are implemented.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

In Armv8.3, the only permitted value is 0b0001. ARMv8.3-RCPC implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0010. ARMv8.4-RCPC implements the functionality identified by the value 0b0010.

All other values are reserved.

From Armv8.3:

Indicates support for weaker release consistency, RCpc based model. Defined values are:

LRCPC	Meaning
0b0000	The LDAPRB, LDAPRH and LDAPR instructions are not implemented.
0b0001	The LDAPRB, LDAPRH and LDAPR instructions are implemented.

All other values are reserved.

ARMv8.3-RCPC implements the functionality identified by the value 0b0001.

ARMv8.4-RCPCIn implementsArmv8.0, theArmv8.1, functionalityand identifiedArmv8.2, by the only permitted value is 0b00100b0000.

In Armv8.3, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

FCMA, bits [19:16]

From Armv8.3:

From Armv8.4, the only permitted value is 0b0010.

All other values are reserved.

FCMA, bits [19:16]

Indicates support for complex number addition and multiplication, where numbers are stored in vectors. Defined values are:

FCMA	Meaning
0b0000	The FCMLA and FCADD instructions are not implemented.
0b0001	The FCMLA and FCADD instructions are implemented.

All other values are reserved.

ARMv8.3-CompNum implements the functionality identified by the value 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

JSCVT, bits [15:12]

From Armv8.3:

Indicates support for javascript conversion from double precision floating point values to integers in AArch64 state. Defined values are:

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

JSCVT, bits [15:12]

Indicates support for JavaScript conversion from double precision floating point values to integers in AArch64 state. Defined values are:

JSCVT	Meaning
0b0000	The FJCVTZS instruction is not implemented.
0b0001	The FJCVTZS instruction is implemented.

All other values are reserved.

ARMv8.3.JSConv implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

~~Otherwise:~~

~~Reserved, RES0.~~

~~API, bits [11:8]~~

~~From Armv8.3:~~

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

API, bits [11:8]

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

API	Meaning
0b0000	Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE, and the HaveEnhancedPAC2() function returning FALSE.
0b0011	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.
0b0100	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

ARMv8.3-PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

ARMv8.3-PAuth2 implements the functionality added by the value 0b0011.

ARMv8.3-FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.APA is non-zero, this field must have the value 0b0000.

~~Reserved, RES0.~~

~~APA, bits [7:4]~~

~~From Armv8.3:~~

~~Otherwise:~~
APA, bits [7:4]

Indicates whether QARMA or Architected algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

APA	Meaning
0b0000	Address Authentication using an Architected algorithm is not implemented.
0b0001	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE.
0b0011	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0100	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

ARMv8.3-PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

ARMv8.3-PAuth2 implements the functionality added by the value 0b0011.

ARMv8.3-FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of the ID_AA64ISAR1_EL1.API is non-zero, this field must have the value 0b0000.

~~Reserved, RES0.~~

~~DPB, bits [3:0]~~

~~From Armv8.2:~~

~~Otherwise:~~
DPB, bits [3:0]

Data Persistence writeback. Indicates support for the DC CVAP and DC CVADP instructions in AArch64 state. Defined values are:

DPB	Meaning
0b0000	DC CVAP not supported.
0b0001	DC CVAP supported.
0b0010	DC CVAP and DC CVADP supported.

All other values are reserved.

ARMv8.2-DCPoP implements the functionality identified by the value 0b0001.

ARMv8.2-DCCVADP implements the functionality identified by the value 0b0010.

From Armv8.2 to Armv8.4, the only permitted value is 0b0001.

From Armv8.5, the only permitted value is 0b0010

Otherwise:

Reserved, RES0.

If ID_AA64ISAR1_EL1.{API, APA} == {0, 0}, then:

- The TCR_EL1.{TBID,TBID0}, TCR_EL2.{TBID0,TBID1}, TCR_EL2.TBID and TCR_EL3.TBID bits are RES0.
- APIAKeyHi_EL1, APIAKeyLo_EL1, APIBKeyHi_EL1, APIBKeyLo_EL1, APDAKeyHi_EL1, APDAKeyLo_EL1, APDBKeyHi_EL1, APDBKeyLo_EL1 are not allocated.
- SCTLR_ELx.EnIA, SCTLR_ELx.EnIB, SCTLR_ELx.EnDA, SCTLR_ELx.EnDB are all RES0.

If ID_AA64ISAR1_EL1.{GPI, GPA, API, APA} == {0, 0, 0, 0}, then:

- HCR_EL2.APK and HCR_EL2.API are RES0.
- SCR_EL3.APK and SCR_EL3.API are RES0.

Accessing the ID_AA64ISAR1_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_AA64ISAR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b001

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else

ID_AA64MMFR0_EL1, AArch64 Memory Model Feature Register 0

The ID_AA64MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

There are no configuration notes.

Attributes

ID_AA64MMFR0_EL1 is a 64-bit register.

Field descriptions

The ID_AA64MMFR0_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ECV				FGT				RES0								ExS				TGran4_2				TGran64_2				TGran16_2

ECV, bits [63:60]

From Armv8.6:

Indicates presence Presence of Enhanced Counter Virtualization. Defined values are:

ECV	Meaning
0b0000	Enhanced Counter Virtualization is not implemented.
0b0001	Enhanced Counter Virtualization is implemented. Supports CNTHCTL_EL2.{ECV, EL1TVT, EL1TVCT, EL1NVPCT, EL1NVVCT, EVNTIS}, CNTKCTL_EL1.EVNTIS, CNTPCTSS_EL0 counter views, and CNTVCTSS_EL0 counter views. Extends the PMSCR_EL1.PCT, PMSCR_EL2.PCT, TRFCR_EL1.TS, and TRFCR_EL2.TS fields.
0b0010	As 0b0001, and also includes support for CNTHCTL_EL2.ECV and CNTPOFF_EL2.

All other values are reserved.

ARMv8.6-ECV implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.6, the only permitted values are 0b0001 and 0b0010.

FGT, bits [59:56]

From Armv8.6:

Presence of the Fine-Grained Trap controls:

Otherwise:
FGT, bits [59:56]

Indicates presence of the Fine-Grained Trap controls:

Reserved, RES0.

- HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2 and HFGWTR_EL2 registers, and their associated traps.
- MDCR_EL2.TDCC and MDCR_EL3.TDCC.
- SCR_EL3.FGTEn.

Defined values are:

FGT	Meaning
0b0000	The fine-grained trap controls are not implemented.
0b0001	The fine-grained trap controlscontols are implemented, and can generate fine-grained traps of EL1 and EL0 functionality.

All other values are reserved.

ARMv8.6-FGT implements the functionality identified by the value 0b0001.

Otherwise:

Reserved, RES0.

From Armv8.6, the only permitted value is 0b0001.

Bits [55:48]

Reserved, RES0.

ExS, bits [47:44]

From Armv8.5:

Indicates supportSupport for disabling context synchronizing exception entry and exit. Defined values are:

ExS	Meaning
0b0000	All exception entries and exits are context synchronization events.
0b0001	Non-context synchronizing exception entry and exit are supported.

All other values are reserved.

ARMv8.5-CSEH implements the functionality identified by the value 0b0001.

TGran4_2, bits [43:40]

From Armv8.5:

Support for 4KB memory granule size for stage 2. Defined values are:

Otherwise:
TGran4_2, bits [43:40]

Indicates support for 4KB memory granule size for stage 2. Defined values are:

Reserved, RES0.

TGran4_2	Meaning
0b0000	4KB Stage 2 granule is identified in the ID_AA64MMFR0_EL1.TGran4~~TGran4~~ field.~~field~~
0b0001	4KB granule not supported at stage 2.
0b0010	4KB granule supported at stage 2.

All other values are reserved.

The 0b0000 value is deprecated.

~~TGran64_2, bits [39:36]~~

~~From Armv8.5:~~

~~Support for 64KB memory granule size for stage 2. Defined values are:~~

~~Otherwise:~~

TGran64_2, bits [39:36]

Indicates support for 64KB memory granule size for stage 2. Defined values are:

~~Reserved, RES0.~~

TGran64_2	Meaning
0b0000	64KB Stage 2 granule is identified in the ID_AA64MMFR0_EL1.TGran64~~TGran64~~ field.~~field~~
0b0001	64KB granule not supported at stage 2.
0b0010	64KB granule supported at stage 2.

All other values are reserved.

The 0b0000 value is deprecated.

~~TGran16_2, bits [35:32]~~

~~From Armv8.5:~~

~~Support for 16KB memory granule size for stage 2. Defined values are:~~

~~Otherwise:~~

TGran16_2, bits [35:32]

Indicates support for 16KB memory granule size for stage 2. Defined values are:

~~Reserved, RES0.~~

TGran16_2	Meaning
0b0000	16KB Stage 2 granule is identified in the ID_AA64MMFR0_EL1.TGran16~~TGran16~~ field
0b0001	16KB granule not supported at stage 2
0b0010	16KB granule supported at stage 2

All other values are reserved.

The 0b0000 value is deprecated.

~~Otherwise:~~

~~Reserved, RES0.~~

TGran4, bits [31:28]

Indicates support~~Support~~ for 4KB memory translation granule size. Defined values are:

TGran4	Meaning
0b0000	4KB granule supported.
0b1111	4KB granule not supported.

All other values are reserved.

TGran64, bits [27:24]

Indicates support~~Support~~ for 64KB memory translation granule size. Defined values are:

TGran64	Meaning
0b0000	64KB granule supported.
0b1111	64KB granule not supported.

All other values are reserved.

TGran16, bits [23:20]

Indicates support~~Support~~ for 16KB memory translation granule size. Defined values are:

TGran16	Meaning
0b0000	16KB granule not supported.
0b0001	16KB granule supported.

All other values are reserved.

BigEndEL0, bits [19:16]

Indicates~~Mixed-endian~~ support for mixed-endian at EL0 only. Defined values are:

BigEndEL0	Meaning
0b0000	No mixed-endian support at EL0. The SCTLR_EL1.E0E bit has a fixed value.
0b0001	Mixed-endian support at EL0. The SCTLR_EL1.E0E bit can be configured.

All other values are reserved.

This field is invalid and is RES0 if ID_AA64MMFR0_EL1.BigEnd~~the BigEnd field, bits [11:8],~~ is not 0b0000.

SNSMem, bits [15:12]

Indicates support for a distinction between Secure and~~versus~~ Non-secure Memory.~~Memory distinction.~~ Defined values are:

SNSMem	Meaning
0b0000	Does not support a distinction between Secure and Non-secure Memory.
0b0001	Does support a distinction between Secure and Non-secure Memory.

All other values are reserved.

BigEnd, bits [11:8]

Indicates~~Mixed-endian~~ support~~configuration~~ for mixed-endian configuration.~~support.~~ Defined values are:

BigEnd	Meaning
0b0000	No mixed-endian support. The SCTLR_ELx.EE bits have a fixed value. See the BigEndEL0 field, bits[19:16], for whether EL0 supports mixed-endian.
0b0001	Mixed-endian support. The SCTLR_ELx.EE and SCTLR_EL1.E0E bits can be configured.

All other values are reserved.

ASIDBits, bits [7:4]

Number of ASID bits. Defined values are:

ASIDBits	Meaning
0b0000	8 bits.
0b0010	16 bits.

All other values are reserved.

PARange, bits [3:0]

Physical Address range supported. Defined values are:

PARange	Meaning
0b0000	32 bits, 4GB.
0b0001	36 bits, 64GB.
0b0010	40 bits, 1TB.
0b0011	42 bits, 4TB.
0b0100	44 bits, 16TB.
0b0101	48 bits, 256TB.
0b0110	52 bits, 4PB.

All other values are reserved.

The value 0b0110 is permitted only if the implementation includes ARMv8.2-LPA, otherwise it is reserved.

Accessing the ID_AA64MMFR0_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_AA64MMFR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b000

```

ID_AA64MMFR1_EL1, AArch64 Memory Model Feature Register 1

The ID_AA64MMFR1_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

There are no configuration notes.

Attributes

ID_AA64MMFR1_EL1 is a 64-bit register.

Field descriptions

The ID_AA64MMFR1_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																								ETS				TWED			
XNX				SpecSEI				PAN				LO				HPDS				VH				VMIDBits				HAFDBS			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:40]

Reserved, RES0.

ETS, bits [39:36]

From Armv8.0:

Indicates supportSupport for Enhanced Translation Synchronization. Defined values are:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is supported.

All other values are reserved.

ARMv8.0-ETS implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

TWED, bits [35:32]

From Armv8.6:

Support for the configurable delayed trapping of WFE. Defined values are:

Otherwise:
TWED, bits [35:32]

Indicates support for the configurable delayed trapping of WFE. Defined values are:

Reserved, RES0.

TWED	Meaning
0b0000	Configurable delayed trapping of WFE is not supported.
0b0001	Configurable delayed trapping of WFE is supported.

All other values are reserved.

ARMv8.6-TWED implements the functionality identified by the value 0b0001.

From Armv8.6, the permitted values are 0b0000 and 0b0001.

XNX, bits [31:28]

From Armv8.2:

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

Otherwise:
XNX, bits [31:28]

Indicates support for execute-never control distinction by Exception level at stage 2. Defined values are:

Reserved, RES0.

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

ARMv8.2-TTS2UXN implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Reserved, RES0.

SpecSEI, bits [27:24]

When RAS is implemented:

Otherwise:
SpecSEI, bits [27:24]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

SpecSEI	Meaning
0b0000	The PE never generates an SError interrupt due to an External abort on a speculative read.
0b0001	The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

Reserved, RES0. This provides no information about whether the PE generates a speculative SError interrupt.

PAN, bits [23:20]

From Armv8.1:

Otherwise:

PAN, bits [23:20]

Privileged Access Never. Indicates support for the PAN bit in PSTATE, SPSR_EL1, SPSR_EL2, SPSR_EL3, and DSPSR_EL0. Defined values are:

PAN	Meaning
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and AT S1E1RP and AT S1E1WP instructions supported.

All other values are reserved.

ARMv8.1-PAN implements the functionality identified by the value 0b0001.

ARMv8.2-ATS1E1 implements the functionality added by the value 0b0010.

In Armv8.1, the only permitted value is 0b0001.

From Armv8.2, the only permitted value is 0b0010.

~~Reserved, RES0.~~

LO, bits [19:16]

From Armv8.1:

Otherwise:

LO, bits [19:16]

LORegions. Indicates support for LORegions. Defined values are:

LO	Meaning
0b0000	LORegions not supported.
0b0001	LORegions supported.

All other values are reserved.

ARMv8.1-LOR implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

HPDS, bits [15:12]

From Armv8.1:

~~Hierarchical permission disables bits in translation tables. Defined values are:~~

Otherwise:

HPDS, bits [15:12]

Hierarchical Permission Disables. Indicates support for disabling hierarchical controls in translation tables. Defined values are:

~~Reserved, RES0.~~

HPDS	Meaning
0b0000	Disabling of hierarchical controls not supported.
0b0001	Disabling of hierarchical controls supported with the TCR_EL1.{HPD1, HPD0}, TCR_EL2.HPD or TCR_EL2.{HPD1, HPD0}, and TCR_EL3.HPD bits.
0b0010	As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

ARMv8.1-HPD implements the functionality identified by the value 0b0001.

ARMv8.2-TTPBHA implements the functionality identified by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

~~Reserved, RES0.~~

~~VH, bits [11:8]~~

~~From Armv8.1:~~

~~Otherwise:~~
VH, bits [11:8]

Virtualization Host Extensions. Defined values are:

VH	Meaning
0b0000	Virtualization Host Extensions not supported.
0b0001	Virtualization Host Extensions supported.

All other values are reserved.

ARMv8.1-VHE implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

~~Reserved, RES0.~~

~~VMIDBits, bits [7:4]~~

~~From Armv8.1:~~

~~Otherwise:~~
VMIDBits, bits [7:4]

Number of VMID bits. Defined values are:

VMIDBits	Meaning
0b0000	8 bits
0b0010	16 bits

All other values are reserved.

ARMv8.1-VMID16 implements the functionality identified by the value 0b0010.

From Armv8.1, the permitted values are 0b0000 and 0b0010.

~~Reserved, RES0.~~

~~HAFDBS, bits [3:0]~~

~~From Armv8.1:~~

~~Otherwise:~~

HAFDBS, bits [3:0]

Hardware updates to Access flag and Dirty state in translation tables. Defined values are:

HAFDBS	Meaning
0b0000	Hardware update of the Access flag and dirty state are not supported.
0b0001	Hardware update of the Access flag is supported.
0b0010	Hardware update of both the Access flag and dirty state is supported.

All other values are reserved.

ARMv8.1-TTHM implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.1, the permitted values are 0b0000, 0b0001, and 0b0010.

Otherwise:

~~Reserved, RES0.~~

Accessing the ID_AA64MMFR1_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_AA64MMFR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b001

```

ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2

The ID_AA64MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

This register is present only when AArch64from isArmv8.2. supported at any Exception level. Otherwise, direct accesses to ID_AA64MMFR2_EL1 are RES0.from EL1, EL2, and EL3.

RW fields in this register reset to architecturally UNKNOWN values.

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64MMFR2_EL1 is a 64-bit register.

Field descriptions

The ID_AA64MMFR2_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
E0PD				EVT				BBM				TTL				RES0				FWB				IDS				AT			
ST				NV				CCIDX				VARange				IESB				LSM				UAO				CnP			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

E0PD, bits [63:60]

From Armv8.5:

Indicates support for the E0PD mechanism. Defined values are:

E0PD	Meaning
0b0000	E0PDx mechanism is not implemented.
0b0001	E0PDx mechanism is implemented.

All other values are reserved.

ARMv8.5-E0PD implements the functionality identified by the value 0b0001.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted values is 0b0001.

Reserved, RES0.

EVT, bits [59:56]

From Armv8.2:

Otherwise:
EVT, bits [59:56]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

EVT	Meaning
0b0000	HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	HCR_EL2.{TOCU, TICAB, TID4} traps are supported. HCR_EL2.{TTLBOS, TTLBIS} traps are not supported.
0b0010	HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

ARMv8.2-EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented, the only permitted value is 0b0000.

From Armv8.1, the permitted values are 0b0000 and 0b0001.

From Armv8.5, if EL2 is implemented, the only permitted valuevalues isare: 0b0010.

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

Otherwise:

Reserved, RES0.

BBM, bits [55:52]

From Armv8.4:

BBM, bits [55:52]

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block size for a translation.

BBM	Meaning
0b0000	Level 0 support for changing block size is supported.
0b0001	Level 1 support for changing block size is supported.
0b0010	Level 2 support for changing block size is supported.

All other values are reserved.

ARMv8.4-TTRem implements the functionality identified by the values 0b0000, 0b0001, and 0b0010.

From Armv8.4, the permitted values are 0b0000, 0b0001, and 0b0010.

Reserved, RES0.

TTL, bits [51:48]

From Armv8.4:

Otherwise:
TTL, bits [51:48]

Indicates support for TTL field in address operations. Defined values are:

TTL	Meaning
0b0000	TLB maintenance instructions by address have bits[47:44] as RES0.
0b0001	TLB maintenance instructions by address have bits[47:44] holding the TTL field.

All other values are reserved.

ARMv8.4-TTL implements the functionality identified by the value 0b0001.

This field affects TLBI IPAS2E1, TLBI IPAS2E1IS, TLBI IPAS2E1OS, TLBI IPAS2LE1, TLBI IPAS2LE1IS, TLBI IPAS2LE1OS, TLBI VAAE1, TLBI VAAE1IS, TLBI VAAE1OS, TLBI VAALE1, TLBI VAALE1IS, TLBI VAALE1OS, TLBI VAE1, TLBI VAE1IS, TLBI VAE1OS, TLBI VAE2, TLBI VAE2IS, TLBI VAE2OS, TLBI VAE3, TLBI VAE3IS, TLBI VAE3OS,TLBI VALE1, TLBI VALE1IS, TLBI VALE1OS, TLBI VALE2, TLBI VALE2IS, TLBI VALE2OS, TLBI VALE3, TLBI VALE3IS, TLBI VALE3OS.

From Armv8.4, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

Bits [47:44]

Reserved, RES0.

FWB, bits [43:40]

From Armv8.4:

Indicates support for HCR_EL2.FWB. Defined values are:FWB

FWB	Meaning
0b0000	HCR_EL2.FWB bit is not supported. HCR_EL2.FWB bit is not supported and the field is RES0
0b0001	HCR_EL2.FWB is supported.

If ARMv8.4-SecEL2 is implemented the only permitted value is 0b0001

All other values reserved.

ARMv8.4-S2FWB implementsThis thefield functionalityresets identifiedto byan the valuearchitecturally 0b0001UNKNOWN.value.

Otherwise:

Reserved, RES0.

IDS, bits [39:36]

From Armv8.4:

From Armv8.4, the only permitted value is 0b0001.

IDS, bits [39:36]

Indicates the value of ESR_ELx.EC that reports an exception generated by a read access to the feature ID space. Defined values are:

IDS	Meaning
0b0000	An exception which is generated by a read access to the feature ID space, other than a trap caused by HCR_EL2.TIDx, SCTLR_EL1.UCT, or SCTLR_EL2.UCT, is reported by ESR_ELx.EC == 0x0.
0b0001	All exceptions generated by an AArch64 read access to the feature ID space are reported by ESR_ELx.EC == 0x18.

All other values are reserved.

The Feature ID space is defined as the System register space in AArch64 with op0==3, op1=={0, 1, 3}, CRn==0, CRm=={0-7}, op2=={0-7}.

ARMv8.4-IDST implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

~~Reserved, RES0.~~

~~AT, bits [35:32]~~

~~From Armv8.4:~~

~~Otherwise:~~
AT, bits [35:32]

Identifies support for unaligned single-copy atomicity and atomic functions. Defined values are:

AT	Meaning
0b0000	Unaligned single-copy atomicity and atomic functions are not supported.
0b0001	Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.

All other values are reserved.

ARMv8.4-LSE implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

~~Reserved, RES0.~~

~~ST, bits [31:28]~~

~~From Armv8.4:~~

~~Otherwise:~~
ST, bits [31:28]

Identifies support for small translation tables. Defined values are:

ST	Meaning
0b0000	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 39.
0b0001	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.

All other values are reserved.

ARMv8.4-TTST implements the functionality identified by the value 0b0001.

~~Reserved, RES0.~~

NV, bits [27:24]

From Armv8.3:

If ARMv8.4-SecEL2 is implemented the only permitted value is ARMv8.4-SecEL2 is implemented, the only permitted value is `0b0001`.

In an implementation which does not support Secure EL2, the permitted values are ARMv8.4-SecEL2, the permitted values are `0b0000` and `0b0001`.

Otherwise:

NV, bits [27:24]

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are:

NV	Meaning
`0b0000`	Nested virtualization is not supported.
`0b0001`	The HCR_EL2.NV, HCR_EL2.NV1, HCR_EL2.AT bits are implemented.
`0b0010`	The VNCR_EL2 register and the HCR_EL2.{AT, NV, NV1, NV2} bits are implemented.

All other values are reserved.

ARMv8.3-NV implementsIn Armv8.2, the functionalityonly identifiedpermitted byvalue the valueis `0b0001`0b0000.

In Armv8.3, the permitted values are:

- When EL2 is not implemented, `0b0000`.
- When EL2 is implemented, `0b0001`.

ARMv8.4-NV implements the functionality identified by the value `0b0010`.

The feature ARMv8.3-NV implements the functionality identified by the value `0b0001`.

In Armv8.4, the permitted values are:

- When EL2 is not implemented, `0b0000`.
- When EL2 is implemented, `0b0010`.

The feature ARMv8.4-NV implements the functionality identified by the value `0b0010`.

Otherwise:

Reserved, RES0.

CCIDX, bits [23:20]

From Armv8.3:

CCIDX, bits [23:20]

Support for the use of revised CCSIDR_EL1 register format. Defined values are:

CCIDX	Meaning
`0b0000`	32-bit format implemented for all levels of the CCSIDR_EL1.
`0b0001`	64-bit format implemented for all levels of the CCSIDR_EL1.

All other values are reserved.

This feature is identified as ARMv8.3-CCIDX implements the functionality identified by the value `0b0001`.

From Armv8.3, the permitted values are `0b0000` and `0b0001`.

Reserved, RES0.

~~VARange, bits [19:16]~~

~~From Armv8.2:~~

~~Otherwise:~~
VARange, bits [19:16]

Indicates support for a larger virtual address. Defined values are:

VARange	Meaning
0b0000	VMSAv8-64 supports 48-bit VAs.
0b0001	VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The other translation granules support 48-bit VAs.

All other values are reserved.

ARMv8.2-LVA implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

~~Reserved, RES0.~~

~~IESB, bits [15:12]~~

~~From Armv8.2:~~

~~Otherwise:~~
IESB, bits [15:12]

Indicates support for the IESB bit in the SCTLR_ELx registers. Defined values are:

IESB	Meaning
0b0000	IESB bit in the SCTLR_ELx registers is not supported.
0b0001	IESB bit in the SCTLR_ELx registers is supported.

All other values are reserved.

ARMv8.2-IESB implements the functionality identified by the value 0b0001.

~~Reserved, RES0.~~

~~LSM, bits [11:8]~~

~~From Armv8.2:~~

~~Otherwise:~~
LSM, bits [11:8]

Indicates support for LSMAOE and nTLSMD bits in SCTLR_EL1 and SCTLR_EL2. Defined values are:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

ARMv8.2-LSMAOC implements the functionality identified by the value 0b0001.

~~Reserved, RES0.~~

UAO, bits [7:4]

From Armv8.2:

Otherwise:
UAO, bits [7:4]

User Access Override. Defined values are:

UAO	Meaning
0b0000	UAO not supported.
0b0001	UAO supported.

All other values are reserved.

ARMv8.2-UAO implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

CnP, bits [3:0]

From Armv8.2:

Common not Private translations. Defined values are:

Otherwise:
CnP, bits [3:0]

Indicates support for Common not Private translations. Defined values are:

Reserved, RES0.

CnP	Meaning
0b0000	Common not Private translations not supported.
0b0001	Common not Private translations supported.

All other values are reserved.

ARMv8.2-TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0

The ID_AA64PFR0_EL1 characteristics are:

Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

The external register EDPFR gives information from this register.

Attributes

ID_AA64PFR0_EL1 is a 64-bit register.

Field descriptions

The ID_AA64PFR0_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CSV3				CSV2				RES0				DIT				AMU				MPAM				SEL2				SVE			
RAS				GIC				AdvSIMD				FP				EL3				EL2				EL1				EL0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CSV3, bits [63:60]

From Armv8.5:

Speculative use of faulting data. Defined values are:

CSV3	Meaning
0b0000	This Device does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence
0b0001	Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

Reserved, RES0.

CSV2, bits [59:56]

From Armv8.5:

Otherwise:
CSV2, bits [59:56]

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	This Device does not disclose whether branch targets trained in one hardware described context can affect speculative execution in a different hardware described context.
0b0001	Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way. Contexts do not include the SCXTNUM_ELx register contexts, and these registers are not supported.
0b0010	Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way. Contexts include the SCXTNUM_ELx register contexts, and these registers are supported.

From Armv8.5 the only permitted values are 0b0001 or 0b0010.

All other values are reserved.

Otherwise:

Reserved, RES0.

Bits [55:52]

Reserved, RES0.

DIT, bits [51:48]

From Armv8.4:

Data Independent Timing. Defined values are:

DIT	Meaning
0b0000	AArch64 does not guarantee constant execution time of any instructions.
0b0001	AArch64 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

ARMv8.4-DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [47:44]

From Armv8.4:

Activity Monitors Extension. Defined values are:

Otherwise:

AMU, bits [47:44]

Indicates support for Activity Monitors Extension. Defined values are:

Reserved, RES0.

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	AMUv1 for Armv8.4 is implemented.
0b0010	AMUv1 for Armv8.6 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

AMUv1 implements the functionality identified by the value 0b0001.

ARMv8.6-AMU implements the functionality identified by the value 0b0010.

MPAM, bits [43:40]

From Armv8.2:

MPAM Extension. Defined values are:

Otherwise:

MPAM, bits [43:40]

Indicates support for MPAM Extension. Defined values are:

Reserved, RES0.

MPAM	Meaning
0b0000	MPAM is not implemented.
0b0001	MPAM is implemented.

All other values are reserved.

Otherwise:

Reserved, RES0.

SEL2, bits [39:36]

From Armv8.4:

MPAM implements the functionality identified by the value 0b0001.

SEL2, bits [39:36]

Secure EL2. Defined values are:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

All other values are reserved.

Otherwise:

Reserved, RES0.

~~SVE, bits [35:32]~~

~~From Armv8.2:~~

ARMv8.4-SecEL2 implements the functionality identified by the value 0b0001.

SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

SVE	Meaning
0b0000	SVE architectural state and programmers' model are not implemented.
0b0001	SVE architectural state and programmers' model are implemented.

All other values are reserved.

If implemented, refer to ID_AA64ZFR0_EL1 for information about which SVE instructions are available.

~~Otherwise:~~

~~Reserved, RES0.~~

RAS, bits [31:28]

RAS Extension version. Defined~~The~~ ~~defined~~ values ~~of this field~~ are:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	RAS Extension present.
0b0010	ARMv8.4-RAS present. As 0b0001, and adds support for: • If EL3 is implemented, ARMv8.4-DFE. • Additional ERXMISC<m>_EL1 System registers. • Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

~~From Armv8.4, when ARMv8.4-DFE is not implemented, and ERRIDR_EL1.NUM is zero, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010. Otherwise from Armv8.4 the only permitted value is 0b0010.~~

ARMv8.4-RAS implements the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, when ARMv8.4-DFE is not implemented, and ERRIDR_EL1.NUM is zero, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010. Otherwise from Armv8.4, the only permitted value is 0b0010.

~~In Armv8.1 and Armv8.0, the permitted values are 0b0000 and 0b0001.~~

GIC, bits [27:24]

System register GIC CPU~~interface~~ interface.~~support.~~ Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following SISD and SIMD operations: • Integer byte, halfword, word and doubleword element operations. • Single-precision and double-precision floating-point arithmetic. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support that does not include the ARMv8.2-FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support that includes the ARMv8.2-FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

FP, bits [19:16]

Floating-point. Defined values are:

FP	Meaning
0b0000	Floating-point is implemented, and includes support for: • Single-precision and double-precision floating-point types. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support that does not include the ARMv8.2-FP16 extension.
- 0b0001 in an implementation with floating-point support that includes the ARMv8.2-FP16 extension.
- 0b1111 in an implementation without floating-point support.

EL3, bits [15:12]

EL3 Exception level handling. Defined values are:

EL3	Meaning
0b0000	EL3 is not implemented.
0b0001	EL3 can be executed in AArch64 state only.
0b0010	EL3 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL2, bits [11:8]

EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL1, bits [7:4]

EL1 Exception level handling. Defined values are:

EL1	Meaning
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL0, bits [3:0]

EL0 Exception level handling. Defined values are:

EL0	Meaning
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

Accessing the ID_AA64PFR0_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_AA64PFR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b000

ID_AA64PFR1_EL1, AArch64 Processor Feature Register 1

The ID_AA64PFR1_EL1 characteristics are:

Purpose

Reserved for future expansion of information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

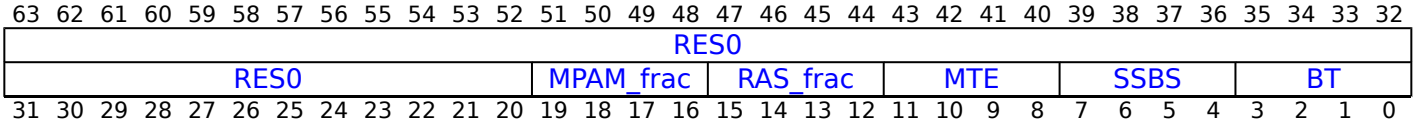
There are no configuration notes.

Attributes

ID_AA64PFR1_EL1 is a 64-bit register.

Field descriptions

The ID_AA64PFR1_EL1 bit assignments are:



Bits [63:20]

Reserved, RES0.

MPAM_frac, bits [19:16]

From Armv8.6:

MPAM Extension fractional field. Defined values are:

MPAM_frac	Meaning
0b0000	If ID_AA64PFR0_EL1.MPAM == 0b0000, MPAM Extension not implemented. If ID_AA64PFR0_EL1.MPAM == 0b0001, MPAM Extension version 1.0 is implemented.
0b0001	If ID_AA64PFR0_EL1.MPAM == 0b0000, implements MPAM version 0.1 which is like version 1.1 but reduces support for Secure PARTIDs. If ID_AA64PFR0_EL1.MPAM == 0b0001, implements MPAM extension version 1.1 and adds support for TIDR bit in MPAM2_EL2 to provide trapping of MPAMIDR_EL1 when MPAMHCR_EL2 is not present.

All other values are reserved.

RAS_frac, bits [15:12]

From Armv8.4:

RAS Extension fractional field.

Otherwise:

RAS_frac, bits [15:12]

RAS Extension fractional field. Defined values are:

Reserved, RES0.

RAS_frac	Meaning
0b0000	If ID_AA64PFR0_EL1.RAS == 0b0001, RAS Extension implemented.
0b0001	If ID_AA64PFR0_EL1.RAS == 0b0001, as 0b0000 and adds support for: • Additional ERXMISC<m>_EL1 System registers. • Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS, and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

This field is valid only if ID_AA64PFR0_EL1.RAS == 0b0001.

MTE, bits [11:8]

From Armv8.5:

Support for the Memory Tagging Extension.

Otherwise:

MTE, bits [11:8]

Support for the Memory Tagging Extension. Defined values are:

Reserved, RES0.

MTE	Meaning
0b0000	Memory Tagging Extension is not implemented.
0b0001	Memory Tagging Extension instructions accessible at EL0 are implemented. Instructions and System Registers defined by the extension not configurably accessible at EL0 are Unallocated and other System Register fields defined by the extension are RES0.
0b0010	Memory Tagging Extension is implemented.

All other values are reserved.

ARMv8.5-MemTag implements the functionality identified by the value 0b0001.

When ID_AA64PFR1_EL1.MTE != 0b0010:

- All register fields added to existing System registers and Special-purpose registers as part of the extension are RES0, and treated as 0.
- The following System registers are UNDEFINED:

    - GMID_EL1, GCR_EL1, RGSR_EL1, TFSRE0_EL1, and TFSR_ELx.
- The following System instructions are UNDEFINED:
    - DC CGSW, DC CIGSW, DC IGSW, DC CGDSW, DC CIGDSW, DC IGDSW, DC IGVAC, and DC IGDVAC.
- The following instructions are UNDEFINED:
    - LDGM, STGM, and STZGM.
- The Tagged memory type encoding in MAIR_ELx is UNPREDICTABLE.

~~Reserved, RES0.~~

~~SSBS, bits [7:4]~~

~~From Armv8.5:~~

~~Otherwise:~~
SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

SSBS	Meaning
0b0000	AArch64 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.
0b0010	AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypassing Safe, and the MSR and MRS instructions to directly read and write the PSTATE.SSBS field

All other values are reserved.

~~Reserved, RES0.~~

~~BT, bits [3:0]~~

~~From Armv8.5:~~

~~Otherwise:~~
BT, bits [3:0]

Branch Target Identification mechanism support in AArch64 state. Defined values are:

BT	Meaning
0b0000	The Branch Target Identification mechanism is not implemented.
0b0001	The Branch Target Identification mechanism is implemented.

All other values are reserved.

ARMv8.5-BTI implements the functionality identified by the value 0b0001.

From Armv8.5, the only permitted value is 0b0001.

~~Otherwise:~~

~~Reserved, RES0.~~

Accessing the ID_AA64PFR1_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID_AA64PFR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b001

ID_AA64ZFR0_EL1, SVE Feature ID register 0

The ID_AA64ZFR0_EL1 characteristics are:

Purpose

Provides additional information about the implemented features of the AArch64 Scalable Vector Extension, when the ID_AA64PFR0_EL1.SVE field is not zero.

For general information about the interpretation of the ID registers see Principles of the ID scheme for fields in ID registers.

Configuration

This register is present only when SVE is implemented. Otherwise, direct accesses to ID_AA64ZFR0_EL1 are RAZ.

Note

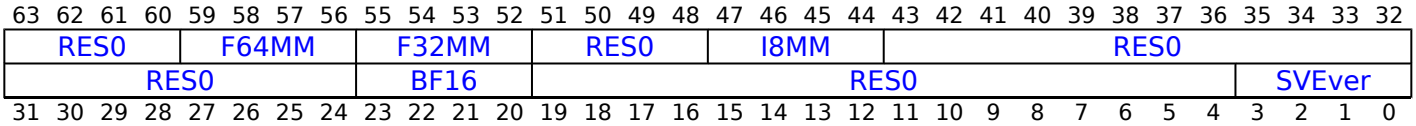
Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64ZFR0_EL1 is a 64-bit register.

Field descriptions

The ID_AA64ZFR0_EL1 bit assignments are:



Bits [63:60]

Reserved, RES0.

F64MM, bits [59:56]

~~**From Armv8.2:**~~

Indicates support for SVE FP64 double-precision floating-point matrix multiplication instructions. Defined values are:

F64MM	Meaning
0b0000	FP64 matrix multiplication and related instructions are not implemented.
0b0001	FMMLA, and LD1RO* instructions are implemented. The 128-bit element variations of TRN1, TRN2, UZP1, UZP2, ZIP1, and ZIP2 are also implemented.

All other values are reserved.

ARMv8.2-F64MM implements the functionality identified by 0b0001.

Otherwise:

Reserved, RES0.

F32MM, bits [55:52]

From Armv8.2:

From Arm v8.2, the permitted values are `0b0000` and `0b0001`.

F32MM, bits [55:52]

Indicates support for the SVE FP32 single-precision floating-point matrix multiplication instruction. Defined values are:

F32MM	Meaning
`0b0000`	FP32 matrix multiplication instruction is not implemented.
`0b0001`	FMMLA instruction is implemented.

All other values are reserved.

ARMv8.2-F32MM implements the functionality identified by `0b0001`.

Otherwise:

Reserved, RES0.

From Arm v8.2, the permitted values are `0b0000` and `0b0001`.

Bits [51:48]

Reserved, RES0.

I8MM, bits [47:44]

From Armv8.2:

Indicates support for SVE Int8 matrix multiplication instructions. Defined values are:

I8MM	Meaning
`0b0000`	Int8 matrix multiplication instructions are not implemented.
`0b0001`	SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.

All other values are reserved.

ARMv8.2-I8MM implements the functionality identified by `0b0001`.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ISAR1_EL1.I8MM.

From Armv8.6, the only permitted value is `0b0001`.

Otherwise:

Reserved, RES0.

Bits [43:24]

Reserved, RES0.

BF16, bits [23:20]

From Armv8.2:

Indicates support for SVE BFloat16 instructions. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	BFCVT, BFCVTNT, BFDOT, BFMLALB, BFMLALT, and BFMMLA instructions are implemented.

All other values are reserved.

ARMv8.2-BF16 implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ISAR1_EL1.BF16.

From ARMv8.6, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

Bits [19:4]

Reserved, RES0.

SVEver, bits [3:0]

Scalable Vector Extension instruction set version. Defined values are:

SVEver	Meaning
0b0000	SVE instructions are implemented.

All other values are reserved. This field is only valid if the ID_AA64PFR0_EL1.SVE field is not zero.

Accessing the ID_AA64ZFR0_EL1

ID_DFR0_EL1, AArch32 Debug Feature Register 0

The ID_DFR0_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, MIDR_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register ID_DFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR0[31:0] .

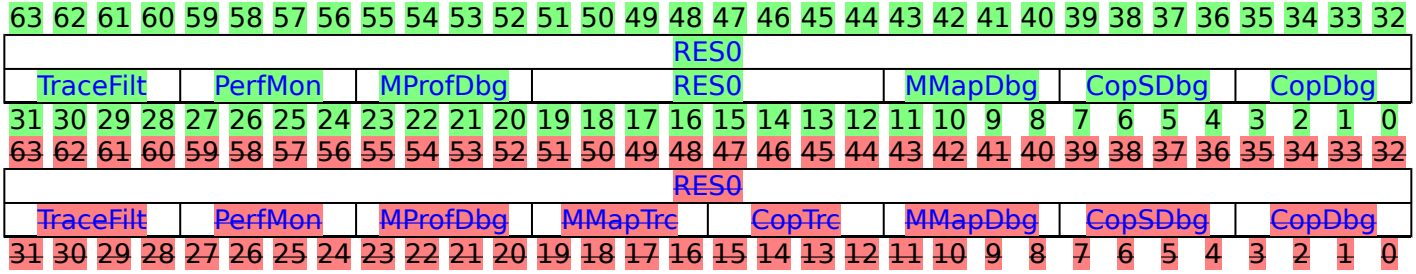
ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_DFR0_EL1 areis UNKNOWN.

