External register index by offset

Below are indexes for external registers in the following blocks:

- AMU
- CTI
- Debug
- GIC CPU interface
- GIC Distributor
- GIC ITS control
- GIC ITS translation
- GIC Redistributor
- GIC Virtual CPU interface
- GIC Virtual interface control
- MPAM
- PMU
- RAS
- Timer

In the AMU block:

Offset	Name	Description
0x000 + 8n	AMEVCNTR0<n>[31:0]	Activity Monitors Event Counter Registers 0
0x004 + 8n	AMEVCNTR0<n>[63:32]	Activity Monitors Event Counter Registers 0
0x100 + 8n	AMEVCNTR1<n>[31:0]	Activity Monitors Event Counter Registers 1
0x104 + 8n	AMEVCNTR1<n>[63:32]	Activity Monitors Event Counter Registers 1
0x400 + 4n	AMEVTYPER0<n>	Activity Monitors Event Type Registers 0
0x480 + 4n	AMEVTYPER1<n>	Activity Monitors Event Type Registers 1
0xC00	AMCNTENSET0	Activity Monitors Count Enable Set Register 0
0xC04	AMCNTENSET1	Activity Monitors Count Enable Set Register 1
0xC20	AMCNTENCLR0	Activity Monitors Count Enable Clear Register 0
0xC24	AMCNTENCLR1	Activity Monitors Count Enable Clear Register 1
0xCE0	AMCGCR	Activity Monitors Counter Group Configuration Register
0xE00	AMCFGR	Activity Monitors Configuration Register
0xE04	AMCR	Activity Monitors Control Register
0xE08	AMIIDR	Activity Monitors Implementation Identification Register
0xFA8	AMDEVAFF0	Activity Monitors Device Affinity Register 0
0xFAC	AMDEVAFF1	Activity Monitors Device Affinity Register 1
0xFBC	AMDEVARCH	Activity Monitors Device Architecture Register
0xFCC	AMDEVTYPE	Activity Monitors Device Type Register
0xFD0	AMPIDR4	Activity Monitors Peripheral Identification Register 4
0xFE0	AMPIDR0	Activity Monitors Peripheral Identification Register 0
0xFE4	AMPIDR1	Activity Monitors Peripheral Identification Register 1
0xFE8	AMPIDR2	Activity Monitors Peripheral Identification Register 2
0xFEC	AMPIDR3	Activity Monitors Peripheral Identification Register 3
0xFF0	AMCIDR0	Activity Monitors Component Identification Register 0
0xFF4	AMCIDR1	Activity Monitors Component Identification Register 1
0xFF8	AMCIDR2	Activity Monitors Component Identification Register 2
0xFFC	AMCIDR3	Activity Monitors Component Identification Register 3

In the CTI block:

Offset	Name	Description
0x000	CTICONTROL	CTI Control register
0x010	CTIINTACK	CTI Output Trigger Acknowledge register
0x014	CTIAPPSET	CTI Application Trigger Set register
0x018	CTIAPPCLEAR	CTI Application Trigger Clear register
0x01C	CTIAPPPULSE	CTI Application Pulse register
0x020 + 4n	CTIINEN<n>	CTI Input Trigger to Output Channel Enable registers
0x0A0 + 4n	CTIOUTEN<n>	CTI Input Channel to Output Trigger Enable registers
0x130	CTITRIGINSTATUS	CTI Trigger In Status register
0x134	CTITRIGOUTSTATUS	CTI Trigger Out Status register
0x138	CTICHINSTATUS	CTI Channel In Status register
0x13C	CTICHOUTSTATUS	CTI Channel Out Status register
0x140	CTIGATE	CTI Channel Gate Enable register
0x144	ASICCTL	CTI External Multiplexer Control register
0x150	CTIDEVCTL	CTI Device Control register
0xF00	CTIITCTRL	CTI Integration mode Control register
0xFA0	CTICLAIMSET	CTI CLAIM Tag Set register
0xFA4	CTICLAIMCLR	CTI CLAIM Tag Clear register
0xFA8	CTIDEVAFF0	CTI Device Affinity register 0
0xFAC	CTIDEVAFF1	CTI Device Affinity register 1
0xFB0	CTILAR	CTI Lock Access Register
0xFB4	CTILSR	CTI Lock Status Register
0xFB8	CTIAUTHSTATUS	CTI Authentication Status register
0xFBC	CTIDEVARCH	CTI Device Architecture register
0xFC0	CTIDEVID2	CTI Device ID register 2
0xFC4	CTIDEVID1	CTI Device ID register 1
0xFC8	CTIDEVID	CTI Device ID register 0
0xFCC	CTIDEVTYPE	CTI Device Type register
0xFD0	CTIPIDR4	CTI Peripheral Identification Register 4
0xFE0	CTIPIDR0	CTI Peripheral Identification Register 0
0xFE4	CTIPIDR1	CTI Peripheral Identification Register 1
0xFE8	CTIPIDR2	CTI Peripheral Identification Register 2
0xFEC	CTIPIDR3	CTI Peripheral Identification Register 3
0xFF0	CTICIDR0	CTI Component Identification Register 0
0xFF4	CTICIDR1	CTI Component Identification Register 1
0xFF8	CTICIDR2	CTI Component Identification Register 2
0xFFC	CTICIDR3	CTI Component Identification Register 3

In the Debug block:

Offset	Name	Description
0x020	EDESR	External Debug Event Status Register
0x024	EDECR	External Debug Execution Control Register
0x030	EDWAR[31:0]	External Debug Watchpoint Address Register
0x034	EDWAR[63:32]	External Debug Watchpoint Address Register
0x080	DBGDTRRX_EL0	Debug Data Transfer Register, Receive
0x084	EDITR	External Debug Instruction Transfer Register
0x088	EDSCR	External Debug Status and Control Register

Offset	Name	Description
0x08C	DBGDTRTX_EL0	Debug Data Transfer Register, Transmit
0x090	EDRCR	External Debug Reserve Control Register
0x094	EDACR	External Debug Auxiliary Control Register
0x098	EDECCR	External Debug Exception Catch Control Register
0x0A0	EDPCSR[31:0]	External Debug Program Counter Sample Register
0x0A4	EDCIDSR	External Debug Context ID Sample Register
0x0A8	EDVIDSR	External Debug Virtual Context Sample Register
0x0AC	EDPCSR[63:32]	External Debug Program Counter Sample Register
0x300	OSLAR_EL1	OS Lock Access Register
0x310	EDPRCR	External Debug Power/Reset Control Register
0x314	EDPRSR	External Debug Processor Status Register
0x400 + 16n	DBGBVR<n>_EL1[63:0]	Debug Breakpoint Value Registers
0x408 + 16n	DBGBCR<n>_EL1	Debug Breakpoint Control Registers
0x800 + 16n	DBGWVR<n>_EL1[63:0]	Debug Watchpoint Value Registers
0x808 + 16n	DBGWCR<n>_EL1	Debug Watchpoint Control Registers
0xD00	MIDR_EL1	Main ID Register
0xD20	EDPFR[31:0]	External Debug Processor Feature Register
0xD24	EDPFR[63:32]	External Debug Processor Feature Register
0xD28	EDDFR[31:0]	External Debug Feature Register
0xD2C	EDDFR[63:32]	External Debug Feature Register
0xD60	EDAA32PFR	External Debug AArch32 Processor Feature Register
0xF00	EDITCTRL	External Debug Integration mode Control register
0xFA0	DBGCLAIMSET_EL1	Debug CLAIM Tag Set register
0xFA4	DBGCLAIMCLR_EL1	Debug CLAIM Tag Clear register
0xFA8	EDDEVAFF0	External Debug Device Affinity register 0
0xFAC	EDDEVAFF1	External Debug Device Affinity register 1
0xFB0	EDLAR	External Debug Lock Access Register
0xFB4	EDLSR	External Debug Lock Status Register
0xFB8	DBGAUTHSTATUS_EL1	Debug Authentication Status register
0xFBC	EDDEVARCH	External Debug Device Architecture register
0xFC0	EDDEVID2	External Debug Device ID register 2
0xFC4	EDDEVID1	External Debug Device ID register 1
0xFC8	EDDEVID	External Debug Device ID register 0
0xFCC	EDDEVTYPE	External Debug Device Type register
0xFD0	EDPIDR4	External Debug Peripheral Identification Register 4
0xFE0	EDPIDR0	External Debug Peripheral Identification Register 0
0xFE4	EDPIDR1	External Debug Peripheral Identification Register 1
0xFE8	EDPIDR2	External Debug Peripheral Identification Register 2
0xFEC	EDPIDR3	External Debug Peripheral Identification Register 3
0xFF0	EDCIDR0	External Debug Component Identification Register 0
0xFF4	EDCIDR1	External Debug Component Identification Register 1
0xFF8	EDCIDR2	External Debug Component Identification Register 2
0xFFC	EDCIDR3	External Debug Component Identification Register 3

In the GIC CPU interface block:

Offset	Name	Description
0x0000	GICC_CTLR	CPU Interface Control Register
0x0004	GICC_PMR	CPU Interface Priority Mask Register

Offset	Name	Description
0x0008	GICC_BPR	CPU Interface Binary Point Register
0x000C	GICC_IAR	CPU Interface Interrupt Acknowledge Register
0x0010	GICC_EOIR	CPU Interface End Of Interrupt Register
0x0014	GICC_RPR	CPU Interface Running Priority Register
0x0018	GICC_HPPIR	CPU Interface Highest Priority Pending Interrupt Register
0x001C	GICC_ABPR	CPU Interface Aliased Binary Point Register
0x0020	GICC_AIAR	CPU Interface Aliased Interrupt Acknowledge Register
0x0024	GICC_AEOIR	CPU Interface Aliased End Of Interrupt Register
0x0028	GICC_AHPPIR	CPU Interface Aliased Highest Priority Pending Interrupt Register
0x002C	GICC_STATUSR	CPU Interface Status Register
0x002C	GICC_STATUSR	CPU Interface Status Register
0x00D0 + 4n	GICC_APR<n>	CPU Interface Active Priorities Registers
0x00E0 + 4n	GICC_NSAPR<n>	CPU Interface Non-secure Active Priorities Registers
0x00FC	GICC_IIDR	CPU Interface Identification Register
0x1000	GICC_DIR	CPU Interface Deactivate Interrupt Register

In the GIC Distributor block:

Offset	Name	Description
0x0000	GICD_CTLR	Distributor Control Register
0x0004	GICD_TYPER	Interrupt Controller Type Register
0x0008	GICD_IIDR	Distributor Implementer Identification Register
0x000C	GICD_TYPER2	Interrupt Controller Type Register 2
0x0010	GICD_STATUSR	Error Reporting Status Register
0x0010	GICD_STATUSR	Error Reporting Status Register
0x0040	GICD_SETSPI_NSR	Set Non-secure SPI Pending Register
0x0048	GICD_CLRSPI_NSR	Clear Non-secure SPI Pending Register
0x0050	GICD_SETSPI_SR	Set Secure SPI Pending Register
0x0058	GICD_CLRSPI_SR	Clear Secure SPI Pending Register
0x0080 + 4n	GICD_IGROUPR<n>	Interrupt Group Registers
0x0100 + 4n	GICD_ISENABLER<n>	Interrupt Set-Enable Registers
0x0180 + 4n	GICD_ICENABLER<n>	Interrupt Clear-Enable Registers
0x0200 + 4n	GICD_ISPENDR<n>	Interrupt Set-Pending Registers
0x0280 + 4n	GICD_ICPENDR<n>	Interrupt Clear-Pending Registers
0x0300 + 4n	GICD_ISACTIVER<n>	Interrupt Set-Active Registers
0x0380 + 4n	GICD_ICACTIVER<n>	Interrupt Clear-Active Registers
0x0400 + 4n	GICD_IPRIORITYR<n>	Interrupt Priority Registers
0x0800 + 4n	GICD_ITARGETSR<n>	Interrupt Processor Targets Registers
0x0C00 + 4n	GICD_ICFGR<n>	Interrupt Configuration Registers
0x0D00 + 4n	GICD_IGRPMODR<n>	Interrupt Group Modifier Registers
0x0E00 + 4n	GICD_NSACR<n>	Non-secure Access Control Registers
0x0F00	GICD_SGIR	Software Generated Interrupt Register
0x0F10 + 4n	GICD_CPENDSGIR<n>	SGI Clear-Pending Registers
0x0F20 + 4n	GICD_SPENDSGIR<n>	SGI Set-Pending Registers
0x1000 + 4n	GICD_IGROUPR<n>E	Interrupt Group Registers (extended SPI range)
0x1200 + 4n	GICD_ISENABLER<n>E	Interrupt Set-Enable Registers
0x1400 + 4n	GICD_ICENABLER<n>E	Interrupt Clear-Enable Registers
0x1600 + 4n	GICD_ISPENDR<n>E	Interrupt Set-Pending Registers (extended SPI range)
0x1800 + 4n	GICD_ICPENDR<n>E	Interrupt Clear-Pending Registers (extended SPI range)

Offset	Name	Description
0x1A00 + 4n	GICD_ISACTIVER<n>E	Interrupt Set-Active Registers (extended SPI range)
0x1C00 + 4n	GICD_ICACTIVER<n>E	Interrupt Clear-Active Registers (extended SPI range)
0x2000 + 4n	GICD_IPRIORITYR<n>E	Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.
0x3000 + 4n	GICD_ICFGR<n>E	Interrupt Configuration Registers (Extended SPI Range)
0x3400 + 4n	GICD_IGRPMODR<n>E	Interrupt Group Modifier Registers (extended SPI range)
0x3600 + 4n	GICD_NSACR<n>E	Non-secure Access Control Registers
0x6000 + 8n	GICD_IROUTER<n>	Interrupt Routing Registers
0x8000 + 8n	GICD_IROUTER<n>E	Interrupt Routing Registers (Extended SPI Range)

In the GIC ITS control block:

Offset	Name	Description
0x0000	GITS_CTLR	ITS Control Register
0x0004	GITS_IIDR	ITS Identification Register
0x0008	GITS_TYPER	ITS Type Register
0x0010	GITS_MPAMIDR	Report maximum PARTID and PMG Register
0x0014	GITS_PARTIDR	Set PARTID and PMG Register
0x0018	GITS_MPIDR	Report ITS's affinity.
0x0080	GITS_CBASER	ITS Command Queue Descriptor
0x0088	GITS_CWRITER	ITS Write Register
0x0090	GITS_CREADR	ITS Read Register
0x0100 + 8n	GITS_BASER<n>	ITS Translation Table Descriptors
0x20020	GITS_SGIR	ITS SGI Register

In the GIC ITS translation block:

Offset	Name	Description
0x0040	GITS_TRANSLATER	ITS Translation Register

In the GIC Redistributor block:

Frame	Offset	Name	Description
RD_base	0x0000	GICR_CTLR	Redistributor Control Register
RD_base	0x0004	GICR_IIDR	Redistributor Implementer Identification Register
RD_base	0x0008	GICR_TYPER	Redistributor Type Register
RD_base	0x0010	GICR_STATUSR	Error Reporting Status Register
RD_base	0x0010	GICR_STATUSR	Error Reporting Status Register
RD_base	0x0014	GICR_WAKER	Redistributor Wake Register
RD_base	0x0018	GICR_MPAMIDR	Report maximum PARTID and PMG Register
RD_base	0x001C	GICR_PARTIDR	Set PARTID and PMG Register
RD_base	0x0040	GICR_SETLPIR	Set LPI Pending Register
RD_base	0x0048	GICR_CLRLPIR	Clear LPI Pending Register
RD_base	0x0070	GICR_PROPBASER	Redistributor Properties Base Address Register
RD_base	0x0078	GICR_PENDBASER	Redistributor LPI Pending Table Base Address Register
RD_base	0x00A0	GICR_INVLPIR	Redistributor Invalidate LPI Register
RD_base	0x00B0	GICR_INVALLR	Redistributor Invalidate All Register
RD_base	0x00C0	GICR_SYNCR	Redistributor Synchronize Register
SGI_base	0x0080	GICR_IGROUPR0	Interrupt Group Register 0

Frame	Offset	Name	Description
SGI_base	0x0080 + 4n	GICR_IGROUPR<n>E	Interrupt Group Registers
SGI_base	0x0100	GICR_ISENABLER0	Interrupt Set-Enable Register 0
SGI_base	0x0100 + 4n	GICR_ISENABLER<n>E	Interrupt Set-Enable Registers
SGI_base	0x0180	GICR_ICENABLER0	Interrupt Clear-Enable Register 0
SGI_base	0x0180 + 4n	GICR_ICENABLER<n>E	Interrupt Clear-Enable Registers
SGI_base	0x0200	GICR_ISPENDR0	Interrupt Set-Pending Register 0
SGI_base	0x0200 + 4n	GICR_ISPENDR<n>E	Interrupt Set-Pending Registers
SGI_base	0x0280	GICR_ICPENDR0	Interrupt Clear-Pending Register 0
SGI_base	0x0280 + 4n	GICR_ICPENDR<n>E	Interrupt Clear-Pending Registers
SGI_base	0x0300	GICR_ISACTIVER0	Interrupt Set-Active Register 0
SGI_base	0x0300 + 4n	GICR_ISACTIVER<n>E	Interrupt Set-Active Registers
SGI_base	0x0380	GICR_ICACTIVER0	Interrupt Clear-Active Register 0
SGI_base	0x0380 + 4n	GICR_ICACTIVER<n>E	Interrupt Clear-Active Registers
SGI_base	0x0400 + 4n	GICR_IPRIORITYR<n>	Interrupt Priority Registers
SGI_base	0x0400 + 4n	GICR_IPRIORITYR<n>E	Interrupt Priority Registers (extended PPI range)
SGI_base	0x0C00	GICR_ICFGR0	Interrupt Configuration Register 0
SGI_base	0x0C00 + 4n	GICR_ICFGR<n>E	Interrupt configuration registers
SGI_base	0x0C04	GICR_ICFGR1	Interrupt Configuration Register 1
SGI_base	0x0D00	GICR_IGRPMODR0	Interrupt Group Modifier Register 0
SGI_base	0x0D00 + 4n	GICR_IGRPMODR<n>E	Interrupt Group Modifier Registers
SGI_base	0x0E00	GICR_NSACR	Non-secure Access Control Register
VLPI_base	0x0070	GICR_VPROPBASER	Virtual Redistributor Properties Base Address Register
VLPI_base	0x0078	GICR_VPENDBASER	Virtual Redistributor LPI Pending Table Base Address Register
VLPI_base	0x0080	GICR_VSGIR	Redistributor virtual SGI pending state request register
VLPI_base	0x0088	GICR_VSGIPENDR	Redistributor virtual SGI pending state register

In the GIC Virtual CPU interface block:

Offset	Name	Description
0x0000	GICV_CTLR	Virtual Machine Control Register
0x0004	GICV_PMR	Virtual Machine Priority Mask Register
0x0008	GICV_BPR	Virtual Machine Binary Point Register
0x000C	GICV_IAR	Virtual Machine Interrupt Acknowledge Register
0x0010	GICV_EOIR	Virtual Machine End Of Interrupt Register
0x0014	GICV_RPR	Virtual Machine Running Priority Register
0x0018	GICV_HPPIR	Virtual Machine Highest Priority Pending Interrupt Register
0x001C	GICV_ABPR	Virtual Machine Aliased Binary Point Register
0x0020	GICV_AIAR	Virtual Machine Aliased Interrupt Acknowledge Register
0x0024	GICV_AEOIR	Virtual Machine Aliased End Of Interrupt Register
0x0028	GICV_AHPPIR	Virtual Machine Aliased Highest Priority Pending Interrupt Register
0x002C	GICV_STATUSR	Virtual Machine Error Reporting Status Register
0x00D0 + 4n	GICV_APR<n>	Virtual Machine Active Priorities Registers
0x00FC	GICV_IIDR	Virtual Machine CPU Interface Identification Register
0x1000	GICV_DIR	Virtual Machine Deactivate Interrupt Register

In the GIC Virtual interface control block:

Offset	Name	Description
0x0000	GICH_HCR	Hypervisor Control Register
0x0004	GICH_VTR	Virtual Type Register
0x0008	GICH_VMCR	Virtual Machine Control Register
0x0010	GICH_MISR	Maintenance Interrupt Status Register
0x0020	GICH_EISR	End Interrupt Status Register
0x0030	GICH_ELRSR	Empty List Register Status Register
0x00F0 + 4n	GICH_APR<n>	Active Priorities Registers
0x0100 + 4n	GICH_LR<n>	List Registers

In the MPAM block:

Frame	Offset	Name	Description
MPAMF_BASE_ns	0x0000	MPAMF_IDR	MPAM Features Identification Register
MPAMF_BASE_ns	0x0018	MPAMF_IIDR	MPAM Implementation Identification Register
MPAMF_BASE_ns	0x0020	MPAMF_AIDR	MPAM Architecture Identification Register
MPAMF_BASE_ns	0x0028	MPAMF_IMPL_IDR	MPAM Implementation-Specific Partitioning Feature Identification Register
MPAMF_BASE_ns	0x0030	MPAMF_CPOR_IDR	MPAM Features Cache Portion Partitioning ID register
MPAMF_BASE_ns	0x0038	MPAMF_CCAP_IDR	MPAM Features Cache Capacity Partitioning ID register
MPAMF_BASE_ns	0x0040	MPAMF_MBW_IDR	MPAM Memory Bandwidth Partitioning Identification Register
MPAMF_BASE_ns	0x0048	MPAMF_PRI_IDR	MPAM Priority Partitioning Identification Register
MPAMF_BASE_ns	0x0050	MPAMF_PARTID_NRW_IDR	MPAM PARTID Narrowing ID register
MPAMF_BASE_ns	0x0080	MPAMF_MSMON_IDR	MPAM Resource Monitoring Identification Register
MPAMF_BASE_ns	0x0088	MPAMF_CSUMON_IDR	MPAM Features Cache Storage Usage