Attributes

ID_DFR0_EL1 is a 64-bit register.

Field descriptions

The ID_DFR0_EL1 bit assignments are:



Bits [63:32]

Reserved, RES0.

TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

ARMv8.4-Trace implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the Alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.1.4.

Defined values are:

PerfMon	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension version 1 implemented, PMUv1.
0b0010	Performance Monitors Extension version 2 implemented, PMUv2.
0b0011	Performance Monitors Extension version 3 implemented, PMUv3.
0b0100	PMUv3 for Armv8.1. As 0b0011, and also includes support for: • Extended 16-bit PMEVTYPER<n>.evtCount field. • If EL2 is implemented, the HDCR.HPMD control bit.
0b0101	PMUv3 for Armv8.4. As 0b0100 and also includes support for the PMMIR register.
0b0110	PMUv3 for Armv8.5. As 0b0101 and also includes support for: • 64-bit event counters. • If EL2 is implemented, the HDCR.HCCD control bit. • If EL3 is implemented, the SDCR.SCCD control bit.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value in new implementations.

ARMv8.1-PMU implements the functionality added by the value 0b0100.

ARMv8.4-PMU implements the functionality added by the value 0b0101.

ARMv8.5-PMU implements the functionality added by the value 0b0110.

All other values are reserved.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, the value 0b0011 is not permitted.

From Armv8.4, the value 0b0100 is not permitted.

From Armv8.5, the value 0b0101 is not permitted.

Note

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

MProfDbg, bits [23:20]

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

MProfDbg	Meaning
0b0000	Not supported.
0b0001	Support for M profile Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

MMapTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

CopTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with System registers access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

BitsMMapTrc, bits [19:1216]

Reserved,Memory Mapped Trace. Support for memory-mapped trace model. Defined values are: RES0.

MMapDbg, bits [11:8]

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In Armv8-A, this field is RES0.

The optional memory map defined by Armv8 is not compatible with Armv7.

CopSDbg, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

CopDbg, bits [3:0]

Support for System registers-based debug model, using registers in the coproc == 0b1110 encoding space, for A and R profile processors. Defined values are:

CopDbg	Meaning
0b0000	Not supported.
0b0010	Support for Armv6, v6 Debug architecture, with System registers access.
0b0011	Support for Armv6, v6.1 Debug architecture, with System registers access.
0b0100	Support for Armv7, v7 Debug architecture, with System registers access.
0b0101	Support for Armv7, v7.1 Debug architecture, with System registers access.
0b0110	Support for Armv8 debug architecture, with System registers access.
0b0111	Support for Armv8 debug architecture, with System registers access, and Virtualization Host extensions.
0b1000	Support for Armv8.2 debug architecture.
0b1001	Support for Armv8.4 debug architecture.

All other values are reserved.

In any Armv8 implementation, the values `0b0000`, `0b0010`, `0b0011`, `0b0100`, and `0b0101` are not permitted.

If ARMv8.1-VHE is not implemented, the only permitted value is `0b0110`.

In an Armv8.0 implementation, the value `0b1000` is not permitted.

Accessing the ID_DFR0_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_DFR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b010

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_DFR0_EL1;
elsif PSTATE.EL == EL2 then
    return ID_DFR0_EL1;
elsif PSTATE.EL == EL3 then
    return ID_DFR0_EL1;
```

ID_DFR1_EL1, Debug Feature Register 1

The ID_DFR1_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch32.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register ID_DFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR1[31:0] .

This register is present only when from AArch32 is supported at any Exception level. Armv8.6. Otherwise, direct accesses to ID_DFR1_EL1 are RES0.

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_DFR1_EL1 is a 64-bit register.

Field descriptions

The ID_DFR1_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																												MTPMU			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:4]

Reserved, RES0.

MTPMU, bits [3:0]

From Armv8.6:

Multi-threaded PMU extension. Defined values are:

MTPMU	Meaning
0b0000	ARMv8.6-MTPMU not implemented. If PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>_EL0.MT are read/write or RES0.
0b0001	ARMv8.6-MTPMU implemented and PMEVTYPER<n>_EL0.MT are read/write. When ARMv8.6-MTPMU is disabled, the Effective values of PMEVTYPER<n>.MT are 0.
0b1111	ARMv8.6-MTPMU not implemented. If PMUv3 is implemented, PMEVTYPER<n>_EL0.MT are RES0.

All other values are reserved.

ARMv8.6-MTPMU implements the functionality identified by the value 0b0001.

In an Armv8.6-compliant implementation that includes PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include PMUv3, the value 0b0001 is not permitted.

Otherwise:

~~Reserved, RES0.~~

Accessing the ID_DFR1_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_DFR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b101

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then

ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0

The ID_ISAR0_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D7.1.3.

Configuration

AArch64 System register ID_ISAR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR0[31:0] .

ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_ISAR0_EL1 areis UNKNOWN.

Attributes

ID_ISAR0_EL1 is a 64-bit register.

Field descriptions

The ID_ISAR0_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0				Divide				Debug				Coproc				CmpBranch				BitField				BitCount				Swap			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:28]

Reserved, RES0.

Divide, bits [27:24]

Indicates the implemented Divide instructions. Defined values are:

Divide	Meaning
0b0000	None implemented.
0b0001	Adds SDIV and UDIV in the T32 instruction set.
0b0010	As for 0b0001, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Debug, bits [23:20]

Indicates the implemented Debug instructions. Defined values are:

Debug	Meaning
0b0000	None implemented.
0b0001	Adds BKPT.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Coproc, bits [19:16]

Indicates the implemented System register access instructions. Defined values are:

Coproc	Meaning
0b0000	None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.
0b0001	Adds generic CDP, LDC, MCR, MRC, and STC.
0b0010	As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.
0b0011	As for 0b0010, and adds generic MCRR and MRRC.
0b0100	As for 0b0011, and adds generic MCRR2 and MRRC2.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

CmpBranch	Meaning
0b0000	None implemented.
0b0001	Adds CBNZ and CBZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:

BitField	Meaning
0b0000	None implemented.
0b0001	Adds BFC, BFI, SBFX, and UBFX.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:

BitCount	Meaning
0b0000	None implemented.
0b0001	Adds CLZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

Swap	Meaning
0b0000	None implemented.
0b0001	Adds SWP and SWPB.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Accessing the ID_ISAR0_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_ISAR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b000

ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1

The ID_ISAR1_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D7.1.3.

Configuration

AArch64 System register ID_ISAR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR1[31:0] .

ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_ISAR1_EL1 areis UNKNOWN.

Attributes

ID_ISAR1_EL1 is a 64-bit register.

Field descriptions

The ID_ISAR1_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Jazelle				Interwork				Immediate				IfThen				Extend				Except_AR				Except				Endian			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions. Defined values are:

Jazelle	Meaning
0b0000	No support for Jazelle.
0b0001	Adds the BXJ instruction and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Interwork, bits [27:24]

Indicates the implemented Interworking instructions. Defined values are:

Interwork	Meaning
0b0000	None implemented.
0b0001	Adds the BX instruction, and the T bit in the PSR.
0b0010	As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.
0b0011	As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

Immediate	Meaning
0b0000	None implemented.
0b0001	Adds: • The MOVT instruction. • The MOV instruction encodings with zero-extended 16-bit immediates. • The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

IfThen	Meaning
0b0000	None implemented.
0b0001	Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

Extend	Meaning
0b0000	No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.
0b0001	Adds the SXTB, SXTH, UXTB, and UXTH instructions.
0b0010	As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Except_AR, bits [11:8]

Indicates the implemented A and R profile exception-handling instructions. Defined values are:

Except_AR	Meaning
0b0000	None implemented.
0b0001	Adds the SRS and RFE instructions, and the A and R profile forms of the CPS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:

Except	Meaning
0b0000	Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.
0b0001	Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Endian, bits [3:0]

Indicates the implemented Endian instructions. Defined values are:

Endian	Meaning
0b0000	None implemented.
0b0001	Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Accessing the ID_ISAR1_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_ISAR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b001

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_ISAR1_EL1;
elsif PSTATE.EL == EL2 then
    return ID_ISAR1_EL1;
elsif PSTATE.EL == EL3 then
    return ID_ISAR1_EL1;
```

ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2

The ID_ISAR2_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register ID_ISAR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR2[31:0] .

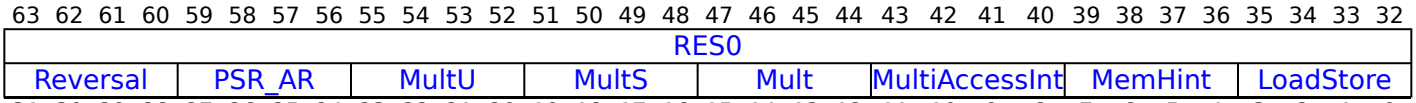
ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_ISAR2_EL1 areis UNKNOWN.

Attributes

ID_ISAR2_EL1 is a 64-bit register.

Field descriptions

The ID_ISAR2_EL1 bit assignments are:



Bits [63:32]

Reserved, RES0.

Reversal, bits [31:28]

Indicates the implemented Reversal instructions. Defined values are:

Reversal	Meaning
0b0000	None implemented.
0b0001	Adds the REV, REV16, and REVSH instructions.
0b0010	As for 0b0001, and adds the RBIT instruction.

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

PSR_AR, bits [27:24]

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:

PSR_AR	Meaning
0b0000	None implemented.
0b0001	Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

MultU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

MultU	Meaning
0b0000	None implemented.
0b0001	Adds the UMULL and UMLAL instructions.
0b0010	As for 0b0001, and adds the UMAAL instruction.

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

MultS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions. Defined values are:

MultS	Meaning
0b0000	None implemented.
0b0001	Adds the SMULL and SMLAL instructions.
0b0010	As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
0b0011	As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.

All other values are reserved.

In Armv8-A the only permitted value is 0b0011.

Mult, bits [15:12]

Indicates the implemented additional Multiply instructions. Defined values are:

Mult	Meaning
0b0000	No additional instructions implemented. This means only MUL is implemented.
0b0001	Adds the MLA instruction.
0b0010	As for 0b0001, and adds the MLS instruction.

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions. Defined values are:

MultiAccessInt	Meaning
0b0000	No support. This means the LDM and STM instructions are not interruptible.
0b0001	LDM and STM instructions are restartable.
0b0010	LDM and STM instructions are continuable.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:

MemHint	Meaning
0b0000	None implemented.
0b0001	Adds the PLD instruction.
0b0010	Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)
0b0011	As for 0b0001 (or 0b0010), and adds the PLI instruction.
0b0100	As for 0b0011, and adds the PLDW instruction.

All other values are reserved.

In Armv8-A the only permitted value is 0b0100.

LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

LoadStore	Meaning
0b0000	No additional load/store instructions implemented.
0b0001	Adds the LDRD and STRD instructions.
0b0010	As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

Accessing the ID_ISAR2_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_ISAR2_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b010

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_ISAR2_EL1;
elsif PSTATE.EL == EL2 then
    return ID_ISAR2_EL1;
elsif PSTATE.EL == EL3 then
    return ID_ISAR2_EL1;
```

ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3

The ID_ISAR3_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D7.1.3.

Configuration

AArch64 System register ID_ISAR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR3[31:0] .

ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_ISAR3_EL1 areis UNKNOWN.

Attributes

ID_ISAR3_EL1 is a 64-bit register.

Field descriptions

The ID_ISAR3_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
T32EE				TrueNOP				T32Copy				TabBranch				SynchPrim				SVC				SIMD				Saturate			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

T32EE, bits [31:28]

Indicates the implemented T32EE instructions. Defined values are:

T32EE	Meaning
0b0000	None implemented.
0b0001	Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions. Defined values are:

TrueNOP	Meaning
0b0000	None implemented. This means there are no NOP instructions that do not have any register dependencies.
0b0001	Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

T32Copy	Meaning
0b0000	Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.
0b0001	Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

TabBranch	Meaning
0b0000	None implemented.
0b0001	Adds the TBB and TBH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

SynchPrim	Meaning
0b0000	If SynchPrim_frac == 0b0000, no Synchronization Primitives implemented.
0b0001	If SynchPrim_frac == 0b0000, adds the LDREX and STREX instructions. If SynchPrim_frac == 0b0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.
0b0010	If SynchPrim_frac == 0b0000, as for [0b0001, 0b0011] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

SVC	Meaning
0b0000	Not implemented.
0b0001	Adds the SVC instruction.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:

SIMD	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
`0b0011`	As for `0b0001`, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In Armv8-A the only permitted value is `0b0011`.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

Saturate	Meaning
`0b0000`	None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
`0b0001`	Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Accessing the ID_ISAR3_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_ISAR3_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b011

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_ISAR3_EL1;
elsif PSTATE.EL == EL2 then
    return ID_ISAR3_EL1;
elsif PSTATE.EL == EL3 then
    return ID_ISAR3_EL1;
```

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4

The ID_ISAR4_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D7.1.3.

Configuration

AArch64 System register ID_ISAR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR4[31:0] .

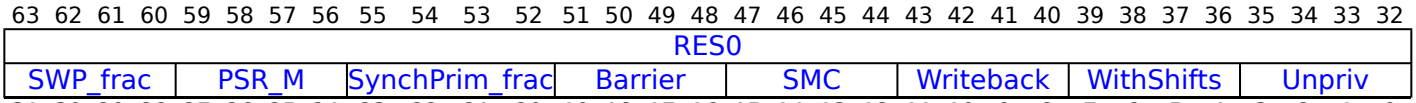
ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_ISAR4_EL1 areis UNKNOWN.

Attributes

ID_ISAR4_EL1 is a 64-bit register.

Field descriptions

The ID_ISAR4_EL1 bit assignments are:



Bits [63:32]

Reserved, RES0.

SWP_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

SWP_frac	Meaning
0b0000	SWP or SWPB instructions not implemented.
0b0001	SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other masters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if the ID_ISAR0.SwapSwap_instrs field is 0b0000.

In Armv8-A, the only permitted value is 0b0000.

PSR_M, bits [27:24]

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

PSR_M	Meaning
0b0000	None implemented.
0b0001	Adds the M profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

SynchPrim_frac, bits [23:20]

Used in conjunction with ID_ISAR3.SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

SynchPrim_frac	Meaning
0b0000	If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.
0b0011	If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

Barrier	Meaning
0b0000	None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.
0b0001	Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SMC, bits [15:12]

Indicates the implemented SMC instructions. Defined values are:

SMC	Meaning
0b0000	None implemented.
0b0001	Adds the SMC instruction.

All other values are reserved.

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32, then this field has the value 0b0000.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes. Defined values are:

Writeback	Meaning
0b0000	Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.
0b0001	Adds support for all of the writeback addressing modes.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

WithShifts	Meaning
0b0000	Nonzero shifts supported only in MOV and shift instructions.
0b0001	Adds support for shifts of loads and stores over the range LSL 0-3.
0b0011	As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.
0b0100	As for 0b0011, and adds support for register-controlled shift options.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

Unpriv	Meaning
0b0000	None implemented. No T variant instructions are implemented.
0b0001	Adds the LDRBT, LDRT, STRBT, and STRT instructions.
0b0010	As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Accessing the ID_ISAR4_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_ISAR4_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b100

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then

ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5

The ID_ISAR5_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR4_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D7.1.3.

Configuration

AArch64 System register ID_ISAR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR5[31:0] .

ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_ISAR5_EL1 areis UNKNOWN.

Attributes

ID_ISAR5_EL1 is a 64-bit register.

Field descriptions

The ID_ISAR5_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
VCMA				RDM				RES0				CRC32				SHA2				SHA1				AES				SEVL			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

VCMA, bits [31:28]

From Armv8.3:

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

VCMA	Meaning
0b0000	The VCMLA and VCADD instructions are not implemented in AArch32.
0b0001	The VCMLA and VCADD instructions are implemented in AArch32.

All other values are reserved.

ARMv8.3-CompNum implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, the only permitted value is 0b0001.

Reserved, RES0.

RDM, bits [27:24]

From Armv8.1:

Otherwise:
RDM, bits [27:24]

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

RDM	Meaning
0b0000	No VQRDMLAH and VQRDMLSH instructions implemented.
0b0001	VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

ARMv8.1-RDMA implements the functionality identified by the value 0b0001.

In Armv8.0, the only permitted value is 0b0000.

From Armv8.1, the only permitted value is 0b0001.

Otherwise:

Reserved, RES0.

Bits [23:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates whether the CRC32 instructions are implemented in AArch32 state.

CRC32	Meaning
0b0000	No CRC32 instructions implemented.
0b0001	CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates whether the SHA2 instructions are implemented in AArch32 state.

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SHA1, bits [11:8]

Indicates whether the SHA1 instructions are implemented in AArch32 state.

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

AES, bits [7:4]

Indicates whether the AES instructions are implemented in AArch32 state.

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC implemented.
0b0010	As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

SEVL, bits [3:0]

Indicates whether the SEVL instruction is implemented in AArch32 state.

SEVL	Meaning
0b0000	SEVL is implemented as a NOP.
0b0001	SEVL is implemented as Send Event Local.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Accessing the ID_ISAR5_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_ISAR5_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b101

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else

ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6

The ID_ISAR6_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1 and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register ID_ISAR6_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR6[31:0] .

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID_ISAR6_EL1 are UNKNOWN.

This register is present only from Armv8.2. Otherwise, direct accesses to ID_ISAR6_EL1 are RES0. In an implementation that supports only AArch64 state, this register is UNKNOWN.

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_ISAR6_EL1 is a 64-bit register.

Field descriptions

The ID_ISAR6_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0				I8MM				BF16				SPECRES				SB				FHM				DP				JSCVT			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:28]

Reserved, RES0.

I8MM, bits [27:24]

From Armv8.2:

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values of this field are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.

All other values are reserved.

ARMv8.2-AA32I8MM implements the functionality identified by 0b0001.

~~Reserved, RES0.~~

~~BF16, bits [23:20]~~

~~From Armv8.2:~~

~~Otherwise:~~

BF16, bits [23:20]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	VCVT, VCVTB, VCVTT, VDOT, VFMAL, and VMMLA instructions with BF16 operand or result types are implemented.

All other values are reserved.

ARMv8.2-AA32BF16 implements the functionality identified by 0b0001.

~~Otherwise:~~

~~Reserved, RES0.~~

SPECRES, bits [19:16]

Indicates support~~supporte~~ for Speculation invalidation instructions~~instruction~~ in AArch32 state. Defined values are:

SPECRES	Meaning
0b0000	Prediction~~CFPRCTX,~~ invalidation~~DVPRCTX, and CPPRCTX~~ instructions are not implemented.
0b0001	CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.

All other values are reserved.

ARMv8.0-PredInv implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [15:12]

Indicates support for the SB instruction in AArch32 state. Defined values are:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

ARMv8.0-SB implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

FHM, bits [11:8]

Indicates support for Advanced SIMD and floating-point VFMAL and VFMSL instructions in AArch32 state. Defined values are:

FHM	Meaning
0b0000	VFMAL and VMFSL instructions are not implemented.
0b0001	VFMAL and VMFSL instructions are implemented.

All other values are reserved.

~~ARMv8.2-FHM implements the functionality identified by the value 0b0001.~~

ARMv8.2-FHM implements~~In Armv8.0 and Armv8.1, the~~ functionality~~only~~ identified~~permitted~~ by~~value is 0b0001~~0b0000~~.

From~~In~~ Armv8.2, the permitted values are 0b0000 and 0b0001.

DP, bits [7:4]

Indicates ~~the~~ support for Advanced~~dot~~ SIMD and floating-point VFMAL and VFMSL~~product~~ instructions in AArch32 state. Defined values are:

DP	Meaning
0b0000	Dot~~No dot~~ product instructions are not implemented.
0b0001	UDOT~~VUDOT~~ and VSDOT instructions are implemented.

All other values are reserved.

~~In Armv8.0 and Armv8.1, the only permitted value is 0b0000.~~

ARMv8.2-DotProd implements the functionality identified by~~ the value~~ 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

~~**JSCVT, bits [3:0]**~~

~~**From Armv8.3:**~~

~~Indicates support for the Javascript conversion instruction in AArch32 state. Defined values are:~~

From Armv8.4, the only permitted value is 0b0001.

JSCVT, bits [3:0]

Indicates support for the VJCVT instruction in AArch32 state. Defined values are:

JSCVT	Meaning
0b0000	The VJCVT instruction is not implemented.
0b0001	The VJCVT instruction is implemented.

All other values are reserved.

ARMv8.3-JSConv implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

~~**Otherwise:**~~

~~Reserved, RES0.~~

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

Accessing the ID_ISAR6_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_ISAR6_EL1
```

ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0

The ID_MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register ID_MMFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR0[31:0] .

ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_MMFR0_EL1 areis UNKNOWN.

Attributes

ID_MMFR0_EL1 is a 64-bit register.

Field descriptions

The ID_MMFR0_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
InnerShr				FCSE				AuxReg				TCM				ShareLvl				OuterShr				PMSA				VMSA			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

InnerShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0_EL1.ShareLvl having the value 0b0001.

When ID_MMFR0_EL1.ShareLvl is zero, this field is UNK. UNKNOWN.

FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE. Defined values are:

FCSE	Meaning
0b0000	Not supported.
0b0001	Support for FCSE.

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

AuxReg	Meaning
0b0000	None supported.
0b0001	Support for Auxiliary Control Register only.
0b0010	Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

TCM	Meaning
0b0000	Not supported.
0b0001	Support is IMPLEMENTATION DEFINED. Armv7 requires this setting.
0b0010	Support for TCM only, Armv6 implementation.
0b0011	Support for TCM and DMA, Armv6 implementation.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

ShareLvl	Meaning
0b0000	One level of shareability implemented.
0b0001	Two levels of shareability implemented.

All other values are reserved.

From Armv8 the only permitted value is 0b0001.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

OuterShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

PMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED PMSA.
0b0010	Support for PMSAv6, with a Cache Type Register implemented.
0b0011	Support for PMSAv7, with support for memory subsections. Armv7-R profile.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

VMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED VMSA.
0b0010	Support for VMSAv6, with Cache and TLB Type Registers implemented.
0b0011	Support for VMSAv7, with support for remapping and the Access flag. Armv7-A profile.
0b0100	As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
0b0101	As for 0b0100, and adds support for the Long-descriptor translation table format.

All other values are reserved.

In Armv8-A the only permitted value is 0b0101.

Accessing the ID_MMFR0_EL1

Accesses to this register use the following encodings:

Bits [63:32]

Reserved, RES0.

BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

BPred	Meaning
0b0000	No branch predictor, or no MMU present. Implies a fixed MPU configuration.
0b0001	Branch predictor requires flushing on: • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Changes to the TTBR0, TTBR1, or TTBCR registers. • Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.
0b0010	Branch predictor requires flushing on: • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.
0b0011	Branch predictor requires flushing only on writing new data to instruction locations.
0b0100	For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In Armv8-A the permitted values are 0b0010, 0b0011, or 0b0100. For values other than 0b0000 and 0b0100 the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

L1TstCln	Meaning
0b0000	None supported.
0b0001	Supported Level 1 data cache test and clean operations are: • Test and clean data cache.
0b0010	As for 0001, and adds: • Test, clean, and invalidate data cache.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

L1Uni	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: • Invalidate cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
0b0010	As for 0001, and adds: • Clean cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

L1Hvd	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: • Invalidate instruction cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
0b0010	As for 0001, and adds: • Invalidate data cache. • Invalidate data cache and instruction cache, including branch predictor if appropriate.
0b0011	As for 0010, and adds: • Clean data cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

L1UniSW	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by set/way are: • Clean cache line by set/way.
0b0010	As for 0001, and adds: • Clean and invalidate cache line by set/way.
0b0011	As for 0010, and adds: • Invalidate cache line by set/way.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

L1HvdSW	Meaning
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by set/way are: • Clean data cache line by set/way. • Clean and invalidate data cache line by set/way.
0b0010	As for 0001, and adds: • Invalidate data cache line by set/way.
0b0011	As for 0010, and adds: • Invalidate instruction cache line by set/way.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

L1UniVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by VA are: • Clean cache line by VA. • Invalidate cache line by VA. • Clean and invalidate cache line by VA.
0b0010	As for 0001, and adds: • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

L1HvdVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by VA are: • Clean data cache line by VA. • Invalidate data cache line by VA. • Clean and invalidate data cache line by VA. • Clean instruction cache line by VA.
0b0010	As for 0001, and adds: • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Accessing the ID_MMFR1_EL1

Accesses to this register use the following encodings:

```

ID_MMFR2_EL1, AArch32 Memory Model Feature Register 2

The ID_MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR3_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register ID_MMFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR2[31:0] .

ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_MMFR2_EL1 areis UNKNOWN.

Attributes

ID_MMFR2_EL1 is a 64-bit register.

Field descriptions

The ID_MMFR2_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
HWAccFlg				WFIStall				MemBarr				UniTLB				HvdTLB				L1HvdRng				L1HvdBG				L1HvdFG			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

HWAccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

HWAccFlg	Meaning
0b0000	Not supported.
0b0001	Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

WFIStall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

WFIStall	Meaning
0b0000	Not supported.
0b0001	Support for WFI stalling.

All other values are reserved.

From Armv8 the permitted values are 0b0000 and 0b0001.

MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==0b1111) encoding space:

MemBarr	Meaning
0b0000	None supported.
0b0001	Supported memory barrier System instructions are: • Data Synchronization Barrier (DSB).
0b0010	As for 0001, and adds: • Instruction Synchronization Barrier (ISB). • Data Memory Barrier (DMB).

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

Arm deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

UniTLB	Meaning
0b0000	Not supported.
0b0001	Supported unified TLB maintenance operations are: • Invalidate all entries in the TLB. • Invalidate TLB entry by VA.
0b0010	As for 0001, and adds: • Invalidate TLB entries by ASID match.
0b0011	As for 0010, and adds: • Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.
0b0100	As for 0011, and adds: • Invalidate Hyp mode unified TLB entry by VA. • Invalidate entire Non-secure PL1&0 unified TLB. • Invalidate entire Hyp mode unified TLB.
0b0101	As for 0b0100, and adds the following operations: TLBIMVALIS, TLBIMVAALIS, TLBIMVALHIS, TLBIMVAL, TLBIMVAAL, TLBIMVALH.
0b0110	As for 0b0101, and adds the following operations: TLBIIPAS2IS, TLBIIPAS2LIS, TLBIIPAS2, TLBIIPAS2L.

All other values are reserved.

In Armv8-A the only permitted value is 0b0110.

HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

L1HvdRng	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache maintenance range operations are: • Invalidate data cache range by VA. • Invalidate instruction cache range by VA. • Clean data cache range by VA. • Clean and invalidate data cache range by VA.

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

L1HvdBG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache background fetch operations are: • Fetch instruction cache range by VA. • Fetch data cache range by VA.

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

L1HvdFG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache foreground fetch operations are: • Fetch instruction cache range by VA. • Fetch data cache range by VA.

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

Accessing the ID_MMFR2_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_MMFR2_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b110

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_MMFR2_EL1;
elsif PSTATE.EL == EL2 then
    return ID_MMFR2_EL1;
elsif PSTATE.EL == EL3 then
    return ID_MMFR2_EL1;
```

ID_MMFR3_EL1, AArch32 Memory Model Feature Register 3

The ID_MMFR3_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, and ID_MMFR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register ID_MMFR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR3[31:0] .

ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_MMFR3_EL1 areis UNKNOWN.

Attributes

ID_MMFR3_EL1 is a 64-bit register.

Field descriptions

The ID_MMFR3_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Supersec				CMemSz				CohWalk				PAN				MaintBcst				BPMaint				CMaintSW				CMaintVA			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

Supersec	Meaning
0b0000	Supersections supported.
0b1111	Supersections not supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b1111.

CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

CMemSz	Meaning
0b0000	4GB, corresponding to a 32-bit physical address range.
0b0001	64GB, corresponding to a 36-bit physical address range.
0b0010	1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In Armv8-A the permitted values are 0b0000, 0b0001, and 0b0010.

CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

CohWalk	Meaning
0b0000	Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.
0b0001	Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

PAN, bits [19:16]

~~From Armv8.1:~~

Privileged Access Never. Indicates support for the PAN bit in CPSR, SPSR, and DSPSR in AArch32 state. Defined values are:

PAN	Meaning
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and ATS1CPRP and ATS1CPWP instructions supported.

All other values are reserved.

ARMv8.1-PAN implements the functionality identified by the value 0b0001.

ARMv8.2-ATS1E1 implements the functionality added by the value 0b0010.

In Armv8.1 the value 0b0000 is not permitted.

From Armv8.2, the only permitted value is 0b0010.

~~Otherwise:~~

~~Reserved, RES0.~~

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

MaintBcst	Meaning
0b0000	Cache, TLB, and branch predictor operations only affect local structures.
0b0001	Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.
0b0010	Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

BPMaint	Meaning
0b0000	None supported.
0b0001	Supported branch predictor maintenance operations are: • Invalidate all branch predictors.
0b0010	As for 0001, and adds: • Invalidate branch predictors by VA.

All other values are reserved.

In Armv8-A the only permitted value is 0b0010.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

CMaintSW	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance instructions by set/way are: • Invalidate data cache by set/way. • Clean data cache by set/way. • Clean and invalidate data cache by set/way.

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

CMaintVA	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance operations by VA are: • Invalidate data cache by VA. • Clean data cache by VA. • Clean and invalidate data cache by VA. • Invalidate instruction cache by VA. • Invalidate all instruction cache entries.

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Accessing the ID_MMFR3_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_MMFR3_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b111

```
if PSTATE.EL == EL0 then

ID_MMFR4_EL1, AArch32 Memory Model Feature Register 4

The ID_MMFR4_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, and ID_MMFR3_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register ID_MMFR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR4[31:0] .

ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_MMFR4_EL1 areis UNKNOWN.

Attributes

ID_MMFR4_EL1 is a 64-bit register.

Field descriptions

The ID_MMFR4_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:32]

Reserved, RES0.

EVT, bits [31:28]

When ARMv8.2-EVT is implemented:

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR2.{TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

EVT	Meaning
0b0000	HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	HCR2.{TOCU, TICAB, TID4} traps are supported. HCR2.TTLBIS trap is not supported.
0b0010	HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

ARMv8.2-EVT implementsIn Armv8.0, the functionalityonly identifiedpermitted byvalue the valuesis 0b00010b0000 and 0b0010.

If EL2 is not implemented, the only permitted value is 0b0000.

From Armv8.1, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.1,Armv8.5 the permitted values are: 0b0000 and 0b0001.

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented. This feature is identified as ARMv8.2-EVT.

Otherwise:

Reserved, RES0.

CCIDX, bits [27:24]

From Armv8.3:

From Armv8.5, if EL2 is implemented, the only permitted value is 0b0010.

CCIDX, bits [27:24]

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.
0b0001	64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.

All other values are reserved.

ARMv8.3-CCIDX implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001. This feature is identified as ARMv8.3-CCIDX.

Otherwise:

Reserved, RAZ.

LSM, bits [23:20]

From Armv8.2:

From Armv8.3, the permitted values are 0b0000 and 0b0001.

LSM, bits [23:20]

Indicates support for LSMAOE and nTLSMD bits in HSCTLR and SCTLR. Defined values are:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

ARMv8.2-LSMAOC implements the functionality identified by the value 0b0001.

Otherwise:

Reserved, RAZ.

HPDS, bits [19:16]

~~From Armv8.2:~~

From Armv8.2, the permitted values are `0b0000` and `0b0001`.

HPDS, bits [19:16]

Hierarchical permission disables bits in translation tables. Defined values are:

HPDS	Meaning
`0b0000`	Disabling of hierarchical controls not supported.
`0b0001`	Supports disabling of hierarchical controls using the TTBCR2.HPD0, TTBCR2.HPD1, and HTCR.HPD bits.
`0b0010`	As for value `0b0001`, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

ARMv8.2-AA32HPD implements the functionality identified by the value `0b0001`.

ARMv8.2-TTPBHA implements the functionality added by the value `0b0010`.

Note

The value `0b0000` implies that the encoding for TTBCR2 is UNDEFINED.

~~Reserved, RAZ.~~

~~**CnP, bits [15:12]**~~

~~From Armv8.2:~~

~~Otherwise:~~
CnP, bits [15:12]

Common not Private translations. Defined values are:

CnP	Meaning
`0b0000`	Common not Private translations not supported.
`0b0001`	Common not Private translations supported.

All other values are reserved.

ARMv8.2-TTCNP implements the functionality identified by the value `0b0001`.

From Armv8.2 the only permitted value is `0b0001`.

~~Reserved, RAZ.~~

~~**XNX, bits [11:8]**~~

~~From Armv8.2:~~

~~Otherwise:~~
XNX, bits [11:8]

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

XNX	Meaning
`0b0000`	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
`0b0001`	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

ARMv8.2-TTS2UXN implements the functionality identified by the value 0b0001.

When ARMv8.2-TTS2UXN is implemented:

- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4_EL1.XNX is 0b0000 or 0b0001:
  - ID_AA64MMFR1_EL1.XNX ==1.
  - EL2 cannot use AArch32.
  - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0b0001.

~~**Otherwise:**~~

~~Reserved, RAZ.~~

AC2, bits [7:4]

Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2. Defined values are:

AC2	Meaning
0b0000	ACTLR2 and HACTLR2 are not implemented.
0b0001	ACTLR2 and HACTLR2 are implemented.

All other values are reserved.

In Armv8.0 and Armv8.1 the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [3:0]

~~**When RAS is implemented:**~~

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

SpecSEI	Meaning
0b0000	The PE never generates an SError interrupt due to an External abort on a speculative read.
0b0001	The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

~~**Otherwise:**~~

~~Reserved, RES0. This provides no information about whether the PE generates a speculative SError interrupt.~~

Accessing the ID_MMFR4_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_MMFR4_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b110

```

ID_MMFR5_EL1, AArch32 Memory Model Feature Register 5

The ID_MMFR5_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register ID_MMFR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR5[31:0] .

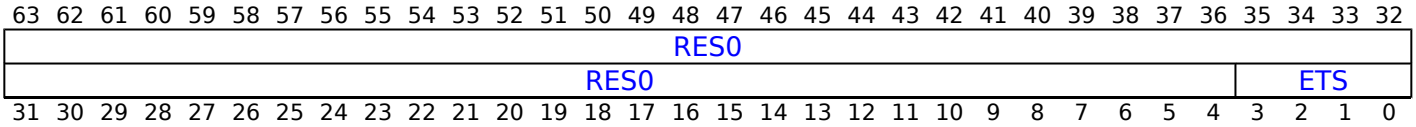
ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_MMFR5_EL1 areis UNKNOWN.

Attributes

ID_MMFR5_EL1 is a 64-bit register.

Field descriptions

The ID_MMFR5_EL1 bit assignments are:



Bits [63:4]

Reserved, RES0.

ETS, bits [3:0]

From Armv8.0:

Support for Enhanced Translation Synchronization. Defined values are:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is supported.

All other values are reserved.

ARMv8.0-ETS implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

Otherwise:

Reserved, RES0.

Accessing the ID_MMFR5_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_MMFR5_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b110

```
if PSTATE.EL == EL0 then

ID_PFR0_EL1, AArch32 Processor Feature Register 0

The ID_PFR0_EL1 characteristics are:

Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register ID_PFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR0[31:0] .

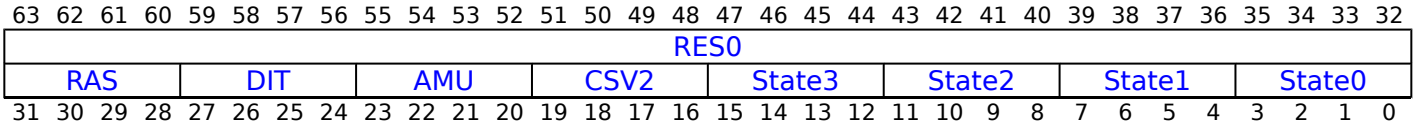
ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_PFR0_EL1 areis UNKNOWN.

Attributes

ID_PFR0_EL1 is a 64-bit register.

Field descriptions

The ID_PFR0_EL1 bit assignments are:



Bits [63:32]

Reserved, RES0.

RAS, bits [31:28]

RAS Extension version. Defined values are:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	RAS Extension present.
0b0010	ARMv8.4-RAS present. As 0b0001, and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS ,and support for the optional RAS Timestamp Extension.

All other values are reserved.

From Armv8.4, when ARMv8.4-DFE is not implemented, and ERRIDR.NUM is zero, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010. Otherwise from Armv8.4 the only permitted value is 0b0010.

ARMv8.4-RAS implements the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, when ARMv8.4-DFE is not implemented, and ERRIDR.NUM is zero, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010. Otherwise from Armv8.4 the only permitted value is 0b0010.

~~In Armv8.1 and Armv8.0, the permitted values are 0b0000 and 0b0001.~~

DIT, bits [27:24]

~~From Armv8.4:~~

Data Independent Timing. Defined values are:

DIT	Meaning
0b0000	AArch32 does not guarantee constant execution time of any instructions.
0b0001	AArch32 provides the CPSR.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

ARMv8.4-DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

~~Reserved, RES0.~~

~~AMU, bits [23:20]~~

~~From Armv8.4:~~

~~Otherwise:~~
AMU, bits [23:20]

Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	AMUv1 for Armv8.4 is implemented.
0b0010	AMUv1 for Armv8.6 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

AMUv1 implements the functionality identified by the value 0b0001.

ARMv8.6-AMU implements the functionality identified by the value 0b0010.

~~Reserved, RES0.~~

~~CSV2, bits [19:16]~~

~~From Armv8.5:~~

~~Otherwise:~~
CSV2, bits [19:16]

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	This Device does not disclose whether branch targets trained in one hardware described context can affect speculative execution in a different hardware described context.
0b0001	Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way.

~~From Armv8.5 the only permitted value is 0b0001.~~

All other values are reserved.

~~**Otherwise:**~~

~~Reserved, RES0.~~

ARMv8.0-CSV2 implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

State3, bits [15:12]

T32EE instruction set support. Defined values are:

State3	Meaning
0b0000	Not implemented.
0b0001	T32EE instruction set implemented.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

State2, bits [11:8]

Jazelle extension support. Defined values are:

State2	Meaning
0b0000	Not implemented.
0b0001	Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.
0b0010	Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

State1, bits [7:4]

T32 instruction set support. Defined values are:

State1	Meaning
0b0000	T32 instruction set not implemented.
0b0001	T32 encodings before the introduction of Thumb-2 technology implemented: • All instructions are 16-bit. • A BL or BLX is a pair of 16-bit instructions. • 32-bit instructions other than BL and BLX cannot be encoded.
0b0011	T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In Armv8-A the only permitted value is 0b0011.

State0, bits [3:0]

A32 instruction set support. Defined values are:

State0	Meaning
0b0000	A32 instruction set not implemented.
0b0001	A32 instruction set implemented.

All other values are reserved.

In Armv8-A the only permitted value is 0b0001.

Accessing the ID_PFR0_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_PFR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b000

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_PFR0_EL1;
elsif PSTATE.EL == EL2 then
    return ID_PFR0_EL1;
elsif PSTATE.EL == EL3 then
    return ID_PFR0_EL1;
```

ID_PFR1_EL1, AArch32 Processor Feature Register 1

The ID_PFR1_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register ID_PFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR1[31:0] .

ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_PFR1_EL1 areis UNKNOWN.

Attributes

ID_PFR1_EL1 is a 64-bit register.

Field descriptions

The ID_PFR1_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
GIC				Virt_frac				Sec_frac				GenTimer				Virtualization				MProgMod				Security				ProgMod			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:

Virt_frac	Meaning
0b0000	No features from the ARMv7 Virtualization Extensions are implemented.
0b0001	The following features of the ARMv7 Virtualization Extensions are implemented: • The SCR.SIF bit, if EL3 is implemented. • The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented. • The MSR (banked register) and MRS (banked register) instructions. • The ERET instruction.

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Virtualization is 0, otherwise it holds the value 0b0000.

Note

The ID_ISAR registers do not identify whether the instructions added by the ARMv7 Virtualization Extensions are implemented.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

Sec_frac	Meaning
0b0000	No features from the ARMv7 Security Extensions are implemented.
0b0001	The following features from the ARMv7 Security Extensions are implemented: • The VBAR register. • The TTBCR.PD0 and TTBCR.PD1 bits.
0b0010	As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Security is 0, otherwise it holds the value 0b0000.

GenTimer, bits [19:16]

Generic Timer support. Defined values are:

GenTimer	Meaning
0b0000	Generic Timer is not implemented.
0b0001	Generic Timer is implemented.
0b0010	Generic Timer is implemented, and also includes support for CNTHCTL.EVNTIS and CNTKCTL.EVNTIS fields, and CNTPCTSS and CNTVCVSS counter views.

All other values are reserved.

ARMv8.6-ECV implements the functionality identified by the value 0b0010.

In Armv8.0, Armv8.1, Armv8.2, Armv8.3, Armv8.4, and Armv8.5, the only permitted value is 0b0001.

From Armv8.6, the only permitted value is 0b0010.

Virtualization, bits [15:12]

Virtualization support. Defined values are:

Virtualization	Meaning
0b0000	EL2, Hyp mode, and the HVC instruction not implemented.
0b0001	EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Note

The ID_ISARs do not identify whether the HVC instruction is implemented.

MProgMod, bits [11:8]

M profile programmers' model support. Defined values are:

MProgMod	Meaning
0b0000	Not supported.
0b0010	Support for two-stack programmers' model.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Security, bits [7:4]

Security support. Defined values are:

Security	Meaning
0b0000	EL3, Monitor mode, and the SMC instruction not implemented.
0b0001	EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.
0b0010	As for 0b0001, and adds the ability to set the NSACR.RFR bit. Not permitted in Armv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

ProgMod, bits [3:0]

Support for the standard programmers' model for Armv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

ProgMod	Meaning
0b0000	Not supported.
0b0001	Supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Accessing the ID_PFR1_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_PFR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b001

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;

ID_PFR2_EL1, AArch32 Processor Feature Register 2

The ID_PFR2_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1 and ID_PFR1_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register ID_PFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR2[31:0] .

ThisIn registeran isimplementation presentthat supports only when AArch32AArch64 is supported at any Exception level. Otherwisestate, directthis accessesregister to ID_PFR2_EL1 areis UNKNOWN.

Attributes

ID_PFR2_EL1 is a 64-bit register.

Field descriptions

The ID_PFR2_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																				RAS_frac				SSBS				CSV3			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:12]

Reserved, RES0.

RAS_frac, bits [11:8]

From Armv8.4:

RAS Extension fractional field. Defined values are:

RAS_frac	Meaning
0b0000	If ID_PFR0_EL1.RAS == 0b0001, RAS Extension implemented.
0b0001	If ID_PFR0_EL1.RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

This field is valid only if ID_PFR0_EL1.RAS == 0b0001.

~~Reserved, RES0.~~

~~SSBS, bits [7:4]~~

~~From Armv8.5:~~

~~Otherwise:~~
SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

SSBS	Meaning
0b0000	AArch32 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

~~Reserved, RES0.~~

~~CSV3, bits [3:0]~~

~~From Armv8.5:~~

~~Otherwise:~~
CSV3, bits [3:0]

Speculative use of faulting data. Defined values are:

CSV3	Meaning
0b0000	This Device does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence
0b0001	Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence

From Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

~~Otherwise:~~

~~Reserved, RES0.~~

Accessing the ID_PFR2_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_PFR2_EL1
```

op0	op1	CRn	CRm	op2

0b11	0b000	0b0000	0b0011	0b100

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("ARMv8.4-IDST") then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;

IFSR32_EL2, Instruction Fault Status Register (EL2)

The IFSR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 IFSR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register IFSR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register IFSR[31:0] .

ThisIf registerEL1 is presentAArch64 only when AArch32 is supported at any Exception level. Otherwise, directthis accessesregister to IFSR32_EL2 areis UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

This register has no effect if EL2 is not enabled in the current Security state.

RW fields in this register reset to architecturally UNKNOWN values.

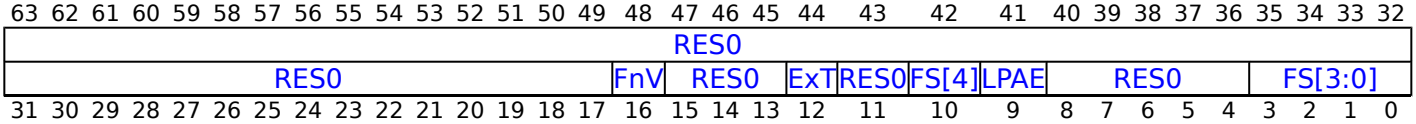
Attributes

IFSR32_EL2 is a 64-bit register.

Field descriptions

The IFSR32_EL2 bit assignments are:

When TTBCR.EAE == 0:



Bits [63:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	IFAR is valid.
0b1	IFAR is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

This field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS[4], bit [10]

This field is bit[4] of FS[4:0].

Fault Status bits. Bits [10] and [3:0] are interpreted together.

FS	Meaning	Applies when
0b00001	PC alignment fault.	
0b00010	Debug exception.	
0b00011	Access flag fault, level 1.	
0b00101	Translation fault, level 1.	
0b00110	Access flag fault, level 2.	
0b00111	Translation fault, level 2.	
0b01000	Synchronous External abort, not on translation table walk.	
0b01001	Domain fault, level 1.	
0b01011	Domain fault, level 2.	
0b01100	Synchronous External abort, on translation table walk, level 1.	
0b01101	Permission fault, level 1.	
0b01110	Synchronous External abort, on translation table walk, level 2.	
0b01111	Permission fault, level 2.	
0b10000	TLB conflict abort.	
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault).	
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.	When RAS is not implemented
0b11100	Synchronous parity or ECC error on translation table walk, level 1.	When RAS is not implemented
0b11110	Synchronous parity or ECC error on translation table walk, level 2.	When RAS is not implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

~~When the RAS Extension is implemented, 0b11001, 0b11100, and 0b11110 are reserved.~~

The FS field is split as follows:

- FS[4] is IFSR32_EL2[10].
- FS[3:0] is IFSR32_EL2[3:0].

This field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

This field resets to an architecturally UNKNOWN value.

Bits [8:4]

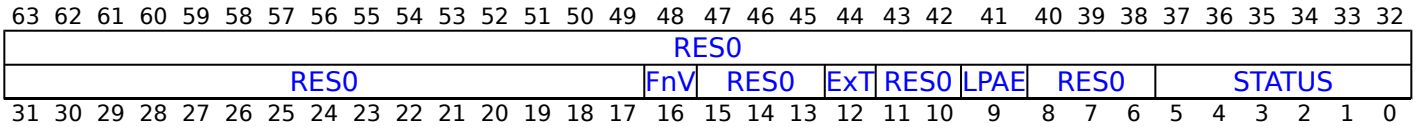
Reserved, RES0.

FS[3:0], bits [3:0]

This field is bits[3:0] of FS[4:0].

See FS[4] for the field description.

When TTBCR.EAE == 1:



Bits [63:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	IFAR is valid.
0b1	IFAR is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

This field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

This field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

This field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. PossibleAll valuesencodings ofnot thisshown fieldbelow are reserved:

STATUS	Meaning	Applies when
0b000000	Address size fault in translation table base register.TTBR0 or TTBR1.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010101	Synchronous External abort, on translation table walk, level 1.	
0b010110	Synchronous External abort, on translation table walk, level 2.	
0b010111	Synchronous External abort, on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When RAS is not implemented
0b100001	PC alignment fault.	
0b100010	Debug exception.	
0b110000	TLB conflict abort.	

All other values are reserved.

When the RAS Extension is implemented, `0b011000`, `0b011101`, `0b011110`, and `0b011111`, are reserved.

- ~~For a fault generated on a translation table walk, the lookup level of the walk being performed.~~
- ~~For a Translation fault, the lookup level of the translation table that gave the fault. If a fault occurs because a stage of address translation is disabled, or because the input address is outside the range specified by the appropriate base address register or registers, the fault is reported as a fault at level 1.~~
- ~~For an Access flag fault, the lookup level of the translation table that gave the fault.~~
- ~~For a Permission fault, including a Permission fault caused by hierarchical permissions, the lookup level of the final level of translation table accessed for the translation. That is, the lookup level of the translation table that returned a Block or Page descriptor.~~

For~~The~~ more information about the lookup level associated with a fault, see~~is:~~ 'The level associated with MMU faults on a Long-descriptor translation table lookup' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

Accessing the IFSR32_EL2

Accesses to this register use the following encodings:

```
MRS <Xt>, IFSR32_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0000	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

MAIR_EL1, Memory Attribute Indirection Register (EL1)

The MAIR_EL1 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

Configuration

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PRRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MAIR0[31:0] when TTBCR.EAE == 1.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register NMRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register MAIR1[31:0] when TTBCR.EAE == 1.

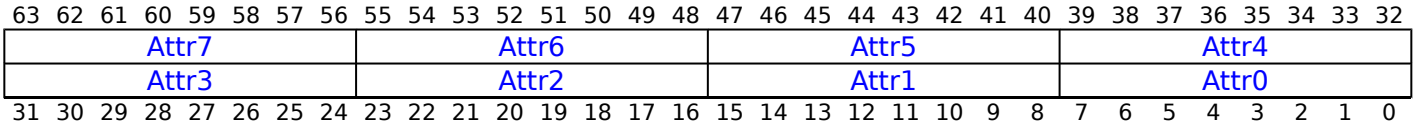
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

MAIR_EL1 is a 64-bit register.

Field descriptions

The MAIR_EL1 bit assignments are:



MAIR_EL1 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 0 to 7

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where AttrIndx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000ddxx, (xx != 00)	UNPREDICTABLE
0booooiiii, (oooo != 0000 and iiii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b11110000	Tagged Normal Memory. Inner+Outer Write-Back Non-transient~~Non-Transient~~ memory, Inner+Outer Read-Allocate, Inner+Outer Write-Allocate.
0bxxxx0000, (xxxx != 0000 and xxxx != 1111)	UNPREDICTABLE

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

This field resets to an architecturally UNKNOWN value.

Accessing the MAIR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic MAIR_EL1 or MAIR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, MAIR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0010	0b000

MAIR_EL2, Memory Attribute Indirection Register (EL2)

The MAIR_EL2 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

Configuration

AArch64 System register MAIR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HMAIR0[31:0] .

AArch64 System register MAIR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HMAIR1[31:0] .

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

MAIR_EL2 is a 64-bit register.

Field descriptions

The MAIR_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Attr7								Attr6								Attr5								Attr4							
Attr3								Attr2								Attr1								Attr0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MAIR_EL2 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 0 to 7

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where AttrIndx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000ddxx, (xx != 00)	UNPREDICTABLE
0booooiiii, (oooo != 0000 and iiii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b11110000	Tagged Normal Memory. Inner+Outer Write-Back Non-transient~~Non-Transient~~ memory, Inner+Outer Read-Allocate, Inner+Outer Write-Allocate.
0bxxxx0000, (xxxx != 0000 and xxxx != 1111)	UNPREDICTABLE

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

This field resets to an architecturally UNKNOWN value.

Accessing the MAIR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic MAIR_EL2 or MAIR_EL1 is~~are~~ not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, MAIR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return MAIR_EL2;
elsif PSTATE.EL == EL3 then
    return MAIR_EL2;
```

MSR MAIR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0010	0b000

MAIR_EL3, Memory Attribute Indirection Register (EL3)

The MAIR_EL3 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL3.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to MAIR_EL3 are UNDEFINED.

Attributes

MAIR_EL3 is a 64-bit register.

Field descriptions

The MAIR_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Attr7								Attr6								Attr5								Attr4							
Attr3								Attr2								Attr1								Attr0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MAIR_EL3 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 0 to 7

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where AttrIndx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000ddxx, (xx != 00)	UNPREDICTABLE
0booooiiii, (oooo != 0000 and iiii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b11110000	Tagged Normal Memory. Inner+Outer Write-Back Non-transient~~Non-Transient~~ memory, Inner+Outer Read-Allocate, Inner+Outer Write-Allocate.
0bxxxx0000, (xxxx != 0000 and xxxx != 1111)	UNPREDICTABLE

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

This field resets to an architecturally UNKNOWN value.

Accessing the MAIR_EL3

Accesses to this register use the following encodings:

```
MRS <Xt>, MAIR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MAIR_EL3;
```

```
MSR MAIR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MAIR_EL3 = X[t];
```

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99c984cbfe3431cc1c9707

MDCR_EL2, Monitor Debug Configuration Register (EL2)

The MDCR_EL2 characteristics are:

Purpose

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

Configuration

AArch64 System register MDCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HDCR[31:0] .

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

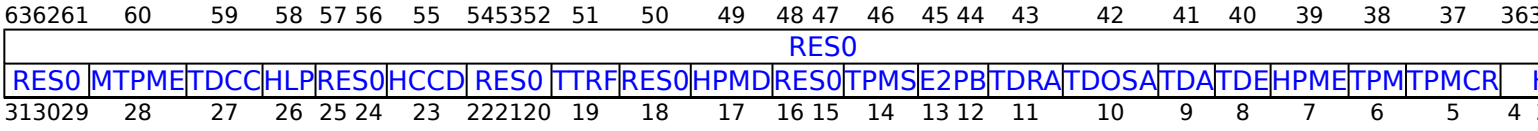
~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

MDCR_EL2 is a 64-bit register.

Field descriptions

The MDCR_EL2 bit assignments are:



Bits [63:29]

Reserved, RES0.

MTPME, bit [28]

When ARMv8.6-MTPMU is implemented and ~~!HaveEL(~~EL3 is not implemented~~):~~

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>_EL0.MT bits.

MTPME	Meaning
0b0	ARMv8.6-MTPMU is disabled. The Effective value of PMEVTYPER<n>_EL0.MT is zero.
0b1	PMEVTYPER<n>_EL0.MT bits not affected by this bit.

If ARMv8.6-MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0.

On a Cold reset, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When ARMv8.6-FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Trap exception to EL2, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: OSDTRRX_EL1, OSDTRTX_EL1, MDCCSR_EL0, MDCCINT_EL1, and, when the PE is in Non-debug state, DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to DBGDTRTXint and STC from DBGDTRRXint.
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL2.TDCC does not trap any accesses to:

AArch64: DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXint and DBGDTRTXint.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HLP, bit [26]

When ARMv8.5-PMU is implemented:

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

HLP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[63:0].

If MDCR_EL2.HPMN is less than PMCR_EL0.N or PMCR.N, this bit affects the operation of event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] or [MDCR_EL2.HPMN..(PMCR.N-1)]. Otherwise this bit has no effect on the operation of the event counters.

Note

The effect of MDCR_EL2.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the MDCR_EL2.HPMN field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [25:24]

Reserved, RES0.

HCCD, bit [23]

When ARMv8.5-PMU is implemented:

Hypervisor Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting at EL2.

HCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this bit.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited at EL2.

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

TTRF, bit [19]

When ARMv8.4-Trace is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2, as follows:

- Access to TRFCR_EL1 is trapped to EL2, reported using EC syndrome value 0x18.
- Access to TRFCR is trapped to EL2, reported using EC syndrome value 0x03.

TTRF	Meaning
0b0	Accesses to TRFCR_EL1 and TRFCR at EL1 are not affected by this control.
0b1	Accesses to TRFCR_EL1 and TRFCR at EL1 generate a trap exception to EL2 when EL2 is enabled in the current Security state.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]

When ARMv8.1-PMU is implemented:

Guest Performance Monitors Disable. This control prohibits event counting at EL2.

HPMD	Meaning
0b0	Event counting allowed at EL2.
0b1	Event counting prohibited at EL2. If ARMv8.2-Debug is not implemented, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().

This control applies only to:

- The event counters in the range [0..(MDCR_EL2.HPMN-1)].
- If PMCR_EL0.DP is set to 1, PMCCNTR_EL0.

The other event counters are unaffected, and when PMCR_EL0.DP is set to 0, PMCCNTR_EL0 is unaffected.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [16:15]

Reserved, RES0.

TPMS, bit [14]

When SPE is implemented:

Trap Performance Monitor Sampling. When EL2 is enabled in the current Security state, this field controls access to Statistical Profiling control registers from EL1.

TPMS	Meaning
0b0	Do not trap Statistical Profiling controls to EL2.
0b1	Accesses to Statistical Profiling controls at EL1 generate a Trap exception to EL2 when EL2 is enabled in the current Security state.

The Statistical Profiling control registers trapped by this control are: PMSCR_EL1, PMSEVFR_EL1, PMSFCR_EL1, PMSICR_EL1, PMSIDR_EL1, PMSIRR_EL1, and PMSLATFR_EL1.

Otherwise:

Reserved, RES0.

E2PB, bits [13:12]

When SPE is implemented:

EL2 Profiling Buffer. If EL2 is implemented and enabled in the Profiling Buffer owning Security state, this field controls the owning translation regime. If EL2 is implemented and enabled in the current Security state, this field controls access to Profiling Buffer control registers from EL1.

E2PB	Meaning
0b00	If EL2 is implemented and enabled in the Profiling Buffer owning Security state, the Profiling Buffer uses the EL2 or EL2&0 stage 1 translation regime. Otherwise the Profiling Buffer uses the EL1&0 stage 1 translation regime. ~~If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.~~ If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.
0b10	Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.
0b11	Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer control registers at EL1 are not trapped to EL2.

All other values are reserved.

The Profiling Buffer control registers trapped by this control are: PMBLIMITR_EL1, PMBPTR_EL1, and PMBSR_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to MDRAR_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 or EL1 is using AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05 and MRRC or MCRR accesses are trapped to EL2, reported using EC syndrome value 0x0C:
  - DBGDRAR, DBGDSAR.

TDRA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by DBGDSCRext.UDCCdis or MDSCR_EL1.TDCC.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDOSA, bit [10]

When ARMv8.0-DoubleLock is implemented:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x18`:
  - OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, and DBGPRCR_EL1.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x05`:
  - DBGOSLSR, DBGOSLAR, DBGOSDLR, and DBGPRCR.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

TDOSA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x18`:
  - OSLAR_EL1, OSLSR_EL1, and DBGPRCR_EL1.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x05`:
  - DBGOSLSR, DBGOSLAR, and DBGPRCR.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 are trapped.~~trapped and DBGOSDLR are trapped.~~

It is IMPLEMENTATION DEFINED whether accesses to DBGOSDLR are trapped.

TDOSA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL0 and EL1 System register accesses to debug System registers that are not trapped by MDCR_EL2.TDRA or MDCR_EL2.TDOSA, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 reported using EC syndrome value `0x18`:
  - MDCCSR_EL0, MDCCINT_EL1, OSDTRRX_EL1, MDSCR_EL1, OSDTRTX_EL1, OSECCR_EL1, DBGBVR<n>_EL1, DBGBCR<n>_EL1, DBGWVR<n>_EL1, DBGWCR<n>_El1, DBGCLAIMSET_EL1, DBGCLAIMCLR_EL1, DBGAUTHSTATUS_EL1.
  - When not in Debug state, DBGDTR_EL0, DBGDTRRX_EL0, DBGDTRTX_EL0.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x05`.
  - DBGDIDR, DBGDSCRint, DBGDCCINT, DBGWFAR, DBGVCR, DBGDSCRext, DBGDTRTXext, DBGDTRRXext, DBGBVR<n>, DBGBCR<n>, DBGBXVR<n>, DBGWCR<n>, DBGWVR<n>, DBGCLAIMSET, DBGCLAIMCLR, DBGAUTHSTATUS, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGOSECCR.
  - When not in Debug state, DBGDTRRXint and DBGDTRTXint.
- In AArch32 state, STC accesses to DBGDTRRXint and LDC accesses to DBGDTRTXint are trapped to EL2, reported using EC syndrome value `0x06`.

TDA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL0 or EL1 System register accesses to the debug registers are trapped from both Execution states to EL2 when EL2 is enabled in the current Security state, unless the access generates a higher priority exception.

Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

Traps of AArch64 accesses to DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0 are ignored in Debug state.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1
- HCR_EL2.TGE == 1

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDE, bit [8]

Trap Debug exceptions.

TDE	Meaning
0b0	This control has no effect on the routing of debug exceptions, and has no effect on accesses to debug registers.
0b1	Debug exceptions generated at EL1 or EL0 are routed to EL2 when EL2 is enabled in the current Security state. The MDCR_EL2.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

This field is treated as being 1 for all purposes other than a direct read when HCR_EL2.TGE == 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPME, bit [7]

When PMUv3 is implemented:

[MDCR_EL2.HPMN..(N-1)] event counters enable.

HPME	Meaning
0b0	Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are disabled.
0b1	Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are enabled by PMCNTENSET_EL0.

If MDCR_EL2.HPMN is less than PMCR_EL0.N or PMCR.N, the event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] or [HDCR.HPMN..(PMCR.N-1)], are enabled and disabled by this bit. Otherwise this bit has no effect on the operation of the event counters.

Note

The effect of MDCR_EL2.HPMN on the operation of this bit applies regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HPMN field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPM, bit [6]

When PMUv3 is implemented:

Trap Performance Monitors accesses. Traps EL0 and EL1 accesses to all Performance Monitor registers to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - ~~PMCR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMOVSCLR_EL0, PMSWINC_EL0, PMSELR_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPER_EL0, PMXEVCNTR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMOVSSET_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMCCFILTR_EL0.~~

    PMCR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMOVSCLR_EL0, PMSWINC_EL0, PMSELR_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPER_EL0, PMXEVCNTR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMOVSSET_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMCCFILTR_EL0.

  - If ARMv8.4-PMU is implemented, PMMIR_EL1

- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value `0x03`, MRRC or MCRR accesses are trapped to EL2 and reported using EC syndrome value `0x04`:
    - ~~PMCR, PMCNTENSET, PMCNTENCLR, PMOVSR, PMSWINC, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXEVNTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR.~~

      PMCR, PMCNTENSET, PMCNTENCLR, PMOVSR, PMSWINC, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXEVNTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR.

    - If ARMv8.4-PMU is implemented, PMMIR.
    - If ARMv8.1-PMU is implemented, PMCEID2, and PMCEID3.
- ~~If ARMv8.4-PMU is implemented, in AArch64 state, PMMIR_EL1 and in AArch32 state, PMMIR.~~
- ~~If ARMv8.1-PMU is implemented, in AArch32 state, PMCEID2, and PMCEID3.~~

TPM	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL0 and EL1 accesses to all Performance Monitor registers are trapped to EL2 when EL2 is enabled in the current Security state.

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPMCR, bit [5]

When PMUv3 is implemented:

Trap PMCR_EL0 or PMCR accesses. Traps EL0 and EL1 accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to PMCR_EL0 are trapped to EL2, reported using EC syndrome value `0x18`.
- In AArch32 state, accesses to PMCR are trapped to EL2, reported using EC syndrome value `0x03`.

TPMCR	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL0 and EL1 accesses to the PMCR_EL0 or PMCR are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by PMUSERENR.EN or PMUSERENR_EL0.EN.

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPMN, bits [4:0]

When PMUv3 is implemented:

Defines the number of event counters that are accessible from EL3, EL2, EL1, and from EL0 if permitted.

If HPMN is less than PMCR_EL0.N, HPMN divides the Performance Monitors into two ranges: [0..(HPMN-1)] and [HPMN..(PMCR_EL0.N-1)].

For an event counter in the range [0..(HPMN-1)]:

- The counter is accessible from EL3, EL2, and EL1, and from EL0 if permitted by PMUSERENR_EL0 or PMUSERENR.
- If ARMv8.5-PMU is implemented, PMCR_EL0.LP or PMCR.LP determines whether the counter overflow flag is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- The counter is enabled by PMCR_EL0.E or PMCR.E and bit <n> of PMCNTENSET_EL0.

Note

If HPMN is equal to PMCR_EL0.N, this applies to all event counters.

If HPMN is less than PMCR_EL0.N, for an event counter in the range [HPMN..(PMCR_EL0.N-1)]:

- The counter is accessible from EL2 and EL3.
- If ARMv8.4-SecEL2 is disabled or is not implemented, the counter is also accessible from Secure EL1, and from Secure EL0 if permitted by PMUSERENR_EL0.
- If ARMv8.5-PMU is implemented, MDCR_EL2.HLP or HDCR.HLP determines whether the counter overflow flag is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- The counter is enabled by MDCR_EL2.HPME or HDCR.HPME and bit <n> of PMCNTENSET_EL0.

If this field is set to 0, or to a value larger than PMCR_EL0.N, then the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of MDCR_EL2.HPMN is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 and EL3 use. That is, the PE behaves as if MDCR_EL2.HPMN is set to an UNKNOWN non-zero value less than or equal to PMCR_EL0.N.
  - All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.

On a Warm reset, this field resets to the value in PMCR_EL0.N.

Otherwise:

Reserved, RES0.

Accessing the MDCR_EL2

Accesses to this register use the following encodings:

```
MRS <Xt>, MDCR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if HaveEL(EL3) && !ELUsingAArch32(EL3) && MDCR_EL3.TDA == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return MDCR_EL2;
elsif PSTATE.EL == EL3 then
    return MDCR_EL2;
```

MSR MDCR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if HaveEL(EL3) && !ELUsingAArch32(EL3) && MDCR_EL3.TDA == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        MDCR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    MDCR_EL2 = X[t];
```

MDCR_EL3, Monitor Debug Configuration Register (EL3)

The MDCR_EL3 characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

Configuration

AArch64 System register MDCR_EL3 bits [31:0] can be mapped to AArch32 System register SDCR[31:0] , but this is not architecturally mandated.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

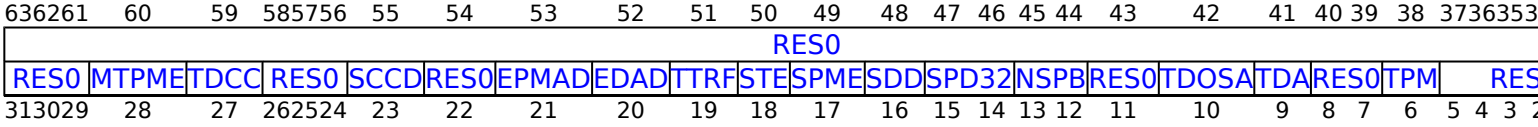
This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to MDCR_EL3 are UNDEFINED.

Attributes

MDCR_EL3 is a 64-bit register.

Field descriptions

The MDCR_EL3 bit assignments are:



Bits [63:29]

Reserved, RES0.

MTPME, bit [28]

When ARMv8.6-MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>_EL0.MT bits.

MTPME	Meaning
0b0	ARMv8.6-MTPMU is disabled. The Effective value of PMEVTYPER<n>_EL0.MT is zero.
0b1	PMEVTYPER<n>_EL0.MT bits not affected by this bit.

If ARMv8.6-MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0.

On a Cold reset, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When ARMv8.6-FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: OSDTRRX_EL1, OSDTRTX_EL1, MDCCSR_EL0, MDCCINT_EL1, and, when the PE is in Non-debug state, DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to DBGDTRTXint and STC from DBGDTRRXint.
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL3.TDCC does not trap any accesses to:

AArch64: DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXint and DBGDTRTXint.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [26:24]

Reserved, RES0.

SCCD, bit [23]

When ARMv8.5-PMU is implemented:

Secure Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting in Secure state.

SCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this bit.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited in Secure state.

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [22]

Reserved, RES0.

EPMAD, bit [21]

When ARMv8.4-Debug is implemented and PMUv3 is implemented:

External Performance Monitors Non-secure Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

EPMAD	Meaning
0b0	Non-secure access to Performance Monitor registers from external debugger is permitted.
0b1	Non-secure access to Performance Monitor registers from external debugger is not permitted.

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

When PMUv3 is implemented:

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

EPMAD	Meaning
0b0	Access to Performance Monitor registers from external debugger is permitted.
0b1	Access to Performance Monitor registers from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EDAD, bit [20]

When ARMv8.4-Debug is implemented:

External Debug Non-secure Access Disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
0b0	Non-secure access to debug registers from external debugger is permitted.
0b1	Non-secure access to breakpoint and watchpoint registers, and OSLAR_EL1 from external debugger is not permitted.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is `0b0`, then the Effective value of this field is `0b1`.

On a Warm reset, this field resets to `0`.

When ARMv8.2-Debug is implemented:

External Debug Access Disable. Controls access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
`0b0`	Access to debug registers, and to OSLAR_EL1 from external debugger is permitted.
`0b1`	Access to breakpoint and watchpoint registers, and to OSLAR_EL1 from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is `0b0`, then the Effective value of this field is `0b1`.

On a Warm reset, this field resets to `0`.

Otherwise:

External Debug Access disable. Controls access to breakpoint, watchpoint, and optionally OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
`0b0`	Access to debug registers from external debugger is permitted.
`0b1`	Access to breakpoint and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is `0b0`, then the Effective value of this field is `0b1`.

On a Warm reset, this field resets to `0`.

TTRF, bit [19]

When ARMv8.4-Trace is implemented:

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

The Trace Filter registers trapped by this control are:

- TRFCR_EL2, TRFCR_EL12, TRFCR_EL1, reported using EC syndrome value `0x18`.
- HTRFCR and TRFCR, reported using EC syndrome value `0x03`.

TTRF	Meaning
`0b0`	Accesses to Trace Filter registers at EL2 and EL1 are not affected by this bit.
`0b1`	Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception.

Otherwise:

Reserved, RES0.

STE, bit [18]

When ARMv8.4-Trace is implemented:

Secure Trace enable. Enables tracing in Secure state.

STE	Meaning
0b0	Trace prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Secure state is not affected by this bit.

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

If EL3 is not implemented the Effective value of SCR_EL3.NS is 0b0, the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SPME, bit [17]

When ARMv8.2-Debug is implemented and PMUv3 is implemented:

Secure Performance Monitors enable. This allows event counting in Secure state.

SPME	Meaning
0b0	Event counting prohibited in Secure state.
0b1	Event counting in Secure state not affected by this bit.

If EL3 is not implemented the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

When PMUv3 is implemented:

Secure Performance Monitors enable. This allows event counting in Secure state.

SPME	Meaning
0b0	Event counting prohibited in Secure state, unless ExternalSecureNoninvasiveDebugEnabled() is TRUE.
0b1	Event counting in Secure state not affected by this bit.

If EL3 is not implemented the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SDD, bit [16]

AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

SDD	Meaning
0b0	Debug exceptions in Secure state are not affected by this bit.
0b1	Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of SCR_EL3.RW is `0b1`.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SPD32, bits [15:14]

When EL1 is capable of using AArch32:

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

SPD32	Meaning
`0b00`	Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.
`0b10`	Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.
`0b11`	Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as `0b00`. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored if the PE is either:

- In~~Ignored~~ Non-secure~~if~~ state.~~the PE is either:~~
  - ~~In Non-secure state.~~
  - ~~In Secure state and Secure EL1 is using AArch64.~~
- In Secure state and Secure EL1 is using AArch64.
- ~~RES0 if the implementation does not support EL1 using AArch32.~~

If Secure EL1 is using AArch32 then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER32_EL3.SUIDEN is `0b1`.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is `0b0`, then the Effective value of this field is `0b11`.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSPB, bits [13:12]

When SPE is implemented:

Non-secure Profiling Buffer. This field controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

NSPB	Meaning
0b00	Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in both security states generate Trap exceptions to EL3.
0b01	Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.
0b10	Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in both security states generate Trap exceptions to EL3.
0b11	Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.

The Statistical Profiling and Profiling Buffer control registers trapped by this control are: PMBLIMITR_EL1, PMBPTR_EL1, PMBSR_EL1, PMSCR_EL1, PMSCR_EL2, PMSEVFR_EL1, PMSFCR_EL1, PMSICR_EL1, PMSIDR_EL1, PMSIRR_EL1, and PMSLATFR_EL1.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b1, the Effective value of this field is 0b11.

~~If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b1, the Effective value of this field is 0b11. If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, the Effective value of this field is 0b01.~~

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, the Effective value of this field is 0b01.

On a Warm reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES0.

TDOSA, bit [10]

When ARMv8.0-DoubleLock is implemented:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:

- Accesses from AArch64 state, OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, DBGPRCR_EL1 and any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit, are trapped to EL3 and reported using EC syndrome value 0x18.
- Accesses using MCR or MRC to DBGOSLAR, DBGOSLSR, DBGOSDLR, and DBGPRCR, are trapped to EL3 and reported using EC syndrome value 0x05.
- Accesses to any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA.

Note

The powerdown debug registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:

- AArch64: OSLAR_EL1, OSLSR_EL1, and DBGPRCR_EL1.
- AArch32: DBGOSLAR, DBGOSLSR, and DBGPRCR.
- AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 and DBGOSDLR are trapped.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA.

Note

The powerdown debug registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the MDCR_EL3.TDOSA field.

Accesses to the debug registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported using EC syndrome value 0x18:
  - DBGBVR<n>_EL1, DBGBCR<n>_EL1, DBGWVR<n>_EL1, DBGWCR<n>_EL1, DBGCLAIMSET_EL1, DBGCLAIMCLR_EL1, DBGAUTHSTATUS_EL1, DBGVCR32_EL2.
  - AArch64: MDCR_EL2, MDRAR_EL1, MDCCSR_EL0, MDCCINT_EL1, MDSCR_EL1, OSDTRRX_EL1, OSDTRTX_EL1, OSECCR_EL1.
- In AArch32 state, SDER is trapped to EL3 and reported using EC syndrome value 0x03.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x05, accesses using MCRR or MRRC are reported using EC syndrome value 0x0C:
  - HDCR, DBGDRAR, DBGDSAR, DBGDIDR, DBGDCCINT, DBGWFAR, DBGVCR, DBGBVR<n>, DBGBCR<n>, DBGBXVR<n>, DBGWCR<n>, DBGWVR<n>.
  - DBGCLAIMSET, DBGCLAIMCLR, DBGAUTHSTATUS, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGOSECCR.
- In AArch32 state, STC accesses to DBGDTRRXint and LDC accesses to DBGDTRTXint are reported using EC syndrome value 0x06.
- When not in Debug state, the following registers are also trapped to EL3:
  - AArch64 accesses to DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0, reported using EC syndrome value 0x18.
  - AArch32 accesses using MCR or MRC to DBGDTRRXint and DBGDTRTXint, reported using EC syndrome value 0x05.

TDA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by MDCR_EL3.TDOSA, are trapped to EL3, from both Security states and both Execution states, unless it is trapped by DBGDSCRext.UDCCdis, MDSCR_EL1.TDCC, HDCR.TDA or MDCR_EL2.TDA.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:7]

Reserved, RES0.

TPM, bit [6]

When PMUv3 is implemented:

Trap Performance Monitor register accesses. Accesses to all Performance Monitor registers from EL0, EL1 and EL2 to EL3, from both Security states and both Execution states are trapped as follows:

- In AArch64 state, accesses to the following registers are trapped to EL3 and are reported using EC syndrome value 0x18:
  - PMCR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMOVSCLR_EL0, PMSWINC_EL0, PMSELR_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPER_EL0, PMXEVCNTR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMOVSSET_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMCCFILTR_EL0...
  - If ARMv8.4-PMU is implemented, PMMIR_EL1
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses using MCRR or MRRC are reported using EC syndrome value 0x04:
  - PMCR, PMCNTENSET, PMCNTENCLR, PMOVSR, PMSWINC, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXEVCNTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSSET, PMEVCNTR<n>, PMEVTPER<n>, PMCFILTR.
  - If ARMv8.1-PMU is implemented, PMCEID2, and PMCEID3.
  - If ARMv8.4-PMU is implemented, PMMIR.
- ~~If ARMv8.4-PMU is implemented, in AArch64 state, PMMIR_EL1, and in AArch32 state, PMMIR.~~
- ~~If ARMv8.1-PMU is implemented, in AArch32 state, PMCEID2, and PMCEID3.~~

TPM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2, EL1, and EL0 System register accesses to all Performance Monitor registers are trapped to EL3, unless it is trapped by HDCR.TPM or MDCR_EL2.TPM.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:0]

Reserved, RES0.

Accessing the MDCR_EL3

Accesses to this register use the following encodings:

```
MRS <Xt>, MDCR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0011	0b001

```

MPAM1_EL1, MPAM1 Register (EL1)

The MPAM1_EL1 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL1.

When EL2 is present and enabled, the MPAM virtualization option is present, MPAMHCR_EL2.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests when executing at EL0.

MPAM1_EL1 is an alias for MPAM2_EL2 when executing at EL2 with HCR_EL2.E2H == 1.

MPAM1_EL12 is an alias for MPAM1_EL1 when executing at EL2 or EL3 with HCR_EL2.E2H == 1.

If EL2 is is present and enabled, the MPAM virtualization option is present and MPAMHCR_EL2.EL1_VPMEN == 1, MPAM PARTIDs in MPAM1_EL1 are virtual and mapped into physical PARTIDs for the current Security state. This mapping of MPAM1_EL1 virtual PARTIDs to physical PARTIDs when EL1_VPMEN is 1 also applies when MPAM1_EL1 is used at EL0 due to MPAMHCR_EL2.GSTAPP_PLK.

Configuration

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when ~~HaveEL(~~EL3 is implemented.~~)~~.

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when ~~!HaveEL(~~EL3~~)~~ is not implemented and ~~HaveEL(~~EL2 is implemented.~~)~~.

This register is present only when MPAM is implemented. Otherwise, direct accesses to MPAM1_EL1 are UNDEFINED.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

MPAM1_EL1 is a 64-bit register.

Field descriptions

The MPAM1_EL1 bit assignments are:

63	62 61	60	59 58 57 56 55 54 53 52 51 50 49 48	47 46 45 44 43 42 41 40	39 38 37 36 35 34 33 32
MPAMEN	RES0	FORCED_NS	RES0	PMG_D	PMG_I
PARTID_D				PARTID_I	
31	30 29	28	27 26 25 24 23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0

MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

~~Values of this field are:~~

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

If neither EL3 nor EL2 is implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write bit MPAM3_EL3.MPAMEN.

If EL3 is not implemented and EL2 is implemented, this field is read-only and reads the current value of the read/write bit MPAM2_EL2.MPAMEN.

This field resets to 0.

Accessing this field has the following behavior:

- When ~~!HaveEL(~~EL3~~)~~ is not implemented and ~~!HaveEL(~~EL2 is not implemented,~~),~~ access to this field is **RW**.
- Otherwise, access to this field is **RO**.

Bits [62:61]

Reserved, RES0.

FORCED_NS, bit [60]

When ARMv8.6-MPAM is implemented:

In the Secure state, FORCED_NS ~~Secure state~~ indicates the state of MPAM3_EL3.FORCE_NS.

FORCED_NS	Meaning
0b0	In the Non-secure state, always reads as 0. In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 0.
0b1	In the Secure state, indicates~~Indicate~~ that MPAM3_EL3.FORCE_NS == 1.

Always reads~~Reads~~ as 0 in the Non-secure state.

Writes are ignored.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [59:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

This field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group property for PARTID_I.

This field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL1.

This field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL1.

This field resets to an architecturally UNKNOWN value.

Accessing the MPAM1_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the mnemonic MPAM1_EL1 or MPAM1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

```
MRS <Xt>, MPAM1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0101	0b000

MPAM2_EL2, MPAM2 Register (EL2)

The MPAM2_EL2 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL2.

Configuration

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when ~~HaveEL(~~EL3 is implemented.~~)~~.

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register MPAM1_EL1[63] .

This register is present only when MPAM is implemented. Otherwise, direct accesses to MPAM2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

MPAM2_EL2 is a 64-bit register.

Field descriptions

The MPAM2_EL2 bit assignments are:

63	62616059	58	5756555453525150	49	48	4746454443424140393837363534333 2
MPAMEN	RES0	TIDR	RES0	TRAPMPAM0EL1	TRAPMPAM1EL1	PMG_D	PMG_I
PARTID_D						PARTID_I
31	30292827	26	2524232221201918	17	16	1514131211109 8 7 6 5 4 3 2 1 0

MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

~~Values of this field are:~~

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information from all Exception levels.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

If EL3 is not implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write MPAM3_EL3.MPAMEN bit.

This field resets to 0.

Accessing this field has the following behavior:

- When ~~!HaveEL(~~EL3 is not implemented,~~),~~ access to this field is **RW**.
- Otherwise, access to this field is **RO**.

Bits [62:59]

Reserved, RES0.

TIDR, bit [58]

When ARMv8.6-MPAM is implemented and MPAMIDR_EL1.HAS_TIDR == 1:

TIDR traps accesses to MPAMIDR_EL1 from EL1 to EL2.

TIDR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Trap accesses to MPAMIDR_EL1 from EL1 to EL2.