Frame	Offset	Name	Description
			Monitoring ID register
MPAMF_BASE_ns	0x0090	MPAMF_MBWUMON_IDR	MPAM Features Memory Bandwidth Usage Monitoring ID register
MPAMF_BASE_ns	0x00F0	MPAMF_ECR	MPAM Error Control Register
MPAMF_BASE_ns	0x00F8	MPAMF_ESR	MPAM Error Status Register
MPAMF_BASE_ns	0x0100	MPAMCFG_PART_SEL	MPAM Partition Configuration Selection Register
MPAMF_BASE_ns	0x0108	MPAMCFG_CMAX	MPAM Cache Maximum Capacity Partition Configuration Register
MPAMF_BASE_ns	0x0200	MPAMCFG_MBW_MIN	MPAM Cache Maximum Capacity Partition Configuration Register
MPAMF_BASE_ns	0x0208	MPAMCFG_MBW_MAX	MPAM Memory Bandwidth Maximum Partition Configuration Register
MPAMF_BASE_ns	0x0220	MPAMCFG_MBW_WINWD	MPAM Memory Bandwidth Partitioning Window Width Configuration Register
MPAMF_BASE_ns	0x0400	MPAMCFG_PRI	MPAM Priority Partition Configuration Register
MPAMF_BASE_ns	0x0500	MPAMCFG_MBW_PROP	MPAM Memory Bandwidth Proportional Stride Partition Configuration Register
MPAMF_BASE_ns	0x0600	MPAMCFG_INTPARTID	MPAM Internal PARTID Narrowing Configuration Register
MPAMF_BASE_ns	0x0800	MSMON_CFG_MON_SEL	MPAM Monitor Instance Selection Register
MPAMF_BASE_ns	0x0808	MSMON_CAPT_EVNT	MPAM Capture Event Generation Register

Frame	Offset	Name	Description
MPAMF_BASE_ns	0x0810	MSMON_CFG_CSU_FLT	MPAM Memory System Monitor Configure Cache Storage Usage Monitor Filter Register
MPAMF_BASE_ns	0x0818	MSMON_CFG_CSU_CTL	MPAM Memory System Monitor Configure Cache Storage Usage Monitor Control Register
MPAMF_BASE_ns	0x0820	MSMON_CFG_MBWU_FLT	MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Filter Register
MPAMF_BASE_ns	0x0828	MSMON_CFG_MBWU_CTL	MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Control Register
MPAMF_BASE_ns	0x0840	MSMON_CSU	MPAM Cache Storage Usage Monitor Register
MPAMF_BASE_ns	0x0848	MSMON_CSU_CAPTURE	MPAM Cache Storage Usage Monitor Capture Register
MPAMF_BASE_ns	0x0860	MSMON_MBWU	MPAM Memory Bandwidth Usage Monitor Register
MPAMF_BASE_ns	0x0868	MSMON_MBWU_CAPTURE	MPAM Memory Bandwidth Usage Monitor Capture Register
MPAMF_BASE_ns	0x0880	MSMON_MBWU_L	MPAM Long Memory Bandwidth Usage Monitor Register
MPAMF_BASE_ns	0x0890	MSMON_MBWU_L_CAPTUREMSMON_MBWU__L_CAPTURE	MPAM Long Memory Bandwidth Usage Monitor Capture Register
MPAMF_BASE_ns	0x1000	MPAMCFG_CPBM	MPAM Cache Portion Bitmap Partition Configuration Register
MPAMF_BASE_ns	0x2000	MPAMCFG_MBW_PBM	MPAM Bandwidth Portion Bitmap

Frame	Offset	Name	Description
			Partition Configuration Register
MPAMF_BASE_s	0x0000	MPAMF_IDR	MPAM Features Identification Register
MPAMF_BASE_s	0x0008	MPAMF_SIDR	MPAM Features Secure Identification Register
MPAMF_BASE_s	0x0018	MPAMF_IIDR	MPAM Implementation Identification Register
MPAMF_BASE_s	0x0020	MPAMF_AIDR	MPAM Architecture Identification Register
MPAMF_BASE_s	0x0028	MPAMF_IMPL_IDR	MPAM Implementation-Specific Partitioning Feature Identification Register
MPAMF_BASE_s	0x0030	MPAMF_CPOR_IDR	MPAM Features Cache Portion Partitioning ID register
MPAMF_BASE_s	0x0038	MPAMF_CCAP_IDR	MPAM Features Cache Capacity Partitioning ID register
MPAMF_BASE_s	0x0040	MPAMF_MBW_IDR	MPAM Memory Bandwidth Partitioning Identification Register
MPAMF_BASE_s	0x0048	MPAMF_PRI_IDR	MPAM Priority Partitioning Identification Register
MPAMF_BASE_s	0x0050	MPAMF_PARTID_NRW_IDR	MPAM PARTID Narrowing ID register
MPAMF_BASE_s	0x0080	MPAMF_MSMON_IDR	MPAM Resource Monitoring Identification Register
MPAMF_BASE_s	0x0088	MPAMF_CSUMON_IDR	MPAM Features Cache Storage Usage Monitoring ID register
MPAMF_BASE_s	0x0090	MPAMF_MBWUMON_IDR	MPAM Features Memory Bandwidth Usage Monitoring ID register
MPAMF_BASE_s	0x00F0	MPAMF_ECR	MPAM Error Control Register

Frame	Offset	Name	Description
MPAMF_BASE_s	0x00F8	MPAMF_ESR	MPAM Error Status Register
MPAMF_BASE_s	0x0100	MPAMCFG_PART_SEL	MPAM Partition Configuration Selection Register
MPAMF_BASE_s	0x0108	MPAMCFG_CMAX	MPAM Cache Maximum Capacity Partition Configuration Register
MPAMF_BASE_s	0x0200	MPAMCFG_MBW_MIN	MPAM Cache Maximum Capacity Partition Configuration Register
MPAMF_BASE_s	0x0208	MPAMCFG_MBW_MAX	MPAM Memory Bandwidth Maximum Partition Configuration Register
MPAMF_BASE_s	0x0220	MPAMCFG_MBW_WINWD	MPAM Memory Bandwidth Partitioning Window Width Configuration Register

AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

Purpose

Disable control bits for the architected s event counters, AMEVCNTR0<n>.

Configuration

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR0_EL0[31:0] .

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR0[31:0] .

The power domain of AMCNTENCLR0 is IMPLEMENTATION DEFINED. ~~Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are RES0.

Attributes

AMCNTENCLR0 is a 32-bit register.

Field descriptions

The AMCNTENCLR0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P<n>, bit [n]																															

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter disable bit for AMEVCNTR0<n>.

Bits [31:N] are RAZ/WI. N is the value in AMCGCR.CG0NC.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR0<n> is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR0<n> is enabled. When written, disables AMEVCNTR0<n>.

On a Cold reset, this field resets to 0.

Accessing the AMCNTENCLR0

AMCNTENCLR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance

AMU	0xC20	AMCNTENCLR0	~~AMCNTENSET0~~

Accesses on this interface are **RO**.

AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>.

Configuration

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR1_EL0[31:0] .

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR1[31:0] .

The power domain of AMCNTENCLR1 is IMPLEMENTATION DEFINED. ~~Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are RES0.

Attributes

AMCNTENCLR1 is a 32-bit register.

Field descriptions

The AMCNTENCLR1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P<n>, bit [n]																															

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter disable bit for AMEVCNTR1<n>.

Bits [31:N] are RAZ/WI. N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR1<n> is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR1<n> is enabled. When written, disables AMEVCNTR1<n>.

On a Cold reset, this field resets to 0.

Accessing the AMCNTENCLR1

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENCLR1 are CONSTRAINED UNPREDICTABLE, and accesses to the register behave as RAZ/WI.

Note

The number of auxiliary activity monitor event counters implemented is zero exactly when AMCFGR.NCG == 0b0000.

AMCNTENCLR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xC24	AMCNTENCLR1

Accesses on this interface are **RO**.

AMDEVAFF0, Activity Monitors Device Affinity Register 0

The AMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Configuration

The power domain of AMDEVAFF0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

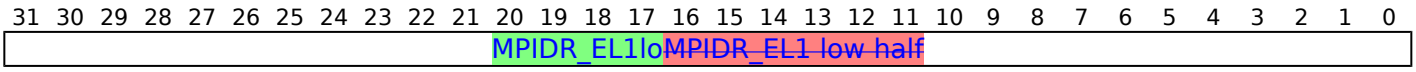
This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMDEVAFF0 are RES0.

Attributes

AMDEVAFF0 is a 32-bit register.

Field descriptions

The AMDEVAFF0 bit assignments are:



MPIDR_EL1loMPIDR_EL1 low half, bits [31:0]

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing the AMDEVAFF0

AMDEVAFF0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFA8	AMDEVAFF0

Accesses on this interface are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

AMEVCNTR0<n>, Activity Monitors Event Counter Registers 0, n = 0 - 15

The AMEVCNTR0<n> characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configuration

External register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR0<n>_EL0[63:0] .

External register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch32 System register AMEVCNTR0<n>[63:0] .

The power domain of AMEVCNTR0<n> is IMPLEMENTATION DEFINED. ~~Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n> are RES0.

Attributes

AMEVCNTR0<n> is a 64-bit register.

Field descriptions

The AMEVCNTR0<n> bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ACNT																															
ACNT																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to `0`.

Accessing the AMEVCNTR0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n> are CONSTRAINED UNPREDICTABLE, and accesses to the register behave as RAZ/WI.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

AMEVCNTR0<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance	Range
AMU	0x000 + 8n	AMEVCNTR0<n>	31:0

Accesses on this interface are **RO**.

Component	Offset	Instance	Range
AMU	0x004 + 8n	AMEVCNTR0<n>	63:32

Accesses on this interface are **RO**.

AMEVCNTR1<n>, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Configuration

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR1<n>_EL0[63:0] .

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch32 System register AMEVCNTR1<n>[63:0] .

The power domain of AMEVCNTR1<n> is IMPLEMENTATION DEFINED. ~~Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

This register is present only when AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are RES0.

Attributes

AMEVCNTR1<n> is a 64-bit register.

Field descriptions

The AMEVCNTR1<n> bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ACNT																															
ACNT																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to `0`.

Accessing the AMEVCNTR1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<n> are CONSTRAINED UNPREDICTABLE, and accesses to the register behave as RAZ/WI.

Note

AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

AMEVCNTR1<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance	Range
AMU	0x100 + 8n	AMEVCNTR1<n>	31:0

Accesses on this interface are **RO**.

Component	Offset	Instance	Range
AMU	0x104 + 8n	AMEVCNTR1<n>	63:32

Accesses on this interface are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

Purpose

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- CNTNSAR controls whether CNTACR<n> is accessible by Non-secure accesses.
- If frame CNTEL0BaseN is implemented, the CNTEL0ACR in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

Configuration

The power domain of CNTACR<n> is IMPLEMENTATION DEFINED.

~~The power domain of CNTACR<n> is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Implemented only if the value of CNTTIDR.Frame<n> is 1.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

Attributes

CNTACR<n> is a 32-bit register.

Field descriptions

The CNTACR<n> bit assignments are:

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6	5	4	3	2	1	0
RES0	RWPT	RWVT	RVOFF	RFRQ	RVCT	RPCT

Bits [31:6]

Reserved, RES0.

RWPT, bit [5]

Read/write access to the EL1 Physical Timer registers CNTP_CVAL, CNTP_TVAL, and CNTP_CTL, in frame <n>. The possible values of this bit are:

RWPT	Meaning
0b0	No access to the EL1 Physical Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the EL1 Physical Timer registers in frame <n>.

This field resets to an architecturally UNKNOWN value.

RWVT, bit [4]

Read/write access to the Virtual Timer register CNTV_CVAL, CNTV_TVAL, and CNTV_CTL, in frame <n>. The possible values of this bit are:

RWVT	Meaning
0b0	No access to the Virtual Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the Virtual Timer registers in frame <n>.

This field resets to an architecturally UNKNOWN value.

RVOFF, bit [3]

Read-only access to CNTVOFF, in frame <n>. The possible values of this bit are:

RVOFF	Meaning
0b0	No access to CNTVOFF in frame <n>. The register is RES0.
0b1	Read-only access to CNTVOFF in frame <n>.

This field resets to an architecturally UNKNOWN value.

RFRQ, bit [2]

Read-only access to CNTFRQ, in frame <n>. The possible values of this bit are:

RFRQ	Meaning
0b0	No access to CNTFRQ in frame <n>. The register is RES0.
0b1	Read-only access to CNTFRQ in frame <n>.

This field resets to an architecturally UNKNOWN value.

RVCT, bit [1]

Read-only access to CNTVCT, in frame <n>. The possible values of this bit are:

RVCT	Meaning
0b0	No access to CNTVCT in frame <n>. The register is RES0.
0b1	Read-only access to CNTVCT in frame <n>.

This field resets to an architecturally UNKNOWN value.

RPCT, bit [0]

Read-only access to CNTPCT, in frame <n>. The possible values of this bit are:

RPCT	Meaning
0b0	No access to CNTPCT in frame <n>. The register is RES0.
0b1	Read-only access to CNTPCT in frame <n>.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTACR<n>

In a system that recognizes two Security states:

- CNTACR<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTACR<n> is accessible by Non-secure accesses.

CNTACR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x040 + 4n	CNTACR<n>

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

CNTCR, Counter Control Register

The CNTCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Configuration

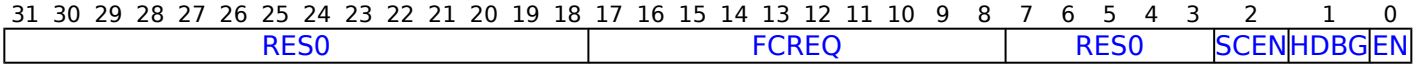
The power domain of CNTCR is IMPLEMENTATION DEFINED. ~~Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

Attributes

CNTCR is a 32-bit register.

Field descriptions

The CNTCR bit assignments are:



Bits [31:18]

Reserved, RES0.

FCREQ, bits [17:8]

Frequency change request. Indicates the number of the entry in the Frequency modes table to select.

Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is IMPLEMENTATION DEFINED up to a maximum of 1004 entries, see 'The Frequency modes table' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile. An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

This field resets to `0`.

Bits [7:3]

Reserved, RES0.

SCEN, bit [2]

When ARMv8.4-CNTSC is implemented:

Scale Enable.

SCEN	Meaning
0b0	Scaling is not enabled. The counter value is incremented by 0x1.0000000 for each counter tick.
0b1	Scaling is enabled. The counter is incremented by CNTSCR.ScaleVal for each counter tick.

The SCEN bit can only be changed when the counter is disabled, when CNTCR.EN == 0.

If the value of CNTCR.SCEN changes when CNTCR.EN == 1 then:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

When the CNTCV register in the CNTControlBase frame of the memory mapped counter module is written to, the accumulated fraction information is reset to zero.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HDBG, bit [1]

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

HDBG	Meaning
0b0	System counter ignores Halt-on-debug.
0b1	Asserted Halt-on-debug signal halts system counter update.

This field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enables the counter:

EN	Meaning
0b0	System counter disabled.
0b1	System counter enabled.

This field resets to 0.

Accessing the CNTCR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x000	CNTCR

Accesses on this interface are **RW**.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

CNTCV, Counter Count Value register

The CNTCV characteristics are:

Purpose

Indicates the current count value.

Configuration

The power domain of CNTCV is IMPLEMENTATION DEFINED.

~~The power domain of CNTCV is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Attributes

CNTCV is a 64-bit register.

Field descriptions

The CNTCV bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CountValue																															
CountValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CountValue, bits [63:0]

Indicates the counter value.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTCV

Frame	Accessibility
CNTControlBase	RW
CNTReadBase	RO

A write to CNTCV must be visible in the CNTPCT register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, and therefore this register instance, is implemented only in the Secure memory map.
- If the counter is enabled, the effect of writing to the register is UNKNOWN.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

CNTCV can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTControlBase	0x008	CNTCV	63:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTReadBase	0x000	CNTCV	63:0

Accesses on this interface are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

CNTEL0ACR, Counter-timer EL0 Access Control Register

The CNTEL0ACR characteristics are:

Purpose

An implementation of CNTEL0ACR in the frame at CNTBaseN controls whether the CNTPCT, CNTVCT, CNTFRQ, EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTEL0BaseN.

Configuration

The power domain of CNTEL0ACR is IMPLEMENTATION DEFINED.

~~The power domain of CNTEL0ACR is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

Implementation of this register is OPTIONAL.

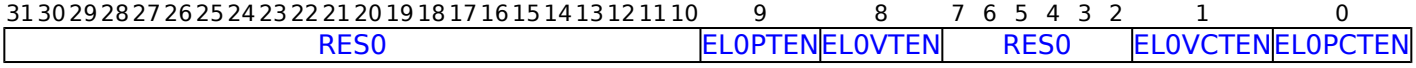
For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Attributes

CNTEL0ACR is a 32-bit register.

Field descriptions

The CNTEL0ACR bit assignments are:



Bits [31:10]

Reserved, RES0.

EL0PTEN, bit [9]

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the CNTP_CVAL, CNTP_TVAL, and CNTP_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:

EL0PTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

This field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

Second view read/write access control for the Virtual Timer registers. This bit controls whether the CNTV_CVAL, CNTV_TVAL, and CNTV_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:

EL0VTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL0VCTEN, bit [1]

Second view read access control for CNTVCT and CNTFRQ. The possible values of this bit are:

EL0VCTEN	Meaning
0b0	CNTVCT is not visible in the second view. If EL0PCTEN is set to 0, CNTFRQ is not visible in the second view.
0b1	Access permitted. If CNTVCT and CNTFRQ are visible in the current frame then they are visible in the second view.

This field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Second view read access control for CNTPCT and CNTFRQ. The possible values of this bit are:

EL0PCTEN	Meaning
0b0	CNTPCT is not visible in the second view. If EL0VCTEN is set to 0, CNTFRQ is not visible in the second view.
0b1	Access permitted. If CNTPCT and CNTFRQ are visible in the current frame then they are visible in the second view.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTEL0ACR

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

- The register location in that frame is RAZ/WI.
- If the corresponding CNTEL0BaseN frame is implemented, the registers CNTFRQ, CNTP_CTL, CNTP_CVAL, CNTP_TVAL, CNTPCT, CNTV_CTL, CNTV_CVAL, CNTV_TVAL, and CNTVCT are not visible in that frame.

CNTEL0ACR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x014	CNTEL0ACR

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

Purpose

Indicates the base frequency of the system counter.

Configuration

The power domain of CNTFID0 is IMPLEMENTATION DEFINED.

~~The power domain of CNTFID0 is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information see 'The Frequency modes table' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

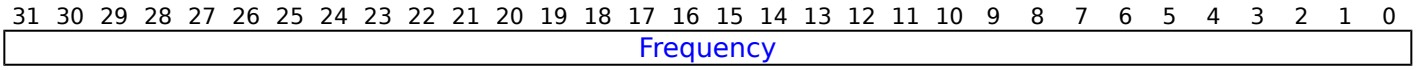
If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID0 is a 32-bit register.

Field descriptions

The CNTFID0 bit assignments are:



Frequency, bits [31:0]

The base frequency of the system counter, in Hz.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTFID0

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTFID0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020	CNTFID0

Accesses on this interface are **RO or RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

CNTFID<n>, Counter Frequency IDs, n > 0, n = 1 - 1003

The CNTFID<n> characteristics are:

Purpose

Indicates alternative system counter update frequencies.

Configuration

The power domain of CNTFID<n> is IMPLEMENTATION DEFINED.

~~The power domain of CNTFID<n> is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0, see 'The Frequency modes table' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The number of CNTFID<n> registers is IMPLEMENTATION DEFINED, and the only required CNTFID<n> register is CNTFID0.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED up to this limit. For an implementation that includes registers in the IMPLEMENTATION DEFINED register space `0x0C0-0x0FC`, the maximum number of entries in the Frequency modes table is 40, including the zero-word end marker.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

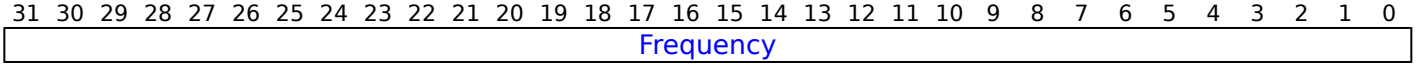
If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID<n> is a 32-bit register.

Field descriptions

The CNTFID<n> bit assignments are:



Frequency, bits [31:0]

A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. Arm strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

increment = (base frequency) / (selected frequency)

This field resets to an architecturally UNKNOWN value.

Accessing the CNTFID<n>

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes these registers, is implemented only in the Secure memory map.

CNTFID<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020 + 4n	CNTFID<n>

Accesses on this interface are **RO or RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. The instance of the register in the CNTCTLBase frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configuration

The power domain of CNTFRQ is IMPLEMENTATION DEFINED.

~~The power domain of CNTFRQ is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

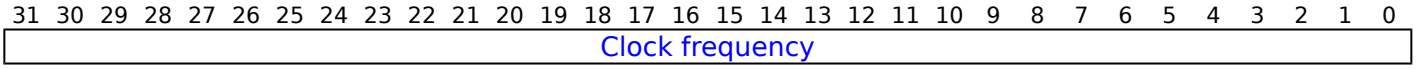
For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Attributes

CNTFRQ is a 32-bit register.

Field descriptions

The CNTFRQ bit assignments are:



Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTFRQ

CNTFRQ must be implemented as an RW register in the CNTCTLBase frame.

In a system that recognizes two Security states, the instance of the register in the CNTCTLBase frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I2 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of CNTACR<n>.RFRQ is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTFRQ is accessible as a RO register in that frame if both:
  - CNTFRQ is accessible in the corresponding CNTBaseN frame.
  - Either the value of CNTEL0ACR.EL0VCTEN is 1 or the value of CNTEL0ACR.EL0PCTEN is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

CNTFRQ can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x010	CNTFRQ

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x010	CNTFRQ

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x000	CNTFRQ

Accesses on this interface are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

Purpose

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

Configuration

The power domain of CNTNSAR is IMPLEMENTATION DEFINED.

~~The power domain of CNTNSAR is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Attributes

CNTNSAR is a 32-bit register.

Field descriptions

The CNTNSAR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								NS7	NS6	NS5	NS4	NS3	NS2	NS1	NS0

Bits [31:8]

Reserved, RES0.

NS<n>, bit [n], for n = 0 to 7

Non-secure access to frame n. The possible values of this bit are:

NS<n>	Meaning
0b0	Secure access only. Behaves as RES0 to Non-secure accesses.
0b1	Secure and Non-secure accesses permitted.