MPAMHCR_EL2.TRAP_MPAMIDR_EL1 == 1 also traps MPAMIDR_EL1 accesses from EL1 to EL2. If either TIDR or TRAP_MPAMIDR_EL1 are 1, accesses are trapped.

Otherwise:

Reserved, RES0.

Bits [57:50]

Reserved, RES0.

TRAPMPAM0EL1, bit [49]

TRAPMPAM0EL1: Trap accesses from EL1 to the MPAM0_EL1 register trap to EL2.

TRAPMPAM0EL1	Meaning
0b0	Accesses to MPAM0_EL1 from EL1 are not trapped.
0b1	Accesses to MPAM0_EL1 from EL1 are trapped to EL2.

This field resets to:

- If EL3 is not implemented, 1.
- If EL3 is implemented, an architecturally UNKNOWN value.

~~When EL3 is not implemented, this field resets to 1. When EL3 is implemented, this field resets to UNKNOWN.~~

TRAPMPAM1EL1, bit [48]

TRAPMPAM1EL1: Trap accesses from EL1 to the MPAM1_EL1 register trap to EL2.

TRAPMPAM1EL1	Meaning
0b0	Accesses to MPAM1_EL1 from EL1 are not trapped.
0b1	Accesses to MPAM1_EL1 from EL1 are trapped to EL2.

This field resets to:

- If EL3 is not implemented, 1.
- If EL3 is implemented, an architecturally UNKNOWN value.

~~When EL3 is not implemented, this field resets to 1. When EL3 is implemented, this field resets to UNKNOWN.~~

PMG_D, bits [47:40]

Performance monitoring group for data accesses.

This field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group for instruction accesses.

This field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL2.

This field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL2.

This field resets to an architecturally UNKNOWN value.

Accessing the MPAM2_EL2

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

```

MPAM3_EL3, MPAM3 Register (EL3)

The MPAM3_EL3 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL3.

Configuration

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when ~~HaveEL(~~EL2 is implemented.~~).~~

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register MPAM1_EL1[63] .

This register is present only when MPAM is implemented. Otherwise, direct accesses to MPAM3_EL3 are UNDEFINED.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

MPAM3_EL3 is a 64-bit register.

Field descriptions

The MPAM3_EL3 bit assignments are:

63	62	61	60	59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32	
MPAMEN	TRAPLOWER	SDEFLT	FORCE_NS	RES0	PMG_D / PMG_I
PARTID_D					PARTID_I
31	30	29	28	27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0	

MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

Values of this field are:

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information when executing at any ELn.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

This field is always read/write in MPAM3_EL3.

This field resets to 0.

TRAPLOWER, bit [62]

Trap direct accesses to any MPAM system registers that are not UNDEFINED from all ELn lower than EL3.

TRAPLOWER	Meaning
0b0	Do not force trapping of direct accesses of MPAM system registers to EL3.
0b1	Force all direct accesses of MPAM system registers to trap to EL3.

On a Cold reset, this field resets to 1.

SDEFLT, bit [61]

When ARMv8.6-MPAM is implemented and MPAMIDR_EL1.HAS_SDEFLT == 1:

SDEFLT overrides the PARTID with the default PARTID when executing in the Secure state.

SDEFLT	Meaning
0b0	The PARTID is determined normally in the Secure state.
0b1	The PARTID is always PARTID 0 when executing in the Secure state.

This field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

FORCE_NS, bit [60]

When ARMv8.6-MPAM is implemented and MPAMIDR_EL1.HAS_FORCE_NS == 1:

FORCE_NS forces MPAM_NS to always be 1 in the Secure state.

FORCE_NS	Meaning
0b0	MPAM_NS is 0 when executing in the Secure state.
0b1	MPAM_NS is 1 when executing in the Secure state.

An implementation is permitted to have this field as RAO if the implementation does not support generating MPAM_NS as 0.

This field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [59:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group for data accesses.

This field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group for instruction accesses.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL3.

This field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL3.

This field resets to an architecturally UNKNOWN value.

Accessing the MPAM3_EL3

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

```
MRS <Xt>, MPAM3_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MPAM3_EL3;
```

```
MSR MPAM3_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MPAM3_EL3 = X[t];
```

MPAMHCR_EL2, MPAM Hypervisor Control Register (EL2)

The MPAMHCR_EL2 characteristics are:

Purpose

Controls the PARTID virtualization features of MPAM. It controls the mapping of virtual PARTIDs into physical PARTIDs in MPAM0_EL1 when EL0_VPMEN == 1 and in MPAM1_EL1 when EL1_VPMEN == 1.

Configuration

This register is present only when MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMHCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

MPAMHCR_EL2 is a 64-bit register.

Field descriptions

The MPAMHCR_EL2 bit assignments are:

63	62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41	40	39 38 37 36 35	34	33	32
RES0						
TRAP_MPAMIDR_EL1	RES0	GSTAPP_PLK	RES0		EL1_VPMEN	EL0_VPMEN
31	30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9	8	7 6 5 4 3 2		1	0

Bits [63:32]

Reserved, RES0.

TRAP_MPAMIDR_EL1, bit [31]

Trap accesses from EL1 to MPAMIDR_EL1 to EL2.

TRAP_MPAMIDR_EL1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Direct accesses to MPAMIDR_EL1 from EL1 are trapped to EL2.

This field resets to:

- If EL3 is not implemented, 1.
- If EL3 is implemented, an architecturally UNKNOWN value.

~~When EL3 is not implemented, this field is reset to 1. When EL3 is implemented, this field resets to UNKNOWN.~~

Bits [30:9]

Reserved, RES0.

GSTAPP_PLK, bit [8]

Make the PARTIDs at EL0 the same as the PARTIDs at EL1. When executing at EL0, EL2 is enabled, HCR_EL2.TGE == 0 and GSTAPP_PLK = 1, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests.

GSTAPP_PLK	Meaning
0b0	MPAM0_EL1 is used to generate MPAM labels when executing at EL0.
0b1	MPAM1_EL1 is used to generate MPAM labels when executing at EL0 with EL2 enabled and HCR_EL2.TGE == 0. Otherwise MPAM0_EL1 is used.

This field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL1_VPMEN, bit [1]

Enable the virtual PARTID mapping of the PARTID fields in MPAM1_EL1 when executing at EL1. This bit also enables virtual PARTID mapping when MPAM1_EL1 is used to generate MPAM labels for memory requests at EL0 due to GSTAPP_PLK == 1.

EL1_VPMEN	Meaning
0b0	MPAM1_EL1.PARTID_I and MPAM1_EL1.PARTID_D are physical PARTIDs that are used to label memory system requests.
0b1	MPAM1_EL1.PARTID_I and MPAM1_EL1.PARTID_D are virtual PARTIDs that are used to index the PhyPARTID fields of MPAMVPM0_EL2 to MPAMVPM7_EL2 registers to map the virtual PARTID into a physical PARTID to label memory system requests.

This field resets to an architecturally UNKNOWN value.

EL0_VPMEN, bit [0]

Enable the virtual PARTID mapping of the PARTID fields of MPAM0_EL1 unless HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1, EL0_VPMEN is ignored and MPAM0_EL1 PARTID fields are not mapped.

When MPAMHCR_EL2.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used as the source of PARTIDs and the virtual PARTID mapping of MPAM1_EL1 PARTIDs is controlled by MPAMHCR_EL2.EL1_VPMEN.

EL0_VPMEN	Meaning
0b0	MPAM0_EL1.PARTID_I and MPAM0_EL1.PARTID_D are physical PARTIDs that are used to label memory system requests.
0b1	MPAM0_EL1.PARTID_I and MPAM0_EL1.PARTID_D are virtual PARTIDs that are used to index the PhyPARTID fields of MPAMVPM0_EL2 to MPAMVPM7_EL2 registers to map the virtual PARTID into a physical PARTID to label memory system requests.

This field resets to an architecturally UNKNOWN value.

Accessing the MPAMHCR_EL2

Accesses to this register use the following encodings:

MRS <Xt>, MPAMHCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0100	0b000

MPAMIDR_EL1, MPAM ID Register (EL1)

The MPAMIDR_EL1 characteristics are:

Purpose

Indicates the presence and maximum PARTID and PMG values supported in the implementation. It also indicates whether the implementation supports MPAM virtualization.

Configuration

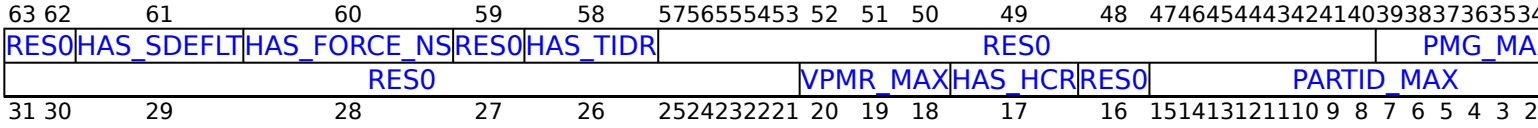
This register is present only when MPAM is implemented. Otherwise, direct accesses to MPAMIDR_EL1 are UNDEFINED.

Attributes

MPAMIDR_EL1 is a 64-bit register.

Field descriptions

The MPAMIDR_EL1 bit assignments are:



MPAMIDR_EL1 indicates the MPAM implementation parameters of the PE.

Bits [63:62]

Reserved, RES0.

HAS_SDEFLT, bit [61]

~~**From Armv8.6:**~~

HAS_SDEFLT indicates support for MPAM3_EL3.SDEFLT bit. Defined values are:

HAS_SDEFLT	Meaning
0b0	The SDEFLT bit is not implemented in MPAM3_EL3.
0b1	The SDEFLT bit is implemented in MPAM3_EL3.

When MPAM3_EL3.SDEFLT == 1, accesses from the Secure execution state use the default PARTID, PARTID == 0.

~~**HAS_FORCE_NS, bit [60]**~~

~~**From Armv8.6:**~~

~~HAS_FORCE_NS indicates support for MPAM3_EL3.FORCE_NS bit.~~

~~**Otherwise:**~~
HAS_FORCE_NS, bit [60]

HAS_FORCE_NS indicates support for MPAM3_EL3.FORCE_NS bit. Defined values are:

~~Reserved, RES0.~~

HAS_FORCE_NS	Meaning
0b0	The FORCE_NS bit is not implemented in MPAM3_EL3.
0b1	The FORCE_NS bit is implemented in MPAM3_EL3.

When MPAM3_EL3.FORCE_NS == 1, accesses from the Secure execution state have MPAM_NS == 1.

~~Otherwise:~~

~~Reserved, RES0.~~

Bit [59]

Reserved, RES0.

HAS_TIDR, bit [58]

~~From Armv8.6:~~

HAS_TIDR indicates support for MPAM2_EL2.TIDR bit. Defined values are:

HAS_TIDR	Meaning
0b0	The TIDR bit is not implemented in MPAM2_EL2.
0b1	The TIDR bit is implemented in MPAM2_EL2.

~~Otherwise:~~

~~Reserved, RES0.~~

Bits [57:40]

Reserved, RES0.

PMG_MAX, bits [39:32]

The largest value of PMG that the implementation can generate. The PMG_I and PMG_D fields of every MPAMn_ELx must implement at least enough bits to represent PMG_MAX.

Bits [31:21]

Reserved, RES0.

VPMR_MAX, bits [20:18]

If HAS_HCR == 0, VPMR_MAX must be 0b000. Otherwise, it indicates the maximum register index n for the MPAMVPM<n>_EL2 registers.

HAS_HCR, bit [17]

HAS_HCR indicates that the PE implementation supports MPAM virtualization, including MPAMHCR_EL2, MPAMVPMV_EL2 and MPAMVPM<n>_EL2 with n in the range 0 to VPMR_MAX. Must be 0 if EL2 is not implemented in either security state.

HAS_HCR	Meaning
0b0	MPAM virtualization is not supported.
0b1	MPAM virtualization is supported.

Bit [16]

Reserved, RES0.

PARTID_MAX, bits [15:0]

The largest value of PARTID that the implementation can generate. The PARTID_I and PARTID_D fields of every MPAMn_ELx must implement at least enough bits to represent PARTID_MAX.

Accessing the MPAMIDR_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, MPAMIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if HaveEL(EL3) && !ELUsingAArch32(EL3) && MPAM3_EL3.TRAPLOWER == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && MPAMIDR_EL1.HAS_HCR == '1' &&
MPAMHCR_EL2.TRAP_MPAMIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && MPAMIDR_EL1.HAS_TIDR == '1' && MPAM2_EL2.TIDR ==
'1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return MPAMIDR_EL1;
elsif PSTATE.EL == EL2 then
    if HaveEL(EL3) && MPAM3_EL3.TRAPLOWER == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return MPAMIDR_EL1;
elsif PSTATE.EL == EL3 then
    return MPAMIDR_EL1;

MVFR0_EL1, AArch32 Media and VFP Feature Register 0

The MVFR0_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR1_EL1 and MVFR2_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register MVFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR0[31:0] .

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MVFR0_EL1 are UNKNOWN.

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

~~In an AArch64 only implementation, this register is UNKNOWN.~~

Attributes

MVFR0_EL1 is a 64-bit register.

Field descriptions

The MVFR0_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
FPRound				FPShVec				FPSqrt				FPDivide				FPTrap				FPDP				FPSP				SIMDReg			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

FPRound	Meaning
0b0000	Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.
0b0001	All rounding modes supported.

All other values are reserved.

In Armv8-A the permitted values are `0b0000` and `0b0001`.

FPShVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

FPShVec	Meaning
`0b0000`	Short vectors not supported.
`0b0001`	Short vector operation supported.

All other values are reserved.

In Armv8-A the only permitted value is `0b0000`.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

FPSqrt	Meaning
`0b0000`	Not supported in hardware.
`0b0001`	Supported.

All other values are reserved.

In Armv8-A the permitted values are `0b0000` and `0b0001`.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

FPDivide	Meaning
`0b0000`	Not supported in hardware.
`0b0001`	Supported.

All other values are reserved.

In Armv8-A the permitted values are `0b0000` and `0b0001`.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

FPTrap	Meaning
`0b0000`	Not supported.
`0b0001`	Supported.

All other values are reserved.

A value of `0b0001` indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

FPDP, bits [11:8]

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:

FPDP	Meaning
0b0000	Not supported in hardware.
0b0001	Supported, VFPv2.
0b0010	Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.
- VDIV.F64 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

FPSP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

FPSP	Meaning
0b0000	Not supported in hardware.
0b0001	Supported, VFPv2.
0b0010	Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

SIMDReg	Meaning
0b0000	The implementation has no Advanced SIMD and floating-point support.
0b0001	The implementation includes floating-point support with 16 x 64-bit registers.
0b0010	The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

Accessing the MVFR0_EL1

MVFR1_EL1, AArch32 Media and VFP Feature Register 1

The MVFR1_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR0_EL1 and MVFR2_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

AArch64 System register MVFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MVFR1_EL1 are UNKNOWN.

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

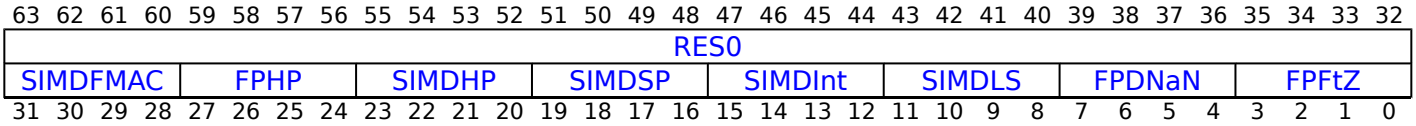
~~In an AArch64 only implementation, this register is UNKNOWN.~~

Attributes

MVFR1_EL1 is a 64-bit register.

Field descriptions

The MVFR1_EL1 bit assignments are:



Bits [63:32]

Reserved, RES0.

SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

SIMDFMAC	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

FPHP, bits [27:24]

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

FPHP	Meaning
0b0000	Not supported.
0b0001	Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds instructions for conversion between double-precision and half-precision.
0b0011	As for 0b0010, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the ARMv8.2-FP16 extension.
- 0b0011 in an implementation with floating-point support that includes the ARMv8.2-FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

Half Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

SIMDHP, bits [23:20]

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

SIMDHP	Meaning
0b0000	Not supported.
0b0001	SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8-A the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0010 in an implementation with SIMD floating-point support that does not include the ARMv8.2-FP16 extension.
- 0b0011 in an implementation with SIMD floating-point support that includes the ARMv8.2-FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

Half Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

SIMDSP, bits [19:16]

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

SIMDSP	Meaning
0b0000	Not implemented.
0b0001	Implemented. This value is permitted only if the SIMDInt field is 0b0001.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SIMDInt, bits [15:12]

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

SIMDInt	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SIMDLS, bits [11:8]

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

SIMDLS	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

FPDNaN, bits [7:4]

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

FPDNaN	Meaning
0b0000	Not implemented, or hardware supports only the Default NaN mode.
0b0001	Hardware supports propagation of NaN values.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

FPFtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

FPFtZ	Meaning
0b0000	Not implemented, or hardware supports only the Flush-to-Zero mode of operation.
0b0001	Hardware supports full denormalized number arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Accessing the MVFR1_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, MVFR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b001

```

MVFR2_EL1, AArch32 Media and VFP Feature Register 2

The MVFR2_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR0_EL1 and MVFR1_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D7.1.3.

Configuration

AArch64 System register MVFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR2[31:0] .

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MVFR2_EL1 are UNKNOWN.

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

~~In an AArch64 only implementation, this register is UNKNOWN.~~

Attributes

MVFR2_EL1 is a 64-bit register.

Field descriptions

The MVFR2_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:8]

Reserved, RES0.

FPMisc, bits [7:4]

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

FPMisc	Meaning
0b0000	Not implemented, or no support for miscellaneous features.
0b0001	Support for Floating-point selection.
0b0010	As 0b0001, and Floating-point Conversion to Integer with Directed Rounding modes.
0b0011	As 0b0010, and Floating-point Round to Integer Floating-point.
0b0100	As 0b0011, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0100`.

SIMDMisc, bits [3:0]

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

SIMDMisc	Meaning
`0b0000`	Not implemented, or no support for miscellaneous features.
`0b0001`	Floating-point Conversion to Integer with Directed Rounding modes.
`0b0010`	As `0b0001`, and Floating-point Round to Integer Floating-point.
`0b0011`	As `0b0010`, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0011`.

NZCV, Condition Flags

The NZCV characteristics are:

Purpose

Allows access to the condition flags.

Configuration

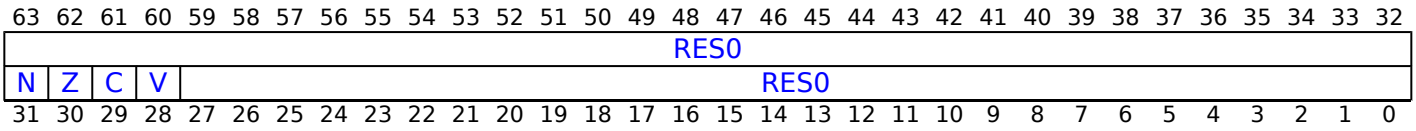
There are no configuration notes.

Attributes

NZCV is a 64-bit register.

Field descriptions

The NZCV bit assignments are:



Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative condition flag. Set to 1 if the result of the last flag-setting instruction was negative.

Z, bit [30]

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

C, bit [29]

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

V, bit [28]

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

Bits [27:0]

Reserved, RES0.

Accessing the NZCV

Accesses to this register use the following encodings:

OSECCR_EL1, OS Lock Exception Catch Control Register

The OSECCR_EL1 characteristics are:

Purpose

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

Configuration

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSECCR[31:0] .

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to External register EDECCR[31:0] .

If OSLSR_EL1.OSLK == 0, then OSECCR_EL1 returns an UNKNOWN value on reads and ignores writes.

Attributes

OSECCR_EL1 is a 64-bit register.

Field descriptions

The OSECCR_EL1 bit assignments are:

When OSLSR_EL1.OSLK~~DBGOSLSR.OSLK~~ == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

PAN, Privileged Access Never

The PAN characteristics are:

Purpose

Allows access to the Privileged Access Never bit.

Configuration

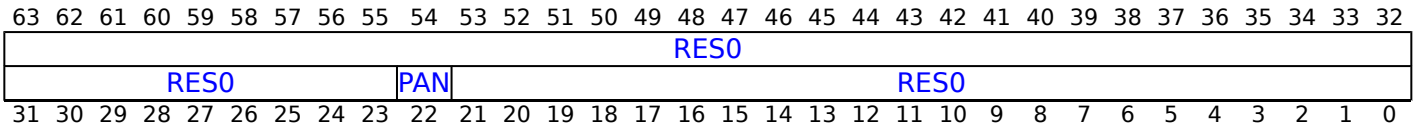
This register is present only when ARMv8.1-PAN is implemented. Otherwise, direct accesses to PAN are UNDEFINED.

Attributes

PAN is a 64-bit register.

Field descriptions

The PAN bit assignments are:



Bits [63:23]

Reserved, RES0.

PAN, bit [22]

Privileged Access Never.

PAN	Meaning
0b0	Privileged reads and write are not disabled by this mechanism.
0b1	Disables privileged read and write accesses to addresses accessible at EL0 for an enabled stage 1 translation regime that defines the EL0 permissions.

The value of this bit is usually preserved on taking an exception, except in the following situations:

- When the target of the exception is EL1, and the value of the SCTLR_EL1.SPAN bit is 0, this bit is set to 1.
- When the target of the exception is EL2, HCR_EL2.{E2H, TGE} is {1, 1}, and the value of the SCTLR_EL2.SPAN bit is 0, this bit is set to 1.

Bits [21:0]

Reserved, RES0.

Accessing the PAN

~~For details on the operation of the MSR (immediate) accessor, see MSR (immediate) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.~~

PAR_EL1, Physical Address Register

The PAR_EL1 characteristics are:

Purpose

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

Configuration

AArch64 System register PAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register PAR[63:0] .

~~RW fields in this register reset to architecturally UNKNOWN values.~~

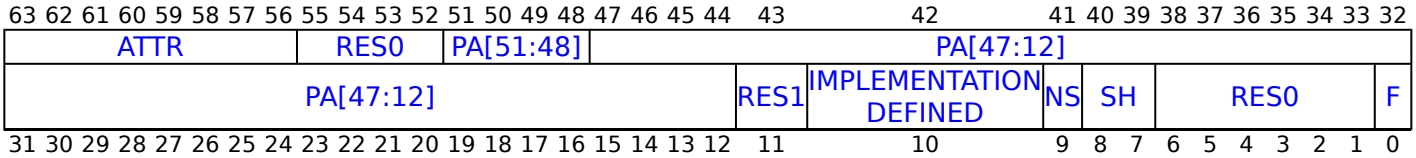
Attributes

PAR_EL1 is a 64-bit register.

Field descriptions

The PAR_EL1 bit assignments are:

When PAR_EL1.F == 0b0:



This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

PA[51:48], bits [51:48]

When ARMv8.2-LPA is implemented:

Extension to PA[47:12]. See PA[47:12] for more details.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[47:12], bits [47:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, the PA[51:48] bits form the upper part of the address value. Otherwise the PA[51:48] bits are RES0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

This field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address. Permitted values are:

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

The value 0b01 is reserved.

Note

This field returns the value `0b10` for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

This field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

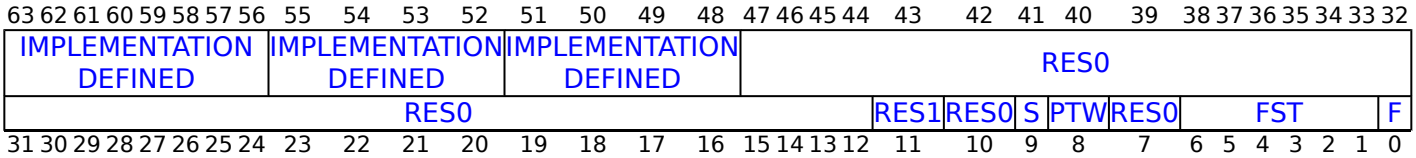
F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
`0b0`	Address translation completed successfully.

This field resets to an architecturally UNKNOWN value.

When PAR_EL1.F == 0b1:



This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Bits [47:12]

Reserved, RES0.

Bit [11]

Reserved, RES1.

Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

S	Meaning
0b0	Translation aborted because of a fault in the stage 1 translation.
0b1	Translation aborted because of a fault in the stage 2 translation.

This field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

This field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort ESR encoding.

FST	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When ARMv8.5-MemTag is implemented
0b010100	Synchronous External abort, on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort, on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort, on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort, on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When RAS is not implemented
0b100001	Alignment fault.	
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When ARMv8.1-TTHM is implemented
0b111101	Section Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When AArch32 is supported at any Exception level and EL1 is capable of using AArch32
0b111110	Page Domain fault, from an AArch32 stage 1 EL1&0	When AArch32 is supported at any

translation regime using Short-descriptor translation table format.	Exception level and EL1 is capable of using AArch32

This field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

This field resets to an architecturally UNKNOWN value.

Accessing the PAR_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, PAR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0111	0b0100	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGRTR_EL2.PAR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return PAR_EL1;
elsif PSTATE.EL == EL2 then
    return PAR_EL1;
elsif PSTATE.EL == EL3 then
    return PAR_EL1;
```

```
MSR PAR_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0111	0b0100	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

PMBSR_EL1, Profiling Buffer Status/syndrome Register

The PMBSR_EL1 characteristics are:

Purpose

Provides syndrome information to software when the buffer is disabled because the management interrupt has been raised.

Configuration

This register is present only when SPE is implemented. Otherwise, direct accesses to PMBSR_EL1 are UNDEFINED.

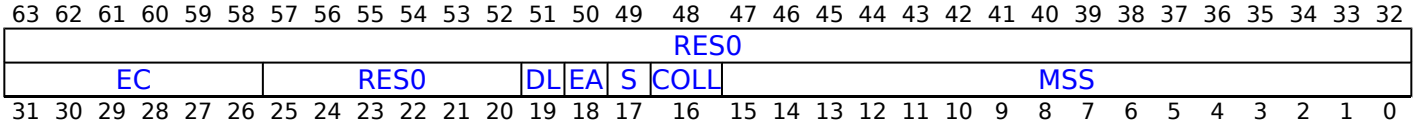
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

PMBSR_EL1 is a 64-bit register.

Field descriptions

The PMBSR_EL1 bit assignments are:



Bits [63:32]

Reserved, RES0.

EC, bits [31:26]

Exception class

Top-level description of the cause of the buffer management event

EC	Meaning	MSS
0b000000	Other buffer management event. All buffer management events other than those described by other defined Exception class codes.	MSS encoding for other buffer management events
0b100100	Stage 1 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer
0b100101	Stage 2 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:20]

Reserved, RES0.

DL, bit [19]

Partial record lost.

Following a buffer management event other than an asynchronous External abort, indicates whether the last record written to the Profiling Buffer is complete.

DL	Meaning
0b0	PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer.
0b1	Part of a record was lost because of a buffer management event or synchronous External abort. PMBPTR_EL1 might not point to the first byte after the last complete record written to the buffer, and so restarting collection might result in a data record stream that software cannot parse. All records prior to the last record have been written to the buffer.

When the buffer management event was because of an asynchronous external abort, this bit is set to 1 and software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if the PE never sets this bit as a result of a buffer management event caused by an asynchronous External abort.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [18]

External abort.

EA	Meaning
0b0	An external abort has not been asserted.
0b1	An external abort has been asserted and detected by the Statistical Profiling Extension.

This bit is RES0 if the PE never sets this bit as the result of an External abort.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [17]

Service

S	Meaning
0b0	PMBIRQ is not asserted.
0b1	PMBIRQ is asserted. All profiling data has either been written to the buffer or discarded.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

COLL, bit [16]

Collision detected.

COLL	Meaning
0b0	No collision events detected.
0b1	At least one collision event was recorded.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS, bits [15:0]

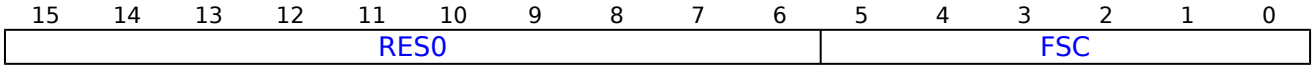
Management Event Specific Syndrome.

Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer



Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b0000000b0000xx	Address sizeSize fault,fault. levelBits [1:0] ofencode translationthe or translation table base register.level.	
0b0000010b0001xx	AddressTranslation sizefault. fault,Bits level[1:0] 1.encode the level.	
0b0000100b0010xx	AddressAccess sizeFlag fault,fault. levelBits 2.[1:0] encode the level.	
0b0000110b0011xx	AddressPermission sizefault. fault,Bits level[1:0] 3.encode the level.	
0b0001000b010000	TranslationSynchronous fault,External levelabort 0.on write.	
0b0001010b0101xx	TranslationSynchronous fault,External levelabort 1.on translation table walk or hardware update of translation table. Bits [1:0] encode the level.	
0b0001100b010001	TranslationAsynchronous fault,External levelabort 2.on write.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010100	Synchronous External abort, on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort, on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort, on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort, on translation table walk or hardware update of translation table, level 3.	
0b100001	Alignment fault.	
0b110000	TLB conflictConflict abort.fault.	
0b110001	Unsupported atomic hardware update fault.	When ARMv8.1-TTHM is implemented

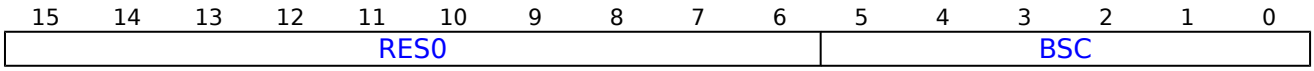
Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

All other values are reserved. Reserved values might be defined in a future version of the architecture.

It is IMPLEMENTATION DEFINED whether each of the Access Flag fault, asynchronous External abort and synchronous External abort, Alignment fault, and TLB Conflict abort values can be generated by the PE. For more information see Faults and Watchpoints.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for other buffer management events



Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Buffer status code

BSC	Meaning
0b000000	Buffer not filled
0b000001	Buffer filled

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMBSR_EL1

Accesses to this register use the following encodings:

```

PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

Configuration

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCCFILTR[31:0] .

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to External register PMCCFILTR_EL0[31:0] .

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are UNDEFINED.

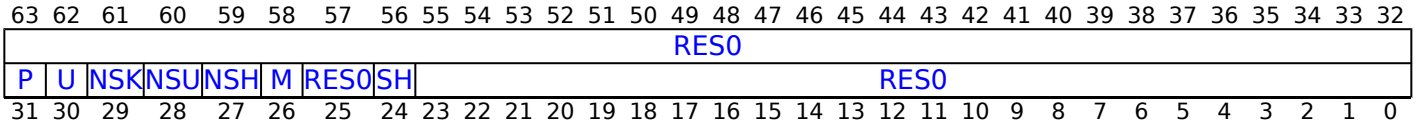
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

PMCCFILTR_EL0 is a 64-bit register.

Field descriptions

The PMCCFILTR_EL0 bit assignments are:



Bits [63:32]

Reserved, RES0.

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

P	Meaning
0b0	Count cycles in EL1.
0b1	Do not count cycles in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

U	Meaning
0b0	Count cycles in EL0.
0b1	Do not count cycles in EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When ~~HaveEL(~~EL3 is implemented~~):~~

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When ~~HaveEL(~~EL3 is implemented~~):~~

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When ~~HaveEL(~~EL2 is implemented~~):~~

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

NSH	Meaning
0b0	Do not count cycles in EL2.
0b1	Count cycles in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When ~~HaveEL(~~EL3 is implemented~~):~~

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

Note

This field is not visible in the AArch32 PMCCFILTR System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]

When ARMv8.4-SecEL2 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is not implemented or is disabled, this field is RES0.

Note

This field is not visible in the AArch32 PMCCFILTR System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:0]

Reserved, RES0.

Accessing the PMCCFILTR_EL0

PMCCFILTR_EL0 can also be accessed by using PMXEVTYPER_EL0 with PMSELR_EL0.SEL set to `0b11111`.

Accesses to this register use the following encodings:

```
MRS <Xt>, PMCCFILTR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b1111	0b111

```
if PSTATE.EL == EL0 then
    if !ELUsingAArch32(EL1) && PMUSERENR_EL0.EN == '0' then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL1) && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) ||
SCR_EL3.FGTEn == '1') && HDFGRTR_EL2.PMCCFILTR_EL0 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && MDCR_EL2.TPM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif HaveEL(EL3) && !ELUsingAArch32(EL3) && MDCR_EL3.TPM == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

AArch64 System register PMCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCR[31:0] .

AArch64 System register PMCR_EL0 bits [7:0] are architecturally mapped to External register PMCR_EL0[7:0] .

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMCR_EL0 are UNDEFINED.

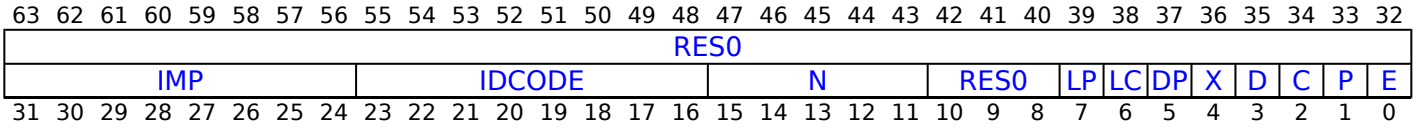
~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

PMCR_EL0 is a 64-bit register.

Field descriptions

The PMCR_EL0 bit assignments are:



Bits [63:32]

Reserved, RES0.

IMP, bits [31:24]

Implementer code. This field has an IMPLEMENTATION DEFINED value.

If this field is zero, then PMCR_EL0.IDCODE is RES0 and software must use the MIDR_EL1 to identify the PE.

Otherwise, this field and PMCR_EL0.IDCODE identifies the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as MIDR_EL1.Implementer.

Access to this field is **RO**.

IDCODE, bits [23:16]

When PMCR_EL0.IMP != 0x00:

Identification code. This field has an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of `0b00000`-`0b11111`. If the value is `0b00000` then only PMCCNTR_EL0 is implemented. If the value is `0b11111` PMCCNTR_EL0 and 31 event counters are implemented.

When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the value of MDCR_EL2.HPMN.

Access to this field is **RO**.

Bits [10:8]

Reserved, RES0.

LP, bit [7]

When ARMv8.5-PMU is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

LP	Meaning
`0b0`	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[31:0].
`0b1`	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[63:0].

If EL2 is implemented and MDCR_EL2.HPMN or HDCR.HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [HDCR.HPMN..(PMCR_EL0.N-1)] or [MDCR_EL2.HPMN..(PMCR_EL0.N-1)].

Note

The effect of MDCR_EL2.HPMN or HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of MDCR_EL2.HPMN or HDCR.HPMN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LC, bit [6]

When AArch32 is supported at any Exception level:

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

LC	Meaning
`0b0`	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].
`0b1`	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].

Arm deprecates use of PMCR_EL0.LC = 0.

~~In an AArch64 only implementation, this field is RES1.~~

On a Warm reset, this field resets to an architecturally UNKNOWN value.

~~DP, bit [5]~~

~~When HaveEL(EL3) or (ARMv8.1-PMU is implemented and HaveEL(EL2)):~~

Otherwise:

Reserved, RES1.

DP, bit [5]

When EL3 is implemented or (ARMv8.1-PMU is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this bit.
0b1	When event counting for counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited, cycle counting by PMCCNTR_EL0 is disabled.

For more information about the interaction between the Performance Monitors and EL3, see 'Effect of EL3 and EL2' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a~~a~~n PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

When AArch32 is supported at any Exception level:

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR_EL0 counts every clock cycle.
0b1	When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR_EL0 to zero.

This bit is always RAZ.

Note

Resetting PMCCNTR_EL0 does not change the cycle counter overflow bit.

The value of PMCR_EL0.LC is ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is **WO**.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

P	Meaning
0b0	No action.
0b1	Reset all event counters accessible in the current Exception level, not including PMCCNTR_EL0, to zero.

This bit is always RAZ.

In EL0 and EL1:

- If EL2 is implemented and enabled in the current Security state, and MDCR_EL2.HPMN is less than PMCR_EL0.N, a write of 1 to this bit does not reset event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)].
- If EL2 is not implemented, EL2 is disabled in the current Security state, or MDCR_EL2.HPMN equals PMCR_EL0.N, a write of 1 to this bit resets all the event counters.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

Note

Resetting the event counters does not change the event counter overflow bits.

If ARMv8.5-PMU is implemented, the values of MDCR_EL2.HLP and PMCR_EL0.LP are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is **WO**.

E, bit [0]

Enable.

E	Meaning
0b0	All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0, are disabled.
0b1	All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0, are enabled by PMCNTENSET_EL0.

If EL2 is implemented, then:

- If EL2 is using AArch32, PMN is HDCR.HPMN.
- If EL2 is using AArch64, PMN is MDCR_EL2.HPMN.
- If PMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [PMN..(PMCR_EL0.N-1)].

If EL2 is not implemented, PMN is PMCR_EL0.N.

Note

The effect of MDCR_EL2.HPMN or HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of MDCR_EL2.HPMN or HDCR.HPMN.

On a Warm reset, this field resets to 0.

Accessing the PMCR_EL0

Accesses to this register use the following encodings:

```
MRS <Xt>, PMCR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b000

PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVCNTR<n>[31:0] .

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to External register PMEVCNTR<n>_EL0[31:0] .

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n>_EL0 are UNDEFINED.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

PMEVCNTR<n>_EL0 is a 64-bit register.

Field descriptions

The PMEVCNTR<n>_EL0 bit assignments are:

When ARMv8.5-PMU is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Event counter n																															
Event counter n																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Event counter n																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMEVCNTR<n>_EL0

PMEVCNTR<n>_EL0 can also be accessed by using PMXEVCNTR_EL0 with PMSELR_EL0.SEL set to the value of <n>.

If ARMv8.6-FGT is implemented, and <n>EL2 is greaterimplemented thanand orenabled equalin to the numbercurrent ofSecurity accessible countersstate, thenfor thereads behaviorand ofwrites at EL1 and permitted reads and writes ofat EL0. PMEVCNTR<n>_EL0 is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, theif access<n> is trappedgreater than or equal to EL2. MDCR_EL2.HPMN, the access is trapped to EL2.

If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVCNTR<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

If ARMv8.6-FGT is not implemented, and <n> is greater than or equal to the numberabove ofbehaviors accessibledo counters,not then reads and writes ofapply: PMEVCNTR<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

```
MRS <Xt>, PMEVCNTR<n>_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b10:n[4:3]	n[2:0]

```
if PSTATE.EL == EL0 then

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVTYPER<n>[31:0] .

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to External register PMEVTYPER<n>_EL0[31:0] .

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are UNDEFINED.

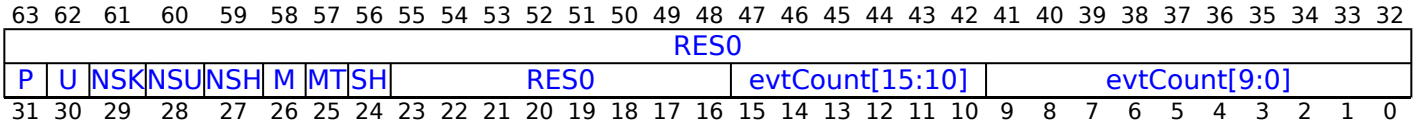
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

PMEVTYPER<n>_EL0 is a 64-bit register.

Field descriptions

The PMEVTYPER<n>_EL0 bit assignments are:



Bits [63:32]

Reserved, RES0.

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

P	Meaning
0b0	Count events in EL1.
0b1	Do not count events in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.

U	Meaning
0b0	Count events in EL0.
0b1	Do not count events in EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When HaveEL(EL3 is implemented):

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When HaveEL(EL3 is implemented):

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When HaveEL(EL2 is implemented):

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.

NSH	Meaning
0b0	Do not count events in EL2.
0b1	Count events in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When HaveEL(EL3 is implemented):

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Secure EL3 are counted.

Otherwise, events in Secure EL3 are not counted.

Most applications can ignore this field and set its value to `0b0`.

Note

This field is not visible in the AArch32 PMEVTYPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]

When (ARMv8.6-MTPMU is implemented and enabled) or an IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:

Multithreading.

MT	Meaning
`0b0`	Count events only on controlling PE.
`0b1`	Count events from any PE with the same affinity at level 1 and above as this PE.

Note

- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]

When ARMv8.4-SecEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

Note

This field is not visible in the AArch32 PMEVTYPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When ARMv8.1-PMU is implemented:

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>_EL0.