This bit also determines whether, in the CNTCTLBase frame, CNTACR<n> and CNTVOFF<n> are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTNSAR

In a system that recognizes two Security states, this register is only accessible by Secure accesses.

CNTNSAR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x004	CNTNSAR

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Configuration

The power domain of CNTP_CTL is IMPLEMENTATION DEFINED.

~~The power domain of CNTP_CTL is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

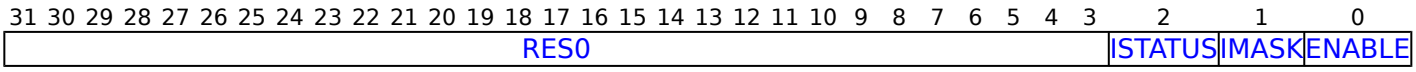
For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Attributes

CNTP_CTL is a 32-bit register.

Field descriptions

The CNTP_CTL bit assignments are:



Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTP_CTL

CNTP_CTL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CTL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CTL is accessible in that frame if both:
  - CNTP_CTL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

CNTP_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x02C	CNTP_CTL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x02C	CNTP_CTL

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the EL1 physical timer.

Configuration

The power domain of CNTP_CVAL is IMPLEMENTATION DEFINED.

~~The power domain of CNTP_CVAL is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

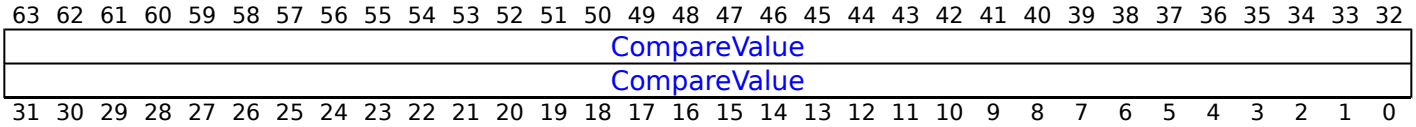
For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Attributes

CNTP_CVAL is a 64-bit register.

Field descriptions

The CNTP_CVAL bit assignments are:



CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTP_CTL.IMASK is 0.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTP_CVAL

CNTP_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CVAL is accessible in that frame if both:
  - CNTP_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

CNTP_CVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x020	CNTP_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x024	CNTP_CVAL	63:32

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x020	CNTP_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x024	CNTP_CVAL	63:32

Accesses on this interface are **RW**.

CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configuration

The power domain of CNTP_TVAL is IMPLEMENTATION DEFINED.

~~The power domain of CNTP_TVAL is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

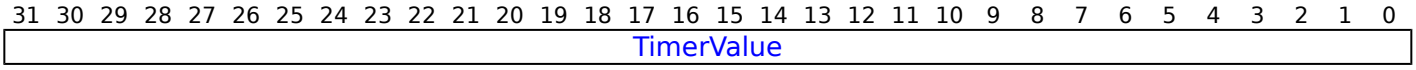
For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Attributes

CNTP_TVAL is a 32-bit register.

Field descriptions

The CNTP_TVAL bit assignments are:



TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL.ENABLE is 1, the value returned is (CompareValue - CNTPCT).

On a write of this register, CompareValue is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTP_TVAL

CNTP_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_TVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_TVAL is accessible in that frame if both:
  - CNTP_TVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

CNTP_TVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x028	CNTP_TVAL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x028	CNTP_TVAL

Accesses on this interface are **RW**.

(old) htmldiff from- (new)

CNTSCR, Counter Scale Register

The CNTSCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Configuration

The power domain of CNTSCR is IMPLEMENTATION DEFINED.

~~The power domain of CNTSCR is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

This register is present only when ARMv8.4-CNTSC is implemented. Otherwise, direct accesses to CNTSCR are RES0.

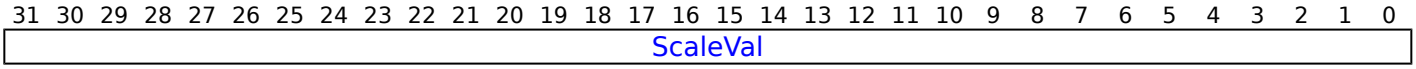
For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Attributes

CNTSCR is a 32-bit register.

Field descriptions

The CNTSCR bit assignments are:



ScaleVal, bits [31:0]

Scale Value

When counter scaling is enabled, ScaleVal is the amount added to the counter value for every counter tick.

Counter tick is defined as one period of the current operating frequency of the Generic counter.

ScaleVal is expressed as an unsigned fixed point number with an 8-bit integer value and a 24-bit fractional value.

CNTSCR.ScaleVal can only be changed when CNTCR.EN == 0. If the value of this field is changed when CNTCR.EN == 1:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTSCR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x10	CNTSCR

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

CNTSR, Counter Status Register

The CNTSR characteristics are:

Purpose

Provides counter frequency status information.

Configuration

The power domain of CNTSR is IMPLEMENTATION DEFINED. ~~Some or all RW fields of this register have defined reset values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

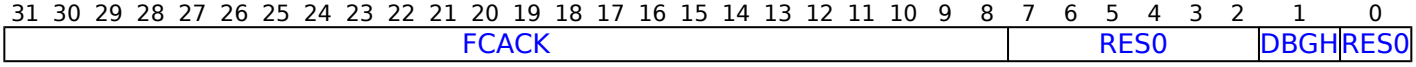
For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Attributes

CNTSR is a 32-bit register.

Field descriptions

The CNTSR bit assignments are:



FCACK, bits [31:8]

Frequency change acknowledge. Indicates the currently selected entry in the Frequency modes table, see 'The Frequency modes table' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

This field resets to `0`.

Bits [7:2]

Reserved, RES0.

DBGH, bit [1]

Indicates whether the counter is halted because the Halt-on-debug signal is asserted:

DBGH	Meaning
`0b0`	Counter is not halted.
`0b1`	Counter is halted.

This field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing the CNTSR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x004	CNTSR

Accesses on this interface are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Configuration

The power domain of CNTV_CTL is IMPLEMENTATION DEFINED.

~~The power domain of CNTV_CTL is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

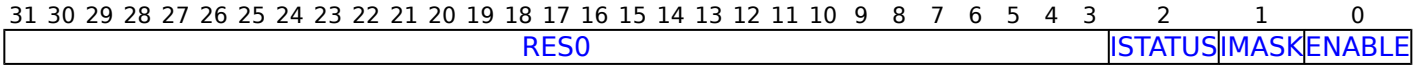
For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions

The CNTV_CTL bit assignments are:



Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

For more information see 'Operation of the CompareValue views of the timers' and 'Operation of the TimerValue views of the timers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, chapter D6.

This bit is read-only.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTV_CTL

CNTV_CTL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CTL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CTL is accessible in that frame if both:
  - CNTV_CTL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

CNTV_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x03C	CNTV_CTL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x03C	CNTV_CTL

Accesses on this interface are **RW**.

CNTV_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the virtual timer.

Configuration

The power domain of CNTV_CVAL is IMPLEMENTATION DEFINED.

~~The power domain of CNTV_CVAL is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

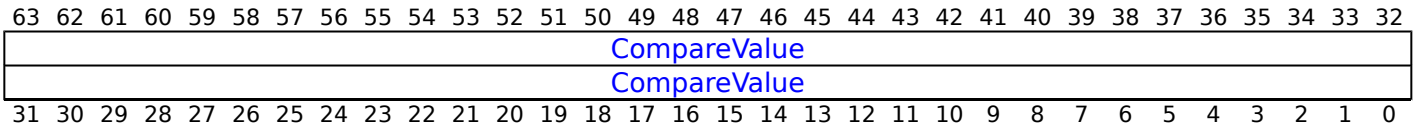
For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Attributes

CNTV_CVAL is a 64-bit register.

Field descriptions

The CNTV_CVAL bit assignments are:



CompareValue, bits [63:0]

Holds the virtual timer CompareValue.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTV_CTL.IMASK is 0.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTV_CVAL

CNTV_CVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CVAL is accessible in that frame if both:
  - CNTV_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

CNTV_CVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x030	CNTV_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x034	CNTV_CVAL	63:32

CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configuration

The power domain of CNTV_TVAL is IMPLEMENTATION DEFINED.

~~The power domain of CNTV_TVAL is IMPLEMENTATION DEFINED. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a reset of the reset domain in which the register is implemented. The register is not affected by a reset of any other reset domain.~~

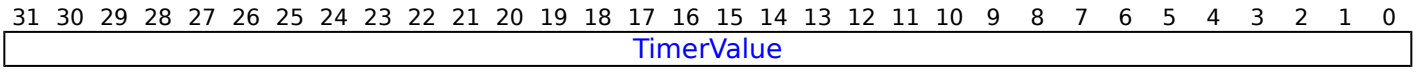
For more information see 'Power and reset domains for the system level implementation of the Generic Timer' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions

The CNTV_TVAL bit assignments are:



TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If CNTV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL.ENABLE is 1, the value returned is (CompareValue - CNTVCT).

On a write of this register, CompareValue is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTV_TVAL

CNTV_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' in Chapter I1 of the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_TVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_TVAL is accessible in that frame if both:
  - CNTV_TVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

CNTV_TVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x038	CNTV_TVAL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x038	CNTV_TVAL

CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

Purpose

Sets bits of the Application Trigger register.

Configuration

CTIAPPSET is in the Debug power domain.

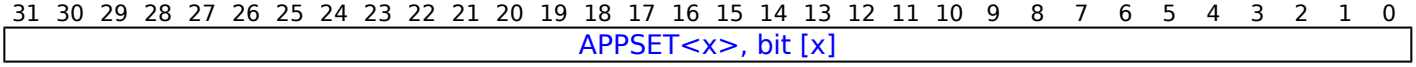
~~CTIAPPSET is in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.~~

Attributes

CTIAPPSET is a 32-bit register.

Field descriptions

The CTIAPPSET bit assignments are:



APPSET<x>, bit [x], for x = 0 to 31

Application trigger <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

APPSET<x>	Meaning
0b0	Reading this means the application trigger is inactive. Writing this has no effect.
0b1	Reading this means the application trigger is active. Writing this sets the corresponding bit in CTIAPPTRIG to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use CTIAPPPULSE.

On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing the CTIAPPSET

CTIAPPSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x014	CTIAPPSET

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.

- When !SoftwareLockStatus() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

Configuration

CTIAUTHSTATUS is in the Debug power domain.

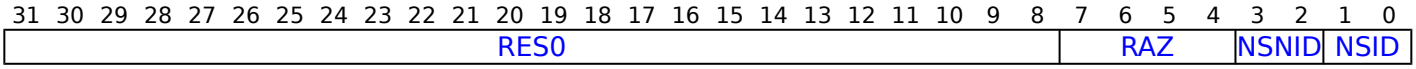
This register is OPTIONAL, and is required for CoreSight compliance.

Attributes

CTIAUTHSTATUS is a 32-bit register.

Field descriptions

The CTIAUTHSTATUS bit assignments are:



Bits [31:8]

Reserved, RES0.

Bits [7:4]

Reserved, RAZ.

NSNID, bits [3:2]

If EL3 is ~~not~~ implemented, this~~and~~ field~~the implemented Security state is Secure state,~~ holds the same value as DBGAUTHSTATUS_EL1.NSNID.~~SNID.~~

If EL3 is not implemented and the implemented Security state is Secure state~~Otherwise~~, this field holds the same value as DBGAUTHSTATUS_EL1.SNID.~~NSNID.~~

NSID, bits [1:0]

If EL3 is ~~not~~ implemented, this~~and~~ field~~the implemented Security state is Secure state,~~ holds the same value as DBGAUTHSTATUS_EL1.NSNID.~~SID.~~

If EL3 is not implemented and the implemented Security state is Secure state~~Otherwise~~, this field holds the same value as DBGAUTHSTATUS_EL1.SID.~~NSID.~~

Accessing the CTIAUTHSTATUS

CTIAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFB8	CTIAUTHSTATUS

Accesses on this interface are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

CTICLAIMCLR, CTI CLAIM Tag Clear register

The CTICLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM bits, and to clear CLAIM tag bits to 0.

Configuration

CTICLAIMCLR is in the Debug power domain. ~~Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.~~

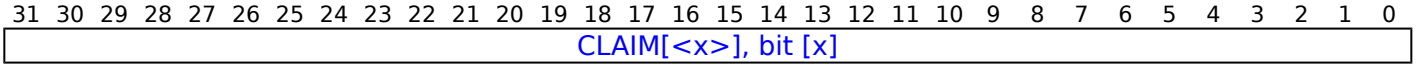
Implementation of this register is OPTIONAL.

Attributes

CTICLAIMCLR is a 32-bit register.

Field descriptions

The CTICLAIMCLR bit assignments are:



CLAIM[<x>], bit [x], for x = 0 to 31

CLAIM tag clear bit.

For values of x greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

For other values of x, reads return the value of CLAIM[x] and the behavior on writes is:

CLAIM[<x>]	Meaning
0b0	No action.
0b1	Indirectly clear CLAIM[x] to 0.

A single write to CTICLAIMCLR can clear multiple tags to 0.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing the CTICLAIMCLR

CTICLAIMCLR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA4	CTICLAIMCLR

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

CTICLAIMSET, CTI CLAIM Tag Set register

The CTICLAIMSET characteristics are:

Purpose

Used by software to set CLAIM bits to 1.

Configuration

CTICLAIMSET is in the Debug power domain. ~~Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.~~

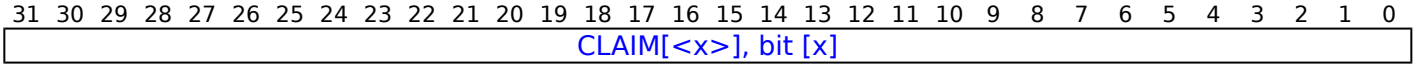
Implementation of this register is OPTIONAL.

Attributes

CTICLAIMSET is a 32-bit register.

Field descriptions

The CTICLAIMSET bit assignments are:



CLAIM[<x>], bit [x], for x = 0 to 31

CLAIM tag set bit.

For values of x greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

For other values of x, the bit is RAO and the behavior on writes is:

CLAIM[<x>]	Meaning
0b0	No action.
0b1	Indirectly set CLAIM[x] tag to 1.

A single write to CTICLAIMSET can set multiple tags to 1.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing the CTICLAIMSET

CTICLAIMSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA0	CTICLAIMSET

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f2116~~134483bd14dc8e12a99c984cbfe3431cc1c9707~~

(old) htmldiff from- (new)

(old) htmldiff from- (new)

CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

Purpose

Controls whether the CTI is enabled.

Configuration

CTICONTROL is in the Debug power domain. ~~Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.~~

Attributes

CTICONTROL is a 32-bit register.

Field descriptions

The CTICONTROL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															GLBEN

Bits [31:1]

Reserved, RES0.

GLBEN, bit [0]

Enables or disables the CTI mapping functions. Possible values of this field are:

GLBEN	Meaning
0b0	CTI mapping functions and application trigger disabled.
0b1	CTI mapping functions and application trigger enabled.

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it remains asserted after the mapping functions are disabled. All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

The following resets apply:

~~On a External debug reset, this field resets to 0.~~

- On a Cold reset, the value of this field is unchanged.
- On an External debug reset, this field resets to 0.
- On a Warm reset, the value of this field is unchanged.

Accessing the CTICONTROL

CTICONTROL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x000	CTICONTROL

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation the CTI must be CTIv2.

If this register is implemented, then CTIDEVAFF1 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Configuration

CTIDEVAFF0 is in the Debug power domain.

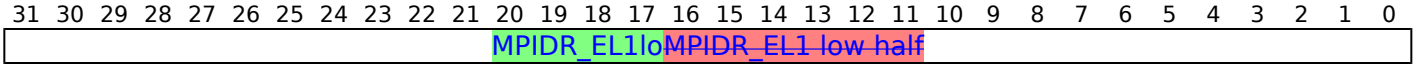
Implementation of this register is OPTIONAL.

Attributes

CTIDEVAFF0 is a 32-bit register.

Field descriptions

The CTIDEVAFF0 bit assignments are:



MPIDR_EL1loMPIDR_EL1 low half, bits [31:0]

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing the CTIDEVAFF0

CTIDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA8	CTIDEVAFF0

Accesses on this interface are **RO**.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation the CTI must be CTIv2.

If this register is implemented, then CTIDEVAFF0 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Configuration

CTIDEVAFF1 is in the Debug power domain.

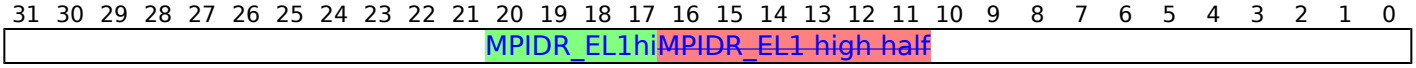
Implementation of this register is OPTIONAL.

Attributes

CTIDEVAFF1 is a 32-bit register.

Field descriptions

The CTIDEVAFF1 bit assignments are:



MPIDR_EL1hiMPIDR_EL1 high half, bits [31:0]

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing the CTIDEVAFF1

CTIDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFAC	CTIDEVAFF1

Accesses on this interface are **RO**.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

CTIDEVCTL, CTI Device Control register

The CTIDEVCTL characteristics are:

Purpose

Provides target-specific device controls

Configuration

CTIDEVCTL is in the Debug power domain. ~~Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.~~

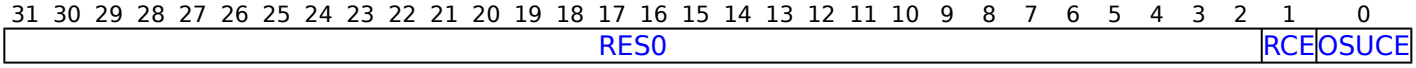
This register is present only when ARMv8.3-DoPD is implemented. Otherwise, direct accesses to CTIDEVCTL are RES0.

Attributes

CTIDEVCTL is a 32-bit register.

Field descriptions

The CTIDEVCTL bit assignments are:



Bits [31:2]

Reserved, RES0.

RCE, bit [1]

Reset Catch Enable.

RCE	Meaning
0b0	Reset Catch debug event disabled.
0b1	Reset Catch debug event enabled.

The following resets apply:

~~On a External debug reset, this field resets to 0.~~

- On a Cold reset, the value of this field is unchanged.
- On an External debug reset, this field resets to 0.
- On a Warm reset, the value of this field is unchanged.

OSUCE, bit [0]

OS Unlock Catch Enable

OSUCE	Meaning
0b0	OS Unlock Catch debug event disabled.
0b1	OS Unlock Catch debug event enabled.

The following resets apply:

~~On a External debug reset, this field resets to 0.~~

- On a Cold reset, the value of this field is unchanged.
- On an External debug reset, this field resets to 0.
- On a Warm reset, the value of this field is unchanged.

Accessing the CTIDEVCTL

CTIDEVCTL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x150	CTIDEVCTL

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

Purpose

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

Configuration

CTIGATE is in the Debug power domain.

~~CTIGATE is in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.~~

Attributes

CTIGATE is a 32-bit register.

Field descriptions

The CTIGATE bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
GATE<x>, bit [x]																															

GATE<x>, bit [x], for x = 0 to 31

Channel <x> gate enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

GATE<x>	Meaning
0b0	Disable output and, if CTIDEVID.INOUT == 0b01, input channel <x> propagation.
0b1	Enable output and, if CTIDEVID.INOUT == 0b01, input channel <x> propagation.

If GATE[x] is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing the CTIGATE

CTIGATE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x140	CTIGATE

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.

- When !SoftwareLockStatus() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

Purpose

Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

Configuration

CTIINEN<n> is in the Debug power domain.

~~CTIINEN<n> is in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.~~

If input trigger n is not connected, the behavior of CTIINEN<n> is IMPLEMENTATION DEFINED.

Attributes

CTIINEN<n> is a 32-bit register.

Field descriptions

The CTIINEN<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
INEN<x>, bit [x]																															

INEN<x>, bit [x], for x = 0 to 31

Input trigger <n> to output channel <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

INEN<x>	Meaning
0b0	Input trigger <n> will not generate an event on output channel <x>.
0b1	Input trigger <n> will generate an event on output channel <x>.

On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing the CTIINEN<n>

CTIINEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x020 + 4n	CTIINEN<n>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.

- When !SoftwareLockStatus() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

Purpose

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

It is IMPLEMENTATION DEFINED whether CTIITCTRL is implemented in the Core power domain or in the Debug power domain. ~~Some or all RW fields of this register have defined reset values, and:~~

- ~~The register is not affected by a Warm reset.~~
- ~~If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.~~
- ~~If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.~~

Implementation of this register is OPTIONAL.

Some or all RW fields of this register have defined reset values, and:

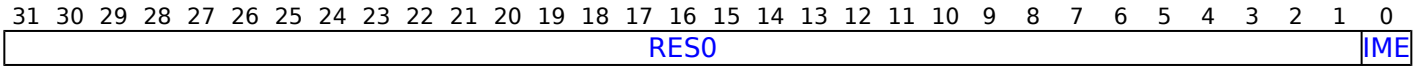
- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain, the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain, the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

Attributes

CTIITCTRL is a 32-bit register.

Field descriptions

The CTIITCTRL bit assignments are:



Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

On a Implementation reset, this field resets to 0.

Accessing the CTIITCTRL

CTIITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xF00	CTIITCTRL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

Purpose

Indicates the current status of the Software Lock for CTI registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILSR is in the Debug power domain. ~~Some or all RW fields of this register have defined reset values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.~~

If ARMv8.4-Debug is implemented, the Software Lock is not implemented.

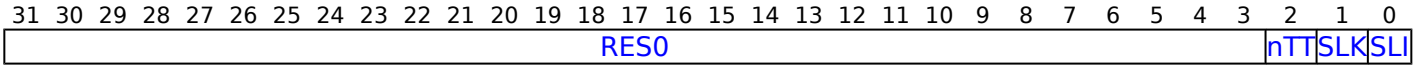
Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILSR is a 32-bit register.

Field descriptions

The CTILSR bit assignments are:



Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

When the Software Lock is implemented.:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

On a External debug reset, this field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Accessing the CTILSR

CTILSR can be accessed through a memory-mapped access to the external debug interface:

Component	Offset	Instance
CTI	0xFB4	CTILSR

Accesses on this interface are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99e984cbfe3431cc1e9707

(old) htmldiff from- (new)

CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

Purpose

Defines which input channels generate output trigger n.

Configuration

CTIOUTEN<n> is in the Debug power domain.