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in Allocation of the PMU event number space.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range `0x0000` to `0x003F`, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range `0x4000` to `0x403F`, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMEVTYPER<n>_EL0

PMEVTYPER<n>_EL0 can also be accessed by using PMXEVTYPER_EL0 with PMSELR_EL0.SEL set to n.

If ARMv8.6-FGT is implemented, and <n>EL2 is greaterimplemented thanand orenabled equalin to the numbercurrent ofSecurity accessible counterstate, thenfor thereads behaviorand ofwrites at EL1 and permitted reads and writes ofat EL0: PMEVTYPER<n>_EL0 is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, theif access<n> is trappedgreater than or equal to EL2. MDCR_EL2.HPMN, the access is trapped to EL2.

~~If <n> is greater than or equal to the number of accessible counters, reads and writes of PMEVTYPER<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:~~

If ARMv8.6-FGT is not implemented~~,~~ and <n> is greater than or equal to the number~~above~~ of~~behaviors~~ accessible~~do~~ counters,~~not~~ then reads and writes of~~apply:~~ PMEVTYPER<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.EN.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

```
MRS <Xt>, PMEVTYPER<n>_EL0
```

PMSCR_EL1, Statistical Profiling Control Register (EL1)

The PMSCR_EL1 characteristics are:

Purpose

Provides EL1 controls for Statistical Profiling

Configuration

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSCR_EL1 are UNDEFINED.

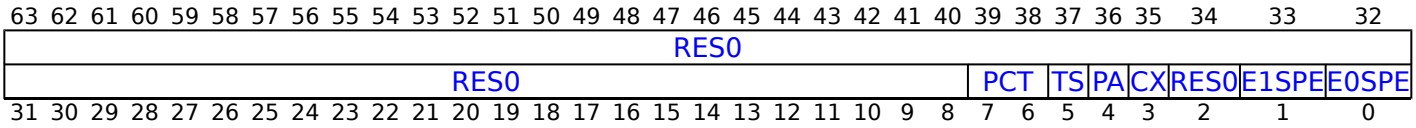
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

PMSCR_EL1 is a 64-bit register.

Field descriptions

The PMSCR_EL1 bit assignments are:



Bits [63:8]

Reserved, RES0.

PCT, bits [7:6]

When ~~HaveEL(~~EL2 is implemented~~:):~~

Physical Timestamp. If timestamp sampling is enabled and the Profiling Buffer is owned by EL1, requests which timestamp counter value is collected.

If ARMv8.6-ECV is implemented, this is a two bit field as shown. Otherwise, bit[7] is RES0.

PCT	Meaning	Applies when
0b00	Virtual counter, CNTVCT_EL0, is collected.	
0b01	Physical counter, CNTPCT_EL0, is collected.	
0b11	Physical counter, CNTPCT_EL0, minus CNTPOFF_EL2 is collected.	When ARMv8.6-ECV is implemented

If the Profiling Buffer owning Exception level is EL2, this field is ignored.

If the Profiling Buffer owning Exception level is EL1, this field is combined with PMSCR_EL2.PCT to determine which timestamp counter value is collected. For more information, see 'Controlling the data that is collected' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true:

- CNTHCTL_EL2.ECV is 0.
- SCR_EL3.ECVEn is 0.
- HCR_EL2.{E2H, TGE} is {1, 1}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Physical Timestamp. Reserved. This field reads as `0b01` and ignores writes. Software should treat this field as UNK/SBZP.

When EL2 is not implemented, the Effective values of CNTVOFF_EL2 and CNTPOFF_EL2 are zero, meaning the virtual counter and physical counter have the same value.

TS, bit [5]

Timestamp enable.

TS	Meaning
`0b0`	Timestamp sampling disabled.
`0b1`	Timestamp sampling enabled.

This bit is ignored by the PE if EL2 is implemented and the Profiling Buffer is owned by EL2. For more information, see 'Controlling the data that is collected' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PA, bit [4]

Physical Address sample enable.

PA	Meaning
`0b0`	Physical addresses are not collected.
`0b1`	Physical addresses are collected.

If EL2 is implemented:

- If the Profiling Buffer is owned by EL1, this bit is combined with PMSCR_EL2.PA to determine which address is collected. For more information, see 'Controlling the data that is collected' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.
- If the Profiling Buffer is owned by EL2, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CX, bit [3]

CONTEXTIDR_EL1 sample enable.

CX	Meaning
`0b0`	CONTEXTIDR_EL1 is not collected.
`0b1`	CONTEXTIDR_EL1 is collected.

If EL2 is implemented and enabled in the current Security state when an operation is sampled:

- If the PE is at EL2, this bit is ignored by the PE.
- If HCR_EL2.TGE == 1, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E1SPE, bit [1]

EL1 Statistical Profiling Enable.

E1SPE	Meaning
0b0	Sampling disabled at EL1.
0b1	Sampling enabled at EL1.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when HCR_EL2.TGE == 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E0SPE, bit [0]

EL0 Statistical Profiling Enable. Controls sampling at EL0 when HCR_EL2.TGE == 0 or if EL2 is disabled or not implemented.

E0SPE	Meaning
0b0	Sampling disabled at EL0.
0b1	Sampling enabled at EL0.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when HCR_EL2.TGE == 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMSCR_EL1

Accesses to this register use the following encodings:

```

PMSEVFR_EL1, Sampling Event Filter Register

The PMSEVFR_EL1 characteristics are:

Purpose

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if E[3] and E[5] are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 set (TLB walk) are recorded

Configuration

This register is present only when SPE is implemented. Otherwise, direct accesses to PMSEVFR_EL1 are UNDEFINED.

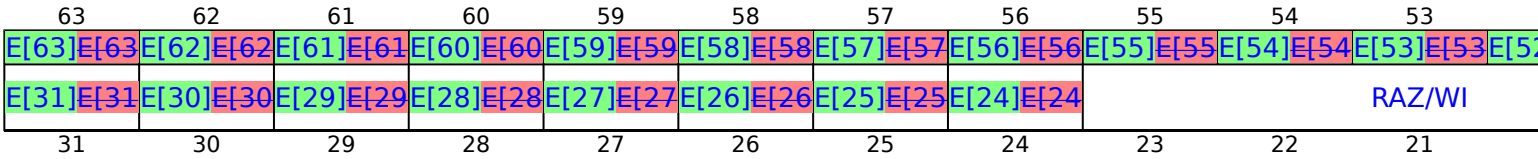
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

PMSEVFR_EL1 is a 64-bit register.

Field descriptions

The PMSEVFR_EL1 bit assignments are:



E[<z>], bit [63z], bitfor [z = 48 to 63]

E[63][<z>] is the event filter for event 63.<z>. If event 63<z> is not implemented, or filtering on event 63<z> is not supported, the corresponding bit is RAZ/WI.

E[63][<z>]	Meaning
0b0	Event 63<z> is ignored.
0b1	Do not record samples that have event 63<z> == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[62], bit [62]

E[62] is the event filter for event 62. If event 62 is not implemented, or filtering on event 62 is not supported, the corresponding bit is RAZ/WI.

E[62]	Meaning
0b0	Event 62 is ignored.
0b1	Do not record samples that have event 62 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[61], bit [61]

E[61] is the event filter for event 61. If event 61 is not implemented, or filtering on event 61 is not supported, the corresponding bit is RAZ/WI.

E[61]	Meaning
0b0	Event 61 is ignored.
0b1	Do not record samples that have event 61 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[60], bit [60]

E[60] is the event filter for event 60. If event 60 is not implemented, or filtering on event 60 is not supported, the corresponding bit is RAZ/WI.

E[60]	Meaning
0b0	Event 60 is ignored.
0b1	Do not record samples that have event 60 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[59], bit [59]

E[59] is the event filter for event 59. If event 59 is not implemented, or filtering on event 59 is not supported, the corresponding bit is RAZ/WI.

E[59]	Meaning
0b0	Event 59 is ignored.
0b1	Do not record samples that have event 59 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[58], bit [58]

E[58] is the event filter for event 58. If event 58 is not implemented, or filtering on event 58 is not supported, the corresponding bit is RAZ/WI.

E[58]	Meaning
0b0	Event 58 is ignored.
0b1	Do not record samples that have event 58 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[57], bit [57]

E[57] is the event filter for event 57. If event 57 is not implemented, or filtering on event 57 is not supported, the corresponding bit is RAZ/WI.

E[57]	Meaning
0b0	Event 57 is ignored.
0b1	Do not record samples that have event 57 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[56], bit [56]

E[56] is the event filter for event 56. If event 56 is not implemented, or filtering on event 56 is not supported, the corresponding bit is RAZ/WI.

E[56]	Meaning
0b0	Event 56 is ignored.
0b1	Do not record samples that have event 56 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[55], bit [55]

E[55] is the event filter for event 55. If event 55 is not implemented, or filtering on event 55 is not supported, the corresponding bit is RAZ/WI.

E[55]	Meaning
0b0	Event 55 is ignored.
0b1	Do not record samples that have event 55 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[54], bit [54]

E[54] is the event filter for event 54. If event 54 is not implemented, or filtering on event 54 is not supported, the corresponding bit is RAZ/WI.

E[54]	Meaning
0b0	Event 54 is ignored.
0b1	Do not record samples that have event 54 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[53], bit [53]

E[53] is the event filter for event 53. If event 53 is not implemented, or filtering on event 53 is not supported, the corresponding bit is RAZ/WI.

E[53]	Meaning
0b0	Event 53 is ignored.
0b1	Do not record samples that have event 53 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[52], bit [52]

E[52] is the event filter for event 52. If event 52 is not implemented, or filtering on event 52 is not supported, the corresponding bit is RAZ/WI.

E[52]	Meaning
0b0	Event 52 is ignored.
0b1	Do not record samples that have event 52 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[51], bit [51]

E[51] is the event filter for event 51. If event 51 is not implemented, or filtering on event 51 is not supported, the corresponding bit is RAZ/WI.

E[51]	Meaning
0b0	Event 51 is ignored.
0b1	Do not record samples that have event 51 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[50], bit [50]

E[50] is the event filter for event 50. If event 50 is not implemented, or filtering on event 50 is not supported, the corresponding bit is RAZ/WI.

E[50]	Meaning
0b0	Event 50 is ignored.
0b1	Do not record samples that have event 50 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[49], bit [49]

E[49] is the event filter for event 49. If event 49 is not implemented, or filtering on event 49 is not supported, the corresponding bit is RAZ/WI.

E[49]	Meaning
0b0	Event 49 is ignored.
0b1	Do not record samples that have event 49 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[48], bit [48]

E[48] is the event filter for event 48. If event 48 is not implemented, or filtering on event 48 is not supported, the corresponding bit is RAZ/WI.

E[48]	Meaning
0b0	Event 48 is ignored.
0b1	Do not record samples that have event 48 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:32]

Reserved, RAZ/WI.

E[<y>], bit [31y], bitfor [y = 24 to 31]

E[31][<y>] is the event filter for event 31.<y>. If event 31<y> is not implemented, or filtering on event 31<y> is not supported, the corresponding bit is RAZ/WI.

E[31][<y>]	Meaning
0b0	Event 31<y> is ignored.
0b1	Do not record samples that have event 31<y> == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[30], bit [30]

E[30] is the event filter for event 30. If event 30 is not implemented, or filtering on event 30 is not supported, the corresponding bit is RAZ/WI.

E[30]	Meaning
0b0	Event 30 is ignored.
0b1	Do not record samples that have event 30 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[29], bit [29]

E[29] is the event filter for event 29. If event 29 is not implemented, or filtering on event 29 is not supported, the corresponding bit is RAZ/WI.

E[29]	Meaning
0b0	Event 29 is ignored.
0b1	Do not record samples that have event 29 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[28], bit [28]

E[28] is the event filter for event 28. If event 28 is not implemented, or filtering on event 28 is not supported, the corresponding bit is RAZ/WI.

E[28]	Meaning
0b0	Event 28 is ignored.
0b1	Do not record samples that have event 28 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[27], bit [27]

E[27] is the event filter for event 27. If event 27 is not implemented, or filtering on event 27 is not supported, the corresponding bit is RAZ/WI.

E[27]	Meaning
0b0	Event 27 is ignored.
0b1	Do not record samples that have event 27 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[26], bit [26]

E[26] is the event filter for event 26. If event 26 is not implemented, or filtering on event 26 is not supported, the corresponding bit is RAZ/WI.

E[26]	Meaning
0b0	Event 26 is ignored.
0b1	Do not record samples that have event 26 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[25], bit [25]

E[25] is the event filter for event 25. If event 25 is not implemented, or filtering on event 25 is not supported, the corresponding bit is RAZ/WI.

E[25]	Meaning
0b0	Event 25 is ignored.
0b1	Do not record samples that have event 25 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[24], bit [24]

E[24] is the event filter for event 24. If event 24 is not implemented, or filtering on event 24 is not supported, the corresponding bit is RAZ/WI.

E[24]	Meaning
0b0	Event 24 is ignored.
0b1	Do not record samples that have event 24 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:19]

Reserved, RAZ/WI.

E[18], bit [18]

When ARMv8.3-SPE is implemented and SVE is implemented:

Empty predicate.

E[18]	Meaning
0b0	Empty predicate event is ignored.
0b1	Do not record samples that have the Empty predicate event == 0.

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]

When ARMv8.3-SPE is implemented and SVE is implemented:

Partial predicate.

E[17]	Meaning
0b0	Partial predicate event is ignored.
0b1	Do not record samples that have the Partial predicate event == 0.

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bit [16]

Reserved, RAZ/WI.

E[~~<x>~~], bit [15~~x~~], bit~~for~~ [~~x = 12 to~~ 15]

E[15][~~<x>~~] is the event filter for event 15.~~<x>~~. If event 15~~<x>~~ is not implemented, or filtering on event 15~~<x>~~ is not supported, the corresponding bit is RAZ/WI.

E[15][~~<x>~~]	Meaning
0b0	Event 15~~<x>~~ is ignored.
0b1	Do not record samples that have event 15~~<x>~~ == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[14], bit [14]

E[14] is the event filter for event 14. If event 14 is not implemented, or filtering on event 14 is not supported, the corresponding bit is RAZ/WI.

E[14]	Meaning
0b0	Event 14 is ignored.
0b1	Do not record samples that have event 14 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[13], bit [13]

E[13] is the event filter for event 13. If event 13 is not implemented, or filtering on event 13 is not supported, the corresponding bit is RAZ/WI.

E[13]	Meaning
0b0	Event 13 is ignored.
0b1	Do not record samples that have event 13 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[12], bit [12]

E[12] is the event filter for event 12. If event 12 is not implemented, or filtering on event 12 is not supported, the corresponding bit is RAZ/WI.

E[12]	Meaning
0b0	Event 12 is ignored.
0b1	Do not record samples that have event 12 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[11], bit [11]

When ARMv8.3-SPE is implemented:

Alignment.

E[11]	Meaning
0b0	Alignment event is ignored.
0b1	Do not record samples that have the Alignment event == 0.

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [10:8]

Reserved, RAZ/WI.

E[7], bit [7]

Mispredicted.

E[7]	Meaning
0b0	Mispredicted event is ignored.
0b1	Do not record samples that have the Mispredicted event == 0.

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RAZ/WI.

E[5], bit [5]

TLB walk.

E[5]	Meaning
0b0	TLB walk event is ignored.
0b1	Do not record samples that have the TLB walk event == 0.

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RAZ/WI.

E[3], bit [3]

Level 1 data or unified cache refill.

E[3]	Meaning
0b0	Level 1 data or unified cache refill event is ignored.
0b1	Do not record samples that have the Level 1 data or unified cache refill event == 0.

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RAZ/WI.

E[1], bit [1]

When the PE supports sampling of speculative instructions:

Architecturally retired.

When the PE supports sampling of speculative instructions:

E[1]	Meaning
0b0	Architecturally retired event is ignored.
0b1	Do not record samples that have the Architecturally retired event == 0.

This bit is ignored by the PE when PMSFCR_EL1.FE == 0.

If the PE does not support the sampling of speculative instructions, or always discards the sample record for speculative instructions, this bit reads as an UNKNOWN value and the PE ignores its value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, UNKNOWN.

Bit [0]

Reserved, RAZ/WI.

Accessing the PMSEVFR_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, PMSEVFR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1001	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

PMUSERENR_EL0, Performance Monitors User Enable Register

The PMUSERENR_EL0 characteristics are:

Purpose

Enables or disables EL0 access to the Performance Monitors.

Configuration

AArch64 System register PMUSERENR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMUSERENR[31:0] .

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR_EL0 are UNDEFINED.

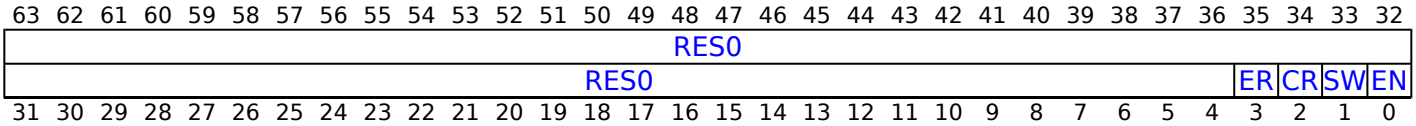
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

PMUSERENR_EL0 is a 64-bit register.

Field descriptions

The PMUSERENR_EL0 bit assignments are:



Bits [63:4]

Reserved, RES0.

ER, bit [3]

Event counter Read. Traps EL0 access to event counters to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value `0x18`.

In AArch32~~AArch64~~ state, trapped accesses are reported using EC syndrome value `0x03`.

ER	Meaning
`0b0`	EL0 using AArch64: EL0 reads of the PMXEVCNTR_EL0 and PMEVCNTR<n>_EL0, and EL0 read/write accesses to the PMSELR_EL0, are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 reads of the PMXEVCNTR and PMEVCNTR<n>, and EL0 read/write accesses to the PMSELR, are trapped if PMUSERENR_EL0.EN is also 0.
`0b1`	Overrides PMUSERENR_EL0.EN and enables RO access to PMXEVCNTR_EL0 and PMEVCNTR<n>_EL0, and RW access to PMSELR_EL0 and PMSELR at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CR, bit [2]

Cycle counter Read. Traps EL0 access to cycle counter reads to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value `0x18`.

In AArch32 state, trapped MRC accesses are reported using EC syndrome value `0x03`, trapped MRRC accesses are reported using EC syndrome value `0x04`.

CR	Meaning
`0b0`	EL0 using AArch64: EL0 read accesses to the PMCCNTR_EL0 are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 read accesses to the PMCCNTR are trapped if PMUSERENR_EL0.EN is also 0.
`0b1`	Overrides PMUSERENR_EL0.EN and enables access to PMCCNTR_EL0 and PMCCNTR at EL0.

SW, bit [1]

Traps Software Increment writes to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value `0x18`.

In AArch32 state, trapped accesses are reported using EC syndrome value `0x03`.

SW	Meaning
`0b0`	EL0 using AArch64: EL0 writes to the PMSWINC_EL0 are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 writes to the PMSWINC are trapped if PMUSERENR_EL0.EN is also 0.
`0b1`	Overrides PMUSERENR_EL0.EN and enables access to:~~PMSWINC_EL0 and PMSWINC at EL0.~~ • PMSWINC_EL0 at EL0. • PMSWINC at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Traps EL0 accesses to the Performance Monitor registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states as follows:

- In AArch64 state, MRS or MSR accesses to the following registers are reported using EC syndrome value `0x18`:
  - PMCR_EL0, PMOVSCLR_EL0, PMSELR_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPER_EL0, PMXEVCNTR_EL0, ~~PMUSERENR_EL0,~~ PMCNTENSET_EL0, PMCNTENSET_EL0, PMOVSSET_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMCCFILTR_EL0.
  - PMSWINC_EL0, MSR accesses only.
  - If ARMv8.4-PMU is implemented, PMMIR_EL1
- In AArch32 state, MRC or MCR accesses to the following registers are reported using EC syndrome value `0x03`, MRRC or MCRR accesses are trapped to EL2 and reported using EC syndrome value `0x04`:
  - PMCR, PMOVSR, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXEVNTR, ~~PMUSERENR,~~ PMCNTENSET, PMCNTENCLR, PMOVSSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR.
  - PMSWINC, MCR accesses only.
  - If ARMv8.4-PMU is implemented, PMMIR.

    - If ARMv8.1-PMU is implemented, in AArch32 state, PMCEID2, and PMCEID3.

- In AArch32 state, MRRC or MCRR accesses to PMCCNTR are reported using EC syndrome value 0x04.
- ~~If ARMv8.4-PMU is implemented, in AArch64 state, PMMIR_EL1 and in AArch32 state, PMMIR.~~
- ~~If ARMv8.1-PMU is implemented, in AArch32 state, PMCEID2, and PMCEID3.~~

EN	Meaning
0b0	While at EL0, accesses~~Accesses~~ to the specified registers at EL0 are trapped, unless overridden by one of PMUSERENR_EL0.{ER, CR, SW}.
0b1	While at EL0, software can access all of the specified registers.

Note

The EL0 access is trapped only if the corresponding EL1 access is permitted. If PMUSERENR_EL0.EN is 0, write access to PMSWINC_EL0 and PMSWINC from EL0 are trapped, but read access is UNDEFINED.

The affected registers do not include PMINTENSET_EL1, PMINTENCLR_EL1, PMINTENSET and PMINTENCLR.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMUSERENR_EL0

Accesses to this register use the following encodings:

```
MRS <Xt>, PMUSERENR_EL0
```

PMXEVCNTR_EL0, Performance Monitors Selected Event Count Register

The PMXEVCNTR_EL0 characteristics are:

Purpose

Reads or writes the value of the selected event counter, PMEVCNTR<n>_EL0. PMSELR_EL0.SEL determines which event counter is selected.

Configuration

AArch64 System register PMXEVCNTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMXEVCNTR[31:0] .

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMXEVCNTR_EL0 are UNDEFINED.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

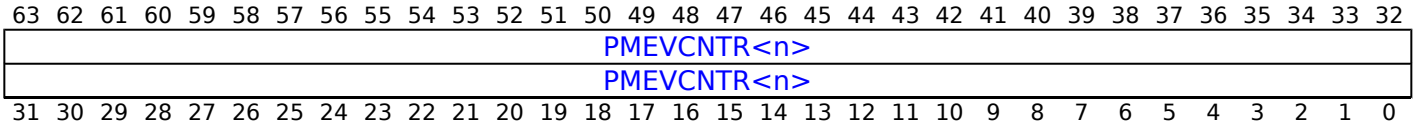
Attributes

PMXEVCNTR_EL0 is a 64-bit register.

Field descriptions

The PMXEVCNTR_EL0 bit assignments are:

When ARMv8.5-PMU is implemented:

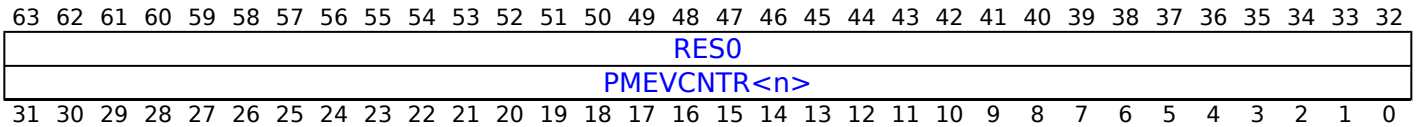


PMEVCNTR<n>, bits [63:0]

Value of the selected event counter, PMEVCNTR<n>_EL0, where n is the value stored in PMSELR_EL0.SEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



Bits [63:32]

Reserved, RES0.

PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, PMEVCNTR<n>_EL0, where n is the value stored in PMSELR_EL0.SEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMXEVCNTR_EL0

If ARMv8.6-FGT is implemented, and EL2 is implemented and enabled in the current Security state, for reads and writes at EL1 and permitted reads and writes at EL0: PMSELR_EL0.SEL is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMXEVCNTR_EL0 is as follows:

- If PMSELR_EL0.SEL selectsis an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.if PMSELR_EL0.SEL is greater than or equal to MDCR_EL2.HPMN, the access is trapped to EL2.

If PMSELR_EL0.SEL is greater than or equal to the number of accessible counters then reads and writes of PMXEVCNTR_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

If ARMv8.6-FGT is not implemented, andor the above behaviors do not apply: PMSELR_EL0.SEL is greater than or equal to the number of accessible counters, then reads and writes of PMXEVCNTR_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a `NOP`
- Accesses to the register behave as if PMSELR_EL0.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and PMSELR_EL0.SEL is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

```
MRS <Xt>, PMXEVCNTR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1101	0b010

PMXEVTYPER_EL0, Performance Monitors Selected Event Type Register

The PMXEVTYPER_EL0 characteristics are:

Purpose

When PMSELR_EL0.SEL selects an event counter, this accesses a PMEVTYPER<n>_EL0 register. When PMSELR_EL0.SEL selects the cycle counter, this accesses PMCCFILTR_EL0.

Configuration

AArch64 System register PMXEVTYPER_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMXEVTYPER[31:0] .

This register is present only when PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER_EL0 are UNDEFINED.

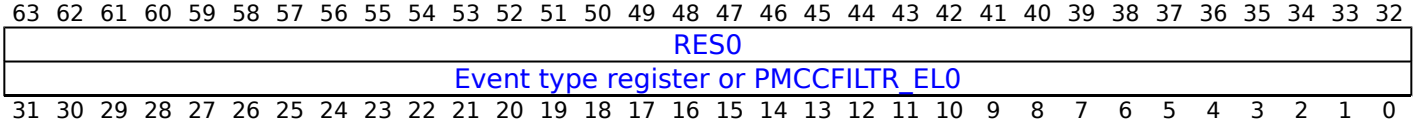
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

PMXEVTYPER_EL0 is a 64-bit register.

Field descriptions

The PMXEVTYPER_EL0 bit assignments are:



Bits [63:32]

Reserved, RES0.

Bits~~Event type register or PMCCFILTR_EL0, bits~~ [31:0]

When PMSELR_EL0.SEL == 31, this register accesses PMCCFILTR_EL0.

Otherwise, this register accesses PMEVTYPER<n>_EL0 where n is the value in PMSELR_EL0.SEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMXEVTYPER_EL0

If ARMv8.6-FGT is implemented, and ~~EL2 is implemented and enabled in the current Security state, for reads and writes at EL1 and permitted reads and writes at EL0:~~ PMSELR_EL0.SEL is not 31 and is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMXEVTYPER_EL0 is as follows:

- If PMSELR_EL0.SEL selects~~is~~ an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.~~if PMSELR_EL0.SEL is not 31 and greater than or equal to MDCR_EL2.HPMN, the access is trapped to EL2.~~

~~If PMSELR_EL0.SEL is not 31 and greater than or equal to the number of accessible counters then reads and writes of PMXEVTYPER_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:~~

If ARMv8.6-FGT is not implemented, and~~or the above behaviors do not apply:~~ PMSELR_EL0.SEL is not 31 and is greater than or equal to the number of accessible counters, then reads and writes of PMXEVTYPER_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a `NOP`
- Accesses to the register behave as if PMSELR_EL0.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR_EL0.SEL is 31.
- If EL2 is implemented and enabled in the current Security state, PMSELR_EL0 is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.EN.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible counters. Otherwise, the number of accessible counters is the number of implemented counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings:

```
MRS <Xt>, PMXEVTYPER_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1101	0b001

```
if PSTATE.EL == EL0 then
    if !ELUsingAArch32(EL1) && PMUSERENR_EL0.EN == '0' then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);

RGSR_EL1, Random Allocation Tag Seed Register.

The RGSR_EL1 characteristics are:

Purpose

Random Allocation Tag Seed Register.

Configuration

This register is present only when ARMv8.5-MemTag is implemented and ID_AA64PFR1_EL1.MTE != 0b0001. Otherwise, direct accesses to RGSR_EL1 are UNDEFINED.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

When GCR_EL1.RRND==0b1, updates to RGSR_EL1 are implementation-specific.

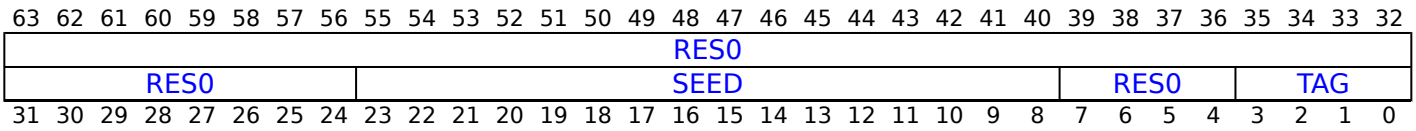
~~When GCR_EL1.RRND==0b1, the value of RGSR_EL1 is UNKNOWN.~~

Attributes

RGSR_EL1 is a 64-bit register.

Field descriptions

The RGSR_EL1 bit assignments are:



Bits [63:24]

Reserved, RES0.

SEED, bits [23:8]

Seed register used for generating values returned by RandomAllocationTag().

This field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

TAG, bits [3:0]

Tag generated by the most recent IRG instruction.

This field resets to an architecturally UNKNOWN value.

Accessing the RGSR_EL1

Accesses to this register use the following encodings:

RMR_EL1, Reset Management Register (EL1)

The RMR_EL1 characteristics are:

Purpose

WhenIf EL1 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL1 can request a Warm reset.
- If EL1 can use allAArch32 Executionand statesAArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch64 System register RMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register RMR[31:0] when the highest implemented Exception level is EL1.IsHighestEL(EL1).

ThisOnly registerimplemented isif presentEL1 only whenis the highest implemented Exception levellevel. isIn EL1. Otherwise,this direct accesses to RMR_EL1 arecase: UNDEFINED.

When EL1 is the highest implemented Exception level:

- If EL1 can use allAArch32 Executionand statesAArch64 then this register must be implemented.
- If EL1 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

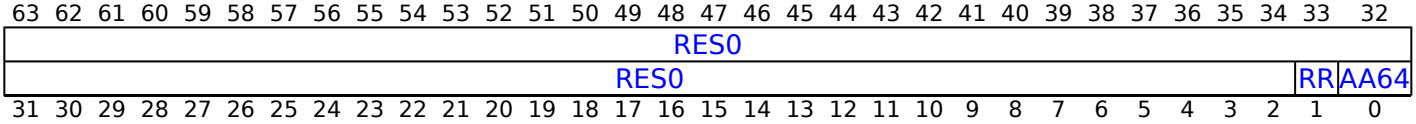
Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

RMR_EL1 is a 64-bit register.

Field descriptions

The RMR_EL1 bit assignments are:



Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0.

AA64, bit [0]

When AArch32 is supported at any Exception level:

When EL1 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
0b0	AArch32.
0b1	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL1 can~~cannot~~ only use AArch64 state,~~AArch32~~ this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

Otherwise:

Reserved, RAO/WI.

Accessing the RMR_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, RMR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0000	0b010

```
if PSTATE.EL == EL1 && IsHighestEL(EL1) then

RMR_EL2, Reset Management Register (EL2)

The RMR_EL2 characteristics are:

Purpose

WhenIf EL2 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use allAArch32 Executionand statesAArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch64 System register RMR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HRMR[31:0] when the highest implemented Exception level is EL2.IsHighestEL(EL2).

ThisOnly registerimplemented isif presentEL2 only whenis the highest implemented Exception levellevel. isIn EL2. Otherwise,this direct accesses to RMR_EL2 arecase: UNDEFINED.

When EL2 is the highest implemented Exception level:

- If EL2 can use allAArch32 Executionand statesAArch64 then this register must be implemented.
- If EL2 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

This register has no effect if EL2 is not enabled in the current Security state.

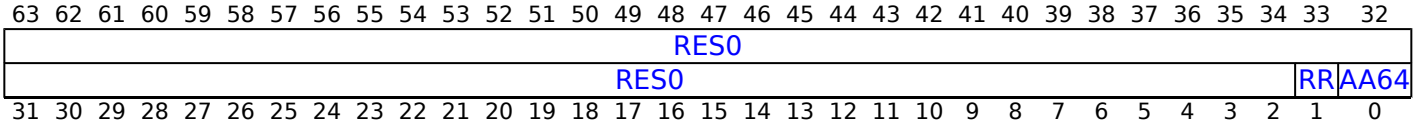
Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.

Attributes

RMR_EL2 is a 64-bit register.

Field descriptions

The RMR_EL2 bit assignments are:



Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

This field resets to 0.

AA64, bit [0]

When AArch32 is supported at any Exception level:

When EL2 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
0b0	AArch32.
0b1	AArch64.

Field descriptions

The RVBAR_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Reset Address																															
Reset Address																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Reset Address. The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

Accessing the RVBAR_EL2

Accesses to this register use the following encodings:

```
MRS <Xt>, RVBAR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b0000	0b001

```
if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    return RVBAR_EL2;
else
    UNDEFINED;
```

RVBAR_EL3, Reset Vector Base Address Register (if EL3 implemented)

The RVBAR_EL3 characteristics are:

Purpose

If EL3 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

Configuration

This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to RVBAR_EL3 are UNDEFINED.

Only implemented if the highest Exception level implemented is EL3.

Attributes

RVBAR_EL3 is a 64-bit register.

Field descriptions

The RVBAR_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Reset Address																															
Reset Address																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Reset Address. The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

Accessing the RVBAR_EL3

Accesses to this register use the following encodings:

```
MRS <Xt>, RVBAR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b0000	0b001