~~CTIOUTEN<n> is in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on an External debug reset. The register is not affected by a Warm reset and is not affected by a Cold reset.~~

If output trigger n is not connected, the behavior of CTIOUTEN<n> is IMPLEMENTATION DEFINED.

Attributes

CTIOUTEN<n> is a 32-bit register.

Field descriptions

The CTIOUTEN<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OUTEN<x>, bit [x]																															

OUTEN<x>, bit [x], for x = 0 to 31

Input channel <x> to output trigger <n> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

OUTEN<x>	Meaning
0b0	An event on input channel <x> will not cause output trigger <n> to be asserted.
0b1	An event on input channel <x> will cause output trigger <n> to be asserted.

On a External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing the CTIOUTEN<n>

CTIOUTEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x0A0 + 4n	CTIOUTEN<n>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configuration

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGAUTHSTATUS_EL1[31:0] .

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGAUTHSTATUS[31:0] .

~~It is IMPLEMENTATION DEFINED whether DBGAUTHSTATUS_EL1 is implemented in the Core power domain or in the Debug power domain.~~

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

Attributes

DBGAUTHSTATUS_EL1 is a 32-bit register.

Field descriptions

The DBGAUTHSTATUS_EL1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SNID		SID		NSNID		NSID	

Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

When ARMv8.4-Debug is implemented:

Secure non-invasive debug.

ExternalSecureNoninvasiveDebugEnabled() == ExternalSecureInvasiveDebugEnabled().

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

Secure non-invasive debug.

SNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.
0b10	Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

SID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.
0b10	Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSNID, bits [3:2]

When ARMv8.4-Debug is implemented:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

If the Effective value of SCR_EL3.NS is 1, or if EL3 is implemented and EL2 is not implemented, this field reads as 0b11.

All other values are reserved.

Otherwise:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b10	Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

NSID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b10	Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

Accessing the DBGAUTHSTATUS_EL1

DBGAUTHSTATUS_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFB8	DBGAUTHSTATUS_EL1

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>_EL1.

Configuration

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGBCR<n>_EL1[31:0] .

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBCR<n>[31:0] .

DBGBCR<n>_EL1 is in the Core power domain.

~~DBGBCR<n>_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBCR<n>_EL1 is a 32-bit register.

Field descriptions

The DBGBCR<n>_EL1 bit assignments are:

31 30 29 28 27 26 25 24	23 22 21 20	19 18 17 16	15 14	13	12 11 10 9	8 7 6 5	4 3	2 1	0
RES0	BT	LBN	SSC	HMC	RES0	BAS	RES0	PMC	E

When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

BT	Meaning
0b0000	Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.
0b0001	As 0b0000 but linked to a Context matching breakpoint.
0b0010	Unlinked Context ID match. When ARMv8.1-VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value.
0b0011	As 0b0010, with linking enabled.
0b0100	Unlinked instruction address mismatch. DBGBVR<n>_EL1 is the address of an instruction to be stepped.
0b0101	As 0b0100, with linking enabled.
0b0110	Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1.
0b0111	As 0b0110, with linking enabled.
0b1000	Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.
0b1001	As 0b1000, with linking enabled.
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.
0b1011	As 0b1010, with linking enabled.
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBVR<n>_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2.
0b1101	As 0b1100, with linking enabled.
0b1110	Unlinked Full Context ID match. DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.ContextID2 is compared against CONTEXTIDR_EL2.
0b1111	As 0b1110, with linking enabled.

Constraints on breakpoint programming mean some values are reserved under certain conditions.

For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug) and 'Reserved DBGBCR<n>_EL1.BT values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>_EL1.E is 0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see DBGBCR<n>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When AArch32 is supported at any Exception level:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

~~Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state. In an AArch64 only implementation, this field is reserved, RES1.~~

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions

All other values are reserved.

For more information, see 'Using the BAS field in Address Match breakpoints' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint
0b0011	DBGBVR<n>_EL1	Use for stepping T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for stepping T32 instructions
0b1111	DBGBVR<n>_EL1	Use for stepping A64 and A32 instructions

For more information, see 'Using the BAS field in Address Match breakpoints' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

For Context matching breakpoints, this field is RES1 and ignored.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint DBGBVR<n>_EL1. Possible values are:

E	Meaning
0b0	Breakpoint disabled.
0b1	Breakpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGBCR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGBCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x408 + 16n	DBGBCR<n>_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n>_EL1.

Configuration

External register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register DBGBVR<n>_EL1[63:0] .

External register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBVR<n>[31:0] .

External register DBGBVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register DBGBXVR<n>[31:0] .

DBGBVR<n>_EL1 is in the Core power domain.

~~DBGBVR<n>_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

How this register is interpreted depends on the value of DBGBCR<n>_EL1.BT.

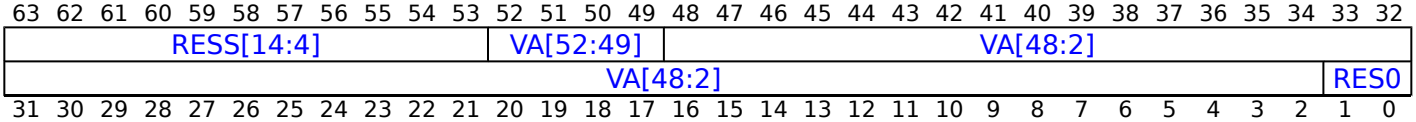
- When DBGBCR<n>_EL1.BT is 0b0x0x, this register holds a virtual address.
- When DBGBCR<n>_EL1.BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When DBGBCR<n>_EL1.BT is 0b100x, this register holds a VMID.
- When DBGBCR<n>_EL1.BT is 0b101x, this register holds a VMID and a Context ID.
- When DBGBCR<n>_EL1.BT is 0b111x, this register holds two Context ID values.

For other values of DBGBCR<n>_EL1.BT, this register is RES0.

Field descriptions

The DBGBVR<n>_EL1 bit assignments are:

When DBGBCR<n>_EL1.BT == 0b0x0x:



RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

VA[52:49], bits [52:49]

When ARMv8.2-LVA is implemented:

Extension to VA[48:2]. See VA[48:2] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Extension to RESS[14:4]. See RESS[14:4] for more details.

VA[48:2], bits [48:2]

If the address is being matched in an AArch64 stage 1 translation regime:

- This field contains bits[48:2] of the address for comparison.
- When ARMv8.2-LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

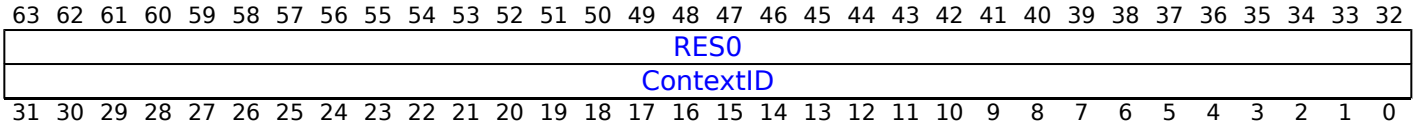
If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b001x:



Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when ARMv8.1-VHE is implemented, EL2 is using AArch64, HCR_EL2.E2H is 1, and either:

- The PE is executing at EL2.
- HCR_EL2.TGE is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against the following:~~CONTEXTIDR when the PE is executing at AArch32, or CONTEXTIDR_EL1 when the PE is executing at AArch64.~~

- CONTEXTIDR when the PE is executing at AArch32
- CONTEXTIDR_EL1 when the PE is executing at AArch64.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b011x, EL2 is implemented and (ARMv8.1-VHE is implemented or ARMv8.2-Debug is implemented)::

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
ContextID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

~~When ARMv8.1-VHE is implemented:~~

Context ID value for comparison against CONTEXTIDR_EL1.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~Otherwise:~~

~~Reserved, RES0.~~

When DBGBCR<n>_EL1.BT == 0b100x and ~~HaveEL(~~EL2 is implemented:~~)~~:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																VMID[15:8]								VMID[7:0]							
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When ARMv8.1-VHE is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. See DBGBVR<n>_EL1.VMID~~VMID~~[7:0] for more details.

If EL2 is using AArch32, this field is RES0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when~~in~~ any of the following are true:~~cases.~~

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- ARMv8.1-VMID16 is not implemented.

~~When ARMv8.1-VMID16 is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.~~

~~VMID[15:8] is RES0 if any of the following applies:~~

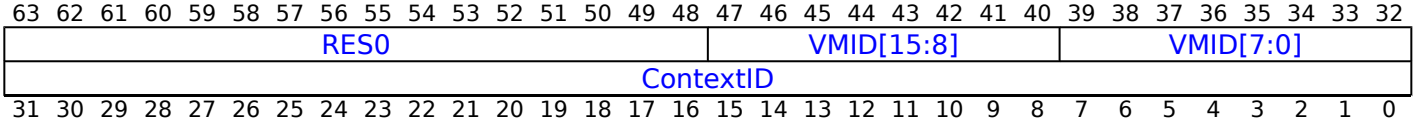
- ~~The implementation has an 8-bit VMID.~~
- ~~VTCR_EL2.VS has a value of 0.~~
- ~~EL2 is using AArch32.~~

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b101x and ~~HaveEL(~~EL2 is implemented~~):~~



Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When ARMv8.1-VMID16 is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. See DBGBVR<n>_EL1.VMID~~VMID~~[7:0] for more details.

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when~~in~~ any of the following are true:~~cases.~~

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- ARMv8.1-VMID16 is not implemented.

~~When ARMv8.1-VMID16 is implemented and EL2 is using AArch64, it is IMPLEMENTATION DEFINED whether the VMID is 8 bits or 16 bits.~~

~~VMID[15:8] is RES0 if any of the following applies:~~

- The implementation has an 8-bit VMID.
- VTCR_EL2.VS has a value of 0.
- EL2 is using AArch32.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b110x, EL2 is implemented and HaveEL(ARMv8.1-VHE is implemented or ARMv8.2-Debug is implementedEL2):

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ContextID2, bits [63:32]

When ARMv8.1-VHE is implemented:

Context ID value for comparison against CONTEXTIDR_EL2.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Reserved, RES0.

~~ContextID, bits [31:0]~~

~~When ARMv8.1-VHE is implemented:~~

~~Otherwise:~~
ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~Otherwise:~~

~~Reserved, RES0.~~

Accessing the DBGBVR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGBVR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x400 + 16n	DBGBVR<n>_EL1	63:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMSET_EL1 register.

Configuration

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0] .

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0] .

DBGCLAIMCLR_EL1 is in the Core power domain. ~~Some or all RW fields of this register have defined reset values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

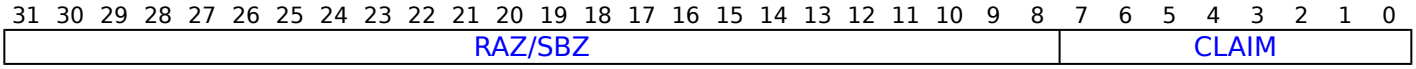
An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR_EL1 is a 32-bit register.

Field descriptions

The DBGCLAIMCLR_EL1 bit assignments are:



Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to `0`.

Accessing the DBGCLAIMCLR_EL1

DBGCLAIMCLR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFA4`	DBGCLAIMCLR_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

Configuration

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0] .

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0] .

DBGDTRRX_EL0 is in the Core power domain.

~~DBGDTRRX_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

Attributes

DBGDTRRX_EL0 is a 32-bit register.

Field descriptions

The DBGDTRRX_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Update DTRRX																															

Bits [31:0]

Update DTRRX.

Writes to this register:

- If RXfull is set to 1, set DTRRX to UNKNOWN.
- If RXfull is set to 0, update the value in DTRRX.

After the write, RXfull is set to 1.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see The Debug Communication Channel and Instruction Transfer Register4.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGDTRRX_EL0

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRRX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x080	DBGDTRRX_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

Configuration

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0] .

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0] .

DBGDTRTX_EL0 is in the Core power domain.

~~DBGDTRTX_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

Attributes

DBGDTRTX_EL0 is a 32-bit register.

Field descriptions

The DBGDTRTX_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Return DTRTX																															

Bits [31:0]

Return DTRTX.

Reads of this register:

- If TXfull is set to 1, return the last value written to DTRTX.
- If TXfull is set to 0, return an UNKNOWN value.

After the read, TXfull is cleared to 0.

Writes to this register:

- If TXfull is set to 1, set DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see The Debug Communication Channel and Instruction Transfer Register.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGDTRTX_EL0

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRTX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x08C	DBGDTRTX_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

Configuration

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGWCR<n>_EL1[31:0] .

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWCR<n>[31:0] .

DBGWCR<n>_EL1 is in the Core power domain.

~~DBGWCR<n>_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

If watchpoint n is not implemented then accesses to this register are:

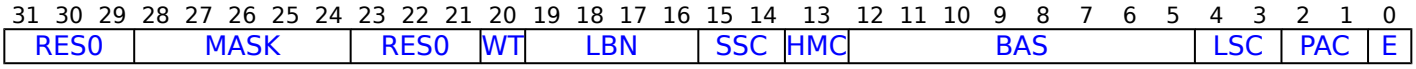
- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

Attributes

DBGWCR<n>_EL1 is a 32-bit register.

Field descriptions

The DBGWCR<n>_EL1 bit assignments are:



When the E field is zero, all the other fields in the register are ignored.

Bits [31:29]

Reserved, RES0.

MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00001	Reserved.
0b00010	Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from `0b00011` masking 3 address bits (`0x00000007` mask for address) to `0b11111` masking 31 address bits (`0x7FFFFFFF` mask for address).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
`0b0`	Unlinked data address match.
`0b1`	Linked data address match.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>_EL1 is being watched.

BAS	Description
xxxxxxx1	Match byte at DBGWVR<n>_EL1
xxxxxx1x	Match byte at DBGWVR<n>_EL1 + 1
xxxxx1xx	Match byte at DBGWVR<n>_EL1 + 2
xxxx1xxx	Match byte at DBGWVR<n>_EL1 + 3

In cases where DBGWVR<n>_EL1 addresses a double-word:

BAS	Description, if DBGWVR<n>_EL1[2] == 0
xxx1xxxx	Match byte at DBGWVR<n>_EL1 + 4
xx1xxxxx	Match byte at DBGWVR<n>_EL1 + 5
x1xxxxxx	Match byte at DBGWVR<n>_EL1 + 6
1xxxxxxx	Match byte at DBGWVR<n>_EL1 + 7

If DBGWVR<n>_EL1[2] == 1, only BAS[3:0] is used. Arm deprecates setting DBGWVR<n>_EL1[2] == 1.

The valid values for BAS are non-zero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>.BAS values' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section G2 (AArch32 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n. Possible values are:

E	Meaning
0b0	Watchpoint disabled.
0b1	Watchpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGWCR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGWCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x808 + 16n	DBGWCR<n>_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99c984cbfe3431cc1c9707

DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1.

Configuration

External register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register DBGWVR<n>_EL1[63:0] .

External register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWVR<n>[31:0] .

DBGWVR<n>_EL1 is in the Core power domain.

~~DBGWVR<n>_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

If watchpoint n is not implemented then accesses to this register are:

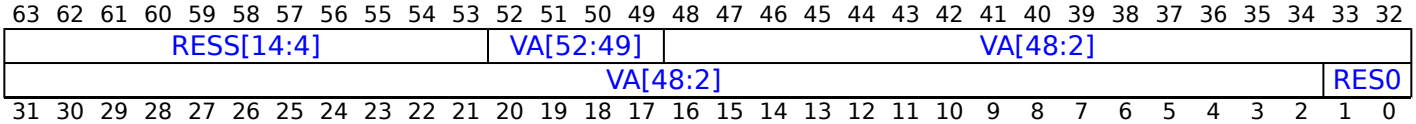
- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions

The DBGWVR<n>_EL1 bit assignments are:



RESS[14:4], bits [63:53]

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

VA[52:49], bits [52:49]

When ARMv8.2-LVA is implemented:

Extension to VA[48:2]. See VA[48:2] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Extension to RESS[14:4]. See RESS[14:4] for more details.

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When ARMv8.2-LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

Arm deprecates setting DBGWVR<n>_EL1[2] == 1.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing the DBGWVR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGWVR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x800 + 16n	DBGWVR<n>_EL1	63:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

EDAA32PFR, External Debug AArch32 Processor Feature Register

The EDAA32PFR characteristics are:

Purpose

Provides information about implemented PE features.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.4.1.

Configuration

It is IMPLEMENTATION DEFINED whether EDAA32PFR is implemented in the Core power domain or in the Debug power domain.

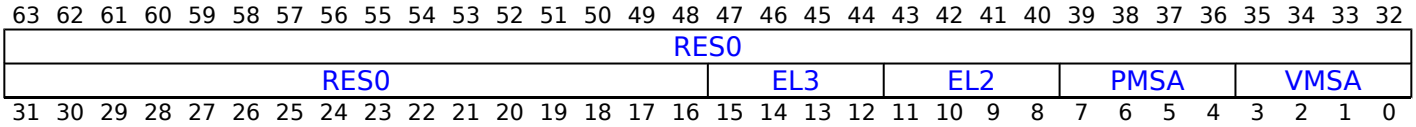
This register is present only when AArch32~~the~~ is~~implementation~~ supported~~only~~ at~~supports~~ any~~execution~~ Exception~~in~~ level.~~AArch32 state.~~ Otherwise, direct accesses to EDAA32PFR are RES0.

Attributes

EDAA32PFR is a 64-bit register.

Field descriptions

The EDAA32PFR bit assignments are:



Bits [63:16]

Reserved, RES0.

EL3, bits [15:12]

AArch32 EL3 Exception level handling. Defined values are:

EL3	Meaning
0b0000	EL3 is not implemented or can be executed in AArch64 state.
0b0001	EL3 can be executed in AArch32 state only.

When the value of EDPFR.EL3 is non-zero, this field must be 0b0000.

All other values are reserved.

Note

EDPFR.{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

EL2, bits [11:8]

AArch32 EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented or can be executed in AArch64 state.
0b0001	EL2 can be executed in AArch32 state only.

When the value of EDPFR.EL2 is non-zero, this field must be 0b0000.

All other values are reserved.

Note

EDPFR.{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

PMSA	Meaning
0b0000	PMSA not supported.
0b0100	Support for an Armv8-R PMSAv8-32.

All other values are reserved. In Armv8-A, the only permitted value is 0b0000.

VMSA, bits [3:0]

Indicates support for a VMSA. When the PMSA field is nonzero, determines support for a VMSA. When the PMSA field is 0b0000, VMSA is supported. Defined values are:

VMSA	Meaning
0b0000	VMSA not supported.

All other values are reserved. In Armv8-A, the only permitted value is 0b0000.

Accessing the EDAA32PFR

EDAA32PFR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD60	EDAA32PFR

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

Purpose

Allows implementations to support IMPLEMENTATION DEFINED controls.

Configuration

It is IMPLEMENTATION DEFINED whether EDACR is implemented in the Core power domain or in the Debug power domain.

~~It is IMPLEMENTATION DEFINED whether EDACR is implemented in the Core power domain or in the Debug power domain. RW fields in this register reset to architecturally UNKNOWN values, and:~~

- ~~The register is not affected by a Warm reset.~~
- ~~If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.~~
- ~~If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.~~

Changing this register from its reset value causes IMPLEMENTATION DEFINED behavior, including possible deviation from the architecturally-defined behavior.

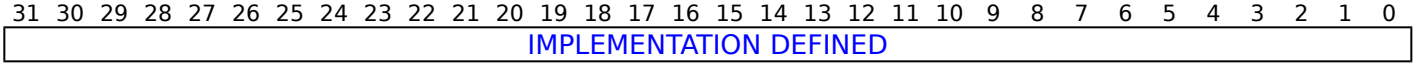
If the EDACR contains any control bits that must be preserved over power down, then these bits must be accessible by the external debug interface when the OS Lock is locked, OSLSR_EL1.OSLK == 1, and when the Core is powered off.

Attributes

EDACR is a 32-bit register.

Field descriptions

The EDACR bit assignments are:



IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

Accessing the EDACR

EDACR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x094	EDACR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether EDCIDR0 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

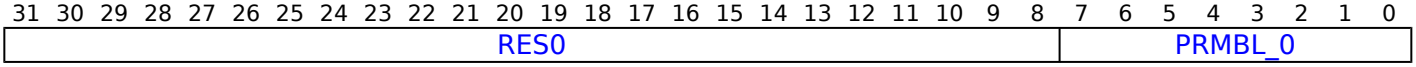
This register is required for CoreSight compliance.

Attributes

EDCIDR0 is a 32-bit register.

Field descriptions

The EDCIDR0 bit assignments are:



Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

~~Preamble. Must read as 0x0D.~~

Reads as 0x0D.

Accessing the EDCIDR0

EDCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF0	EDCIDR0

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether EDCIDR1 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR1 is a 32-bit register.

Field descriptions

The EDCIDR1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								CLASS				PRMBL_1			

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class. Debug component.

~~Component class. Reads as 0x9, debug component.~~

Reads as 0b1001.

PRMBL_1, bits [3:0]

Preamble. ~~RAZ.~~

Reads as 0b0000.

Accessing the EDCIDR1

EDCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF4	EDCIDR1

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99c984cbfe3431cc1c9707

EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether EDCIDR2 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR2 is a 32-bit register.

Field descriptions

The EDCIDR2 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_2							

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

~~Preamble. Must read as 0x05.~~

Reads as 0x05.

Accessing the EDCIDR2

EDCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF8	EDCIDR2

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

EDCIDR3, External Debug Component Identification Register 3

The EDCIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether EDCIDR3 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR3 is a 32-bit register.

Field descriptions

The EDCIDR3 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_3							

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

~~Preamble. Must read as 0xB1.~~

Reads as 0xB1.

Accessing the EDCIDR3

EDCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFFC	EDCIDR3

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

EDCIDSR, External Debug Context ID Sample Register

The EDCIDSR characteristics are:

Purpose

Contains the sampled value of the Context ID, captured on reading EDPCSR[31:0].

Configuration

EDCIDSR is in the Core power domain.

~~EDCIDSR is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

This register is present only when ARMv8.0-PCSample is implemented and ARMv8.2-PCSample is not implemented. Otherwise, direct accesses to EDCIDSR are RES0.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Note

ARMv8.2-PCSample implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDCIDSR is a 32-bit register.