```
if PSTATE.EL == EL3 && IsHighestEL(EL3) then
    return RVBAR_EL3;
else
    UNDEFINED;
```

SCR_EL3, Secure Configuration Register

The SCR_EL3 characteristics are:

Purpose

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0, EL1, and EL2. The Security state is either Secure or Non-secure.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ, SError interrupts, and External abort exceptions are taken to EL3.
- Whether various operations are trapped to EL3.

Configuration

AArch64 System register SCR_EL3 bits [31:0] can be mapped to AArch32 System register SCR[31:0] , but this is not architecturally mandated.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

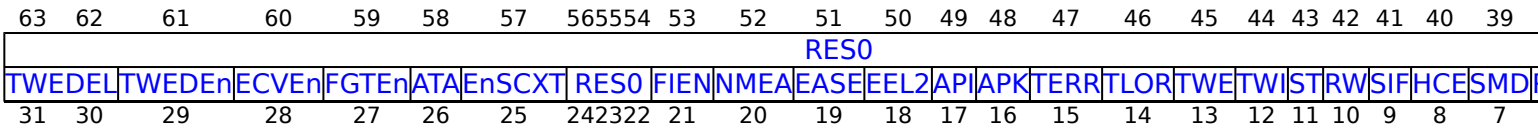
This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to SCR_EL3 are UNDEFINED.

Attributes

SCR_EL3 is a 64-bit register.

Field descriptions

The SCR_EL3 bit assignments are:



Bits [63:36]

Reserved, RES0.

AMVOFFEN, bit [35]

When ARMv8.6-AMU is implemented:

Activity Monitors Virtual Offsets Enable.

AMVOFFEN	Meaning
0b0	Accesses to AMEVCNTVOFF0<n>_EL2 and AMEVCNTVOFF1<n>_EL2 at EL2 are trapped to EL3. Indirect reads of the virtual offset registers are zero.
0b1	Accesses to AMEVCNTVOFF0<n>_EL2 and AMEVCNTVOFF1<n>_EL2 are not affected by this field.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [34]

Reserved, RES0.

TWEDEL, bits [33:30]

When ARMv8.6-TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCR_EL3.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCR_EL3.TWE as 2^(TWEDEL + 8) cycles.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [29]

When ARMv8.6-TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCR_EL3.TWE.

TWEDEn	Meaning
0b0	The delay for taking a WFE trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking a WFE trap is at least the number of cycles defined in SCR_EL3.TWEDEL.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECVEn, bit [28]

When ARMv8.6-ECV is implemented:

ECV Enable. Enables access to the CNTPOFF_EL2 register.

ECVEn	Meaning
0b0	EL2 accesses to CNTPOFF_EL2 are trapped to EL3, and the value of CNTPOFF_EL2 is treated as 0 for all purposes other than direct reads or writes to the register from EL3.
0b1	EL2 accesses to CNTPOFF_EL2 are not trapped to EL3 by this mechanism.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTEn, bit [27]

When ARMv8.6-FGT is implemented:

Enables access to the Fine-Grained Traps registers: HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2 and HFGWTR_EL2.

FGTEn	Meaning
0b0	EL2 Accesses to HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2 and HFGWTR_EL2 registers are trapped to EL3, and those registers behave as if all bits are set to 0.
0b1	EL2 Accesses to HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2 and HFGWTR_EL2 registers are not trapped to EL3 by this mechanism.

Traps caused by accesses to the fine-grained trap registers are reported using the EC code of 0x18 and its associated ISS.

Otherwise:

Reserved, RES0.

ATA, bit [26]

When ARMv8.5-MemTag is implemented:

Allocation Tag Access. Controls access at EL2, EL1 and EL0 to Allocation Tags.

When access is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
- MRS and MSR instructions at EL1 and EL2 using GCR_EL1, RGSR_EL1, TFSR_EL1, TFSR_EL2 or TFSRE0_EL1 that are not UNDEFINED or trapped to a lower Exception level are trapped to EL3.
- MRS and MSR instructions at EL2 using TFSR_EL12 that are not UNDEFINED are trapped to EL3.

ATA	Meaning
0b0	Access is prevented.
0b1	Access is not prevented.

This field is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [25]

When ARMv8.0-CSV2 is implemented:

Enable access to the SCXTNUM_EL2, SCXTNUM_EL1, and SCXTNUM_EL0 registers. The defined values are:

EnSCXT	Meaning
0b0	EL2, EL1 and EL0 access to SCXTNUM_EL0, EL2 and EL1 access to SCXTNUM_EL1, EL2 access to SCXTNUM_EL2 registers are disabled by this mechanism, causing an exception to EL3, and the values of these registers to be treated as 0.
0b1	This control does not cause accesses to SCXTNUM_EL0, SCXTNUM_EL1, SCXTNUM_EL2 to be trapped.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:22]

Reserved, RES0.

FIEN, bit [21]

When ARMv8.4-RAS is implemented:

Fault Injection enable. Trap accesses to the RAS ERX* registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 from EL1 and EL2 to EL3, reported using EC syndrome value 0x18.

FIEN	Meaning
0b0	Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.
0b1	This control does not cause any instructions to be trapped.

If EL3 is not implemented, the Effective value of SCR_EL3.FIEN is 0b1.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [20]

When ARMv8.4-DFE is implemented:

Non-maskable External Aborts. When SCR_EL3.EA == 1, controls whether PSTATE.A masks SError interrupts at EL3.

NMEA	Meaning
0b0	If SCR_EL3.EA == 1, asserted SError interrupts are not taken at EL3 if PSTATE.A == 1.
0b1	If SCR_EL3.EA == 1, asserted SError interrupts are taken at EL3 regardless of the value of PSTATE.A.

When SCR_EL3.EA == 0:

- Asserted SError interrupts are not taken at EL3 regardless of the value of PSTATE.A and this field.
- This field is ignored and its Effective value is 0.

This field resets to 0.

Otherwise:

Reserved, RES0.

EASE, bit [19]

When ARMv8.4-DFE is implemented:

External aborts to SError interrupt vector.

EASE	Meaning
0b0	Synchronous External abort exceptions taken to EL3 are taken to the appropriate synchronous exception vector offset from VBAR_EL3.
0b1	Synchronous External abort exceptions taken to EL3 are taken to the appropriate SError interrupt vector offset from VBAR_EL3.

This field resets to 0.

Otherwise:

Reserved, RES0.

EEL2, bit [18]

When ARMv8.4-SecEL2 is implemented:

Secure EL2 Enable.

EEL2	Meaning
0b0	All behaviors associated with Secure EL2 are disabled. All registers, including timer registers, defined by ARMv8.4-SecEL2 are UNDEFINED, and those timers are disabled.
0b1	All behaviors associated with Secure EL2 are enabled.

When the value of this bit is 1, then:

- When SCR_EL3.NS == 0, the SCR_EL3.RW bit is treated as 1 for all purposes other than reading or writing the register.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2, using the EC value of ESR_EL2.EC== 0x3 :
  - A read or write of the SCR.
  - A read or write of the NSACR.
  - A read or write of the MVBAR.
  - A read or write of the SDCR.
  - Execution of an ATS12NSO** instruction.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using the EC value of ESR_EL2.EC== 0x0 :
  - Execution of an SRS instruction that uses R13_mon.
  - Execution of an MRS (Banked register) or MSR (Banked register) instruction that would access SPSR_mon, R13_mon, or R14_mon.

Note

If the Effective value of SCR_EL3.EEL2 is 0, then these operations executed in Secure EL1 using AArch32 are trapped to EL3.

In a Secure only implementation that does not implement EL3 but implements EL2, behaves as if SCR_EL3.EEL2 == 1.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [17]

When ARMv8.4-SecEL2 is implemented and ARMv8.3-PAuth is implemented:

Controls the use of the following instructions related to Pointer Authentication. Traps are reported using EC syndrome value `0x09`:

- PACGA, which is always enabled.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAB when:
  - In EL0, when HCR_EL2.TGE==0 or HCR_EL2.E2H==0, and the associated SCTLR_EL1.En<N><M> == 1.
  - In EL0, when HCR_EL2.TGE==1 and HCR_EL2.E2H==1, and the associated SCTLR_EL2.En<N><M> == 1.
  - In EL1, when the associated SCTLR_EL1.En<N><M> == 1.
  - In EL2, when the associated SCTLR_EL2.En<N><M> == 1.

API	Meaning
`0b0`	The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.API bit.
`0b1`	This control does not cause any instructions to be trapped.

An instruction is trapped only if Pointer Authentication is enabled for that instruction, for more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Note

If ARMv8.3-PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

This field resets to an architecturally UNKNOWN value.

When ARMv8.4-SecEL2 is not implemented and ARMv8.3-PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- PACGA.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZ, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAB when:
  - In Non-secure EL0, when HCR_EL2.TGE==0 or HCR_EL2.E2H==0, and the associated SCTLR_EL1.En<N><M>== 1.
  - In Non-secure EL0, when HCR_EL2.TGE==1 and HCR_EL2.E2H==1, and the associated SCTLR_EL2.En<N><M> == 1.
  - In Secure EL0, when the associated SCTLR_EL2.En<N><M> == 1.
  - In Secure or Non-secure EL1, when the associated SCTLR_EL1.En<N><M> == 1.
  - In EL2, when the associated SCTLR_EL2.En<N><M> == 1.

API	Meaning
0b0	The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.API bit.
0b1	This control does not cause any instructions to be trapped.

Note

If ARMv8.3-PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [16]

When ARMv8.3-PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers, using EC syndrome value 0x18, from EL1 or EL2 to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps:

- APIAKeyLo_EL1, APIAKeyHi_EL1, APIBKeyLo_EL1, APIBKeyHi_EL1.
- APDAKeyLo_EL1, APDAKeyHi_EL1, APDBKeyLo_EL1, APDBKeyHi_EL1.
- APGAKeyLo_EL1, and APGAKeyHi_EL1.

APK	Meaning
0b0	Access to the registers holding "key" values for pointer authentication from EL1 or EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps.
0b1	This control does not cause any instructions to be trapped.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Note

If ARMv8.3-PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [15]

When RAS is implemented:

Trap Error record accesses. Accesses to the RAS ERR and RAS ERX registers from EL1 and EL2 to EL3 are trapped as follows:

- If EL1 is using AArch64, ERRIDR_EL1, ERRSELR_EL1, ERXADDR_EL1, ERXCTLR_EL1, ERXFR_EL1, ERXMISC0_EL1, ERXMISC1_EL1, and ERXSTATUS_EL1, are trapped and reported using EC syndrome value 0x18.

- If ARMv8.4-RAS is implemented, ERXMISC2_EL1, and ERXMISC3_EL1, are trapped and reported using EC syndrome value 0x18.
- If EL1 is using AArch32, accesses by MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses by MCRR or MRRC are reported using EC syndrome value 0x04:
  - ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXFR, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS.
- If ARMv8.4-RAS is implemented, accesses by MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses by MCRR or MRRC are reported using EC syndrome value 0x04:
  - ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

TERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [14]

When ARMv8.1-LOR is implemented:

Trap LOR registers. Traps accesses to the LORSA_EL1, LOREA_EL1, LORN_EL1, LORC_EL1, and LORID_EL1 registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

TLOR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped HCR_EL2.TLOR.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [13]

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from both Security states and both Execution states, reported using EC syndrome value 0x01.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE, HCR.TWE, SCTLR_EL1.nTWE, SCTLR_EL2.nTWE, or HCR_EL2.TWE.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or

WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

TWI, bit [12]

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from both Security states and both Execution states, reported using EC syndrome value `0x01`.

TWI	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI, HCR.TWI, SCTLR_EL1.nTWI, SCTLR_EL2.nTWI, or HCR_EL2.TWI.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

ST, bit [11]

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only, reported using EC syndrome value `0x18`.

ST	Meaning
`0b0`	Secure EL1 using AArch64 accesses to the CNTPS_TVAL_EL1, CNTPS_CTL_EL1, and CNTPS_CVAL_EL1 are trapped to EL3 when Secure EL2 is disabled. If Secure EL2 is enabled, the behavior is as if the value of this field was `0b1`.
`0b1`	This control does not cause any instructions to be trapped.

Note

Accesses to the Counter-timer Physical Secure timer registers are always enabled at EL3. These registers are not accessible at EL0.

This field resets to an architecturally UNKNOWN value.

RW, bit [10]

When AArch32 is supported at any Exception level:

Execution state control for lower Exception levels.

RW	Meaning
0b0	Lower levels are all AArch32.
0b1	The next lower level is AArch64. If EL2 is present: • EL2 is AArch64. • EL2 controls EL1 and EL0 behaviors. If EL2 is not present: • EL1 is AArch64. • EL0 is determined by the Execution state described in the current process state when executing at EL0.

If AArch32 state is not supported by the implementation at EL2 and AArch32 state is not supported by the implementation at EL1, then this bit is RAO/WI.

If AArch32 state is supported by the implementation at EL1, SCR_EL3.NS == 1 and AArch32 state is not supported by the implementation at EL2, the Effective value of this bit is 1.

If AArch32 state is supported by the implementation at EL1, ARMv8.4-SecEL2 is implemented and SCR_EL3.{EEL2, NS} == {1, 0}, the Effective value of this bit is 1.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.

SIF, bit [9]

When ARMv8.4-SecEL2 is implemented:

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from memory marked in the first stage of translation as being Non-secure. The possible values for this bit are:

SIF	Meaning
0b0	Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are permitted.
0b1	Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are not permitted.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory.

SIF	Meaning
0b0	Secure state instruction fetches from Non-secure memory are permitted.
0b1	Secure state instruction fetches from Non-secure memory are not permitted.

This bit is permitted to be cached in a TLB.

This field resets to an architecturally UNKNOWN value.

HCE, bit [8]

Hypervisor Call instruction enable. Enables HVC instructions at EL3 and, if EL2 is enabled in the current Security state, at EL2 and EL1, in both Execution states, reported using EC syndrome value 0x00.

HCE	Meaning
0b0	HVC instructions are UNDEFINED.
0b1	HVC instructions are enabled at EL3, EL2, and EL1.

Note

HVC instructions are always UNDEFINED at EL0 and, if Secure EL2 is disabled, at Secure EL1. Any resulting exception is taken from the current Exception level to the current Exception level.

If EL2 is not implemented, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

SMD, bit [7]

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from both Security states and both Execution states, reported using EC syndrome value 0x00.

SMD	Meaning
0b0	SMC instructions are enabled at EL3, EL2 and EL1.
0b1	SMC instructions are UNDEFINED.

Note

SMC instructions are always UNDEFINED at EL0. Any resulting exception is taken from the current Exception level to the current Exception level.

If HCR_EL2.TSC or HCR.TSC traps attempted EL1 execution of SMC instructions to EL2, that trap has priority over this disable.

This field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

EA, bit [3]

External Abort and SError interrupt routing.

EA	Meaning
0b0	When executing at Exception levels below EL3, External aborts and SError interrupts are not taken to EL3. In addition, when executing at EL3: • SError interrupts are not taken. • External aborts are taken to EL3.
0b1	When executing at any Exception level, External aborts and SError interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers' Model).

This field resets to an architecturally UNKNOWN value.

FIQ, bit [2]

Physical FIQ Routing.

FIQ	Meaning
0b0	When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3. When executing at EL3, physical FIQ interrupts are not taken.
0b1	When executing at any Exception level, physical FIQ interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1.

This field resets to an architecturally UNKNOWN value.

IRQ, bit [1]

Physical IRQ Routing.

IRQ	Meaning
0b0	When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3. When executing at EL3, physical IRQ interrupts are not taken.
0b1	When executing at any Exception level, physical IRQ interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1.

This field resets to an architecturally UNKNOWN value.

NS, bit [0]

Non-secure bit.

NS	Meaning
0b0	Indicates that EL0 and EL1 are in Secure state.
0b1	Indicates that Exception levels lower than EL3 are in Non-secure state, and so memory accesses from those Exception levels cannot access Secure memory.

When SCR_EL3.{EEL2, NS} == {1, 0}, then EL2 is using AArch64 and in Secure state.

This field resets to an architecturally UNKNOWN value.

Accessing the SCR_EL3

Accesses to this register use the following encodings:

```
MRS <Xt>, SCR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return SCR_EL3;
```

```
MSR SCR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SCR_EL3 = X[t];
```

SCTLR_EL1, System Control Register (EL1)

The SCTLR_EL1 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL1 and EL0.

Configuration

AArch64 System register SCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SCTLR[31:0] .

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL1 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

SCTLR_EL1 is a 64-bit register.

Field descriptions

The SCTLR_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	4
RES0														TWEDEL				TWEDEn	DSSBS	ATA	AT
EnIA	EnIB	LSMAOE	nTLSMD	EnDA	UCI	EE	E0E	SPAN	EIS	IESB	TSCXT	WXN	nTWE	RES0	nTWI	UCT	DZE	EnDB	I	EOS	EnR
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	1

Bits [63:50]

Reserved, RES0.

TWEDEL, bits [49:46]

When ARMv8.6-TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL1.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR_EL1.nTWE as 2~~^(TWEDEL + 8) cycles.~~ (TWEDEL + 8) cycles.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]

When ARMv8.6-TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR_EL1.nTWE.

TWEDEn	Meaning
0b0	The delay for taking a WFE trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking a WFE trap is at least the number of cycles defined in SCTLR_EL1.TWEDEL.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]

When ARMv8.0-SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL1.
0b1	PSTATE.SSBS is set to 1 on an exception to EL1.

In a system where the PE resets into EL1, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When ARMv8.5-MemTag is implemented:

Allocation Tag Access in EL1. When SCR_EL3.ATA=1 and HCR_EL2.ATA=1, controls EL1 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

ATA	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	Access to Allocation Tags is not prevented.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]

When ARMv8.5-MemTag is implemented:

Allocation Tag Access in EL0. When SCR_EL3.ATA=1, HCR_EL2.ATA=1, and HCR_EL2.{E2H,TGE} != {1,1}, controls EL0 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

ATA0	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	Access to Allocation Tags is not prevented.

This field is permitted to be cached in a TLB.

Note

Software may change this control bit on a context switch.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF, bits [41:40]

When ARMv8.5-MemTag is implemented:

Tag Check Fault~~Fail~~ in EL1. Controls the effect of Tag~~tag~~ Check~~check~~ Faults~~fails~~ due to Loads and Stores in EL1.

TCF	Meaning
0b00	Tag Check~~check~~ Faults~~fails~~ have no effect on the PE.
0b01	Tag Check~~check~~ Faults~~fails~~ causes a synchronous exception.
0b10	Tag Check~~check~~ Faults~~fails~~ are asynchronously accumulated.

The value 0b11 is reserved.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]

When ARMv8.5-MemTag is implemented:

Tag Check Fault~~Fail~~ in EL0. When HCR_EL2.{E2H,TGE} != {1,1}, controls the effect of Tag~~tag~~ Check~~check~~ Faults~~fails~~ due to Loads and Stores in EL0.

TCF0	Meaning
0b00	Tag Check~~check~~ Faults~~fails~~ have no effect on the PE.
0b01	Tag Check~~check~~ Faults~~fails~~ causes a synchronous exception.
0b10	Tag Check~~check~~ Faults~~fails~~ are asynchronously accumulated.

The value 0b11 is reserved.

Note

Software may change this control bit on a context switch.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]

When ARMv8.5-MemTag is implemented:

When synchronous exceptions are not being generated by Tag Check Faultsfails which are generated for Loads and Stores in EL0 or EL1, controls the auto-synchronization of Tag Check Faultsfails into TFSRE0_EL1 and TFSR_EL1.

ITFSB	Meaning
0b0	Tag Checkcheck Faultsfails are not synchronized on entry to EL1.
0b1	Tag Checkcheck Faultsfails are synchronized on entry to EL1.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT1, bit [36]

When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL1.

BT1	Meaning
0b0	When the PE is executing at EL1, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL1, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]

When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL0.

BT0	Meaning
0b0	When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

When HCR_EL2.E2H == 1 && HCR_EL2.TGE == 1, the value of the SCTLR_EL1.BT0 has no effect on execution at EL0

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [34:32]

Reserved, RES0.

EnIA, bit [31]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

EnIA	Meaning
0b0	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

EnIB	Meaning
0b0	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]

When ARMv8.2-LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]

When ARMv8.2-LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnDA, bit [27]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

EnDA	Meaning
0b0	Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

Traps EL0 execution of cache maintenance instructions, to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18.

This applies to DC CVAU, DC CIVAC, DC CVAC, DC CVAP, and IC IVAU.

If ARMv8.2-DCCVADP is implemented, this trap also applies to DC CVADP.

If ARMv8.5-MemTag is implemented, this trap also applies to DC CIGVAC, DC CIGDVAC, DC CGVAC, DC CGDVAC, DC CGVAP, and DC CGDVAP.

If ARMv8.2-DCCVADP and ARMv8.5-MemTag are implemented, this trap also applies to DC CGVADP and DC CGDVADP.

UCI	Meaning
0b0	Execution of the specified instructions at EL0 using AArch64 is trapped.
0b1	This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

EE, bit [25]

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

The possible values of this bit are:

EE	Meaning
0b0	Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.
0b1	Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]

Endianness of data accesses at EL0.

The possible values of this bit are:

E0E	Meaning
0b0	Explicit data accesses at EL0 are little-endian.
0b1	Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SPAN, bit [23]

When ARMv8.1-PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 on taking an exception to EL1.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EIS, bit [22]

When ARMv8.5-CSEH is implemented:

Exception Entry is Context Synchronizing. The defined values are:

EIS	Meaning
0b0	The taking of an exception to EL1 is not a context synchronizing event.
0b1	The taking of an exception to EL1 is a context synchronizing event.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EIS is set to 0b0:

- Indirect writes to ESR_EL1, FAR_EL1, SPSR_EL1, ELR_EL1 are synchronized on exception entry to EL1, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EIS:

- Changes to the PSTATE information on entry to EL1.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When ARMv8.2-IESB is implemented:

Implicit Error Synchronization event enable. Possible values are:

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: • At each exception taken to EL1. • Before the operational pseudocode of each ERET instruction executed at EL1.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL1 and before each DRPS instruction executed at EL1, in addition to the other cases where it is added.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When ARMv8.0-CSV2 is implemented:

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64. The defined values are:

TSCXT	Meaning
0b0	EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.
0b1	EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The value of SCXTNUM_EL0 is treated as 0.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL1&0 translation regime is forced to XN for accesses from software executing at EL1 or EL0.

This bit applies only when SCTLR_EL1.M bit is set.

The WXN bit is permitted to be cached in a TLB.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, reported using EC syndrome value 0x01.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, reported using EC syndrome value 0x01.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

UCT, bit [15]

Traps EL0 accesses to the CTR_EL0 to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC value 0x18.

UCT	Meaning
0b0	Accesses to the CTR_EL0 from EL0 using AArch64 are trapped.
0b1	This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

DZE, bit [14]

Traps EL0 execution of DC ZVA instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18.

If ARMv8.5-MemTag is implemented, this trap also applies to DC GVA and DC GZVA.

DZE	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions this trap applies to are not supported.
0b1	This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

EnDB, bit [13]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

EnDB	Meaning
0b0	Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL0 and EL1:

I	Meaning
0b0	All instruction access to Normal memory from EL0 and EL1 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL0 and EL1. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

When the value of the HCR_EL2.DC bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the SCTLR_EL1.I bit.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to 0.

EOS, bit [11]

When ARMv8.5-CSEH is implemented:

Exception Exit is Context Synchronizing. The defined values are:

EOS	Meaning
0b0	An exception return from EL1 is not a context synchronizing event
0b1	An exception return from EL1 is a context synchronizing event

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL1 and ELR_EL1 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]

When ARMv8.0-PredInv is implemented:

Enable EL0 Access to the following~~AArch32 CFPRCTX, DVPRCTX and CPPRCTX~~ instructions~~, and the AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions. The defined values are~~:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

The defined values are:

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.
0b1	EL0 access to these instructions is enabled.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UMA, bit [9]

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.{D, A, I, F} masks to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18.

UMA	Meaning
0b0	Any attempt at EL0 using AArch64 to execute an MRS, MSR(REGISTER), or MSR(IMMEDIATE) instruction that accesses the DAIF is trapped.
0b1	This control does not cause any instructions to be trapped.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SED, bit [8]

When AArch32 is supported at any Exception level and EL0 is capable of using AArch32:

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

SED	Meaning
0b0	SETEND instruction execution is enabled at EL0 using AArch32.
0b1	SETEND instructions are UNDEFINED at EL0 using AArch32 and any attempt at EL0 to access a SETEND instruction generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, reported using EC syndrome value 0x00.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

~~If EL0 cannot use AArch32, this bit is RES1.~~

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

~~**ITD, bit [7]**~~

Otherwise:

Reserved, RES1.

ITD, bit [7]

When AArch32 is supported at any Exception level and EL0 is capable of using AArch32:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL0 using AArch32.
0b1	Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED and generates an exception, reported using EC syndrome value 0x00, to EL1 or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1: • All encodings of the IT instruction with hw1[3:0]!=1000. • All encodings of the subsequent instruction with the following values for hw1: ◦ 0b11xxxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. ◦ 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5. ◦ 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm ◦ 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm] ◦ 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. ◦ 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as: • A 16-bit instruction, that can only be followed by another 16-bit instruction. • The first half of a 32-bit instruction. This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section E1.2.4

~~If EL0 cannot use AArch32, this bit is RES1.~~

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nAA, bit [6]

When ARMv8.4-LSE is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions.

nAA	Meaning
0b0	LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1	This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]

When AArch32 is supported at any Exception level and EL0 is capable of using AArch32:

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

CP15BEN	Meaning
0b0	EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED and generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The exception is reported using EC syndrome value 0x00.
0b1	EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

~~If EL0 cannot use AArch32, this bit is RES0.~~

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAO/WI.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SA0, bit [4]

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers' Model).

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers' Model).

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

C	Meaning
0b0	All data access to Normal memory from EL0 and EL1, and all Normal memory accesses to the EL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	This control has no effect on the Cacheability of: • Data access to Normal memory from EL0 and EL1. • Normal memory accesses to the EL1&0 stage 1 translation tables.

When the value of the HCR_EL2.DC bit is 1, the PE ignores SCLTR.C. This means that Non-secure EL0 and Non-secure EL1 data accesses to Normal memory are Cacheable.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0 ~~.EL0.~~

A	Meaning
0b0	Alignment fault checking disabled when executing at EL1 or EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at EL1 or EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL1&0 ~~and EL0~~ stage 1 address translation. ~~Possible values of this bit are:~~

M	Meaning
0b0	EL1&0 ~~and EL0~~ stage 1 address translation disabled. See the SCTLR_EL1.I field for the behavior of instruction accesses to Normal memory.
0b1	EL1&0 ~~and EL0~~ stage 1 address translation enabled.

If the value of HCR_EL2.{DC, TGE} is not {0, 0} then in Non-secure state the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of the field.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

In a system where the PE resets into EL1, this field resets to `0`.

Accessing the SCTLR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SCTLR_EL1 or SCTLR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, SCTLR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);

SCTLR_EL2, System Control Register (EL2)

The SCTLR_EL2 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL2.

When ARMv8.1-VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, these controls apply also to execution at EL0.

Configuration

AArch64 System register SCTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSCTLR[31:0] .

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL2 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

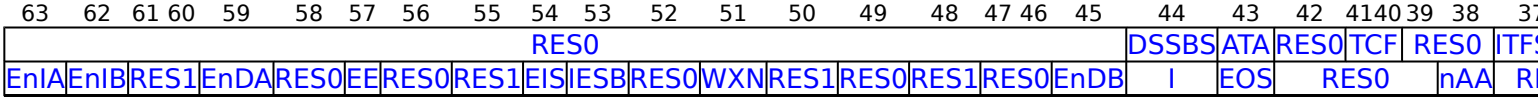
Attributes

SCTLR_EL2 is a 64-bit register.

Field descriptions

The SCTLR_EL2 bit assignments are:

When HCR_EL2.E2H != 0b1 or HCR_EL2.TGE != 0b1:



This format applies in all Armv8.0 implementations, and from Armv8.1 when the Effective value of HCR_EL2.{E2H, TGE} != {1, 1}.

Bits [63:45]

Reserved, RES0.

DSSBS, bit [44]

When ARMv8.0-SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL2.
0b1	PSTATE.SSBS is set to 1 on an exception to EL2.

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When ARMv8.5-MemTag is implemented:

Allocation Tag Access. When SCR_EL3.ATA=1, controls EL2 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions thatwhich Load or Store data are Unchecked.
- Instructions thatwhich Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions thatwhich insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions thatwhich invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

ATA	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	Access to Allocation Tags is not prevented.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TCF, bits [41:40]

When ARMv8.5-MemTag is implemented:

TagTack Check Fault.Fail in EL2. Controls the effect of Tagtag Checkcheck Faultsfails due to Loads and Stores in EL2.

TCF	Meaning
0b00	Tag Checkcheck Faultsfails have no effect on the PE.
0b01	Tag Checkcheck Faultsfails causecauses a synchronous exception.
0b10	Tag Checkcheck Faultsfails are asynchronously accumulated.

The value 0b11 is reserved.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

ITFSB, bit [37]

When ARMv8.5-MemTag is implemented:

When synchronous exceptions are not being generated by Tag Check Faults,~~fails~~ which are generated for Loads and Stores in EL0, EL1 or EL2, controls the auto-synchronizaton~~auto-synchronisaton~~ of Tag Check Faults~~fails~~ into TFSRE0_EL1, TFSR_EL1, and TFSR_EL2.

ITFSB	Meaning
0b0	Tag Check~~check~~ Faults~~fails~~ are not synchronized on entry to EL2.
0b1	Tag Check~~check~~ Faults~~fails~~ are synchronized on entry to EL2.

Otherwise:

Reserved, RES0.

BT, bit [36]

When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL2.

BT	Meaning
0b0	When the PE is executing at EL2, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL2, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:32]

Reserved, RES0.

EnIA, bit [31]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

EnIA	Meaning
0b0	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

EnIB	Meaning
0b0	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

EnDA	Meaning
0b0	Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

~~The possible values of this bit are:~~

EE	Meaning
0b0	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are little-endian.
0b1	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bit [23]

Reserved, RES1.

EIS, bit [22]

When ARMv8.5-CSEH is implemented:

Exception entry is a context synchronization event. The defined values are:

EIS	Meaning
0b0	The taking of an exception to EL2 is not a context synchronization event.
0b1	The taking of an exception to EL2 is a context synchronization event.

If SCTLR_EL2.EIS is set to 0b0:

- Indirect writes to ESR_EL2, FAR_EL2, SPSR_EL2, ELR_EL2, and HPFAR_EL2 are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.

- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When ARMv8.2-IESB is implemented:

Implicit Error Synchronization event enable.

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: • At each exception taken to EL2. • Before the operational pseudocode of each ERET instruction executed at EL2.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN:

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2.

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:14]

Reserved, RES0.

EnDB, bit [13]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

EnDB	Meaning
0b0	Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2:

I	Meaning
0b0	All instruction accessesaccess to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL2. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0 or EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

EOS, bit [11]

When ARMv8.5-CSEH is implemented:

Exception exit is a context synchronization Event.

EOS	Meaning
0b0	An exception return from EL2 is not a context synchronization event.
0b1	An exception return from EL2 is a context synchronization event.

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL2 and ELR_EL2 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [10:7]

Reserved, RES0.

nAA, bit [6]

When ARMv8.4-LSE is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL2 under certain conditions.

nAA	Meaning
0b0	LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1	This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then ana SP alignment fault exception is generated. For more

information, see 'SP alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers' Model).

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

C	Meaning
0b0	All data accessesaccess to Normal memory from EL2, and all Normal memory accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	This control has no effect on the Cacheability of: • Data access to Normal memory from EL2. • Normal memory accesses to the EL2 translation tables.

This bit has no effect on the EL1&0 or EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

A	Meaning
0b0	Alignment fault checking disabled when executing at EL2. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at EL2. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 stage 1 address translation. ~~Possible values of this bit are:~~

M	Meaning
0b0	EL2 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.
0b1	EL2 stage 1 address translation enabled.

In a system where the PE resets into EL2, this field resets to 0.

When HCR_EL2.E2H == 0b1 and HCR_EL2.TGE == 0b1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	4
RES0														TWEDEL				TWEDEn	DSSBS	ATA	AT
EnIA	EnIB	LSMAOE	nTLSMD	EnDA	UCI	EE	E0E	SPAN	EIS	IESB	TSCXT	WXN	nTWE	RES0	nTWI	UCT	DZE	EnDB	I	EOS	EnR
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	1

This format applies only from Armv8.1 when EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}.

Bits [63:50]

Reserved, RES0.

TWEDEL, bits [49:46]

When ARMv8.6-TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR_EL2.nTWE as 2^(TWEDEL + 8) cycles.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]

When ARMv8.6-TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR_EL2.nTWE.

TWEDEn	Meaning
0b0	The delay for taking a WFE trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking a WFE trap is at least the number of cycles defined in SCTLR_EL2.TWEDEL.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]

When ARMv8.0-SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL2.
0b1	PSTATE.SSBS is set to 1 on an exception to EL2.

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When ARMv8.5-MemTag is implemented:

Allocation Tag Access in EL2. When SCR_EL3.ATA=1, controls EL2 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.

- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

ATA	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	Access to Allocation Tags is not prevented.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]

When ARMv8.5-MemTag is implemented:

Allocation Tag Access in EL0. When SCR_EL3.ATA=1, controls EL0 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

ATA0	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	Access to Allocation Tags is not prevented.

This field is permitted to be cached in a TLB.

Note

Software may change this control bit on a context switch.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF, bits [41:40]

When ARMv8.5-MemTag is implemented:

Tag Check Fault~~Fail~~ in EL2. Controls the effect of Tag~~tag~~ Check~~check~~ Faults~~fails~~ due to Loads and Stores in EL2.

TCF	Meaning
0b00	Tag Check~~check~~ Faults~~fails~~ have no effect on the PE.
0b01	Tag Check~~check~~ Faults~~fails~~ causes a synchronous exception.
0b10	Tag Check~~check~~ Faults~~fails~~ are asynchronously accumulated.

The value 0b11 is reserved.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]

When ARMv8.5-MemTag is implemented:

Tag Check FaultFail in EL0. Controls the effect of Tagtag Checkcheck Faultsfails due to Loads and Stores in EL0.

TCF0	Meaning
0b00	Tag Checkcheck Faultsfails have no effect on the PE.
0b01	Tag Checkcheck Faultsfails causes a synchronous exception.
0b10	Tag Checkcheck Faultsfails are asynchronously accumulated.

The value 0b11 is reserved.

Note

Software may change this control bit on a context switch.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]

When ARMv8.5-MemTag is implemented:

When synchronous exceptions are not being generated by Tag Check Faultsfails which are generated for Loads and Stores in EL0, EL1 or EL2, controls the auto-synchronizaton of Tag Check Faultsfails into TFSRE0_EL1, TFSR_EL1 and TFSR_EL2.

ITFSB	Meaning
0b0	Tag Checkcheck Faultsfails are not synchronized on entry to EL2.
0b1	Tag Checkcheck Faultsfails are synchronized on entry to EL2.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT1, bit [36]

When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL2.

BT1	Meaning
0b0	When the PE is executing at EL2, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL2, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]

When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL0.

BT0	Meaning
0b0	When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [34:32]

Reserved, RES0.

EnIA, bit [31]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

EnIA	Meaning
0b0	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

EnIB	Meaning
0b0	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]

When ARMv8.2-LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]

When ARMv8.2-LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnDA, bit [27]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

EnDA	Meaning
0b0	Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

Traps EL0 execution of cache maintenance instructions to EL2, from AArch64 state only. This applies to DC CVAU, DC CIVAC, DC CVAC, DC CVAP, and IC IVAU.

If ARMv8.2-DCCVADP is implemented, this trap also applies to DC CVADP.

If ARMv8.5-MemTag is implemented, this trap also applies to DC CIGVAC, DC CIGDVAC, DC CGVAC, DC CGDVAC, DC CGVAP, and DC CGDVAP.

If ARMv8.2-DCCVADP and ARMv8.5-MemTag are implemented, this trap also applies to DC CGVADP and DC CGDVADP.

UCI	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime.

The possible values of this bit are:

EE	Meaning
0b0	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime are little-endian.
0b1	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]

Endianness of data accesses at EL0.

E0E	Meaning
0b0	Explicit data accesses at EL0 are little-endian.
0b1	Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

SPAN, bit [23]

Set Privileged Access Never, on taking an exception to EL2.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 on taking an exception to EL2.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL2.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

EIS, bit [22]

When ARMv8.5-CSEH is implemented:

Exception Entry is a context synchronization event.

EIS	Meaning
0b0	The taking of an exception to EL2 is not a context synchronization event.
0b1	The taking of an exception to EL2 is a context synchronization event.

If SCTLR_EL2.EIS is set to 0b0:

- Indirect writes to ESR_EL2, FAR_EL2, SPSR_EL2, ELR_EL2, HPFAR_EL2 are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When ARMv8.2-IESB is implemented:

Implicit Error Synchronization event Enable.

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: • After each exception taken to EL2. • Before the operational pseudocode of each ERET instruction executed at EL2.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When ARMv8.0-CSV2 is implemented:

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.

TSCXT	Meaning
0b0	EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.
0b1	EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL2, and the SCXTNUM_EL0 value is treated at 0.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2.

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL2, from both Execution states.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL2, from both Execution states.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

UCT, bit [15]

Traps EL0 accesses to the CTR_EL0 to EL2, from AArch64 state only.

UCT	Meaning
0b0	Accesses to the CTR_EL0 from EL0 using AArch64 are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

DZE, bit [14]

Traps EL0 execution of DC ZVA instructions to EL2, from AArch64 state only.

If ARMv8.5-MemTag is implemented, this trap also applies to DC GVA and DC GZVA.

DZE	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions that this trap applies to are not supported.
0b1	This control does not cause any instructions to be trapped.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

EnDB, bit [13]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

EnDB	Meaning
0b0	Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2 and EL0:

I	Meaning
0b0	All instruction access to Normal memory from EL2 and EL0 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and EL0. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

EOS, bit [11]

When ARMv8.5-CSEH is implemented:

Exception exit is a context synchronization event.

EOS	Meaning
0b0	An exception return from EL2 is not a context synchronization event.
0b1	An exception return from EL2 is a context synchronization event.

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL2 and ELR_EL2 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]

When ARMv8.0-PredInv is implemented:

Enable EL0 Access to the followingAArch32 ~~CFPRCTX, DVPRCTX and CPPRCTX~~ instructions~~:, and the AArch64 CFP RCTX, DVP RCT and CPP RCTX System instructions.~~

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

The defined values are:

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL1.
0b1	EL0 access to these instructions is enabled.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SED, bit [8]

When AArch32 is supported at any Exception level and EL0 is capable of using AArch32:

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

SED	Meaning
0b0	SETEND instruction execution is enabled at EL0 using AArch32.
0b1	SETEND instructions are UNDEFINED at EL0 using AArch32.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

~~If EL0 cannot use AArch32, this bit is RES1.~~

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

~~**ITD, bit [7]**~~

Otherwise:

Reserved, RES1.

ITD, bit [7]

When AArch32 is supported at any Exception level and EL0 is capable of using AArch32:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL0 using AArch32.
0b1	Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED: • All encodings of the IT instruction with hw1[3:0]!=1000. • All encodings of the subsequent instruction with the following values for hw1: ◦ 0b11xxxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. ◦ 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5. ◦ 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm ◦ 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm] ◦ 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. ◦ 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn. These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as: • A 16-bit instruction, that can only be followed by another 16-bit instruction. • The first half of a 32-bit instruction. This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section E1.2.4

~~If EL0 cannot use AArch32, this bit is RES1.~~

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nAA, bit [6]

When ARMv8.4-LSE is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL2 and EL0 under certain conditions.

nAA	Meaning
0b0	LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1	This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]

When AArch32 is supported at any Exception level and EL0 is capable of using AArch32:

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

CP15BEN	Meaning
0b0	EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.
0b1	EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

~~If EL0 cannot use AArch32, this bit is RES0.~~

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAO/WI.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SA0, bit [4]

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers' Model).

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers' Model).

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

C	Meaning
0b0	All data access to Normal memory from EL2 and EL0, and all Normal memory accesses to the EL2&0 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	This control has no effect on the Cacheability of: • Data access to Normal memory from EL2 and EL0. • Normal memory accesses to the EL2&0 translation tables.

This bit has no effect on the EL3 translation regimes.

In a system where the PE resets into EL2, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and EL0.

A	Meaning
0b0	Alignment fault checking disabled when executing at EL2 and EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at EL2 and EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2&0 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL2&0 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.
0b1	EL2&0 stage 1 address translation enabled.

In a system where the PE resets into EL2, this field resets to 0.

Accessing the SCTLR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCTLR_EL2 or SCTLR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, SCTLR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return SCTLR_EL2;
elsif PSTATE.EL == EL3 then
    return SCTLR_EL2;
```

```
MSR SCTLR_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    SCTLR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    SCTLR_EL2 = X[t];
```

MRS <Xt>, SCTLR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGRTR_EL2.SCTLR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<NV2,NV1,NV> == '111' then
        return NVMem[0x110];
    else
        return SCTLR_EL1;
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        return SCTLR_EL2;
    else
        return SCTLR_EL1;
elsif PSTATE.EL == EL3 then
    return SCTLR_EL1;
```

MSR SCTLR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGWTR_EL2.SCTLR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<NV2,NV1,NV> == '111' then
        NVMem[0x110] = X[t];
    else
        SCTLR_EL1 = X[t];
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        SCTLR_EL2 = X[t];
    else
        SCTLR_EL1 = X[t];
elsif PSTATE.EL == EL3 then
    SCTLR_EL1 = X[t];
```

SCTLR_EL3, System Control Register (EL3)

The SCTLR_EL3 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL3.

Configuration

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into EL3 using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to SCTLR_EL3 are UNDEFINED.

Attributes

SCTLR_EL3 is a 64-bit register.

Field descriptions

The SCTLR_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37
RES0																			DSSBS	ATA	RES0	TCF		RES0		ITFS
EnIA	EnIB	RES1		EnDA	RES0	EE	RES0	RES1	EIS	IESB	RES0	WXN	RES1	RES0	RES1	RES0		EnDB	I	EOS	RES0				nAA	R
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5

Bits [63:45]

Reserved, RES0.

DSSBS, bit [44]

When ARMv8.0-SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL3.
0b1	PSTATE.SSBS is set to 1 on an exception to EL3.

In a system where the PE resets into EL3, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When ARMv8.5-MemTag is implemented:

Allocation Tag Access in EL3. Controls EL3 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

ATA	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	Access to Allocation Tags is not prevented.

This bit is permitted to be cached in a TLB.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TCF, bits [41:40]

When ARMv8.5-MemTag is implemented:

Tag Check Fault~~Fail~~ in EL3. Controls the effect of Tag~~tag~~ Check~~check~~ Faults~~fails~~ due to Loads and Stores in EL3.

TCF	Meaning
0b00	Tag Check~~check~~ Faults~~fails~~ have no effect on the PE.
0b01	Tag Check~~check~~ Faults~~fails~~ causes a synchronous exception.
0b10	Tag Check~~check~~ Faults~~fails~~ are asynchronously accumulated.

The value 0b11 is reserved.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

ITFSB, bit [37]

When ARMv8.5-MemTag is implemented:

When asynchronous exceptions are being generated by Tag Check Faults~~fails~~ which are generated for Loads and Stores at any exception level, controls the auto-synchronisaton of Tag Check Faults~~fails~~ into TFSRE0_EL1 and TFSR_ELx.

ITFSB	Meaning
0b0	Tag Check~~check~~ Faults~~fails~~ are not synchronized on entry to EL3.
0b1	Tag Check~~check~~ Faults~~fails~~ are synchronized on entry to EL3.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bit [36]

When ARMv8.5-BTI is implemented:

PAC Branch Type compatibility at EL3.

BT	Meaning
0b0	When the PE is executing at EL3, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL3, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:32]

Reserved, RES0.

EnIA, bit [31]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

EnIA	Meaning
0b0	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

EnIB	Meaning
0b0	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL3 translation regime.

EnDA	Meaning
0b0	Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian.
0b1	Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

In a system where the PE resets into EL3, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bit [23]

Reserved, RES1.

EIS, bit [22]

When ARMv8.5-CSEH is implemented:

Exception Entry is Context Synchronizing.

EIS	Meaning
0b0	The taking of an exception to EL3 is not a context synchronizing event.
0b1	The taking of an exception to EL3 is a context synchronizing event.

If SCTLR_EL3.EIS is set to 0b0:

- Indirect writes to ESR_EL3, FAR_EL3, SPSR_EL3, ELR_EL3 are synchronized on exception entry to EL3, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EIS:

- Changes to the PSTATE information on entry to EL3.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Debug state exit.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When ARMv8.2-IESB is implemented:

Implicit Error Synchronization event enable.

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: • At each exception taken to EL3. • Before the operational pseudocode of each ERET instruction executed at EL3.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL3 and before each DRPS instruction executed at EL3, in addition to the other cases where it is added.

When ARMv8.4-DFE is implemented, and the Effective value of SCR_EL3.NMEA is 1, this field is ignored and its Effective value is 1.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3.

This bit applies only when SCTLR_EL3.M bit is set.

The WXN bit is permitted to be cached in a TLB.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:14]

Reserved, RES0.

EnDB, bit [13]

When ARMv8.3-PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL3 translation regime.

EnDB	Meaning
0b0	Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

For more information, see 'System register control of pointer authentication' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL3:

I	Meaning
0b0	All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL3. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

In a system where the PE resets into EL3, this field resets to 0.

EOS, bit [11]

When ARMv8.5-CSEH is implemented:

Exception Exit is Context Synchronizing.

EOS	Meaning
0b0	An exception return from EL3 is not a context synchronizing event
0b1	An exception return from EL3 is a context synchronizing event

If SCTLR_EL3.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL3 and ELR_EL3 on exception return is synchronized.
- If the PE enters Debug state before the first instruction after an Exception return from EL3 to Non-secure state, any pending Halting debug event completes execution.
- The GIC behavior that allocates interrupts to FIQ or IRQ changes simultaneously with leaving the EL3 Exception level.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [10:7]

Reserved, RES0.

nAA, bit [6]

When ARMv8.4-LSE is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL3 under certain conditions.

nAA	Meaning
0b0	LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1	This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D1 (The AArch64 System Level Programmers' Model).

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

C	Meaning
0b0	All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	This control has no effect on the Cacheability of: • Data access to Normal memory from EL3. • Normal memory accesses to the EL3 translation tables.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

In a system where the PE resets into EL3, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL3.

A	Meaning
0b0	Alignment fault checking disabled when executing at EL3. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at EL3. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL3 stage 1 address translation disabled. See the SCTLR_EL3.I field for the behavior of instruction accesses to Normal memory.
0b1	EL3 stage 1 address translation enabled.

In a system where the PE resets into EL3, this field resets to 0.