Field descriptions

The EDCIDSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CONTEXTIDR																															

CONTEXTIDR, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent EDPCSR sample. When the most recent EDPCSR sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR. ~~If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register, and EDCIDSR samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent EDPCSR sample.~~
- If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register, and EDCIDSR samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent EDPCSR sample.

Because the value written to EDCIDSR is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether EDCIDSR is set to the original or new value if EDPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDCIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN' in chapter H7.

EDCIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A4	EDCIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configuration

~~It is IMPLEMENTATION DEFINED whether EDDEVAFF0 is implemented in the Core power domain or in the Debug power domain.~~

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVAFF0 is a 32-bit register.

Field descriptions

The EDDEVAFF0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MPIDR_EL1lo~~MPIDR_EL1 low half~~																															

MPIDR_EL1lo~~MPIDR_EL1 low half~~, bits [31:0]

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing the EDDEVAFF0

EDDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA8	EDDEVAFF0

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f211~~6134483bd14dc8c12a99c984cbfe3431cc1c9707~~

EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configuration

~~It is IMPLEMENTATION DEFINED whether EDDEVAFF1 is implemented in the Core power domain or in the Debug power domain.~~

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVAFF1 is a 32-bit register.

Field descriptions

The EDDEVAFF1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MPIDR_EL1hi~~MPIDR_EL1 high half~~																															

MPIDR_EL1hi~~MPIDR_EL1 high half~~, bits [31:0]

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing the EDDEVAFF1

EDDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFAC	EDDEVAFF1

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f211~~6134483bd14dc8c12a99c984cbfe3431cc1c9707~~

(old) htmldiff from- (new)

(old) htmldiff from- (new)

EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the external debug component.

Configuration

~~It is IMPLEMENTATION DEFINED whether EDDEVARCH is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

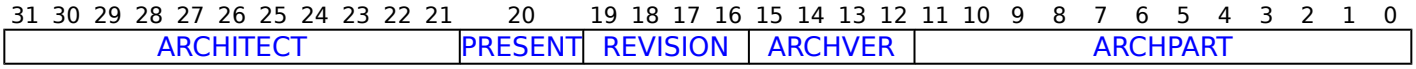
If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVARCH is a 32-bit register.

Field descriptions

The EDDEVARCH bit assignments are:



ARCHITECT, bits [31:21]

Defines the architecture of the component. For debug, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, `0x4`.

Bits [27:21] are the JEP106 ID code, `0x3B`.

PRESENT, bit [20]

When set to 1, indicates that the DEVARCH is present.

This field is 1 in Armv8.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For debug, the revision defined by Armv8-A is `0x0`.

All other values are reserved.

ARCHVER, bits [15:12]

Defines the architecture version of the component. This is the same value as ID_AA64DFR0_EL1.DebugVer and DBGDIDR.Version. The defined values of this field are:

ARCHVER	Meaning
0b0110	Armv8.0 Debug architecture.
0b0111	Armv8.0 Debug architecture with Virtualization Host Extensions.
0b1000	Armv8.2 Debug architecture.
0b1001	Armv8.4 Debug architecture.

ARMv8.4-Debug adds the functionality indicated by the value 0b1001. ARMv8.2-Debug adds the functionality indicated by the value 0b1000. If ARMv8.1-VHE is not implemented, the only permitted value is 0b0110.

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHVER is ARCHID[15:12].

ARCHPART, bits [11:0]

ARCHPART	Meaning
0xA15	The part number of the Armv8-A debug component.

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHPART is ARCHID[11:0].

Accessing the EDDEVARCH

EDDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFBC	EDDEVARCH

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

~~It is IMPLEMENTATION DEFINED whether EDDEVID is implemented in the Core power domain or in the Debug power domain.~~

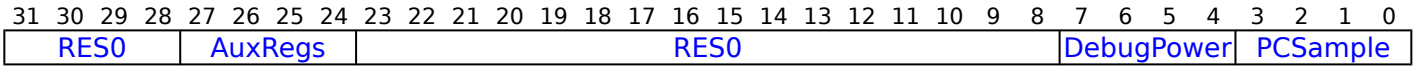
If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID is a 32-bit register.

Field descriptions

The EDDEVID bit assignments are:



Bits [31:28]

Reserved, RES0.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Permitted values for this field are:

AuxRegs	Meaning
0b0000	None supported.
0b0001	Support for External Debug Auxiliary Control Register, EDACR.

All other values are reserved.

Bits [23:8]

Reserved, RES0.

DebugPower, bits [7:4]

From Armv8.3:

Indicates support for the ARMv8.3-DoPD feature. Defined values of this field are:

DebugPower	Meaning
0b0000	ARMv8.3-DoPD not implemented. Registers in the external debug interface register map are implemented in a mix of the Debug and Core power domains.
0b0001	ARMv8.3-DoPD implemented. All registers in the external debug interface register map are implemented in the Core power domain.

ARMv8.3-DoPD implements the functionality added by the value 0b0001.

All other values are reserved.

Otherwise:

Reserved, RES0.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Permitted values of this field are:

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the external debug registers space.
0b0010	Only EDPCSR and EDCIDSR are implemented. This option is only permitted if EL3 and EL2 are not implemented.
0b0011	EDPCSR, EDCIDSR, and EDVIDSR are implemented.

All other values are reserved.

When ARMv8.2-PCSample is implemented, the only permitted value is 0b0000.

Note

ARMv8.2-PCSample implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

Accessing the EDDEVID

EDDEVID can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC8	EDDEVID

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVID1, External Debug Device ID register 1

The EDDEVID1 characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

~~It is IMPLEMENTATION DEFINED whether EDDEVID1 is implemented in the Core power domain or in the Debug power domain.~~

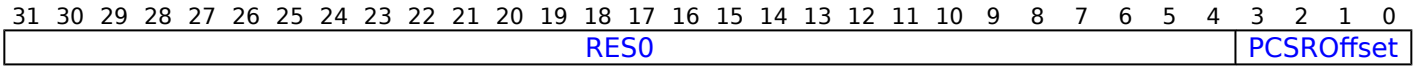
If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID1 is a 32-bit register.

Field descriptions

The EDDEVID1 bit assignments are:



Bits [31:4]

Reserved, RES0.

PCSROffset, bits [3:0]

This field indicates the offset applied to PC samples returned by reads of EDPCSR. Permitted values of this field in Armv8 are:

PCSROffset	Meaning
0b0000	EDPCSR not implemented.
0b0010	EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.

When ARMv8.2-PCSample is implemented, the only permitted value is 0b0000.

Note

ARMv8.2-PCSample implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

Accessing the EDDEVID1

EDDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC4	EDDEVID1

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99e984cbfe3431cc1c9707

(old) htmldiff from- (new)

EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

Purpose

Reserved for future descriptions of features of the debug implementation.

Configuration

~~It is IMPLEMENTATION DEFINED whether EDDEVID2 is implemented in the Core power domain or in the Debug power domain.~~

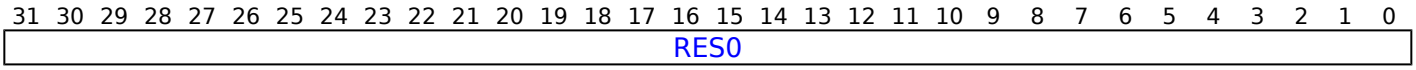
If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID2 is a 32-bit register.

Field descriptions

The EDDEVID2 bit assignments are:



Bits [31:0]

Reserved, RES0.

Accessing the EDDEVID2

EDDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC0	EDDEVID2

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

EDDEVTYPE, External Debug Device Type register

The EDDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PEs debug logic.

Configuration

~~It is IMPLEMENTATION DEFINED whether EDDEVTYPE is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

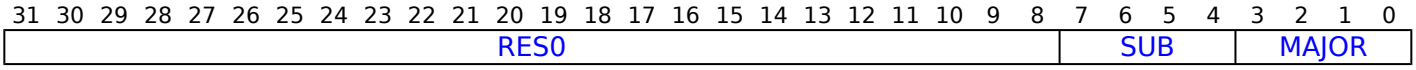
If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVTYPE is a 32-bit register.

Field descriptions

The EDDEVTYPE bit assignments are:



Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Must read as `0x1` to indicate this is a component within a PE.

MAJOR, bits [3:0]

Major type. Must read as `0x5` to indicate this is a debug logic component.

Accessing the EDDEVTYPE

EDDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFCC`	EDDEVTYPE

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

EDDFR, External Debug Feature Register

The EDDFR characteristics are:

Purpose

Provides top level information about the debug system.

Note

Debuggers must use EDDEVARCH to determine the Debug architecture version.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Configuration

It is IMPLEMENTATION DEFINED whether EDDFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDDFR is a 64-bit register.

Field descriptions

The EDDFR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																				TraceFilt				UNKNOWN							
CTX_CMPs				RES0				WRPs				RES0				BRPs				PMUVer				TraceVer				UNKNOWN			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:44]

Reserved, RES0.

TraceFilt, bits [43:40]

~~From Armv8.4:~~

Armv8.4 Self-hosted Trace Extension version. Defined~~The defined~~ values ~~of this field~~ are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension is not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension is implemented.

All other values are reserved.

~~Otherwise:~~

~~Reserved, RES0.~~

ARMv8.4-Trace implements the functionality added by `0b0001`.

From Armv8.4, the permitted values are `0b0000` and `0b0001`.

Bits [39:32]

Reserved, UNKNOWN.

CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.CTX_CMPs.

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of `0b0000` is reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.WRPs.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of `0b0000` is reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.BRPs.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the Alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D10.1.4.

Defined values are:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension implemented, PMUv3.
0b0100	PMUv3 for Armv8.1. As 0b0001, and also includes support for: • Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. • If EL2 is implemented, the MDCR_EL2.HPMD control bit.
0b0101	PMUv3 for Armv8.4. As 0b0100, and also includes support for the PMMIR register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and also includes support for: • 64-bit event counters. • If EL2 is implemented, the MDCR_EL2.HCCD control bit. • If EL3 is implemented, the MDCR_EL3.SCCD control bit.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value in new implementations.

ARMv8.1-PMU implements the functionality added by the value 0b0100.

ARMv8.4-PMU implements the functionality added by the value 0b0101.

ARMv8.5-PMU implements the functionality added by the value 0b0110.

All other values are reserved.

From Armv8.1, the value 0b0001 is not permitted.

From Armv8.4, the value 0b0100 is not permitted.

From Armv8.5, the value 0b0101 is not permitted.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.PMUVer.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

TraceVer	Meaning
0b0000	PE trace unit System registers not implemented.
0b0001	PE trace unit System registers implemented.

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.TraceVer.

Bits [3:0]

Reserved, UNKNOWN.

Accessing the EDDFR

EDDFR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD28	EDDFR	31:0

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

Component	Offset	Instance	Range
Debug	0xD2C	EDDFR	63:32

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99c984cbfe3431cc1c9707

EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

Purpose

Controls Exception Catch debug events.

Configuration

External register EDECCR bits [31:0] are architecturally mapped to AArch64 System register OSECCR_EL1[31:0] .

External register EDECCR bits [31:0] are architecturally mapped to AArch32 System register DBGOSECCR[31:0] .

EDECCR is in the Core power domain. ~~Some or all RW fields of this register have defined reset values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

Attributes

EDECCR is a 32-bit register.

Field descriptions

The EDECCR bit assignments are:

When ARMv8.2-Debug is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																NSR3	NSR2	NSR1	NSR0	SR3	SR2	SR1	SR0	NSE3	NSE2	NSE1	NSE0	SE3	SE2	SE1	SE0

Bits [31:16]

Reserved, RES0.

NSR<n>, bit [n+12], for n = 0 to 3

Controls Non-secure exception catch on exception return to EL<n> in conjunction with NSE<n>. See the summary of Exception Catch debug event control for information.

~~If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 0, this field is reserved, RES0. Otherwise, possible values for this field are:~~

NSR<n>	Meaning
0b0	If the corresponding NSE<n> bit is 0, then Exception Catch debug events are disabled for Non-secure Exception level <n>. If the corresponding NSE<n> bit is 1, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Non-secure Exception level <n>.
0b1	If the corresponding NSE<n> bit is 0, then Exception Catch debug events are enabled for exception returns to Non-secure Exception level <n>. If the corresponding NSE<n> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure Exception level <n>.

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 0, this field is reserved, RES0.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level is permitted to generate an Exception Catch debug event.

A value of the NSR field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSR field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSR by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

SR<n>, bit [n+8], for n = 0 to 3

Controls Secure exception catch on exception return to EL<n> in conjunction with SE<n>. See the summary of Exception Catch debug event control for information.

~~If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 1, this field is reserved, RES0. Otherwise, possible values for this field are:~~

SR<n>	Meaning
0b0	If the corresponding SE<n> bit is 0, then Exception Catch debug events are disabled for Secure Exception level <n>. If the corresponding SE<n> bit is 1, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Secure Exception level <n>.
0b1	If the corresponding SE<n> bit is 0, then Exception Catch debug events are enabled for exception returns to Secure Exception level <n>. If the corresponding SE<n> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure Exception level <n>.

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 1, this field is reserved, RES0.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level is permitted to generate an Exception Catch debug event.

A value of the SR field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SR field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SR by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

NSE<n>, bit [n+4], for n = 0 to 3

Coarse-grained Non-secure exception catch for EL<n>. This controls whether Exception Catch debug events are enabled for Non-secure EL<n>. This also controls:

- The behavior of exception catch on exception entry to EL<n>.
- The behavior of exception catch on exception return to EL<n> in conjunction with NSR<n>.

~~If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 0, this field is reserved, RES0. Otherwise, possible values for this field are:~~

NSE<n>	Meaning
0b0	If the corresponding NSR<n> bit is 0, then Exception Catch debug events are disabled for Non-secure Exception level <n>. If the corresponding NSR<n> bit is 1, then Exception Catch debug events are enabled for exception returns to Non-secure Exception level <n>.
0b1	If the corresponding NSR<n> bit is 0, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Non-secure Exception level <n>. If the corresponding NSR<n> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure Exception level <n>.

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 0, this field is reserved, RES0.

A value of the NSE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSE by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

SE<n>, bit [n], for n = 0 to 3

Coarse-grained Secure exception catch for EL<n>. This field controls whether Exception Catch debug events are enabled for Secure EL<n>.

- The behavior of exception catch on exception entry to EL<n>.
- The behavior of exception catch on exception return to EL<n> in conjunction with SR<n>.

~~If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 1, this field is reserved, RES0. Otherwise, possible values for this field are:~~

SE<n>	Meaning
0b0	If the corresponding SR<n> bit is 0, then Exception Catch debug events are disabled for Secure Exception level <n>. If the corresponding SR<n> bit is 1, then Exception Catch debug events are enabled for exception returns to Secure Exception level <n>.
0b1	If the corresponding SR<n> bit is 0, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Secure Exception level <n>. If the corresponding SR<n> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure Exception level <n>.

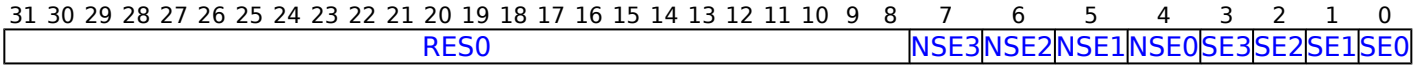
If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 1, this field is reserved, RES0.

A value of the SE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SE by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

Otherwise:



Bits [31:8]

Reserved, RES0.

NSE<n>, bit [n+4], for n = 0 to 3

Coarse-grained Non-secure exception catch. If EL3 and EL2 are not implemented and the PE behaves as if SCR_EL3.NS is set to 0, this field is reserved, RES0. Otherwise, possible values for this field are:

NSE<n>	Meaning
0b0	Exception Catch debug events are disabled for Non-secure Exception level <n>.
0b1	Exception Catch debug events are enabled for Non-secure Exception level <n>.

A value of the NSE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSE by a read of EDECCR is UNKNOWN.

SE<n>, bit [n], for n = 0 to 3

Coarse-grained Secure exception catch.

~~Coarse-grained Secure exception catch. If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 1, this field is reserved, RES0. Otherwise, possible values for this field are:~~

SE<n>	Meaning
0b0	Exception Catch debug events are disabled for Secure Exception level <n>.
0b1	Exception Catch debug events are enabled for Secure Exception level <n>.

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 1, this field is reserved, RES0.

A value of the SE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SE by a read of EDECCR is UNKNOWN.

Accessing the EDECCR

EDECCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x098	EDECCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

EDECR, External Debug Execution Control Register

The EDECR characteristics are:

Purpose

Controls Halting debug events.

Configuration

If ARMv8.3-DoPD is implemented, this register is in the Core power domain.

It is IMPLEMENTATION DEFINED whether EDECR is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

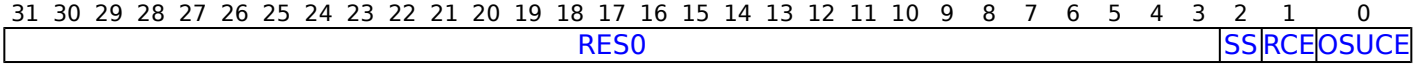
If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDECR is a 32-bit register.

Field descriptions

The EDECR bit assignments are:



Bits [31:3]

Reserved, RES0.

SS, bit [2]

Halting step enable. Possible values of this field are:

SS	Meaning
0b0	Halting step debug event disabled.
0b1	Halting step debug event enabled.

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is CONSTRAINED UNPREDICTABLE as described in 'Changing the value of EDECR.SS when not in Debug state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

The following resets apply:

- On a Cold reset, this field resets to:
  - If ARMv8.3-DoPD is implemented, 0.
- On ana External debug reset, this field resets to:

- If ARMv8.3-DoPD is not implemented, 0.

- On a Warm reset, this field resets to:
  - If ARMv8.3-DoPD is implemented, an unchanged value.

RCE, bit [1]

When ARMv8.3-DoPD is not implemented:

Reset Catch Enable.

RCE	Meaning
0b0	Reset Catch debug event disabled.
0b1	Reset Catch debug event enabled.

The following resets apply:

~~On a External debug reset, this field resets to 0.~~

- On an External debug reset, this field resets to 0.
- On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.

OSUCE, bit [0]

When ARMv8.3-DoPD is not implemented:

OS Unlock Catch Enable.

OSUCE	Meaning
0b0	OS Unlock Catch debug event disabled.
0b1	OS Unlock Catch debug event enabled.

The following resets apply:

~~On a External debug reset, this field resets to 0.~~

- On an External debug reset, this field resets to 0.
- On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.

Accessing the EDECR

EDECR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x024	EDECR

This interface is accessible as follows:

- When (ARMv8.3-DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are **RO**.
- When (ARMv8.3-DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are **RW**.

- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

EDESR, External Debug Event Status Register

The EDESR characteristics are:

Purpose

Indicates the status of internally pending Halting debug events.

Configuration

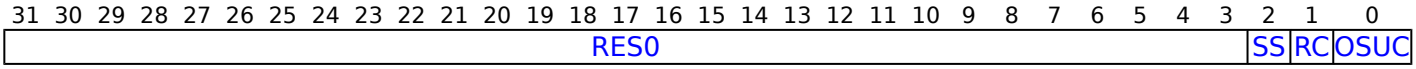
EDESR is in the Core power domain. ~~Some or all RW fields of this register have defined reset values. The field descriptions identify when the reset values apply.~~

Attributes

EDESR is a 32-bit register.

Field descriptions

The EDESR bit assignments are:



Bits [31:3]

Reserved, RES0.

SS, bit [2]

When ARMv8.3-DoPD is implemented:

Halting step debug event pending. Possible values of this field are:

SS	Meaning
0b0	Reading this means that a Halting step debug event is not pending. Writing this means no action.
0b1	Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

On a Cold reset, this field resets to 0.

Otherwise:

Halting step debug event pending. Possible values of this field are:

SS	Meaning
0b0	Reading this means that a Halting step debug event is not pending. Writing this means no action.
0b1	Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

On a Warm reset, this field resets to the value in EDECR.SS.

RC, bit [1]

Reset Catch debug event pending. Possible values of this field are:

RC	Meaning
0b0	Reading this means that a Reset Catch debug event is not pending. Writing this means no action.
0b1	Reading this means that a Reset Catch debug event is pending. Writing this clears the pending Reset Catch debug event.

On a Warm reset, this field resets to:

- If ARMv8.3-DoPD is implemented, theThe value in CTIDEVCTL.RCE.
- If ARMv8.3-DoPD is not implemented, theThe value in EDECR.RCE.

OSUC, bit [0]

OS Unlock Catch debug event pending. Possible values of this field are:

OSUC	Meaning
0b0	Reading this means that an OS Unlock Catch debug event is not pending. Writing this means no action.
0b1	Reading this means that an OS Unlock Catch debug event is pending. Writing this clears the pending OS Unlock Catch debug event.

On a Warm reset, this field resets to 0.

Accessing the EDESR

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is CONSTRAINED UNPREDICTABLE whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it might become pending again when the Core is powered back on and Cold reset.

EDESR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x020	EDESR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

EDITCTRL, External Debug Integration mode Control register

The EDITCTRL characteristics are:

Purpose

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

It is IMPLEMENTATION DEFINED whether EDITCTRL is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

Implementation of this register is OPTIONAL.

Attributes

EDITCTRL is a 32-bit register.

Field descriptions

The EDITCTRL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															IME

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

On a Implementation reset, this field resets to 0.

Accessing the EDITCTRL

EDITCTRL can be accessed through the external debug interface:

Component	Offset	Instance

Debug	0xF00	EDITCTRL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

Purpose

Used in Debug state for passing instructions to the PE for execution.

Configuration

EDITR is in the Core power domain.

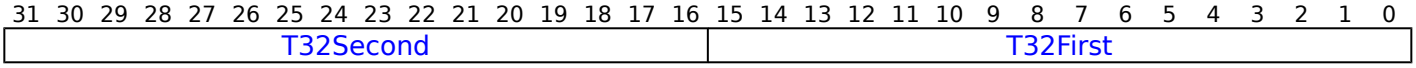
Attributes

EDITR is a 32-bit register.

Field descriptions

The EDITR bit assignments are:

When AArch32 is supported at any Exception level and in AArch32 state:



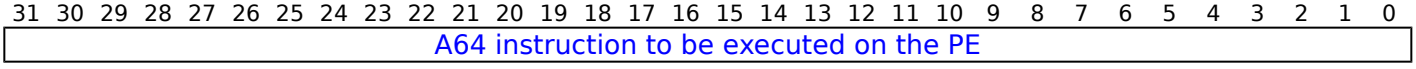
T32Second, bits [31:16]

Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information see 'Behavior in Debug state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H2, Debug State.

T32First, bits [15:0]

First halfword of the T32 instruction to be executed on the PE.

When AArch64 is supported at any Exception level and in AArch64 state:



Bits [31:0]

A64 instruction to be executed on the PE.

Accessing the EDITR

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.

- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

EDITR ignores writes if the PE is in Non-debug state.

EDITR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x084	EDITR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99e984cbfe3431cc1e9707

(old) htmldiff from- (new)

EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

Purpose

Allows or disallows access to the external debug registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

~~If ARMv8.3-DoPD is implemented, then ARMv8.0-SoftwareLock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.~~

If ARMv8.3-DoPD is implemented, then ARMv8.0-SoftwareLock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

~~It is IMPLEMENTATION DEFINED whether EDLAR is implemented in the Core power domain or in the Debug power domain.~~

If ARMv8.3-DoPD is not implemented, then this register is in the Debug power domain.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

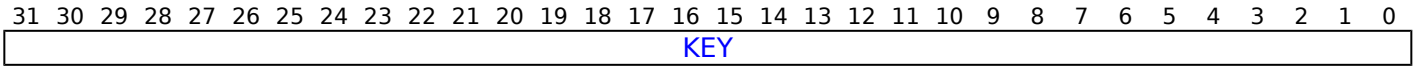
Attributes

EDLAR is a 32-bit register.

Field descriptions

The EDLAR bit assignments are:

When the Software Lock is implemented.:

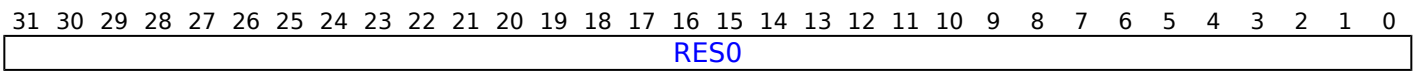


KEY, bits [31:0]

Lock Access control. Writing the key value `0xC5ACCE55` to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:



Otherwise

Bits [31:0]

Reserved, RES0.

Accessing the EDLAR

EDLAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
Debug	0xFB0	EDLAR

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

Purpose

Indicates the current status of the software lock for external debug registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

~~If ARMv8.3-DoPD is implemented, then ARMv8.0-SoftwareLock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.~~

If ARMv8.3-DoPD is implemented, then ARMv8.0-SoftwareLock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

~~It is IMPLEMENTATION DEFINED whether EDLSR is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:~~

- ~~The register is not affected by a Warm reset.~~
- ~~If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.~~
- ~~If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.~~

If ARMv8.3-DoPD is not implemented, then this register is in the Debug power domain.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLSR is a 32-bit register.

Field descriptions

The EDLSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																													nTT	SLK	SLI

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

When the Software Lock is implemented.:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The following resets apply:

- If Armv8.3-DoPD is implemented, this register is reset by Cold reset and not affected by External debug reset. If Armv8.3-DoPD is not implemented, this register is reset by External debug reset and not affected by Cold reset.
- This field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Accessing the EDLSR

EDLSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
Debug	0xFB4	EDLSR

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configuration

EDPCSR is in the Core power domain.

~~EDPCSR is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

This register is present only when ARMv8.0-PCSample is implemented and ARMv8.2-PCSample is not implemented. Otherwise, direct accesses to EDPCSR are RES0.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Note

ARMv8.2-PCSample implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

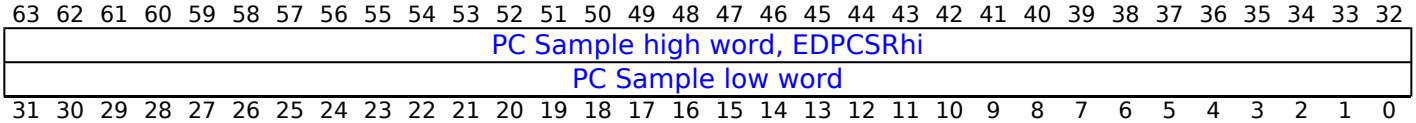
EDPCSR is a pair of 32-bit registers.

If ARMv8.1-VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Field descriptions

The EDPCSR bit assignments are:

When ARMv8.1-VHE is not implemented or EDSCR.SC2 == 0:



Bits [63:32]

PC Sample high word, EDPCSRhi. If EDVIDSR.HV == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as `0xFFFFFFFF` when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of EDPCSR[31:0] is permitted but not required to return `0xFFFFFFFF`.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of EDPCSR[31:0].

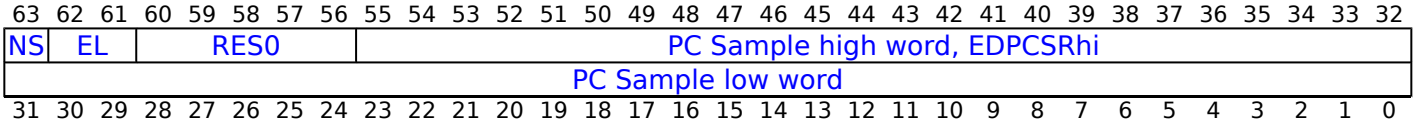
For the cases where a read of EDPCSR[31:0] returns `0xFFFFFFFF` or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ARMv8.1-VHE is implemented and EDSCR.SC2 == 1:



NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

EL	Meaning
0b00	Sample is from EL0.
0b01	Sample is from EL1.
0b10	Sample is from EL2.
0b11	Sample is from EL3.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [60:56]

Reserved, RES0.

Bits [55:32]

PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as `0xFFFFFFFF` when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of EDPCSR[31:0] is permitted but not required to return `0xFFFFFFFF`.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns `0xFFFFFFFF` or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile

EDPCSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance	Range
Debug	`0x0A0`	EDPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
Debug	`0x0AC`	EDPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

Purpose

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Configuration

It is IMPLEMENTATION DEFINED whether EDPFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDPFR is a 64-bit register.

Field descriptions

The EDPFR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN				UNKNOWN				RES0				UNKNOWN				AMU				UNKNOWN				SEL2				SVE			
UNKNOWN				GIC				AdvSIMD				FP				EL3				EL2				EL1				EL0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:60]

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

Bits [59:56]

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

Bits [55:52]

Reserved, RES0.

Bits [51:48]

From Armv8.4:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

AMU, bits [47:44]

~~From Armv8.4:~~

Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	Activity Monitors Extension version 1 is implemented.

All other values are reserved.

AMUv1~~ARMv8.4-AMUv1~~ implements the functionality identified by the value 0b0001.

In Armv8.0, Armv8.1, Armv8.2, and Armv8.3, the only permitted value is 0b0000.

From Armv8.4, the permitted values are 0b0000 and 0b0001.

~~Otherwise:~~

~~Reserved, RES0.~~

Bits [43:40]

From Armv8.2:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

SEL2, bits [39:36]

~~From Armv8.4:~~

Secure EL2. Defined values are:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

All other values are reserved.

~~Reserved, RES0.~~

SVE, bits [35:32]

From Armv8.2:

Otherwise:
SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

SVE	Meaning
0b0000	SVE is not implemented.
0b0001	SVE is implemented.

All other values are reserved.

Otherwise:

Reserved, RES0.

Bits [31:28]

From Armv8.2:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

GIC, bits [27:24]

System register GIC interface support. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.GIC.

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following SISD and SIMD operations: • Integer byte, halfword, word and doubleword element operations. • Single-precision and double-precision floating-point arithmetic. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- `0b0000` in an implementation with Advanced SIMD support, that does not include the ARMv8.2-FP16 extension.
- `0b0001` in an implementation with Advanced SIMD support, that includes the ARMv8.2-FP16 extension.
- `0b1111` in an implementation without Advanced SIMD support.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.AdvSIMD.

FP, bits [19:16]

Floating-point. Defined values are:

FP	Meaning
`0b0000`	Floating-point is implemented, and includes support for: • Single-precision and double-precision floating-point types. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
`0b0001`	As for `0b0000`, and also includes support for half-precision floating-point arithmetic.
`0b1111`	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- `0b0000` in an implementation with floating-point support, that does not include the ARMv8.2-FP16 extension.
- `0b0001` in an implementation with floating-point support, that includes the ARMv8.2-FP16 extension.
- `0b1111` in an implementation without floating-point support.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.FP.

EL3, bits [15:12]

AArch64 EL3 Exception level handling. Defined values are:

EL3	Meaning
`0b0000`	EL3 is not implemented or cannot be executed in AArch64 state.
`0b0001`	EL3 can be executed in AArch64 state only.
`0b0010`	EL3 can be executed in both~~either~~ Execution~~AArch64~~ states.~~or AArch32 state.~~

When the value of EDAA32PFR.EL3 is non-zero, this field must be `0b0000`.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.EL3.

EL2, bits [11:8]

AArch64 EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented or cannot be executed in AArch64 state.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in bothe~~either~~ Execution~~AArch64~~ states.~~or AArch32 state.~~

When the value of EDAA32PFR.EL2 is non-zero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.EL2.

EL1, bits [7:4]

AArch64 EL1 Exception level handling. Defined values are:

EL1	Meaning
0b0000	EL1 cannot be executed in AArch64 state. ~~EL1 can be executed in AArch32 state only.~~ EL1 can be executed in AArch32 state only.
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in bothe~~either~~ Execution~~AArch64~~ states.~~or AArch32 state.~~

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.EL1.

EL0, bits [3:0]

AArch64 EL0 Exception level handling. Defined values are:

EL0	Meaning
0b0000	EL0 cannot be executed in AArch64 state. ~~EL0 can be executed in AArch32 state only.~~ EL0 can be executed in AArch32 state only.
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in bothe~~either~~ Execution~~AArch64~~ states.~~or AArch32 state.~~

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.EL0.

Accessing the EDPFR

EDPFR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD20	EDPFR	31:0

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

Component	Offset	Instance	Range
Debug	0xD24	EDPFR	63:32

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.

- Otherwise accesses to this register are **IMPDEF**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

EDPIDR0, External Debug Peripheral Identification Register 0

The EDPIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether EDPIDR0 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

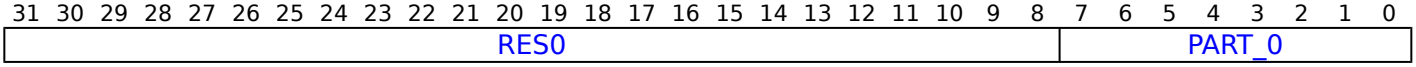
This register is required for CoreSight compliance.

Attributes

EDPIDR0 is a 32-bit register.

Field descriptions

The EDPIDR0 bit assignments are:



Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

Accessing the EDPIDR0

EDPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE0	EDPIDR0

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

EDPIDR1, External Debug Peripheral Identification Register 1

The EDPIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether EDPIDR1 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

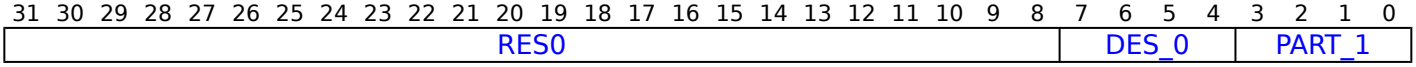
This register is required for CoreSight compliance.

Attributes

EDPIDR1 is a 32-bit register.

Field descriptions

The EDPIDR1 bit assignments are:



Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is `0b1011`.

PART_1, bits [3:0]

Part number, most significant nibble.

Accessing the EDPIDR1

EDPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFE4`	EDPIDR1

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether EDPIDR2 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

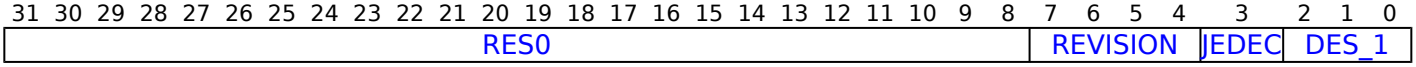
This register is required for CoreSight compliance.

Attributes

EDPIDR2 is a 32-bit register.

Field descriptions

The EDPIDR2 bit assignments are:



Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

JEDEC, bit [3]

RAO. Indicates a JEP106 identity code is used.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is `0b011`.

Accessing the EDPIDR2

EDPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE8	EDPIDR2

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99c984cbfe3431cc1c9707

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether EDPIDR3 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

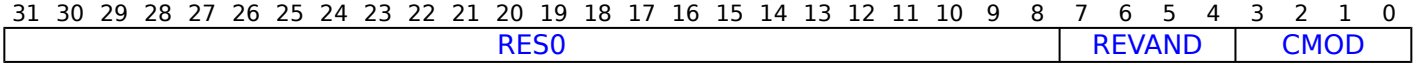
This register is required for CoreSight compliance.

Attributes

EDPIDR3 is a 32-bit register.

Field descriptions

The EDPIDR3 bit assignments are:



Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using EDPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

Accessing the EDPIDR3

EDPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance

Debug	0xFEC	EDPIDR3

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether EDPIDR4 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

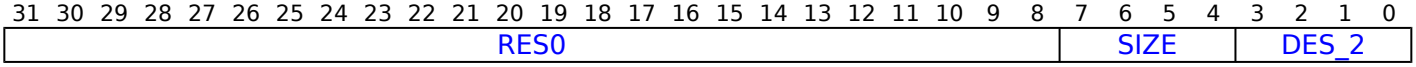
This register is required for CoreSight compliance.

Attributes

EDPIDR4 is a 32-bit register.

Field descriptions

The EDPIDR4 bit assignments are:



Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. RAZ. Log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is `0b0100`.

Accessing the EDPIDR4

EDPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance

Debug	0xFD0	EDPIDR4

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

Purpose

Controls the PE functionality related to powerup, reset, and powerdown.

Configuration

EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.

~~For RW fields see the field description for a description of the behavior of the field on a reset that applies to its power domain. However:~~

- ~~Fields that are in the Core power domain are not affected by a warm reset and are not affected by an External debug reset.~~
- ~~Fields that are in the Debug power domain reset to their defined reset values on an External debug reset, and are not affected by a Warm reset and are not affected by a Cold reset.~~

If ARMv8.3-DoPD is implemented then all fields in this register are in the Core power domain.

CORENPDRQ is the only field that is mapped between the EDPRCR and DBGPRCR and DBGPRCR_EL1.

Attributes

EDPRCR is a 32-bit register.

Field descriptions

The EDPRCR bit assignments are:

When ARMv8.3-DoPD is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																														CWRR	CORENPDRQ

Bits [31:2]

Reserved, RES0.

CWRR, bit [1]

Warm reset request. Write-only bit that reads as zero.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

CWRR	Meaning
0b0	No action.
0b1	Request Warm reset.

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or SoftwareLockStatus(), access to this field is **WI**.
- Otherwise, access to this field is **WO**.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the DBGPRCR.CORENPDRQ and DBGPRCR_EL1.CORENPDRQ fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see Core power domain power states.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

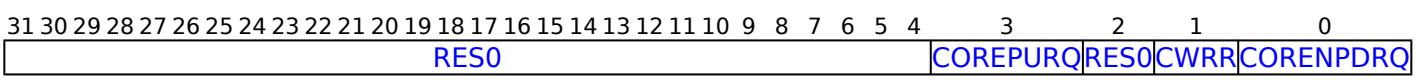
The following resets apply:

- On a Cold reset, this field is set to 1 if the powerup request is implemented and the powerup request has been asserted, and is set to 0 otherwise.
- On a Warm reset, the value of this field is unchanged.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or OSLockStatus(), access to this field is **UNKNOWN**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:



Bits [31:4]

Reserved, RES0.

COREPURQ, bit [3]

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain, and that the power controller emulates powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

COREPURQ	Meaning
0b0	Do not request power up of the Core power domain.
0b1	Request power up of the Core power domain, and emulation of powerdown.

In an implementation that includes the recommended external debug interface, this bit drives the DBGPWRUPREQ signal.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a External debug reset, this field resets to 0.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Bit [2]

Reserved, RES0.

CWRR, bit [1]

Warm reset request. Write-only bit that reads as zero.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

CWRR	Meaning
0b0	No action.
0b1	Request Warm reset.

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

On a Warm reset, this field resets to `0`.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or SoftwareLockStatus(), access to this field is **WI**.
- Otherwise, access to this field is **WO**.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
`0b0`	If the system responds to a powerdown request, it powers down Core power domain.
`0b1`	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the DBGPRCR.CORENPDRQ and DBGPRCR_EL1.CORENPDRQ fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see Core power domain power states.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The following resets apply:

- On a Cold reset, this field resets to the value in EDPRCR.COREPURQ.
- On a Warm reset, the value of this field is unchanged.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or OSLockStatus(), access to this field is **UNKNOWN**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Accessing the EDPRCR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

EDPRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x310	EDPRCR

This interface is accessible as follows:

- When (ARMv8.3-DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are **RO**.
- When (ARMv8.3-DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

Purpose

Holds information about the reset and powerdown state of the PE.

Configuration

EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

~~Some of the fields in the Core power domain are in the Cold reset domain and others are in the Warm reset domain. See the field descriptions for more information. However:~~

- ~~Fields that are in the Cold reset domain are not affected by a warm reset and are not affected by an External debug reset.~~
- ~~Fields in the Warm reset domain are also reset by a Cold reset but are not affected by an External debug reset.~~
- ~~Fields in the Debug power domain are not affected by a Warm reset and are not affected by a Cold reset.~~

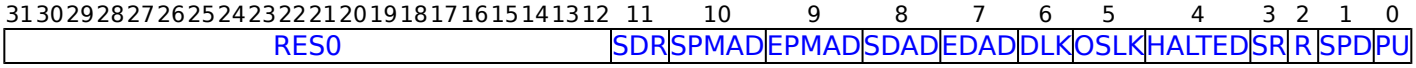
If ARMv8.3-DoPD is implemented then all fields in this register are in the Core power domain.

Attributes

EDPRSR is a 32-bit register.

Field descriptions

The EDPRSR bit assignments are:



Bits [31:12]

Reserved, RES0.

SDR, bit [11]

Sticky Debug Restart. Set to 1 when the PE exits Debug state.

Permitted values are:

SDR	Meaning
0b0	The PE has not restarted since EDPRSR was last read.
0b1	The PE has restarted since EDPRSR was last read.

Note

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is UNKNOWN on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If The Core power domain is powered up, then following a read of EDPRSR:

- If ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If ARMv8.0-DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain and the Warm reset domain.

This field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC**.

SPMAD, bit [10]

When ARMv8.4-Debug is implemented:

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because AllowExternalPMUAccess() == FALSE.

Permitted values are:

SPMAD	Meaning
0b0	No Non-secure external debug interface accesses to the external Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read.
0b1	At least one Non-secure external debug interface access to the external Performance Monitors register has failed and returned an error because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If ARMv8.0-DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC**.

Otherwise:

Sticky EPMAD error.

SPMAD	Meaning
0b0	No external debug interface accesses to the Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.
0b1	At least one external debug interface access to the Performance Monitors registers has failed and returned an error because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If ARMv8.0-DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to `0`.

Accessing this field has the following behavior:

- When !IsCorePowered(), or OSLockStatus(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC**.

EPMAD, bit [9]

When ARMv8.4-Debug is implemented:

External Performance Monitors Access Disable status.

EPMAD	Meaning
`0b0`	External Non-secure Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE for a Non-secure access.
`0b1`	External Non-secure Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

Otherwise:

External Performance Monitors access disable status.

EPMAD	Meaning
`0b0`	External Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE.
`0b1`	External Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When !IsCorePowered(), or OSLockStatus(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

SDAD, bit [8]

When ARMv8.4-Debug is implemented:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

SDAD	Meaning
`0b0`	No Non-secure external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.
`0b1`	At least one Non-secure external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If ARMv8.0-DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to `0`.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

Otherwise:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

SDAD	Meaning
`0b0`	No external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.
`0b1`	At least one external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If ARMv8.0-DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This bit is UNKNOWN on reads if OSLockStatus() == TRUE and external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

On a Cold reset, this field resets to `0`.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

EDAD, bit [7]

When ARMv8.4-Debug is implemented:

External Debug Access Disable status.

EDAD	Meaning
`0b0`	External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE for a Non-secure access.
`0b1`	External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

When ARMv8.2-Debug is implemented:

External Debug Access Disable status.

EDAD	Meaning
0b0	External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE.
0b1	External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE.

This bit is not valid and reads UNKNOWN if OSLockStatus() == TRUE and external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

Otherwise:

External Debug Access Disable status.

EDAD	Meaning
0b0	External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE.
0b1	External access to breakpoint registers, watchpoint registers disabled. It is IMPLEMENTATION DEFINED whether accesses to OSLAR_EL1 are enabled or disabled. AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

DLK, bit [6]

When ARMv8.4-Debug is implemented:

This field is RES0.

When ARMv8.2-Debug is implemented and ARMv8.0-DoubleLock is implemented:

Double Lock.

From Armv8.2, this field is deprecated.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When IsCorePowered() and !DoubleLockStatus(), access to this field is **RAZ**.
- Otherwise, access to this field is **UNKNOWN**.

When ARMv8.0-DoubleLock is implemented:

Double Lock.

This field returns the result of the pseudocode function DoubleLockStatus().

If the Core power domain is powered up and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether:

- EDPRSR.PU reads as 1, EDPRSR.DLK reads as 1, and EDPRSR.SPD is UNKNOWN.
- EDPRSR.PU reads as 0, EDPRSR.DLK is UNKNOWN, and EDPRSR.SPD reads as 0.

This field is in the Core power domain.

DLK	Meaning
0b0	DoubleLockStatus() returns FALSE.
0b1	DoubleLockStatus() returns TRUE and the Core power domain is powered up.

Accessing this field has the following behavior:

- When !IsCorePowered(), access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

OSLK, bit [5]

OS Lock status bit.

A read of this bit returns the value of OSLSR_EL1.OSLK.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When !IsCorePowered(), DoubleLockStatus() and EDPRSR.R == 1, access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

HALTED, bit [4]

Halted status bit.

HALTED	Meaning
0b0	PE is in Non-debug state.
0b1	PE is in Debug state.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When !IsCorePowered(), access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

SR, bit [3]

Sticky core Reset status bit.