Accessing the SCTLR_EL3

Accesses to this register use the following encodings:

```
MRS <Xt>, SCTLR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0000	0b000

SCXTNUM_EL1, EL1 Read/Write Software Context Number

The SCXTNUM_EL1 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL1 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

Configuration

This register is present only when ARMv8.0-CSV2 is implemented. Otherwise, direct accesses to SCXTNUM_EL1 are UNDEFINED.

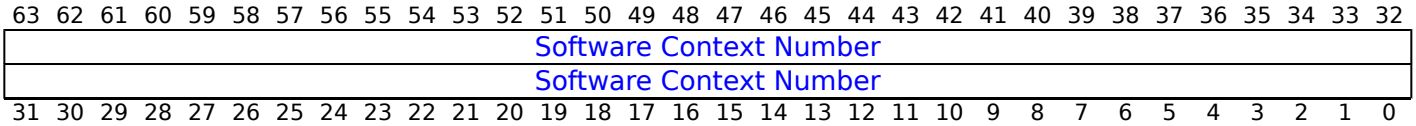
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

SCXTNUM_EL1 is a 64-bit register.

Field descriptions

The SCXTNUM_EL1 bit assignments are:



Bits [63:0]

Software Context Number. A number to identify the context within the EL1 exception level.

This field resets to an architecturally UNKNOWN value.

Accessing the SCXTNUM_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, SCXTNUM_EL1

SDER32_EL3, AArch32 Secure Debug Enable Register

The SDER32_EL3 characteristics are:

Purpose

Allows access to the AArch32 register SDER from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register SDER32_EL3 bits [31:0] are architecturally mapped to AArch32 System register SDER[31:0] .

This register is present only when ~~HaveEL(~~EL3 is implemented~~)~~ and EL1 supports AArch32. Otherwise, direct accesses to SDER32_EL3 are UNDEFINED.

This register is ignored by the PE when when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

SDER32_EL3 is a 64-bit register.

Field descriptions

The SDER32_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0

Bits [63:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable.

SUNIDEN	Meaning
0b0	This bit does not affect Performance Monitors event counting at Secure EL0.
0b1	If EL1 is using AArch32, Performance Monitors event counting is allowed in Secure EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

SUIDEN, bit [0]

Secure User Invasive Debug Enable.

SUIDEN	Meaning
0b0	This bit does not affect the generation of debug exceptions at Secure EL0.
0b1	If EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the SDER32_EL3

Accesses to this register use the following encodings:

```
MRS <Xt>, SDER32_EL3
```

SP_EL0, Stack Pointer (EL0)

The SP_EL0 characteristics are:

Purpose

Holds the stack pointer associated with EL0. At higher Exception levels, this is used as the current stack pointer when the value of SPSel.SP is 0.

Configuration

There are no configuration notes.

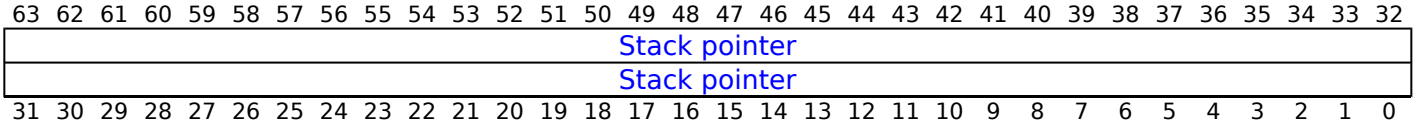
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

SP_EL0 is a 64-bit register.

Field descriptions

The SP_EL0 bit assignments are:



Bits [63:0]

Stack pointer.

This field resets to an architecturally UNKNOWN value.

Accessing the SP_EL0

When the value of PSTATE.SP is 0, this register is accessible at all Exception levels as the current stack pointer.

Accesses to this register use the following encodings:

```
MRS <Xt>, SP_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        return SP_EL0;
elsif PSTATE.EL == EL2 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        return SP_EL0;
elsif PSTATE.EL == EL3 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        return SP_EL0;
```

```
MSR SP_EL0, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        SP_EL0 = X[t];
elsif PSTATE.EL == EL2 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        SP_EL0 = X[t];
elsif PSTATE.EL == EL3 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        SP_EL0 = X[t];
```

SP_EL1, Stack Pointer (EL1)

The SP_EL1 characteristics are:

Purpose

Holds the stack pointer associated with EL1. When executing at EL1, the value of SPSel.SP determines the current stack pointer:

SPSel.SP	Current stack pointer
0b0	SP_EL0
0b1	SP_EL1

Configuration

There are no configuration notes.

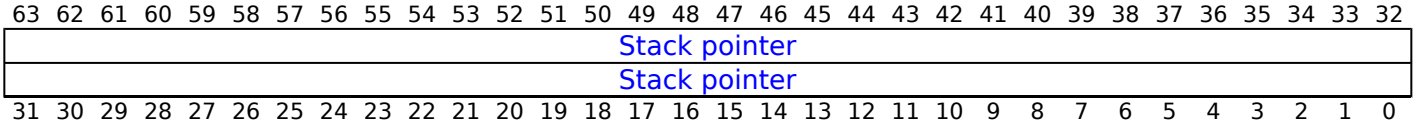
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

SP_EL1 is a 64-bit register.

Field descriptions

The SP_EL1 bit assignments are:



Bits [63:0]

Stack pointer.

This field resets to an architecturally UNKNOWN value.

Accessing the SP_EL1

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of SPSel.SP is 1, this register is also accessible at EL1 as the current stack pointer.

Note

When the value of SPSel.SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.

Accesses to this register use the following encodings:

```
MRS <Xt>, SP_EL1
```

op0	op1	CRn	CRm	op2

0b11	0b100	0b0100	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x240];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return SP_EL1;
elsif PSTATE.EL == EL3 then
    return SP_EL1;
```

MSR SP_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x240] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    SP_EL1 = X[t];
elsif PSTATE.EL == EL3 then
    SP_EL1 = X[t];
```

SP_EL3, Stack Pointer (EL3)

The SP_EL3 characteristics are:

Purpose

Holds the stack pointer associated with EL3. When executing at EL3, the value of SPSel.SP determines the current stack pointer:

SPSel.SP	Current stack pointer
0b0	SP_EL0
0b1	SP_EL3

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to SP_EL3 are UNDEFINED.

Attributes

SP_EL3 is a 64-bit register.

Field descriptions

The SP_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:0]

Stack pointer.

This field resets to an architecturally UNKNOWN value.

Accessing the SP_EL3

This register is not accessible using MRS and MSR instructions.

When the value of SPSel.SP is 1, this register is accessible at EL3 as the current stack pointer.

Note

When the value of SPSel.SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

SPSel, Stack Pointer Select

The SPSel characteristics are:

Purpose

Allows the Stack Pointer to be selected between SP_EL0 and SP_ELx.

Configuration

There are no configuration notes.

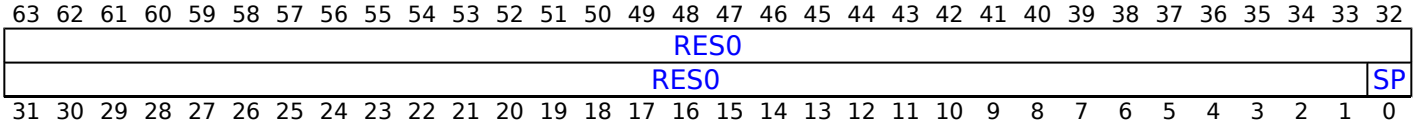
~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

SPSel is a 64-bit register.

Field descriptions

The SPSel bit assignments are:



Bits [63:1]

Reserved, RES0.

SP, bit [0]

Stack pointer to use. Possible values of this bit are:

SP	Meaning
0b0	Use SP_EL0 at all Exception levels.
0b1	Use SP_ELx for Exception level ELx.

This field resets to 1.

Accessing the SPSel

~~For details on the operation of the MSR (immediate) accessor, see MSR (immediate) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.~~

Accesses to this register use the following encodings:

```

SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

Purpose

Holds the saved process state when an exception is taken to Abort mode.

Configuration

AArch64 System register SPSR_abt bits [31:0] are architecturally mapped to AArch32 System register SPSR_abt[31:0] .

~~RW fields in this register reset to architecturally UNKNOWN values.~~

If EL1 only~~does~~ supports~~not~~ ~~support~~ execution in AArch64~~AArch32~~ state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_abt is a 64-bit register.

Field descriptions

The SPSR_abt bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]		J	SSBS	PAN	DIT	IL	GE				IT[7:2]						E	A	I	F	T	M[4:0]				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Abort mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Abort mode.

On executing an exception return operation in Abort mode SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ~~Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.~~

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Abort mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Abort mode.

SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_abt

Accesses to this register use the following encodings:

```
MRS <Xt>, SPSR_abt
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b001

SPSR_EL1, Saved Program Status Register (EL1)

The SPSR_EL1 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL1.

Configuration

AArch64 System register SPSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SPSR_svc[31:0] .

~~RW fields in this register reset to architecturally UNKNOWN values.~~

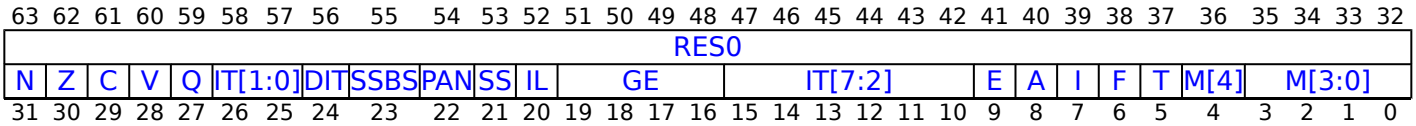
Attributes

SPSR_EL1 is a 64-bit register.

Field descriptions

The SPSR_EL1 bit assignments are:

When AArch32 is supported at any Exception level and exception taken from AArch32 state:



An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL1, and copied to PSTATE.Q on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL1, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL1.

On executing an exception return operation in EL1 SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL1, and copied to PSTATE.GE on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL1, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL1.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL1, and copied to PSTATE.E on executing an exception return operation in EL1.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL1, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL1, and copied to PSTATE.T on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to `0b1`, the value of PSTATE.nRW, on taking an exception to EL1 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

M[4]	Meaning
`0b1`	AArch32 execution state.

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL1, and copied to PSTATE.M[3:0] on executing an exception return operation in EL1.

M[3:0]	Meaning
`0b0000`	User.
`0b0001`	FIQ.
`0b0010`	IRQ.
`0b0011`	Supervisor.
`0b0111`	Abort.
`0b1011`	Undefined.
`0b1111`	System.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm®Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	RES0							TCO	DIT	UAO	PAN	SS	IL	RES0				SSBS	BTYPE		D	A	I	F	RES0		M[4]	M[3:0]	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When ARMv8.5-MemTag is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL1, and copied to PSTATE.TCO on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When ARMv8.2-UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL1, and copied to PSTATE.UAO on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Bits [19:13]

Reserved, RES0.

SSBS, bit [12]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When ARMv8.5-BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL1, and copied to PSTATE.BTYPE on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL1, and copied to PSTATE.D on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

This field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

When AArch32 is supported at any Exception level:

Execution state. Set to `0b0`, the value of PSTATE.nRW, on taking an exception to EL1 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

M[4]	Meaning
`0b0`	AArch64 execution state.

~~If AArch32 is not supported at any Exception level, this bit is RES0.~~

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm®Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL1 and copied to PSTATE.EL on executing an exception return operation in EL1.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL1 and copied to PSTATE.SP on executing an exception return operation in EL1

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SPSR_EL1 or SPSR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, SPSR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0000	0b000

```
if PSTATE.EL == EL0 then

SPSR_EL2, Saved Program Status Register (EL2)

The SPSR_EL2 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL2.

Configuration

AArch64 System register SPSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register SPSR_hyp[31:0] .

This register has no effect if EL2 is not enabled in the current Security state.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

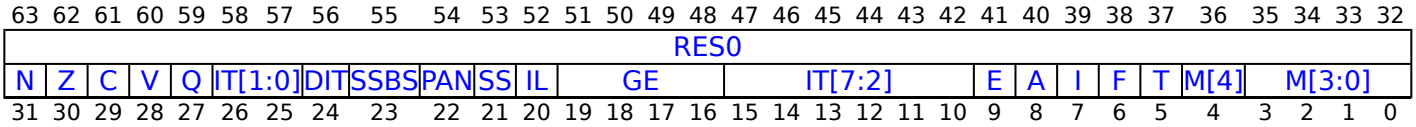
Attributes

SPSR_EL2 is a 64-bit register.

Field descriptions

The SPSR_EL2 bit assignments are:

When AArch32 is supported at any Exception level and exception taken from AArch32 state:



An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL2, and copied to PSTATE.Q on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL2, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL2.

On executing an exception return operation in EL2 SPSR_EL2.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL2, and copied to PSTATE.GE on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL2, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL2.

SPSR_EL2.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL2, and copied to PSTATE.E on executing an exception return operation in EL2.

If the implementation does not support big-endian operation, SPSR_EL2.E is RES0. If the implementation does not support little-endian operation, SPSR_EL2.E is RES1. On executing an exception return operation in EL2, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL2.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL2.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL2, and copied to PSTATE.T on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to `0b1`, the value of PSTATE.nRW, on taking an exception to EL2 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

M[4]	Meaning
0b1	AArch32 execution state.

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

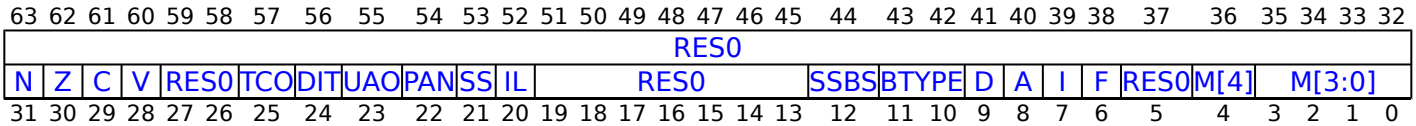
AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL2, and copied to PSTATE.M[3:0] on executing an exception return operation in EL2.

M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm®Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:



An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When ARMv8.5-MemTag is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL2, and copied to PSTATE.TCO on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When ARMv8.2-UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL2, and copied to PSTATE.UAO on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Bits [19:13]

Reserved, RES0.

SSBS, bit [12]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When ARMv8.5-BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL2, and copied to PSTATE.BTYPE on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL2, and copied to PSTATE.D on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

This field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

When AArch32 is supported at any Exception level:

Execution state. Set to `0b0`, the value of PSTATE.nRW, on taking an exception to EL2 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

M[4]	Meaning
`0b0`	AArch64 execution state.

~~If AArch32 is not supported at any Exception level, this bit is RES0.~~

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.
0b1000	EL2t.
0b1001	EL2h.

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm®Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL2 and copied to PSTATE.EL on executing an exception return operation in EL2.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL2 and copied to PSTATE.SP on executing an exception return operation in EL2

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SPSR_EL2 or SPSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, SPSR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return SPSR_EL1;
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return SPSR_EL2;
elsif PSTATE.EL == EL3 then
    return SPSR_EL2;
```

```

SPSR_EL3, Saved Program Status Register (EL3)

The SPSR_EL3 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL3.

Configuration

AArch64 System register SPSR_EL3 bits [31:0] can be mapped to AArch32 System register SPSR_mon[31:0] , but this is not architecturally mandated.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to SPSR_EL3 are UNDEFINED.

Attributes

SPSR_EL3 is a 64-bit register.

Field descriptions

The SPSR_EL3 bit assignments are:

When AArch32 is supported at any Exception level and exception taken from AArch32 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]		DIT	SSBS	PAN	SS	IL	GE				IT[7:2]						E	A	I	F	T	M[4]	M[3:0]			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL3 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL3, and copied to PSTATE.Q on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL3, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL3.

On executing an exception return operation in EL3 SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL3, and copied to PSTATE.GE on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL3, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL3.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL3, and copied to PSTATE.E on executing an exception return operation in EL3.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL3, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL3, and copied to PSTATE.T on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to `0b1`, the value of PSTATE.nRW, on taking an exception to EL3 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

M[4]	Meaning
`0b1`	AArch32 execution state.

This field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

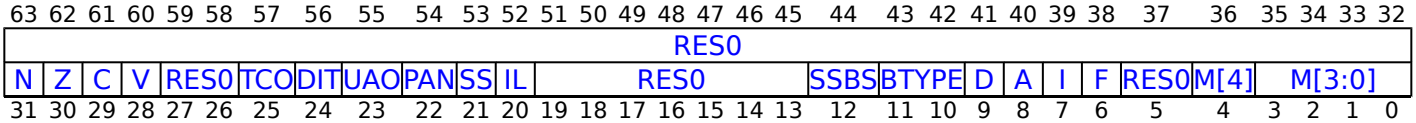
AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL3, and copied to PSTATE.M[3:0] on executing an exception return operation in EL3.

M[3:0]	Meaning
`0b0000`	User.
`0b0001`	FIQ.
`0b0010`	IRQ.
`0b0011`	Supervisor.
`0b0110`	Monitor.
`0b0111`	Abort.
`0b1010`	Hyp.
`0b1011`	Undefined.
`0b1111`	System.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm®Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:



An exception return from EL3 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When ARMv8.5-MemTag is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL3, and copied to PSTATE.TCO on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When ARMv8.2-UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL3, and copied to PSTATE.UAO on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Bits [19:13]

Reserved, RES0.

SSBS, bit [12]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When ARMv8.5-BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL3, and copied to PSTATE.BTYPE on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL3, and copied to PSTATE.D on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

This field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

When AArch32 is supported at any Exception level:

Execution state. Set to `0b0`, the value of PSTATE.nRW, on taking an exception to EL3 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

M[4]	Meaning
`0b0`	AArch64 execution state.

~~If AArch32 is not supported at any Exception level, this bit is RES0.~~

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.
0b1000	EL2t.
0b1001	EL2h.
0b1100	EL3t.
0b1101	EL3h.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state' in the Arm®Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL3 and copied to PSTATE.EL on executing an exception return operation in EL3.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL3 and copied to PSTATE.SP on executing an exception return operation in EL3

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_EL3

Accesses to this register use the following encodings:

```
MRS <Xt>, SPSR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0100	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return SPSR_EL3;
```

```
MSR SPSR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0100	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SPSR_EL3 = X[t];
```

SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

Purpose

Holds the saved process state when an exception is taken to FIQ mode.

Configuration

AArch64 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch32 System register SPSR_fiq[31:0] .

~~RW fields in this register reset to architecturally UNKNOWN values.~~

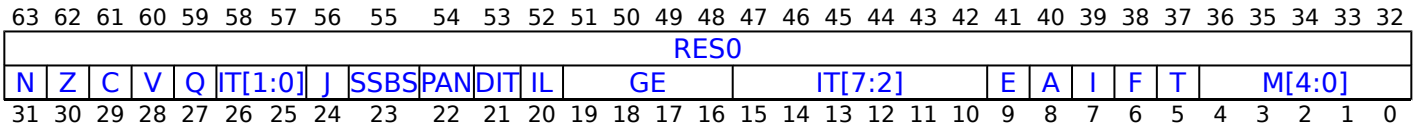
If EL1 only~~does~~ supports~~not~~ ~~support~~ execution in AArch64~~AArch32~~ state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_fiq is a 64-bit register.

Field descriptions

The SPSR_fiq bit assignments are:



Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to FIQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in FIQ mode.

On executing an exception return operation in FIQ mode SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ~~Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.~~

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to FIQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in FIQ mode.

SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_fiq

Accesses to this register use the following encodings:

```

SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

Purpose

Holds the saved process state when an exception is taken to IRQ mode.

Configuration

AArch64 System register SPSR_irq bits [31:0] are architecturally mapped to AArch32 System register SPSR_irq[31:0] .

~~RW fields in this register reset to architecturally UNKNOWN values.~~

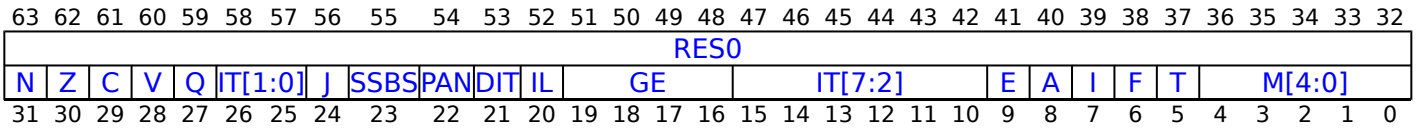
If EL1 only~~does~~ supports~~not~~ ~~support~~ execution in AArch64~~AArch32~~ state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_irq is a 64-bit register.

Field descriptions

The SPSR_irq bit assignments are:



Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to IRQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ~~Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.~~

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to IRQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in IRQ mode.

SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_irq

Accesses to this register use the following encodings:

```
MRS <Xt>, SPSR_irq
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return SPSR_irq;
elsif PSTATE.EL == EL3 then
    return SPSR_irq;
```

```
MSR SPSR_irq, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    SPSR_irq = X[t];
elsif PSTATE.EL == EL3 then
    SPSR_irq = X[t];
```

SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

Purpose

Holds the saved process state when an exception is taken to Undefined mode.

Configuration

AArch64 System register SPSR_und bits [31:0] are architecturally mapped to AArch32 System register SPSR_und[31:0] .

~~RW fields in this register reset to architecturally UNKNOWN values.~~

If EL1 only~~does~~ supports~~not~~ ~~support~~ execution in AArch64~~AArch32~~ state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_und is a 64-bit register.

Field descriptions

The SPSR_und bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]		J	SSBS	PAN	DIT	IL	GE				IT[7:2]						E	A	I	F	T	M[4:0]				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Undefined mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode SPSR_und.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ~~Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.~~

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When ARMv8.0-SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When ARMv8.1-PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When ARMv8.4-DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Undefined mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Undefined mode.

SPSR_und.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in 'Illegal return events from AArch32 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_und

Accesses to this register use the following encodings:

```
MRS <Xt>, SPSR_und
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return SPSR_und;
elsif PSTATE.EL == EL3 then
    return SPSR_und;
```

```
MSR SPSR_und, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    SPSR_und = X[t];
elsif PSTATE.EL == EL3 then
    SPSR_und = X[t];
```

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

SSBS, Speculative Store Bypass Safe

The SSBS characteristics are:

Purpose

Allows access to the Speculative Store Bypass Safe bit.

Configuration

This register is present only when ARMv8.0-SSBS is implemented. Otherwise, direct accesses to SSBS are UNDEFINED.

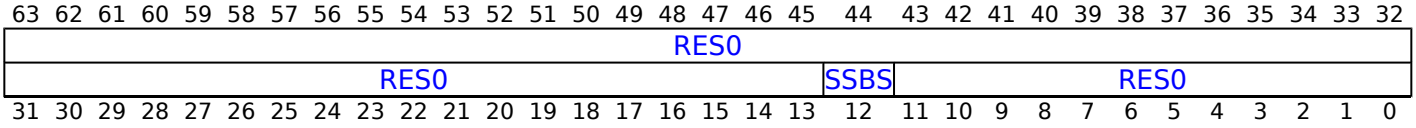
~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

SSBS is a 64-bit register.

Field descriptions

The SSBS bit assignments are:



Bits [63:13]

Reserved, RES0.

SSBS, bit [12]

Speculative Store Bypass Safe.

Prohibits speculative loads or stores which might practically allow a cache timing side channel.

A cache timing side channel might be exploited where a load or store uses an address that is derived from a register that is being loaded from memory using a load instruction speculatively read from a memory location. If PSTATE.SSBS is enabled, the address derived from the load instruction might be from earlier in the coherence order than the latest store to that memory location with the same virtual address.

SSBS	Meaning
0b0	Hardware is not permitted to load or store speculatively, in a manner that could practically give rise to a cache timing side channel, using an address derived from a register value that has been loaded from memory using a load instruction (L) that speculatively reads an entry from earlier in the coherence order from that location being loaded from than the entry generated by the latest store (S) to that location using the same virtual address as L.
0b1	Hardware is permitted to load or store speculatively, in a manner that could practically give rise to a cache timing side channel, using an address derived from a register value that has been loaded from memory using a load instruction (L) that speculatively reads an entry from earlier in the coherence order fro that location being loaded from than the entry generated by the latest store (S) to that location using the same virtual address as L.

The value of this bit is set to the value in the SCTLR_ELx.DSSBS field on taking an exception to ELx.

This field resets to an IMPLEMENTATION DEFINED value.

Bits [11:0]

Reserved, RES0.

Accessing the SSBS

~~For details on the operation of the MSR (immediate) accessor, see MSR (immediate) in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.~~

Accesses to this register use the following encodings:

`MRS <Xt>, SSBS`

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b110

```
if PSTATE.EL == EL0 then
    return Zeros(51):PSTATE.SSBS:Zeros(12);
elsif PSTATE.EL == EL1 then
    return Zeros(51):PSTATE.SSBS:Zeros(12);
elsif PSTATE.EL == EL2 then
    return Zeros(51):PSTATE.SSBS:Zeros(12);
elsif PSTATE.EL == EL3 then
    return Zeros(51):PSTATE.SSBS:Zeros(12);
```

`MSR SSBS, <Xt>`

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b110

```
if PSTATE.EL == EL0 then
    PSTATE.SSBS = X[t]<12>;
elsif PSTATE.EL == EL1 then
    PSTATE.SSBS = X[t]<12>;
elsif PSTATE.EL == EL2 then
    PSTATE.SSBS = X[t]<12>;
elsif PSTATE.EL == EL3 then
    PSTATE.SSBS = X[t]<12>;
```

MSR SSBS, #<imm>

op0	op1	CRn	op2
0b00	0b011	0b0100	0b001

TCR_EL1, Translation Control Register (EL1)

The TCR_EL1 characteristics are:

Purpose

The control register for stage 1 of the EL1&0 translation regime.

Configuration

AArch64 System register TCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register TTBCR[31:0] .

AArch64 System register TCR_EL1 bits [63:32] are architecturally mapped to AArch32 System register TTBCR2[31:0] .

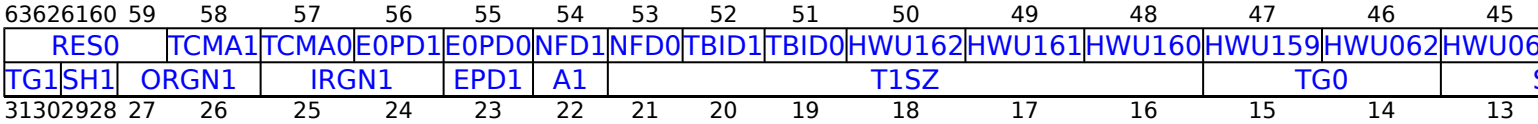
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

TCR_EL1 is a 64-bit register.

Field descriptions

The TCR_EL1 bit assignments are:



Any of the bits in TCR_EL1, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

Bits [63:59]

Reserved, RES0.

TCMA1, bit [58]

When ARMv8.5-MemTag is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if HCR_EL2.{E2H,TGE}!={1,1}, when address[59:55] = 0b11111.

TCMA1	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL1 or EL0.
0b1	All accesses at EL1 and EL0 are Unchecked.

Note

Software may change this control bit on a context switch.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]

When ARMv8.5-MemTag is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if HCR_EL2.{E2H,TGE}!={1,1}, when address[59:55] = 0b00000.

TCMA0	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL1 or EL0.
0b1	All accesses at EL1 and EL0 are Unchecked.

Note

Software may change this control bit on a context switch.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD1, bit [56]

When ARMv8.5-E0PD is implemented:

Faulting control for EL0 access to any address translated by TTBR1_EL1.

E0PD1	Meaning
0b0	Unprivileged access to any address translated by TTBR1_EL1 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR1_EL1 will generate a level 0 translation fault

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD0, bit [55]

When ARMv8.5-E0PD is implemented:

Faulting control for EL0 access to any address translated by TTBR0_EL1.

E0PD0	Meaning
0b0	Unprivileged access to any address translated by TTBR0_EL1 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR0_EL1 will generate a level 0 translation fault

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]

When SVE is implemented:

Non-fault translation table walk disable for stage 1 translations using TTBR1_EL1.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault access from EL0 for a virtual address that is translated using TTBR1_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See 'The Scalable Vector Extension (SVE)', in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for more information.

Defined values are:

NFD1	Meaning
0b0	Does not disable stage 1 translation table walks using TTBR1_EL1.
0b1	A TLB miss on a virtual address that is translated using TTBR1_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]

When SVE is implemented:

Non-fault translation table walk disable for stage 1 translations using TTBR0_EL1.

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault access from EL0 for a virtual address that is translated using TTBR0_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

See 'The Scalable Vector Extension (SVE)', in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for more information.

Defined values are:

NFD0	Meaning
0b0	Does not disable stage 1 translation table walks using TTBR0_EL1.
0b1	A TLB miss on a virtual address that is translated using TTBR0_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]

When ARMv8.3-PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

TBID1	Meaning
0b0	TCR_EL1.TBI1 applies to Instruction and Data accesses.
0b1	TCR_EL1.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]

When ARMv8.3-PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

TBID0	Meaning
0b0	TCR_EL1.TBI0 applies to Instruction and Data accesses.
0b1	TCR_EL1.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

HWU162	Meaning
0b0	For translations using TTBR1_EL1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [49]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

HWU161	Meaning
0b0	For translations using TTBR1_EL1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU160, bit [48]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

HWU160	Meaning
0b0	For translations using TTBR1_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [47]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

HWU159	Meaning
0b0	For translations using TTBR1_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU062	Meaning
0b0	For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [45]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU061	Meaning
0b0	For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [44]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU060	Meaning
0b0	For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [43]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU059	Meaning
0b0	For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [42]

When ARMv8.1-HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR1_EL1.

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]

When ARMv8.1-HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL1.

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When ARMv8.1-TTHM is implemented:

Hardware management of dirty state in stage 1 translations from EL0 and EL1.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When ARMv8.1-TTHM is implemented:

Hardware Access flag update in stage 1 translations from EL0 and EL1.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte ignored - indicates whether the top byte of an address is used for address match for the TTBR1_EL1 region, or ignored and used for tagged addresses. Defined values are:

TBI1	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL1.TBID1 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

This field resets to an architecturally UNKNOWN value.

TBI0, bit [37]

Top Byte ignored - indicates whether the top byte of an address is used for address match for the TTBR0_EL1 region, or ignored and used for tagged addresses. Defined values are:

TBI0	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL1.TBID0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

This field resets to an architecturally UNKNOWN value.

AS, bit [36]

ASID Size. Defined values are:

AS	Meaning
0b0	8 bit - the upper 8 bits of TTBR0_EL1 and TTBR1_EL1 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
0b1	16 bit - the upper 16 bits of TTBR0_EL1 and TTBR1_EL1 are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

This field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

IPS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 0b110 is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL1 are 0b0000.

This field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

Granule size for the TTBR1_EL1.

TG1	Meaning
0b01	16KB.
0b10	4KB.
0b11	64KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1_EL1.

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Translation table walk disable for translations using TTBR1_EL1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1_EL1. The encoding of this bit is:

EPD1	Meaning
0b0	Perform translation table walks using TTBR1_EL1.
0b1	A TLB miss on an address that is translated using TTBR1_EL1 generates a Translation fault. No translation table walk is performed.

This field resets to an architecturally UNKNOWN value.

A1, bit [22]

Selects whether TTBR0_EL1 or TTBR1_EL1 defines the ASID. The encoding of this bit is:

A1	Meaning
0b0	TTBR0_EL1.ASID defines the ASID.
0b1	TTBR1_EL1.ASID defines the ASID.

This field resets to an architecturally UNKNOWN value.

T1SZ, bits [21:16]

The size offset of the memory region addressed by TTBR1_EL1. The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the TTBR0_EL1.

TG0	Meaning
0b00	4KB
0b01	64KB
0b10	16KB

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0_EL1.

SH0	Meaning
0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL1.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL1.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Translation table walk disable for translations using TTBR0_EL1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0_EL1. The encoding of this bit is:

EPD0	Meaning
0b0	Perform translation table walks using TTBR0_EL1.
0b1	A TLB miss on an address that is translated using TTBR0_EL1 generates a Translation fault. No translation table walk is performed.

This field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by TTBR0_EL1. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally UNKNOWN value.

Accessing the TCR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TCR_EL1 or TCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```
MRS <Xt>, TCR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGRTR_EL2.TCR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.<NV2,NV1,NV> == '111' then
        return NVMem[0x120];
    else
        return TCR_EL1;
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        return TCR_EL2;
    else
        return TCR_EL1;
elsif PSTATE.EL == EL3 then
    return TCR_EL1;
```

```
MSR TCR_EL1, <Xt>
```

op0	op1	CRn	CRm	op2

0b11	0b000	0b0010	0b0000	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

TCR_EL3, Translation Control Register (EL3)

The TCR_EL3 characteristics are:

Purpose

The control register for stage 1 of the EL3 translation regime.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to TCR_EL3 are UNDEFINED.

Attributes

TCR_EL3 is a 64-bit register.

Field descriptions

The TCR_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES1	TCMA	TBID	HWU62	HWU61	HWU60	HWU59	HPD	RES1	HD	HA	TBI	RES0	PS			TG0	SH0	ORGN0		IRGN0		RES0						T0SZ

Any of the bits in TCR_EL3 are permitted to be cached in a TLB.

Bits [63:32]

Reserved, RES0.

Bit [31]

Reserved, RES1.

TCMA, bit [30]

When ARMv8.5-MemTag is implemented:

Controls the generation of Unchecked accesses at EL3 when address [59:56] = `0b0000`.

TCMA	Meaning
`0b0`	This control has no effect on the generation of Unchecked accesses.
`0b1`	All accesses are Unchecked.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]

When ARMv8.3-PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

TBID	Meaning
0b0	TCR_EL3.TBI applies to Instruction and Data accesses.
0b1	TCR_EL3.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL3.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]

When ARMv8.2-TTPBHA is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]

When ARMv8.1-HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL3.

HPD	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

Note
In this case bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]

When ARMv8.1-TTHM is implemented:

Hardware management of dirty state in stage 1 translations from EL3.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When ARMv8.1-TTHM is implemented:

Hardware Access flag update in stage 1 translations from EL3.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL3 region, or ignored and used for tagged addresses.

TBI	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL3. It has an effect whether the EL3 translation regime is enabled or not.

If ARMv8.3-PAuth is implemented and TCR_EL3.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- An exception return to EL3.

For more information, see 'Address tagging in AArch64 state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Note

This control detrmines the scope of address tagging. It never causes an exception to be generated.

This field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

PS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.

Other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

The value 0b110 is permitted only if ARMv8.2-LPA is implemented and the translation granule size is 64KB.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL3 are 0b0000.

This field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the TTBR0_EL3.

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

This field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0_EL3.

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in AArch64 System registers and translation table entries' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section K1.2.2.

This field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by TTBR0_EL3. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

This field resets to an architecturally UNKNOWN value.

Accessing the TCR_EL3

Accesses to this register use the following encodings:

```
MRS <Xt>, TCR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0000	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;

TFSR_EL1, Tag FaultFail Status Register (EL1)

The TFSR_EL1 characteristics are:

Purpose

Holds accumulated Tag Check FaultsFails occurring in EL1 thatwhich are not taken precisely.

Configuration

This register is present only when ARMv8.5-MemTag is implemented and ID_AA64PFR1_EL1.MTE != 0b0001. Otherwise, direct accesses to TFSR_EL1 are UNDEFINED.

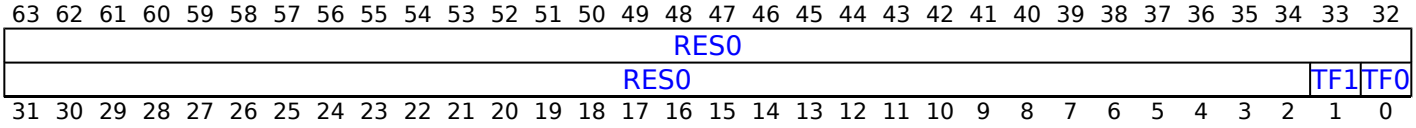
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TFSR_EL1 is a 64-bit register.

Field descriptions

The TFSR_EL1 bit assignments are:



Bits [63:2]

Reserved, RES0.

TF1, bit [1]

Tag Check Fault.Fail. Asynchronously set to 1 when a Tag Check Faultfail using a virtual address with bit[<55] ==>== 0b1 occurs.

This field resets to an architecturally UNKNOWN value.

TF0, bit [0]

Tag Check Fault.Fail. Asynchronously set to 1 when a Tag Check Faultfail using a virtual address with bit[<55] ==>== 0b0 occurs.

This field resets to an architecturally UNKNOWN value.

Accessing the TFSR_EL1

Accesses to this register use the following encodings:

```

TFSR_EL2, Tag FaultFail Status Register (EL2)

The TFSR_EL2 characteristics are:

Purpose

Holds accumulated Tag Check FaultsFails occurring in EL2 thatwhich are not taken precisely.

Configuration

This register is present only when ARMv8.5-MemTag is implemented and ID_AA64PFR1_EL1.MTE != 0b0001. Otherwise, direct accesses to TFSR_EL2 are UNDEFINED.

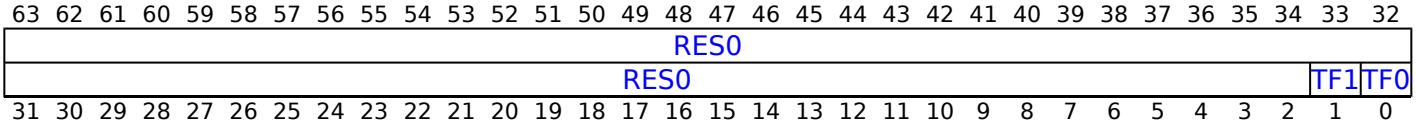
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TFSR_EL2 is a 64-bit register.

Field descriptions

The TFSR_EL2 bit assignments are:



Bits [63:2]

Reserved, RES0.

TF1, bit [1]

Tag Check Fault.Fail. Asynchronously set to 1 when a Tag Check Faultfail using a virtual address with bit[<55] ==>== `0b1` occurs.

When HCR_EL2.E2H==`0b0`, this field is RES0.

This field resets to an architecturally UNKNOWN value.

TF0, bit [0]

Tag Check Fault.Fail. Asynchronously set to 1 when a Tag Check Faultfail using a virtual address with bit[<55] ==>== `0b0` occurs.

This field resets to an architecturally UNKNOWN value.

Accessing the TFSR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TFSR_EL2 or TFSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, TFSR_EL2

op0	op1	CRn	CRm	op2

TFSR_EL3, Tag FaultFail Status Register (EL3)

The TFSR_EL3 characteristics are:

Purpose

Holds accumulated Tag Check FaultsFails occurring in EL3 thatwhich are not taken precisely.

Configuration

This register is present only when ARMv8.5-MemTag is implemented and ID_AA64PFR1_EL1.MTE != 0b0001. Otherwise, direct accesses to TFSR_EL3 are UNDEFINED.

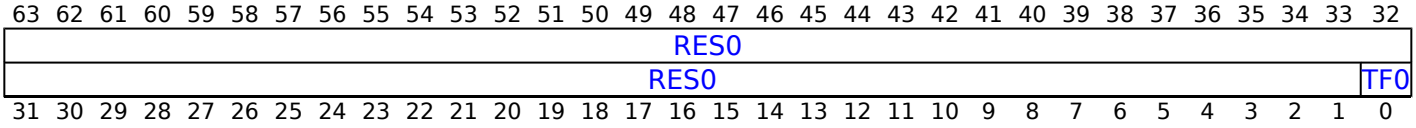
RW fields in this register reset to architecturally UNKNOWN values.

Attributes

TFSR_EL3 is a 64-bit register.

Field descriptions

The TFSR_EL3 bit assignments are:



Bits [63:1]

Reserved, RES0.

TF0, bit [0]

Tag Check Fault.Fail. Asynchronously set to 1 when a Tag Check Faultfail using a virtual address with bit[<55] ==>== 0b0 occurs.

This field resets to an architecturally UNKNOWN value.

Accessing the TFSR_EL3

Accesses to this register use the following encodings:

```
MRS <Xt>, TFSR_EL3
```

op0	op1	CRn	CRm	op2

TLBI ALLE1, TLB Invalidate All, EL1

The TLBI ALLE1 characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If SCR_EL3.NS is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If SCR_EL3.NS is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation only applies to the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

Configuration

There are no configuration notes.

Attributes

TLBI ALLE1 is a 64-bit System instruction.

Field descriptions

TLBI ALLE1 ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

Executing the TLBI ALLE1 instruction

Accesses to this instruction use the following encodings:

```
TLBI ALLE1{, <Xt>}
```

op0	op1	CRn	CRm	op2	Rt
0b01	0b100	0b1000	0b0111	0b100	0b11111

TLBI ASIDE1, TLB Invalidate by ASID, EL1

The TLBI ASIDE1 characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate an address using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

Configuration

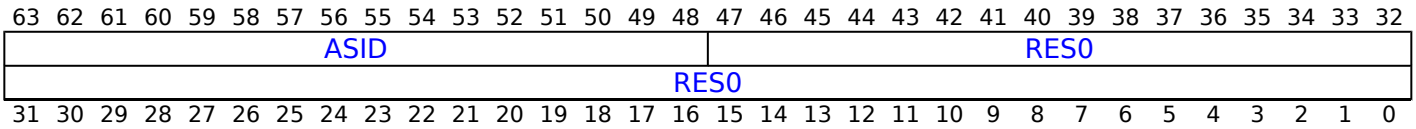
There are no configuration notes.