Permitted values are:

SR	Meaning
0b0	The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read.
0b1	The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read.

If EDPRSR.PU reads as 1 and EDPRSR.R reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of EDPRSR:

- If ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If ARMv8.0-DoubleLock is implemented and DoubleLockStatus() == TRUE, it is UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain and the Warm reset domain.

This field resets to 1.

Accessing this field has the following behavior:

- When !IsCorePowered() or DoubleLockStatus(), access to this field is **UNKNOWN**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC**.

R, bit [2]

PE Reset status bit.

Permitted values are:

R	Meaning
0b0	The non-debug logic of the PE is not in reset state.
0b1	The non-debug logic of the PE is in reset state.

If ARMv8.0-DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see 'EDPRSR.{DLK, R} and reset state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support)

This field is in the Core power domain.

Accessing this field has the following behavior:

- When !IsCorePowered() or DoubleLockStatus(), access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

SPD, bit [1]

Sticky core Powerdown status bit.

If ARMv8.0-DoubleLock is implemented and DoubleLockStatus() == TRUE, then:

- If ARMv8.2-Debug is implemented, this bit reads as 0.
- If ARMv8.2-Debug is not implemented, this bit might read as 0 or 1.

For more information, see EDPRSR.{DLK, SPD, PU} and the Core power domain.

SPD	Meaning
0b0	If EDPRSR.PU is 0, it is not known whether the state of the debug registers in the Core power domain is lost. If EDPRSR.PU is 1, the state of the debug registers in the Core power domain has not been lost.
0b1	The state of the debug registers in the Core power domain has been lost.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If ARMv8.0-DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

When the Core power domain is in either retention or powerdown state, the value of EDPRSR.SPD is IMPLEMENTATION DEFINED. For more information, see 'EDPRSR.SPD when the Core domain is in either retention or powerdown state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support).

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} bits

record accessibility and lost of state in Core power domain' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support).

This field is in the Core power domain and the Cold reset domain.

On a Cold reset, this field resets to 1.

Accessing this field has the following behavior:

- When !IsCorePowered(), access to this field is **RAZ**.
- When IsCorePowered() and DoubleLockStatus(), access to this field is **UNKNOWN**.
- Otherwise, access to this field is **RO**.

PU, bit [0]

When ARMv8.3-DoPD is implemented:

Core powerup status bit.

Access to this field is **RAO**.

When ARMv8.2-Debug is implemented:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

PU	Meaning
0b0	Either the Core power domain is in a low-power or powerdown state, or ARMv8.0-DoubleLock is implemented and DoubleLockStatus() == TRUE, meaning the debug registers in the Core power domain cannot be accessed.
0b1	The Core power domain is in a powerup state, and either ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE, meaning the debug registers in the Core power domain can be accessed.

If ARMv8.0-DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see 'EDPRSR.{DLK, R} and reset state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support)

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} bits record accessibility and lost of state in Core power domain' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support)

Access to this field is **RO**.

Otherwise:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

When the Core power domain is powered-up and DoubleLockStatus() == TRUE, then the value of EDPRSR.PU is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.

Otherwise, permitted values are:

PU	Meaning
0b0	Core power domain is in a low-power or powerdown state where the debug registers in the Core power domain cannot be accessed.
0b1	Core power domain is in a powerup state where the debug registers in the Core power domain can be accessed.

If ARMv8.0-DoubleLock is implemented, the Core power domain is powered up, and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

If ARMv8.0-DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see 'EDPRSR.{DLK, R} and reset

state' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support)

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} bits record accessibility and lost of state in Core power domain' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H6 (Debug Reset and Powerdown Support)

Access to this field is **RO**.

Accessing the EDPRSR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If ARMv8.0-DoubleLock is not implemented or DoubleLockStatus() == FALSE, then:
  - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
  - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).
- Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

EDPRSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x314	EDPRSR

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99e984cbfe3431cc1e9707

EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

External register EDSCR bits [30:29] are architecturally mapped to AArch64 System register MDCCSR_EL0[30:29] .

EDSCR is in the Core power domain. ~~Some or all RW fields of this register have defined reset values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

Attributes

EDSCR is a 32-bit register.

Field descriptions

The EDSCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13:12	11:10	9	8	7	6	5:4	3:2	1:0
TFO	RXfull	TXfull	ITO	RXO	TXU	PipeAdv	ITE	INTdis		TDA	MA	SC2	NS	RES0	SDD	RES0	HDE	RW		EL	A		ERR	STATUS		

TFO, bit [31]

When ARMv8.4-Trace is implemented:

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

TFO	Meaning
0b0	Trace Filter controls are not affected.
0b1	Trace Filter controls in TRFCR_EL1, TRFCR_EL2 are ignored.~~, TRFCR, and HTRFCR are ignored.~~ Trace Filter controls TRFCR and HTRFCR are ignored.

When OSLSR_EL1.OSLK == 1, this bit can be indirectly read and written through the MDSCR_EL1 and DBGDSCRext System registers.

This bit is ignored by the PE when ExternalSecureNoninvasiveDebugEnabled() == FALSE and the Effective value of MDCR_EL3.STE == 1.

On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

DTRRX full.

On a Cold reset, this field resets to 0.

Access to this field is **RO**.

TXfull, bit [29]

DTRTX full.

On a Cold reset, this field resets to `0`.

Access to this field is **RO**.

ITO, bit [28]

ITR overrun.

If the PE is in Non-debug state, this bit is UNKNOWN. ITO is set to 0 on entry to Debug state.

Access to this field is **RO**.

RXO, bit [27]

DTRRX overrun.

On a Cold reset, this field resets to `0`.

Access to this field is **RO**.

TXU, bit [26]

DTRTX underrun.

On a Cold reset, this field resets to `0`.

Access to this field is **RO**.

PipeAdv, bit [25]

Pipeline advance. Set to 1 every time the PE pipeline retires one or more instructions. Cleared to 0 by a write to EDRCR.CSPA.

The architecture does not define precisely when this bit is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing.

Access to this field is **RO**.

ITE, bit [24]

ITR empty.

If the PE is in Non-debug state, this bit is UNKNOWN. It is always valid in Debug state.

Access to this field is **RO**.

INTdis, bits [23:22]

When ARMv8.4-Debug is implemented:

Interrupt disable. Disables taking interrupts in Non-Debug state.

INTdis	Meaning
0b0	Masking of interrupts is controlled by PSTATE and interrupt routing controls.
0b1	If ExternalSecureDebugEnabled() == TRUE, then all interrupts, including virtual and SError interrupts, are masked. If ExternalSecureDebugEnabled() == FALSE, then all interrupts targetting Non-secure state are masked.

When OSLSR_EL1.OSLK == 1, this field can be indirectly read and written through the MDSCR_EL1 and DBGDSCRext System registers.

This field is ignored by the PE and treated as zero when ExternalDebugEnabled() == FALSE.

On a Cold reset, this field resets to 0.

Otherwise:

Interrupt disable.

When OSLSR_EL1.OSLK == 1, this field can be indirectly read and written through the MDSCR_EL1 and DBGDSCRext System registers.

INTdis	Meaning
0b00	Do not disable interrupts.
0b01	Disable interrupts taken to Non-secure EL1.
0b10	Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If ExternalSecureInvasiveDebugEnabled() == TRUE, also disable interrupts taken to Secure EL1.
0b11	Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If ExternalSecureInvasiveDebugEnabled() == TRUE, also disable all other interrupts.

On a Cold reset, this field resets to 0.

TDA, bit [21]

Traps accesses to the following debug System registers:

- AArch64: DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, DBGWVR<n>_EL1.
- AArch32: DBGBCR<n>, DBGBVR<n>, DBGBXVR<n>, DBGWCR<n>, DBGWVR<n>.

The possible values of this field are:

TDA	Meaning
0b0	Accesses to debug System registers do not generate a Software Access Debug event.
0b1	Accesses to debug System registers generate a Software Access Debug event, if OSLSR_EL1.OSLK is 0 and if halting is allowed.

On a Cold reset, this field resets to 0.

MA, bit [20]

Memory access mode. Controls the use of memory-access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

MA	Meaning
0b0	Normal access mode.
0b1	Memory access mode.

On a Cold reset, this field resets to 0.

SC2, bit [19]

When ARMv8.0-PCSample is implemented, (ARMv8.1-VHE is implemented or ARMv8.2-Debug is implemented) and ARMv8.2-PCSample is not implemented:

Sample CONTEXTIDR_EL2. Controls whether the PC Sample-based Profiling Extension samples CONTEXTIDR_EL2 or VTTBR_EL2.VMID.

SC2	Meaning
0b0	Sample VTTBR_EL2.VMID.
0b1	Sample CONTEXTIDR_EL2.

On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NS, bit [18]

Non-secure status. When in Debug state, gives the current Security state:

NS	Meaning
0b0	Secure state, IsSecure() == TRUE.
0b1	Non-secure state, IsSecure() == FALSE.

In Non-debug state, this bit is UNKNOWN.

Access to this field is **RO**.

Bit [17]

Reserved, RES0.

SDD, bit [16]

Secure debug disabled.

On entry to Debug state:

- If entering in Secure state, SDD is set to 0.
- If entering in Non-secure state, SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled().

In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

In Non-debug state:

- SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a context synchronization event is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

Access to this field is **RO**.

Bit [15]

Reserved, RES0.

HDE, bit [14]

Halting debug enable. The possible values of this field are:

HDE	Meaning
0b0	Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.
0b1	Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.

On a Cold reset, this field resets to 0.

RW, bits [13:10]

Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level.~~level:~~

RW	Meaning	Applies when
0b1111	All Exception levels are using AArch64 or the PE is in Non-debug state.	
0b1110	The PE is in Debug state. EL0 is using AArch32. All other Exception levels are using AArch64. Only permitted if the PE is executing at EL0.	When AArch32 is supported at any Exception level
0b110x	The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 and EL3 are using AArch64. Only permitted if EL2 is implemented and enabled in the current Security state.	When AArch32 is supported at any Exception level
0b10xx	The PE is in Debug state. EL0, EL1, and, if implemented in the current Security state, EL2 are using AArch32. EL3 is using AArch64. ~~Only permitted if EL3 is implemented.~~	When AArch32 is supported at any Exception level and EL3 is implemented
0b0xxx	The PE is in Debug state. All Exception levels are using AArch32.	

In Non-debug state, this field is RAO.

Access to this field is **RO**.

EL, bits [9:8]

Exception level. In Debug state, this gives the current Exception level~~EL~~ of the PE.

In Non-debug state, this field is RAZ.

Access to this field is **RO**.

A, bit [7]

SError interrupt pending. In Debug state, indicates whether an SError interrupt is pending:

- If HCR_EL2.{AMO, TGE} = {1, 0}, EL2 is enabled in the current Security state, and the PE is executing at EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

A	Meaning
0b0	No SError interrupt pending.
0b1	SError interrupt pending.

A debugger can read EDSCR to check whether an SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

UNKNOWN in Non-debug state.

Access to this field is **RO**.

ERR, bit [6]

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

On a Cold reset, this field resets to `0`.

Access to this field is **RO**.

STATUS, bits [5:0]

Debug status flags.

STATUS	Meaning
`0b000001`	PE is restarting, exiting Debug state.
`0b000010`	PE is in Non-debug state.
`0b000111`	Breakpoint.
`0b010011`	External debug request.
`0b011011`	Halting step, normal.
`0b011111`	Halting step, exclusive.
`0b100011`	OS Unlock Catch.
`0b100111`	Reset Catch.
`0b101011`	Watchpoint.
`0b101111`	HLT instruction.
`0b110011`	Software access to debug register.
`0b110111`	Exception Catch.
`0b111011`	Halting step, no syndrome.

All other values of STATUS are reserved.

Access to this field is **RO**.

Accessing the EDSCR

EDSCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x088`	EDSCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

Purpose

Contains sampled values captured on reading EDPCSR[31:0].

Configuration

EDVIDSR is in the Core power domain.

~~EDVIDSR is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

This register is present only when ARMv8.0-PCSample is implemented and ARMv8.2-PCSample is not implemented. Otherwise, direct accesses to EDVIDSR are RES0.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

When the PC Sample-based Profiling Extension is implemented in the external debug registers space, if EL2 is not implemented and EL3 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

Note

ARMv8.2-PCSample implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

If ARMv8.1-VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Field descriptions

The EDVIDSR bit assignments are:

When ARMv8.1-VHE is not implemented or EDSCR.SC2 == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NS	E2	E3	HV	RES0												VMID[15:8]								VMID							

This format applies in all Armv8.0 implementations.

NS, bit [31]

Non-secure state sample. Indicates the Security state associated with the most recent EDPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

E2, bit [30]

When ~~HaveEL(~~EL2 is implemented~~):~~

Exception level 2 status sample. Indicates whether the most recent EDPCSR sample was associated with EL2.

E2	Meaning
0b0	Sample is not from EL2.
0b1	Sample is from EL2.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [29]

When ~~HaveEL(~~EL3~~)~~ is implemented and the highest implemented Exception level is using AArch64 state:~~!HighestELUsingAArch32():~~

Exception level 3 status sample. Indicates whether the most recent EDPCSR sample was associated with EL3 using AArch64.

E3	Meaning
0b0	Sample is not from EL3 using AArch64.
0b1	Sample is from EL3 using AArch64.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HV, bit [28]

EDPCSRhi (EDPCSR[63:32]) valid. Indicates whether bits [63:32] of the most recent EDPCSR sample might be nonzero:

HV	Meaning
0b0	Bits[63:32] of the most recent EDPCSR sample are zero.
0b1	Bits[63:32] of the most recent EDPCSR sample might be nonzero.

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi (EDPCSR[63:32]) does not need to be read.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [27:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When ARMv8.1-VMID16 is implemented and ~~HaveEL(~~EL2 is implemented~~):~~

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]

When ~~HaveEL(~~EL2 is implemented~~):~~

VMID sample. The VMID associated with the most recent EDPCSRlo (EDPCSR[31:0]) sample. When the most recent EDPCSR sample was generated:

- This field is RES0 if any of the following apply:
  - The PE is executing in Secure state.
  - The PE is executing at EL2.
- Otherwise:
  - If EL2 is using AArch64 and either ARMv8.1-VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
  - If EL2 is using AArch64, ARMv8.1-VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
  - If EL2 is using AArch32, this field is set to VTTBR.VMID.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When (ARMv8.1-VHE is implemented or ARMv8.2-Debug is implemented) and EDSCR.SC2 == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CONTEXTIDR_EL2																															

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent EDPCSR sample. When the most recent EDPCSR sample was generated:

- If EL2 was using AArch64 and the PE was executing in Non-secure state, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- If EL2 was using AArch32 or the PE was executing in Secure state, then this field is set to an UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile

EDVIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A8	EDVIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

Purpose

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

Configuration

EDWAR is in the Core power domain.

~~EDWAR is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

Attributes

EDWAR is a 64-bit register.

Field descriptions

The EDWAR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Watchpoint address																															
Watchpoint address																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the DC ZVA block size.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The value of EDWAR[63:32] is UNKNOWN if Debug state was entered for a Watchpoint debug event taken from AArch32 state.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See 'Determining the memory location that caused a Watchpoint exception' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section D2 (AArch64 Self-hosted Debug)

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDWAR

EDWAR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x030	EDWAR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.

- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
Debug	0x034	EDWAR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

ERRCIDR0, Component Identification Register 0

The ERRCIDR0 characteristics are:

Purpose

Provides discovery information aboutfor the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRCIDR0 are RES0.

Attributes

ERRCIDR0 is a 32-bit register.

Field descriptions

The ERRCIDR0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_0							

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Component identification preamble, segment 0.

Component identification preamble, segment 0. This field reads as 0x0D.

This field reads as 0x0D.

Accessing the ERRCIDR0

ERRCIDR0 can be accessed through the memory-mapped interfaces:

Component	Offset
RAS	0xFF0

Component	Offset	Instance
RAS	0xFF0	ERRCIDR0

Accesses on this interface are **RO**.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRCIDR1, Component Identification Register 1

The ERRCIDR1 characteristics are:

Purpose

Provides discovery information aboutfor the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

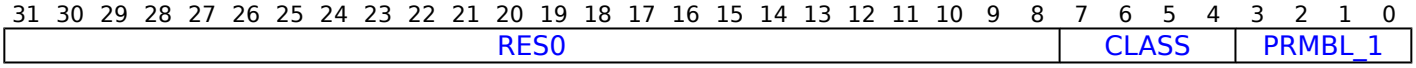
This register is present only when RAS is implemented. Otherwise, direct accesses to ERRCIDR1 are RES0.

Attributes

ERRCIDR1 is a 32-bit register.

Field descriptions

The ERRCIDR1 bit assignments are:



Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1111	Generic peripheral with IMPLEMENTATION DEFINED register layout.

This field reads as 0xF.

Other values are defined by the CoreSight Architecture.

This field reads as 0xF.

PRMBL_1, bits [3:0]

Component identification preamble, segment 1.

Component identification preamble, segment 1. This field reads as 0x0.

This field reads as 0x0.

Accessing the ERRCIDR1

ERRCIDR1 can be accessed through the memory-mapped interfaces:

Component	Offset
RAS	0xFF4

Component	Offset	Instance
RAS	0xFF4	ERRCIDR1

Accesses on this interface are **RO**.

ERRCRICR0, Critical Error Interrupt Configuration Register 0

The ERRCRICR0 characteristics are:

Purpose

Interrupt configuration register.

Configuration

External register ERRCRICR0 is architecturally mapped to External register ERRIRQCR4.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERRCRICR0 are RES0.

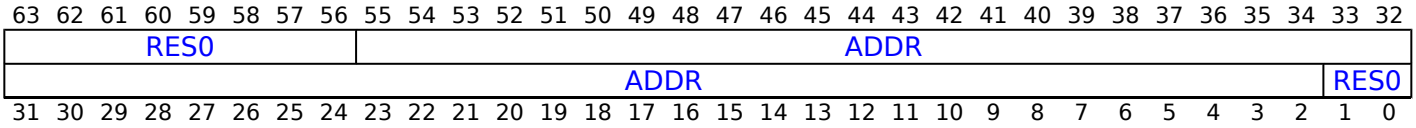
Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

Attributes

ERRCRICR0 is a 64-bit register.

Field descriptions

The ERRCRICR0 bit assignments are:



Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address.

Specifies the address that the component writes to when signaling an interrupt.

The size of a physical address is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The following resets apply:

- On ana~~a~~ Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing the ERRCRICR0

ERRCRICR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEA0	ERRCRICR0

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

ERRCRICR1, Critical Error Interrupt Configuration Register 1

The ERRCRICR1 characteristics are:

Purpose

Interrupt configuration register.

Configuration

External register ERRCRICR1 bits [31:0] are architecturally mapped to External register ERRIRQCR5[31:0] .

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERRCRICR1 are RES0.

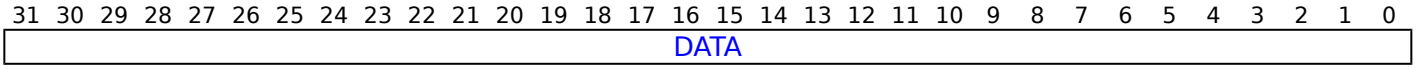
Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

Attributes

ERRCRICR1 is a 32-bit register.

Field descriptions

The ERRCRICR1 bit assignments are:



DATA, bits [31:0]

Payload for a message signaled interrupt.

The following resets apply:

- On ana~~a~~ Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERRCRICR1

ERRCRICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEA8	ERRCRICR1

Accesses on this interface are **RW**.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

ERRCRICR2, Critical Error Interrupt Configuration Register 2

The ERRCRICR2 characteristics are:

Purpose

Interrupt configuration register.

Configuration

External register ERRCRICR2 bits [31:0] are architecturally mapped to External register ERRIRQCR5[63:32] .

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERRCRICR2 are RES0.

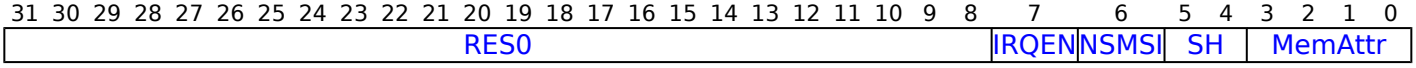
Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

Attributes

ERRCRICR2 is a 32-bit register.

Field descriptions

The ERRCRICR2 bit assignments are:



Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

Message Signaled Interrupt enable.

Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Message signaled interrupts are disabled.
0b1	Message signaled interrupts are enabled.

If the component does not support disabling message signaled interrupts, this bit is RES0.

The following resets apply:

- On ana~~a~~ Error recovery reset, this field resets to 0.
- On a Cold reset, this field resets to 0.

NSMSI, bit [6]

Security attribute.

Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Physical address space for message signaled interrupts is Secure.
0b1	Physical address space for message signaled interrupts is Non-secure.

If the component prohibits Non-secure writes and does not support configuring the Security attribute, then the Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

If the component allows Non-secure writes, then the Security attribute used for message signaled interrupts is Non-secure.

This bit is RES0 if any of the following are true:

- The component allows Non-secure writes.
- The component does not support configuring the Security attribute.

On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

SH, bits [5:4]

Shareability.

Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Message signaled interrupts are in the Not shared Shareability domain.
0b10	Message signaled interrupts are in the Outer Shareable Shareability domain.
0b11	Message signaled interrupts are in the Inner Shareable Shareability domain.

If the component does not support configuring the Shareability domain, this field is RES0, meaning the Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

The following resets apply:

- On ana Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MemAttr, bits [3:0]

Memory type.

Defines the memory type for message signaled interrupts. The values which correspond to each memory type are:

MemAttr	Meaning
0b0000	Device-nGnRnE.
0b0001	Device-nGnRE.
0b0010	Device-nGRE.
0b0011	Device-GRE.
0b0101	Outer Non-cacheable, Inner Non-cacheable.
0b0110	Outer Non-cacheable, Inner Write-Through Cacheable.
0b0111	Outer Non-cacheable, Inner Write-Back Cacheable.
0b1001	Outer Write-Through Cacheable, Inner Non-cacheable.
0b1010	Outer Write-Through Cacheable, Inner Write-Through Cacheable.
0b1011	Outer Write-Through Cacheable, Inner Write-Back Cacheable.
0b1101	Outer Write-Back Cacheable, Inner Non-cacheable.
0b1110	Outer Write-Back Cacheable, Inner Write-Through Cacheable.
0b1111	Outer Write-Back Cacheable, Inner Write-Back Cacheable.