Attributes

TLBI ASIDE1 is a 64-bit System instruction.

Field descriptions

The TLBI ASIDE1 input value bit assignments are:



ASID, bits [63:48]

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this System instruction.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

Bits [47:0]

Reserved, RES0.

Executing the TLBI ASIDE1 instruction

Accesses to this instruction use the following encodings:

```
TLBI ASIDE1{, <Xt>}
```

op0	op1	CRn	CRm	op2

TLBI IPAS2E1, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI IPAS2E1 characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS==1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.NS==0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Configuration

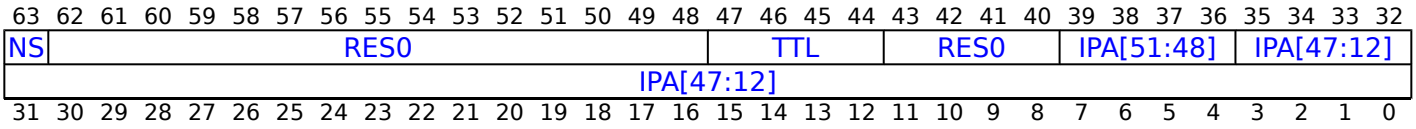
There are no configuration notes.

Attributes

TLBI IPAS2E1 is a 64-bit System instruction.

Field descriptions

The TLBI IPAS2E1 input value bit assignments are:



NS, bit [63]

When ARMv8.4-SecEL2 is implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

When ARMv8.2-LPA is implemented:

Extension to IPA[47:12]. See IPA[47:12] for more details.

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2E1 instruction

Accesses to this instruction use the following encodings:

```
TLBI IPAS2E1{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TLBI_IPAS2E1(X[t]);
elsif PSTATE.EL == EL3 then
    if !EL2Enabled() then
        //no operation
    else
        TLBI_IPAS2E1(X[t]);
```

TLBI IPAS2E1IS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI IPAS2E1IS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS==1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.NS==0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Configuration

There are no configuration notes.

Attributes

TLBI IPAS2E1IS is a 64-bit System instruction.

Field descriptions

The TLBI IPAS2E1IS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NS	RES0															TTL				RES0				IPA[51:48]				IPA[47:12]			
IPA[47:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NS, bit [63]

When ARMv8.4-SecEL2 is implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

When ARMv8.2-LPA is implemented:

Extension to IPA[47:12]. See IPA[47:12] for more details.

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2E1IS instruction

Accesses to this instruction use the following encodings:

```
TLBI IPAS2E1IS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0000	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TLBI_IPAS2E1IS(X[t]);
elsif PSTATE.EL == EL3 then
    if !EL2Enabled() then
        //no operation
    else
        TLBI_IPAS2E1IS(X[t]);
```

TLBI IPAS2LE1, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBI IPAS2LE1 characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS==1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.NS==0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Configuration

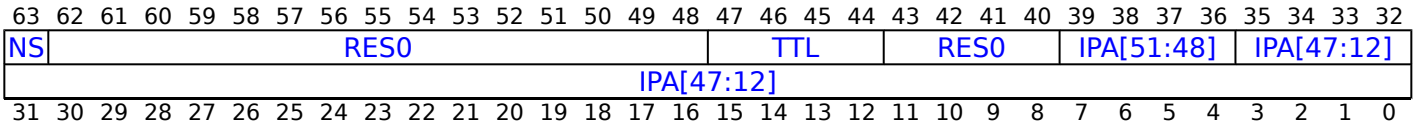
There are no configuration notes.

Attributes

TLBI IPAS2LE1 is a 64-bit System instruction.

Field descriptions

The TLBI IPAS2LE1 input value bit assignments are:



NS, bit [63]

When ARMv8.4-SecEL2 is implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

When ARMv8.2-LPA is implemented:

Extension to IPA[47:12]. See IPA[47:12] for more details.

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2LE1 instruction

Accesses to this instruction use the following encodings:

```
TLBI IPAS2LE1{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TLBI_IPAS2LE1(X[t]);
elsif PSTATE.EL == EL3 then
    if !EL2Enabled() then
        //no operation
    else
        TLBI_IPAS2LE1(X[t]);
```

TLBI IPAS2LE1IS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBI IPAS2LE1IS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - SCR_EL3.NS==1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.NS==0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction see 'Invalidation of TLB entries from stage 2 translations' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Configuration

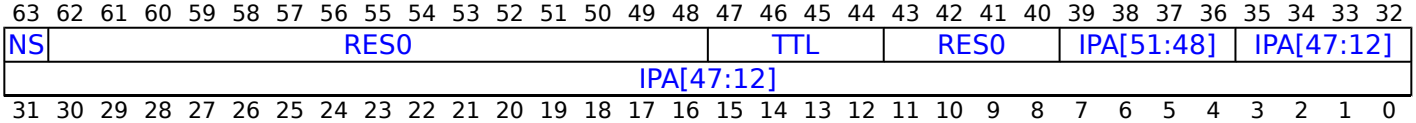
There are no configuration notes.

Attributes

TLBI IPAS2LE1IS is a 64-bit System instruction.

Field descriptions

The TLBI IPAS2LE1IS input value bit assignments are:



NS, bit [63]

When ARMv8.4-SecEL2 is implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When ARMv8.4-SecEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

When ARMv8.2-LPA is implemented:

Extension to IPA[47:12]. See IPA[47:12] for more details.

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When ARMv8.2-LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2LE1IS instruction

Accesses to this instruction use the following encodings:

```
TLBI IPAS2LE1IS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0000	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TLBI_IPAS2LE1IS(X[t]);
elsif PSTATE.EL == EL3 then
    if !EL2Enabled() then
        //no operation
    else
        TLBI_IPAS2LE1IS(X[t]);
```

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

TLBI VAAE1, TLB Invalidate by VA, All ASID, EL1

The TLBI VAAE1 characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

Configuration

There are no configuration notes.

Attributes

TLBI VAAE1 is a 64-bit System instruction.

Field descriptions

The TLBI VAAE1 input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TTL				VA[55:12]											
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VAAE1IS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI VAAE1IS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

Configuration

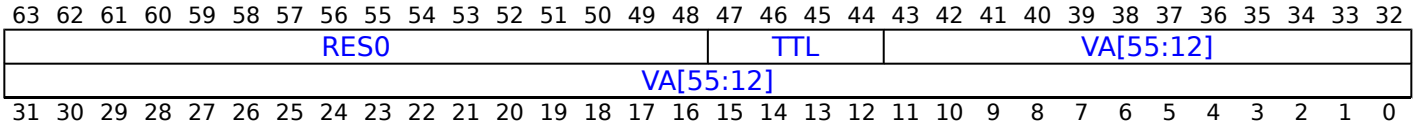
There are no configuration notes.

Attributes

TLBI VAAE1IS is a 64-bit System instruction.

Field descriptions

The TLBI VAAE1IS input value bit assignments are:



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAAE1IS instruction

Accesses to this instruction use the following encodings:

```
TLBI VAAE1IS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0011	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLBIS == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGITR_EL2.TLBIVAAE1IS == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        TLBI_VAAE1IS(X[t]);
elsif PSTATE.EL == EL2 then
    TLBI_VAAE1IS(X[t]);
elsif PSTATE.EL == EL3 then
    TLBI_VAAE1IS(X[t]);
```

TLBI VAALE1, TLB Invalidate by VA, All ASID, Last level, EL1

The TLBI VAALE1 characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

Configuration

There are no configuration notes.

Attributes

TLBI VAALE1 is a 64-bit System instruction.

Field descriptions

The TLBI VAALE1 input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TTL				VA[55:12]											
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAALE1 instruction

Accesses to this instruction use the following encodings:

```
TLBI VAALE1{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0111	0b111

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGITR_EL2.TLBIVAALE1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.FB == '1' then
        TLBI_VAALE1IS(X[t]);
    else
        TLBI_VAALE1(X[t]);
elsif PSTATE.EL == EL2 then
    TLBI_VAALE1(X[t]);
elsif PSTATE.EL == EL3 then
    TLBI_VAALE1(X[t]);
```

TLBI VAALE1IS, TLB Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI VAALE1IS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

Configuration

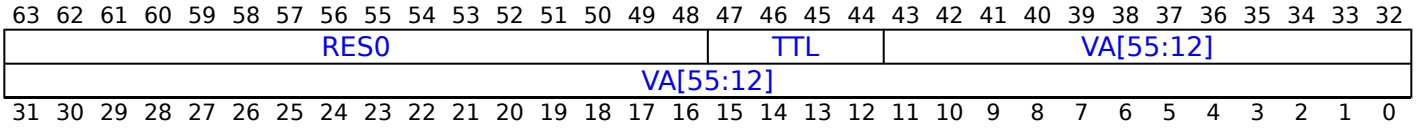
There are no configuration notes.

Attributes

TLBI VAALE1IS is a 64-bit System instruction.

Field descriptions

The TLBI VAALE1IS input value bit assignments are:



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAALE1IS instruction

Accesses to this instruction use the following encodings:

TLBI VAE1, TLB Invalidate by VA, EL1

The TLBI VAE1 characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

Configuration

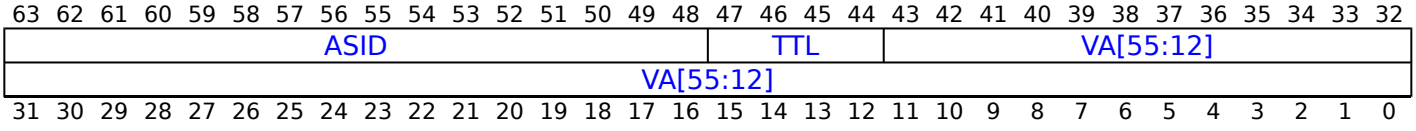
There are no configuration notes.

Attributes

TLBI VAE1 is a 64-bit System instruction.

Field descriptions

The TLBI VAE1 input value bit assignments are:



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE1 instruction

Accesses to this instruction use the following encodings:

```
TLBI VAE1{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0111	0b001

TLBI VAE1IS, TLB Invalidate by VA, EL1, Inner Shareable

The TLBI VAE1IS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Configuration

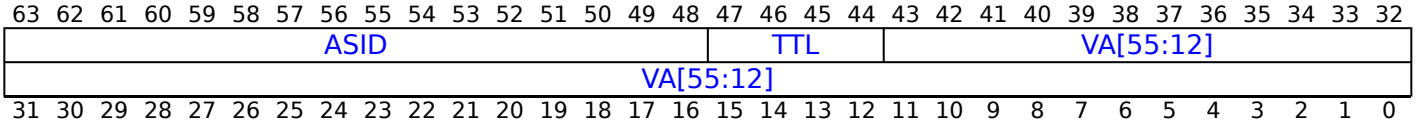
There are no configuration notes.

Attributes

TLBI VAE1IS is a 64-bit System instruction.

Field descriptions

The TLBI VAE1IS input value bit assignments are:



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE1IS instruction

Accesses to this instruction use the following encodings:

```
TLBI VAE1IS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0011	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLBIS == '1' then

TLBI VAE2, TLB Invalidate by VA, EL2

The TLBI VAE2 characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or the EL2&0 translation regime.
- If HCR_EL2.E2H == 0, the entry is from any level of the translation table walk.
- If HCR_EL2.E2H == 1 one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

Configuration

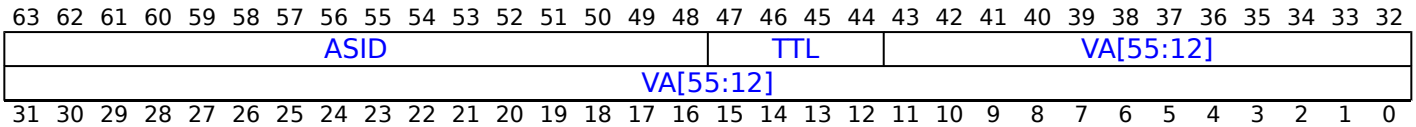
There are no configuration notes.

Attributes

TLBI VAE2 is a 64-bit System instruction.

Field descriptions

The TLBI VAE2 input value bit assignments are:



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.

TLBI VAE2IS, TLB Invalidate by VA, EL2, Inner Shareable

The TLBI VAE2IS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or the EL2&0 translation regime.
- If HCR_EL2.E2H == 0, the entry is from any level of the translation table walk.
- If HCR_EL2.E2H == 1 one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

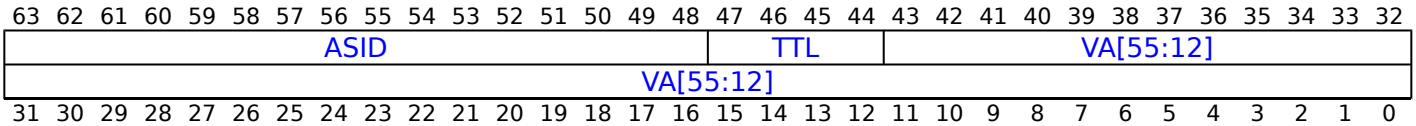
There are no configuration notes.

Attributes

TLBI VAE2IS is a 64-bit System instruction.

Field descriptions

The TLBI VAE2IS input value bit assignments are:



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VAE3, TLB Invalidate by VA, EL3

The TLBI VAE3 characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

Configuration

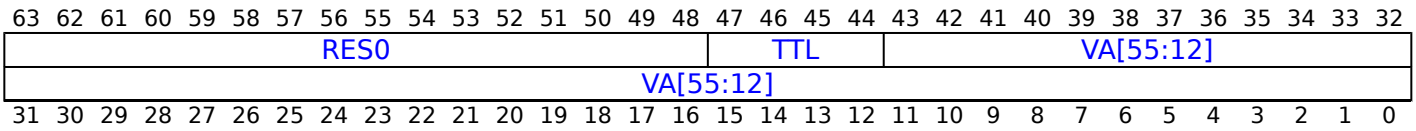
There are no configuration notes.

Attributes

TLBI VAE3 is a 64-bit System instruction.

Field descriptions

The TLBI VAE3 input value bit assignments are:



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VALE1, TLB Invalidate by VA, Last level, EL1

The TLBI VALE1 characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

Configuration

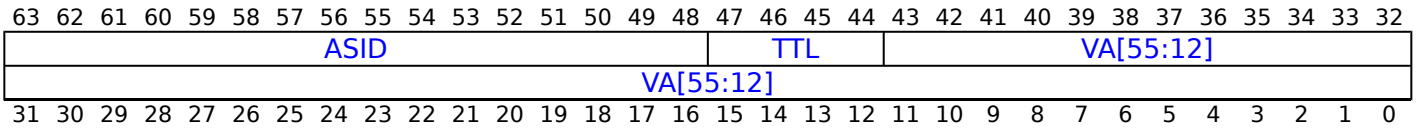
There are no configuration notes.

Attributes

TLBI VALE1 is a 64-bit System instruction.

Field descriptions

The TLBI VALE1 input value bit assignments are:



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE1 instruction

Accesses to this instruction use the following encodings:

```

TLBI VALE1IS, TLB Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI VALE1IS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Configuration

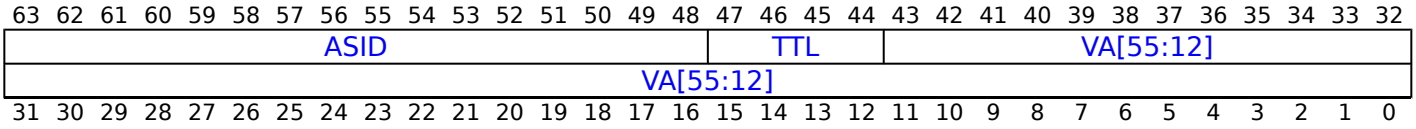
There are no configuration notes.

Attributes

TLBI VALE1IS is a 64-bit System instruction.

Field descriptions

The TLBI VALE1IS input value bit assignments are:



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.

- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE1IS instruction

Accesses to this instruction use the following encodings:

```
TLBI VALE1IS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0011	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLBIS == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGITR_EL2.TLBIVALE1IS == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        TLBI_VALE1IS(X[t]);
elsif PSTATE.EL == EL2 then
    TLBI_VALE1IS(X[t]);
elsif PSTATE.EL == EL3 then
    TLBI_VALE1IS(X[t]);
```

TLBI VALE2, TLB Invalidate by VA, Last level, EL2

The TLBI VALE2 characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If HCR_EL2.E2H == 0, the entry is from the final level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of translation table walk that matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

Configuration

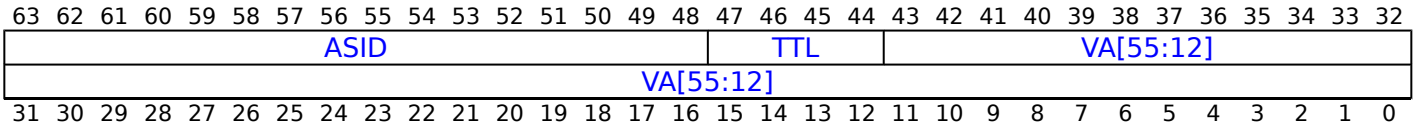
There are no configuration notes.

Attributes

TLBI VALE2 is a 64-bit System instruction.

Field descriptions

The TLBI VALE2 input value bit assignments are:



ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE2 instruction

Accesses to this instruction use the following encodings:

```
TLBI VALE2{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0111	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;

TLBI VALE2IS, TLB Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI VALE2IS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If HCR_EL2.E2H == 0, the entry is from the final level of the translation table walk.
- If HCR_EL2.E2H == 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

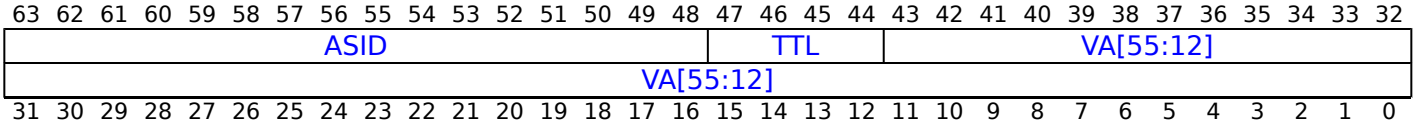
There are no configuration notes.

Attributes

TLBI VALE2IS is a 64-bit System instruction.

Field descriptions

The TLBI VALE2IS input value bit assignments are:



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, but only 8 bits are being used in the context being invalidated, the upper bits are RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

TLBI VALE3, TLB Invalidate by VA, Last level, EL3

The TLBI VALE3 characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

Configuration

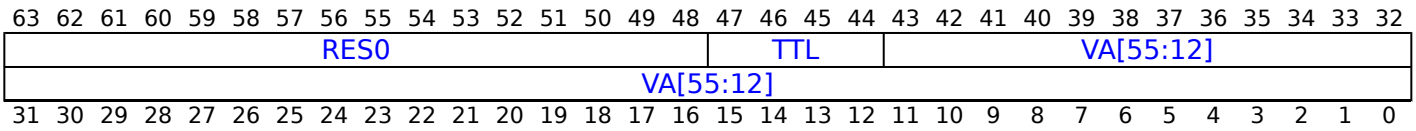
There are no configuration notes.

Attributes

TLBI VALE3 is a 64-bit System instruction.

Field descriptions

The TLBI VALE3 input value bit assignments are:



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When ARMv8.4-TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Reserved. Treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE3IS instruction

Accesses to this instruction use the following encodings:

```
TLBI VALE3IS{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0011	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TLBI_VALE3IS(X[t]);
```

TLBI VMALLE1, TLB Invalidate by VMID, All at stage 1, EL1

The TLBI VMALLE1 characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

Configuration

There are no configuration notes.

Attributes

TLBI VMALLE1 is a 64-bit System instruction.

Field descriptions

TLBI VMALLE1 ignores the value in the register specified by the instruction encoding. Software does not have to write a value to the register before issuing this instruction.

Executing the TLBI VMALLE1 instruction

Accesses to this instruction use the following encodings:

```
TLBI VMALLE1{, <Xt>}
```

op0	op1	CRn	CRm	op2	Rt
0b01	0b000	0b1000	0b0111	0b000	0b11111

```
if PSTATE.EL == EL0 then

TLBI VMALLE1IS, TLB Invalidate by VMID, All at stage 1, EL1, Inner Shareable

The TLBI VMALLE1IS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

Configuration

There are no configuration notes.

TPIDR_EL3, EL3 Software Thread ID Register

The TPIDR_EL3 characteristics are:

Purpose

Provides a location where software executing at EL3 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to TPIDR_EL3 are UNDEFINED.

Attributes

TPIDR_EL3 is a 64-bit register.

Field descriptions

The TPIDR_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Thread ID																															
Thread ID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

This field resets to an architecturally UNKNOWN value.

Accessing the TPIDR_EL3

Accesses to this register use the following encodings:

```
MRS <Xt>, TPIDR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1101	0b0000	0b010

TRFCR_EL1, Trace Filter Control Register (EL1)

The TRFCR_EL1 characteristics are:

Purpose

Provides EL1 controls for Trace.

Configuration

AArch64 System register TRFCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register TRFCR[31:0] .

This register is present only when ARMv8.4-Trace is implemented. Otherwise, direct accesses to TRFCR_EL1 are UNDEFINED.

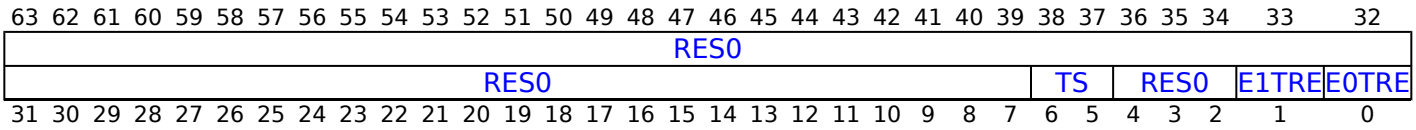
~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

TRFCR_EL1 is a 64-bit register.

Field descriptions

The TRFCR_EL1 bit assignments are:



Bits [63:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control

TS	Meaning	Applies when
0b01	Virtual timestamp. The traced timestamp is the physical counter value, minus the value of CNTVOFF_EL2.	
0b10	Guest Physical timestamp. The traced timestamp is the physical counter value, minus the value of CNTPOFF_EL2.	When ARMv8.6-ECV is implemented
0b11	Physical timestamp. The traced timestamp is the physical counter value.	

All other values are reserved

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.

- EL2 is implemented and TRFCR_EL2.TS != 0b00.

IfWhen EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true: ARMv8.6-ECV is implemented, and EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if any of the following are true:

- CNTHCTL_EL2.ECV is 0.
- SCR_EL3.ECVEn is 0.
- HCR_EL2.{E2H, TGE} is {1, 1}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

E1TRE	Meaning
0b0	Trace is prohibited at EL1.
0b1	Trace is allowed at EL1.

This field is ignored if SelfHostedTraceEnabled() == FALSE.

On a Warm reset, this field resets to 0.

E0TRE, bit [0]

EL0 Trace Enable.

E0TRE	Meaning
0b0	Trace is prohibited at EL0.
0b1	Trace is allowed at EL0.

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and enabled in the current Security state and HCR_EL2.TGE == 1.

On a Warm reset, this field resets to 0.

Accessing the TRFCR_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, TRFCR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0010	0b001

TRFCR_EL2, Trace Filter Control Register (EL2)

The TRFCR_EL2 characteristics are:

Purpose

Provides EL2 controls for Trace.

Configuration

AArch64 System register TRFCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTRFCR[31:0] .

This register is present only when ARMv8.4-Trace is implemented. Otherwise, direct accesses to TRFCR_EL2 are UNDEFINED.

~~Some or all RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch64. Otherwise, RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

TRFCR_EL2 is a 64-bit register.

Field descriptions

The TRFCR_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																									TS		RES0	CX	RES0	E2TRE	E0HTRE

Bits [63:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

TS	Meaning	Applies when
0b00	Timestamp controlled by TRFCR_EL1.TS or TRFCR.TS.	
0b01	Virtual timestamp. The traced timestamp is the physical counter value, minus the value of CNTVOFF_EL2.	
0b10	Guest Physical timestamp. The traced timestamp is the physical counter value, minus the value of CNTPOFF_EL2.	When ARMv8.6-ECV is implemented
0b11	Physical timestamp. The traced timestamp is the physical counter value.	

All other values are reserved.

This field is ignored if SelfHostedTraceEnabled() == FALSE.

IfWhen EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true: ARMv8.6-ECV is implemented, and EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if any of the following are true:

- CNTHCTL_EL2.ECV is 0.
- SCR_EL3.ECVEn is 0.
- HCR_EL2.{E2H, TGE} is {1, 1}.

On a Warm reset, this field resets to `0`.

Bit [4]

Reserved, RES0.

CX, bit [3]

CONTEXTIDR_EL2 and VMID trace enable.

CX	Meaning
`0b0`	CONTEXTIDR_EL2 and VMID trace prohibited.
`0b1`	CONTEXTIDR_EL2 and VMID trace allowed.

This field is ignored if SelfHostedTraceEnabled() == FALSE.

On a Warm reset, this field resets to `0`.

Bit [2]

Reserved, RES0.

E2TRE, bit [1]

EL2 Trace Enable.

E2TRE	Meaning
`0b0`	Trace is prohibited at EL2.
`0b1`	Trace is allowed at EL2.

This field is ignored if SelfHostedTraceEnabled() == FALSE.

On a Warm reset, this field resets to `0`.

E0HTRE, bit [0]

EL0 Trace Enable.

E0HTRE	Meaning
`0b0`	Trace is prohibited at EL0 when HCR_EL2.TGE == 1.
`0b1`	Trace is allowed at EL0 when HCR_EL2.TGE == 1.

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is disabled in the current security state.
- HCR_EL2.TGE == 0.

On a Warm reset, this field resets to `0`.

Accessing the TRFCR_EL2

Accesses to this register use the following encodings:

MRS <Xt>, TRFCR_EL2

TTBR0_EL1, Translation Table Base Register 0 (EL1)

The TTBR0_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR0_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR0[63:0] .

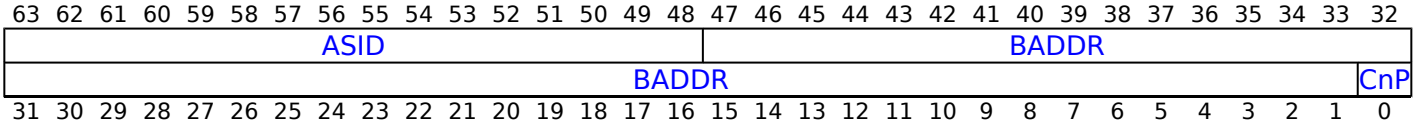
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

TTBR0_EL1 is a 64-bit register.

Field descriptions

The TTBR0_EL1 bit assignments are:



ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

This field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL1.IPS is `0b110`, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.

- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

Note

- In an implementation that includes ARMv8.2-LPA a TCR_EL1.IPS value of `0b110`, that selects an IPA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL1.IPS is `0b110` and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL1.IPS is not `0b110` then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are `0b0000`.

Note

This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR0_EL1[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR0_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T0SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR0_EL1.CnP on those other PEs. • The value of the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
0b1	The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR0_EL1. • The translation tables relate to the same translation regime. • The ASID is the same as the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This field is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the TTBR0_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR0_EL1 or TTBR0_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

```

TTBR0_EL3, Translation Table Base Register 0 (EL3)

The TTBR0_EL3 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL3 translation regime, and other information for this translation regime.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

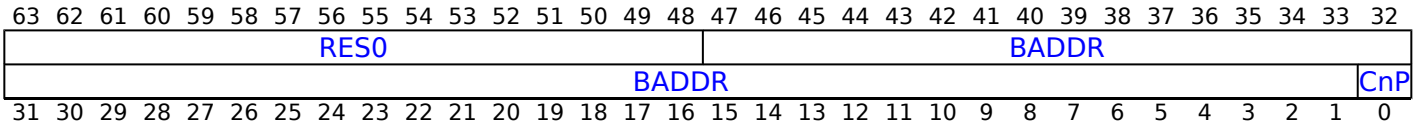
This register is present only when ~~HaveEL(~~EL3 is implemented.~~).~~ Otherwise, direct accesses to TTBR0_EL3 are UNDEFINED.

Attributes

TTBR0_EL3 is a 64-bit register.

Field descriptions

The TTBR0_EL3 bit assignments are:



Bits [63:48]

Reserved, RES0.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x].

Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL3.PS is `0b110` then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.

- In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

Note

- In an implementation that includes ARMv8.2-LPA a TCR_EL3.PS value of `0b110`, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL3.PS is `0b110` and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL3.PS is not `0b110` then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are `0b0000`.

Note

This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR0_EL3[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR0_EL3, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL3.T0SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL3 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1.

CnP	Meaning
`0b0`	The translation table entries pointed to by TTBR0_EL3, for the current translation regime, are permitted to differ from corresponding entries for TTBR0_EL3 for other PEs in the Inner Shareable domain. This is not affected by the value of TTBR0_EL3.CnP on those other PEs.
`0b1`	The translation table entries pointed to by TTBR0_EL3 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1 and the translation table entries are pointed to by TTBR0_EL3.

This field is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL3.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL3s do not point to the same translation table entries the results of translations using TTBR0_EL3 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to

caching of control or data values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTBR1_EL1, Translation Table Base Register 1 (EL1)

The TTBR1_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 stage 1 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR1_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR1[63:0] .

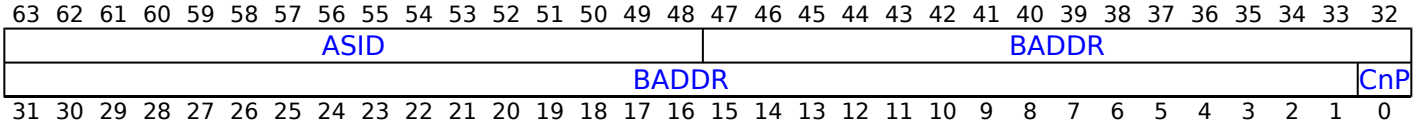
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

TTBR1_EL1 is a 64-bit register.

Field descriptions

The TTBR1_EL1 bit assignments are:



ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

This field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes ARMv8.2-LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes ARMv8.2-LPA, if the value of TCR_EL1.IPS is `0b110`, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.

- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes ARMv8.2-TTCNP bit[0] of the stage 1 translation table base address is zero.

Note

- In an implementation that includes ARMv8.2-LPA a TCR_EL1.IPS value of `0b110`, that selects an IPA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the value of TCR_EL1.IPS is `0b110` and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR_EL1.IPS is not `0b110` then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits[51:48] of the translation table base addresses used in this stage of translation are `0b0000`.

Note

This definition applies:

- To an implementation that includes ARMv8.2-LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include ARMv8.2-LPA.

If any TTBR1_EL1[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR1_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T1SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When ARMv8.2-TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR1_EL1.CnP on those other PEs. • The value of the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
0b1	The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR1_EL1. • The translation tables relate to the same translation regime. • The ASID is the same as the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This field is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the TTBR1_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR1_EL1 or TTBR1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

VBAR_EL1, Vector Base Address Register (EL1)

The VBAR_EL1 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL1.

Configuration

AArch64 System register VBAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register VBAR[31:0] .

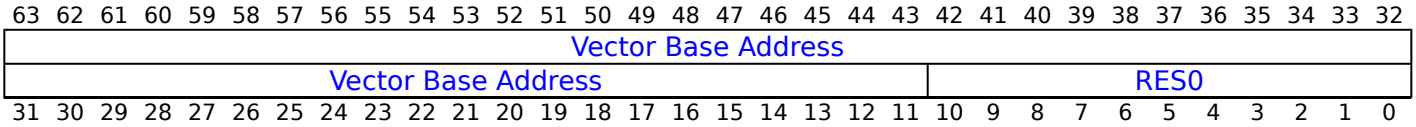
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

VBAR_EL1 is a 64-bit register.

Field descriptions

The VBAR_EL1 bit assignments are:



Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL1.

If the implementation does not support ARMv8.2-LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

If the implementation supports ARMv8.2-LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

This field resets to an architecturally UNKNOWN value.

Bits [10:0]

Reserved, RES0.

Accessing the VBAR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic VBAR_EL1 or VBAR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

VDISR_EL2, Virtual Deferred Interrupt Status Register

The VDISR_EL2 characteristics are:

Purpose

Records that a virtual SError interrupt has been consumed by an ESB instruction executed at EL1.

An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value written to be observed by a direct read of DISR_EL1 or DISR occurring in program order after the ESB instruction.

Configuration

AArch64 System register VDISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VDISR[31:0] .

This register is present only when RAS is implemented. Otherwise, direct accesses to VDISR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

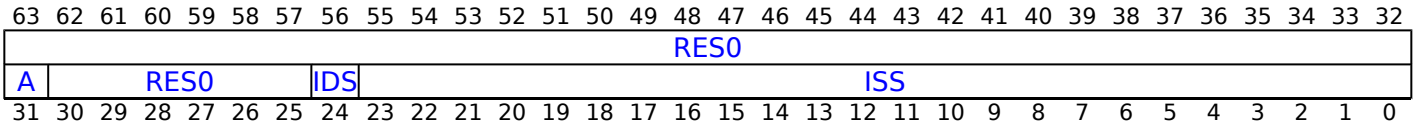
Attributes

VDISR_EL2 is a 64-bit register.

Field descriptions

The VDISR_EL2 bit assignments are:

When ~~!ELUsingAArch32(~~EL1 is using AArch64:~~):~~



Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

The value copied from VSESR_EL2.IDS.

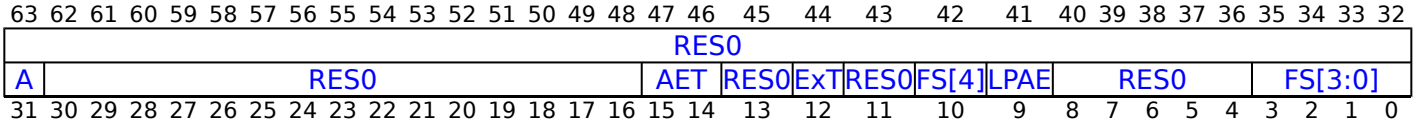
This field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

The value copied from VSESR_EL2.ISS.

This field resets to an architecturally UNKNOWN value.

When ~~ELUsingAArch32(~~EL1 is using AArch32~~)~~ and VDISR_EL2.LPAE == 0:



Bits [63:32]

Reserved, RES0.

A, bit [31]

This field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VSESR_EL2.ExT.

This field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS[4], bit [10]

This field is bit[4] of FS[4:0].

Fault status code. Set to `0b10110` when an ESB instruction defers a virtual SError interrupt.

FS	Meaning
0b10110	Asynchronous SError interrupt.

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR_EL2[10].
- FS[3:0] is VDISR_EL2[3:0].

This field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to TTBCR.EAE when an ESB instruction defers a virtual SError interrupt.

LPAE	Meaning
0b0	Using the Short-descriptor translation table format.

This field resets to an architecturally UNKNOWN value.

Bits [8:4]

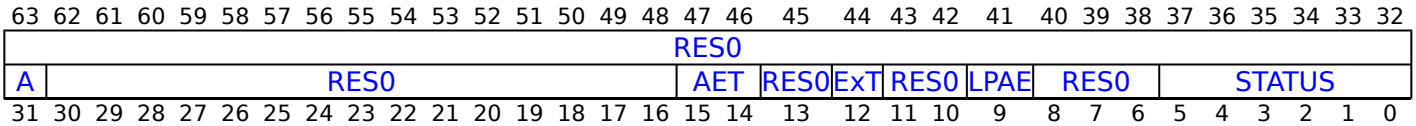
Reserved, RES0.

FS[3:0], bits [3:0]

This field is bits[3:0] of FS[4:0].

See FS[4] for the field description.

When ~~ELUsingAArch32(~~EL1 is using AArch32~~)~~ and VDISR_EL2.LPAE == 1:



Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VSESR_EL2.AET.

This field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VSESR_EL2.ExT.

This field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

Set to TTBCR.EAE when an ESB instruction defers a virtual SError interrupt.

LPAE	Meaning
0b1	Using the Long-descriptor translation table format.

This field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.

STATUS	Meaning
0b010001	Asynchronous SError interrupt.

All other values are reserved.

This field resets to an architecturally UNKNOWN value.

Accessing the VDISR_EL2

An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR_EL1 or DISR occurring in program order after the ESB instruction.

Accesses to this register use the following encodings:

```
MRS <Xt>, VDISR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b0001	0b001

VMPIDR_EL2, Virtualization Multiprocessor ID Register

The VMPIDR_EL2 characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by EL1 reads of MPIDR_EL1.

Configuration

AArch64 System register VMPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VMPIDR[31:0] .

If EL2 is not implemented, reads of this register return the value of the MPIDR_EL1 ,~~-~~and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

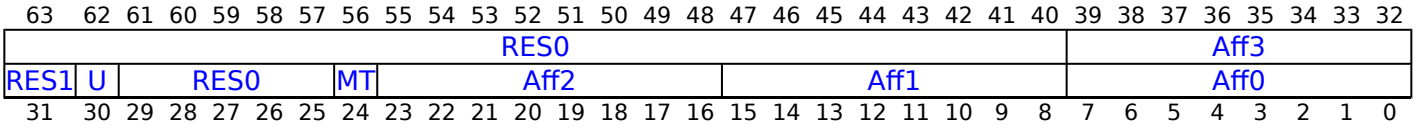
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

VMPIDR_EL2 is a 64-bit register.

Field descriptions

The VMPIDR_EL2 bit assignments are:



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of VMPIDR_EL2.Aff0~~Aff0~~ for more information.

Aff3 is not supported in AArch32 state.

This field resets to an architecturally UNKNOWN value.

Bit [31]

Reserved, RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. ~~The possible values of this bit are:~~

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

This field resets to an architecturally UNKNOWN value.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of VMPIDR_EL2.Aff0~~Aff0~~ for more information about affinity levels. ~~The possible values of this bit are:~~

MT	Meaning
0b0	Performance of PEs at the lowest affinity level is largely independent.
0b1	Performance of PEs at the lowest affinity level is very interdependent.

This field resets to an architecturally UNKNOWN value.

Aff2, bits [23:16]

Affinity level 2. See the description of VMPIDR_EL2.Aff0~~Aff0~~ for more information.

This field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1. See the description of VMPIDR_EL2.Aff0~~Aff0~~ for more information.

This field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field resets to an architecturally UNKNOWN value.

Accessing the VMPIDR_EL2

Accesses to this register use the following encodings:

```
MRS <Xt>, VMPIDR_EL2
```

VNCR_EL2, Virtual Nested Control Register

The VNCR_EL2 characteristics are:

Purpose

When ARMv8.4-NV is implemented, holds the base address that is used to define the memory location that is accessed by transformed reads and writes of System registers.

Configuration

This register is present only when ARMv8.4-NV is implemented. Otherwise, direct accesses to VNCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

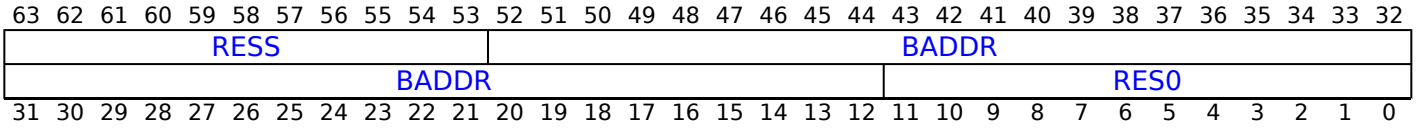
~~RW fields in this register reset to architecturally UNKNOWN values.~~

Attributes

VNCR_EL2 is a 64-bit register.

Field descriptions

The VNCR_EL2 bit assignments are:



RESS, bits [63:53]

Reserved, Sign extended. If the bits marked as RESS do not all have the same value, then there is a CONSTRAINED UNPREDICTABLE choice between:

- Generating an EL2 translation regime Translation abort on use of the VNCR_EL2 register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes other than reading back the register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52] for all purposes other than reading back the register.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52].

Where the EL2 translation regime has upper and lower address ranges, bit[52] is used to select between those address ranges to determine if the address space supports more than 48 bits.

BADDR, bits [52:12]

Base Address. If the virtual address space for EL2 does not support more than 48 bits, then bits [52:49] are RESS.

When a register read/write is transformed to be a Load or Store, the address of the load/store is to SignOffset(VNCR_EL2.BADDR~~VNCR.BADDR~~:Offset<11:0>, 64).

This field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing the VNCR_EL2

Accesses to this register use the following encodings:

```
MRS <Xt>, VNCR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