If the component does not support configuring the memory type, this field is RES0, meaning the memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The following resets apply:

- On ana Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERRCRICR2

ERRCRICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEAC	ERRCRICR2

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

ERRDEVAFF, Device Affinity Register

The ERRDEVAFF characteristics are:

Purpose

IfFor RAS System Architecture v1.1 is not implemented, a group of error records that ishas associated with a PE or group or PEs must have affinity with either a single PE or allcluster theof PEs, atERRDEVAFF anis affinitya level.copy ofMPIDR_EL1 or part of MPIDR_EL1:

For a group of error records that has affinity with a single PE or a group of PEs, ERRDEVAFF is a copy of MPIDR_EL1 or part of MPIDR_EL1:

- If the group of error records has affinity with a single PE, the affinity level is 0, ERRDEVAFF reads the same value as MPIDR_EL1, and ERRDEVAFF.F0V reads-as-one to indicate affinity level 0.
- If the group of error records has affinity with a groupcluster of PEs, the affinity level is 1, 2, or 3, parts of ERRDEVAFF reads the same value as parts of MPIDR_EL1, and the rest of ERRDEVAFF indicates the level.

For example, if the groupaffinity oflevel PEs is a subset of the PEs at affinity level 12 then all of the following are true:

- ERRDEVAFF.Aff1 reads as 0x80 and ERRDEVAFF.{Aff0,F0V} read-as-zero, to indicate affinity level 2.
- AllThe thegroup of error records has affinity with all PEs in the groupsystem that have the same valuesvalue in MPIDR_EL1.{Aff3,Aff2}, and these values are equal to ERRDEVAFF.{Aff3,Aff2}.
- ERRDEVAFF.Aff1ERRDEVAFF.{Aff3,Aff2} isreads nonzerothe andsame notvalue as 0x80, and ERRDEVAFF.{Aff0,F0V} read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the group of error records has affinity with is indicated by the least-significant set bit in ERRDEVAFF.Aff1. In this example, if ERRDEVAFF.Aff1[2:0] is 0b100, then the group of error records has affinity with the up-to 8 PEs that have MPIDR_EL1.Aff1[7:3] == ERRDEVAFF.Aff1[7:3].{Aff3,Aff2}.

Configuration

Implementation of this register is OPTIONAL.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRDEVAFF are RES0.

Present only if a group has affinity with a PE or cluster of PEs, and otherwise RES0.

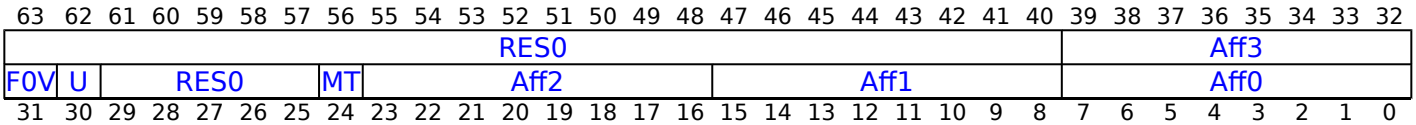
This register is present only when the group of error records has affinity with a PE or cluster of PEs. Otherwise, direct accesses to ERRDEVAFF are RES0.

Attributes

ERRDEVAFF is a 64-bit register.

Field descriptions

The ERRDEVAFF bit assignments are:



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

PE affinity~~Affinity~~ level 3. The MPIDR_EL1.Aff3 field, viewed from the highest Exception level of the associated PE or PEs.

F0V, bit [31]

Indicates that the ERRDEVAFF.Aff0 field is valid.

F0V	Meaning
0b0	ERRDEVAFF.Aff0 is not valid, and the PE affinity ~~level~~ is above~~1,~~ level~~2~~ 0 or a subset of level 0.~~3.~~
0b1	ERRDEVAFF.Aff0 is valid, and the PE affinity ~~level~~ is at level 0.

U, bit [30]

When ERRDEVAFF.F0V == 0b1:

Uniprocessor. The MPIDR_EL1.U bit, viewed from the highest Exception level of the associated PE.

~~U~~	~~Meaning~~
~~0b0~~	~~The PE is part of a multiprocessor system.~~
~~0b1~~	~~The PE is part of a uniprocessor system.~~

~~If ERRDEVAFF.Aff0 is not valid, this bit is not valid and reads as UNKNOWN.~~

Otherwise:

Reserved, UNKNOWN.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

When ERRDEVAFF.F0V == 0b1:

Multithreaded. The MPIDR_EL1.MT bit, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Aff2, bits [23:16]

When affine with a PE or PEs at affinity level 2 or below:

PE affinity level 2. The MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PE or PEs.

When affine with a sub-set of PEs at affinity level 2:

PE affinity level 2. Defines part of the MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PEs.

Aff2MT	Meaning
0bxxxxxxx10b0	ERRDEVAFF.Aff2[7:1]Performance isof PEs at the valuelowest ofaffinity level is largely independent. MPIDR_EL1.Aff2[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx100b1	ERRDEVAFF.Aff2[7:2]Performance isof PEs at the valuelowest ofaffinity level is very interdependent. MPIDR_EL1.Aff2[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	ERRDEVAFF.Aff2[7:3] is the value of MPIDR_EL1.Aff2[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	ERRDEVAFF.Aff2[7:4] is the value of MPIDR_EL1.Aff2[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	ERRDEVAFF.Aff2[7:5] is the value of MPIDR_EL1.Aff2[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	ERRDEVAFF.Aff2[7:6] is the value of MPIDR_EL1.Aff2[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	ERRDEVAFF.Aff2[7] is the value of MPIDR_EL1.Aff2[7], viewed from the highest Exception level of the associated PEs.

If ERRDEVAFF.Aff0 is not valid, this bit is not valid and reads as UNKNOWN.

Aff2, bits [23:16]

Affinity level 2.

When the PE affinity level is 0, 1, or 2, this field is the MPIDR_EL1.Aff2 field viewed from the highest Exception level of the associated PE or PEs.

When the PE affinity level is 3, this field indicates that ERRDEVAFF.Aff3 field is valid, and the following values are defined:

Otherwise:

PE affinity level 2. Indicates whether the PE affinity is at level 3.

Aff2	Meaning
0x80	ERRDEVAFF.Aff3 is valid, and the PE affinity level is at level 3.

This field reads as 0x80.

All other values are reserved.

Aff1, bits [15:8]

When affine with a PE or PEs at affinity level 1 or below:

PEAffinity affinity level 1. The MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PE or PEs.

When the PE affinity level is 0 or 1, this field is the MPIDR_EL1.Aff1 field viewed from the highest Exception level of the associated PE or PEs.

When the PE affinity level is 2 or 3, this field indicates that ERRDEVAFF.Aff2 is valid, and the following values are defined:

When affine with a sub-set of PEs at affinity level 1:

PE affinity level 1. Defines part of the MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PEs.

Aff1	Meaning
0bxxxxxxx10x00	ERRDEVAFF.Aff1[7:1]ERRDEVAFF.Aff2 is not valid, and the valuePE ofaffinity level is 3. MPIDR_EL1.Aff1[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx100x80	ERRDEVAFF.Aff1[7:2]ERRDEVAFF.Aff2 is valid, and the valuePE ofaffinity level is 2. MPIDR_EL1.Aff1[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	ERRDEVAFF.Aff1[7:3] is the value of MPIDR_EL1.Aff1[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	ERRDEVAFF.Aff1[7:4] is the value of MPIDR_EL1.Aff1[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	ERRDEVAFF.Aff1[7:5] is the value of MPIDR_EL1.Aff1[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	ERRDEVAFF.Aff1[7:6] is the value of MPIDR_EL1.Aff1[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	ERRDEVAFF.Aff1[7] is the value of MPIDR_EL1.Aff1[7], viewed from the highest Exception level of the associated PEs.

All other values are reserved.

Aff0, bits [7:0]

Affinity level 0.

When the PE affinity level is 0, this field is the MPIDR_EL1.Aff0 field viewed from the highest Exception level of the associated PE or PEs.

When the PE affinity level is 1, 2 or 3, this field indicates that ERRDEVAFF.Aff1 is valid, and the following values are defined:

Otherwise:

PE affinity level 1. Indicates whether the PE affinity is at level 2.

Aff1Aff0	Meaning
0x00	PEERRDEVAFF.Aff1 affinity is abovenot levelvalid, 2and orthe aPE subsetaffinity of level 2.is 2 or 3.
0x80	ERRDEVAFF.Aff1 is valid, and the PE affinity level is at level 2.1.

All other values are reserved.

Aff0, bits [7:0]

When affine with a PE at affinity level 0:

PE affinity level 0. The MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PE.

When affine with a sub-set of PEs at affinity level 0:

PE affinity level 0. Defines part of the MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PEs.

Aff0	Meaning
0bxxxxxxx1	ERRDEVAFF.Aff0[7:1] is the value of MPIDR_EL1.Aff0[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	ERRDEVAFF.Aff0[7:2] is the value of MPIDR_EL1.Aff0[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	ERRDEVAFF.Aff0[7:3] is the value of MPIDR_EL1.Aff0[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	ERRDEVAFF.Aff0[7:4] is the value of MPIDR_EL1.Aff0[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	ERRDEVAFF.Aff0[7:5] is the value of MPIDR_EL1.Aff0[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	ERRDEVAFF.Aff0[7:6] is the value of MPIDR_EL1.Aff0[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	ERRDEVAFF.Aff0[7] is the value of MPIDR_EL1.Aff0[7], viewed from the highest Exception level of the associated PEs.

Otherwise:

PE affinity level 0. Indicates whether the PE affinity is at level 1.

Aff0	Meaning
0x00	PE affinity is above level 1 or a subset of level 1.
0x80	PE affinity is at level 1.

Accessing the ERRDEVAFF

ERRDEVAFF can be accessed through the memory-mapped interfaces:

Component	Offset
RAS	0xFA8

~~Component~~	~~Offset~~	~~Instance~~
~~RAS~~	~~0xFA8~~	~~ERRDEVAFF~~

Accesses on this interface are **RO**.

ERRDEVARCH, Device Architecture Register

The ERRDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

Configuration

~~This register is present only when RAS is implemented. Otherwise, direct accesses to ERRDEVARCH are UNDEFINED.~~

There are no configuration notes.

Attributes

ERRDEVARCH is a 32-bit register.

Field descriptions

The ERRDEVARCH bit assignments are:

31 30 29 28 27 26 25 24 23 22 21	20	19 18 17 16	15 14 13 12	11 10 9 8 7 6 5 4 3 2 1 0
ARCHITECT	PRESENT	REVISION	ARCHVER	ARCHPART

ARCHITECT, bits [31:21]

~~Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.~~

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

ARCHITECT	Meaning
0b01000111011	JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.

~~This field reads as 0x23B.~~

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

PRESENT, bit [20]

~~Defines that the DEVARCH register is present.~~

DEVARCH Present. Defines that the DEVARCH register is present.

PRESENT	Meaning
0b0	Device Architecture information not present.
0b1	Device Architecture information present.

This bit reads~~is~~ as~~RAO.~~ 0b1.

REVISION, bits [19:16]

~~Defines the architecture revision of the component. The defined values of this field are:~~

Revision. Defines the architecture revision of the component.

REVISION	Meaning
0b0000	RAS System Architecture v1.0.
0b0001	RAS System Architecture v1.1. As 0b0000 and also: • Simplifies ERR<n>STATUS. • Adds support for additional ERR<n>MISC<m> registers. • Adds support for the optional RAS Timestamp Extension. • Adds support for the optional RAS Common Fault Injection Model Extension.

All other values are reserved.

ARCHVER, bits [15:12]

~~Defines the architecture version of the component. The defined values of this field are:~~

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0000	RAS System Architecture v1.

~~This field reads as 0b0000.~~

All other values are reserved.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0b0000.

ARCHPART, bits [11:0]

~~Defines the architecture of the component.~~

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA00	RAS System~~system~~ Architecture.~~architecture.~~

~~This register reads as 0xA00.~~

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA00.

Accessing the ERRDEVARCH

ERRDEVARCH can be accessed through the memory-mapped interfaces:

Component	Offset
RAS	0xFBC

~~Component~~	~~Offset~~	~~Instance~~
~~RAS~~	~~0xFBC~~	~~ERRDEVARCH~~

Accesses on this interface are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

ERRDEVID, Device Configuration Register

The ERRDEVID characteristics are:

Purpose

Provides discovery information for the component.

Configuration

~~This register is present only when RAS is implemented. Otherwise, direct accesses to ERRDEVID are UNDEFINED.~~

There are no configuration notes.

Attributes

ERRDEVID is a 32-bit register.

Field descriptions

The ERRDEVID bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																NUM															

Bits [31:16]

Reserved, RES0.

NUM, bits [15:0]

IMPLEMENTATION DEFINED.

Highest numbered index of the error records in this group, plus one. Each implemented record is owned by a node. A node might own multiple records.

~~This field reads as an IMPLEMENTATION DEFINED value.~~

This manual describes ~~a~~the group~~memory-mapped view~~ of error records accessed via a standard~~group~~ 4KB~~with~~ memory-mapped~~up~~ peripheral.~~to~~ For~~56~~ a 4KB peripheral~~records~~, up~~the~~ to~~most~~ 24~~that~~ error records can be accessed~~contained~~ if~~in~~ the~~a~~ Common~~4KB~~ Fault~~component,~~ Injection~~meaning~~ Model~~the~~ is~~highest~~ implemented,~~possible~~ and~~value~~ up~~for~~ to~~this~~ 56~~field~~ otherwise.~~is 56.~~

Accessing the ERRDEVID

ERRDEVID can be accessed through the memory-mapped interfaces:

Component	Offset
RAS	0xFC8

~~Component~~	~~Offset~~	~~Instance~~
~~RAS~~	~~0xFC8~~	~~ERRDEVID~~

Accesses on this interface are **RO**.

ERRERICR0, Error Recovery Interrupt Configuration Register 0

The ERRERICR0 characteristics are:

Purpose

Interrupt configuration register.

Configuration

External register ERRERICR0 is architecturally mapped to External register ERRIRQCR2.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRERICR0 are RES0.

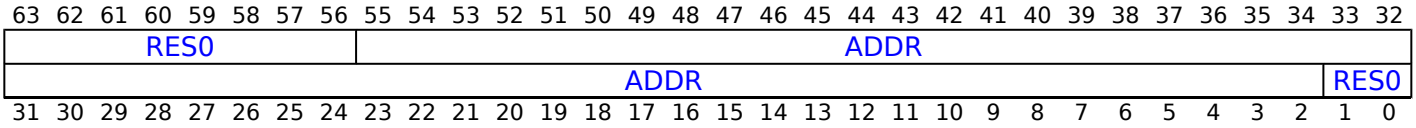
Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

Attributes

ERRERICR0 is a 64-bit register.

Field descriptions

The ERRERICR0 bit assignments are:



Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address.

Specifies the address that the component writes to when signaling an interrupt.

The size of a physical address is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The following resets apply:

- On ana~~a~~ Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing the ERRERICR0

ERRERICR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE90	ERRERICR0

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

ERRERICR1, Error Recovery Interrupt Configuration Register 1

The ERRERICR1 characteristics are:

Purpose

Interrupt configuration register.

Configuration

External register ERRERICR1 bits [31:0] are architecturally mapped to External register ERRIRQCR3[31:0] .

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRERICR1 are RES0.

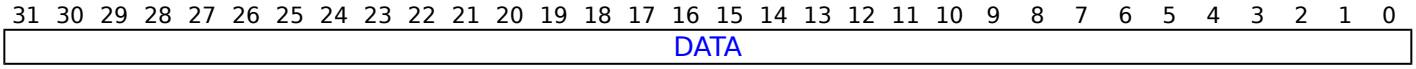
Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

Attributes

ERRERICR1 is a 32-bit register.

Field descriptions

The ERRERICR1 bit assignments are:



DATA, bits [31:0]

Payload for a message signaled interrupt.

The following resets apply:

- On ana~~a~~ Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERRERICR1

ERRERICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE98	ERRERICR1

Accesses on this interface are **RW**.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

ERRERICR2, Error Recovery Interrupt Configuration Register 2

The ERRERICR2 characteristics are:

Purpose

Interrupt configuration register.

Configuration

External register ERRERICR2 bits [31:0] are architecturally mapped to External register ERRIRQCR3[63:32] .

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRERICR2 are RES0.

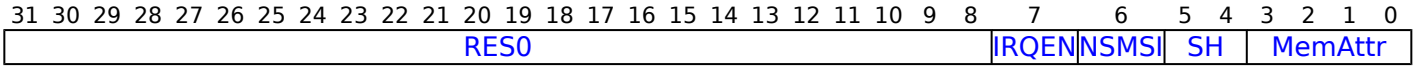
Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

Attributes

ERRERICR2 is a 32-bit register.

Field descriptions

The ERRERICR2 bit assignments are:



Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

Message Signaled Interrupt enable.

Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Message signaled interrupts are disabled.
0b1	Message signaled interrupts are enabled.

If the component does not support disabling message signaled interrupts, this bit is RES0.

The following resets apply:

- On ana~~a~~ Error recovery reset, this field resets to 0.
- On a Cold reset, this field resets to 0.

NSMSI, bit [6]

Security attribute.

Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Physical address space for message signaled interrupts is Secure.
0b1	Physical address space for message signaled interrupts is Non-secure.

If the component prohibits Non-secure writes and does not support configuring the Security attribute, then the Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

If the component allows Non-secure writes, then the Security attribute used for message signaled interrupts is Non-secure.

This bit is RES0 if any of the following are true:

- The component allows Non-secure writes.
- The component does not support configuring the Security attribute.

On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

SH, bits [5:4]

Shareability.

Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Message signaled interrupts are in the Not shared Shareability domain.
0b10	Message signaled interrupts are in the Outer Shareable Shareability domain.
0b11	Message signaled interrupts are in the Inner Shareable Shareability domain.

If the component does not support configuring the Shareability domain, this field is RES0, meaning the Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

The following resets apply:

- On ana Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MemAttr, bits [3:0]

Memory type.

Defines the memory type for message signaled interrupts. The values which correspond to each memory type are:

MemAttr	Meaning
0b0000	Device-nGnRnE.
0b0001	Device-nGnRE.
0b0010	Device-nGRE.
0b0011	Device-GRE.
0b0101	Outer Non-cacheable, Inner Non-cacheable.
0b0110	Outer Non-cacheable, Inner Write-Through Cacheable.
0b0111	Outer Non-cacheable, Inner Write-Back Cacheable.
0b1001	Outer Write-Through Cacheable, Inner Non-cacheable.
0b1010	Outer Write-Through Cacheable, Inner Write-Through Cacheable.
0b1011	Outer Write-Through Cacheable, Inner Write-Back Cacheable.
0b1101	Outer Write-Back Cacheable, Inner Non-cacheable.
0b1110	Outer Write-Back Cacheable, Inner Write-Through Cacheable.
0b1111	Outer Write-Back Cacheable, Inner Write-Back Cacheable.

If the component does not support configuring the memory type, this field is RES0, meaning the memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The following resets apply:

- On ana Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERRERICR2

ERRERICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE9C	ERRERICR2

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

ERRFHICR0, Fault-Handling Interrupt Configuration Register 0

The ERRFHICR0 characteristics are:

Purpose

Interrupt configuration register.

Configuration

External register ERRFHICR0 is architecturally mapped to External register ERRIRQCR0.

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRFHICR0 are RES0.

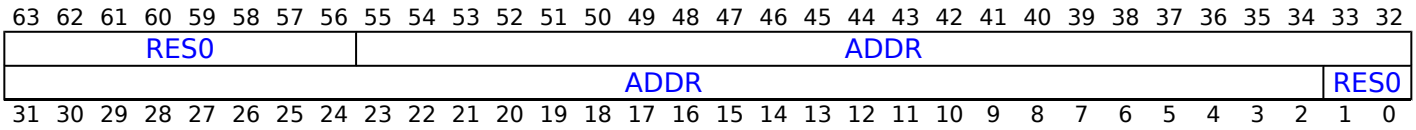
Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

Attributes

ERRFHICR0 is a 64-bit register.

Field descriptions

The ERRFHICR0 bit assignments are:



Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address.

Specifies the address that the component writes to when signaling an interrupt.

The size of a physical address is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The following resets apply:

- On ana~~a~~ Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing the ERRFHICR0

ERRFHICR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE80	ERRFHICR0

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

ERRFHICR1, Fault-Handling Interrupt Configuration Register 1

The ERRFHICR1 characteristics are:

Purpose

Interrupt configuration register.

Configuration

External register ERRFHICR1 bits [31:0] are architecturally mapped to External register ERRIRQCR1[31:0] .

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRFHICR1 are RES0.

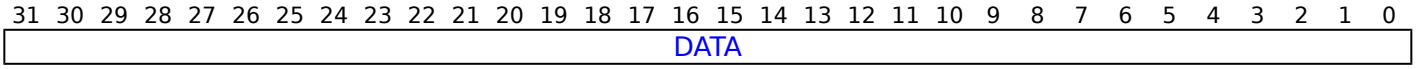
Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

Attributes

ERRFHICR1 is a 32-bit register.

Field descriptions

The ERRFHICR1 bit assignments are:



DATA, bits [31:0]

Payload for a message signaled interrupt.

The following resets apply:

- On ana Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERRFHICR1

ERRFHICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE88	ERRFHICR1

Accesses on this interface are **RW**.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

ERRFHICR2, Fault-Handling Interrupt Configuration Register 2

The ERRFHICR2 characteristics are:

Purpose

Interrupt configuration register.

Configuration

External register ERRFHICR2 bits [31:0] are architecturally mapped to External register ERRIRQCR1[63:32] .

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRFHICR2 are RES0.

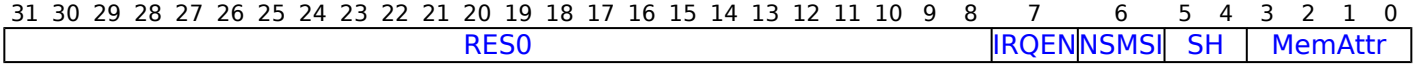
Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.

Attributes

ERRFHICR2 is a 32-bit register.

Field descriptions

The ERRFHICR2 bit assignments are:



Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

Message Signaled Interrupt enable.

Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Message signaled interrupts are disabled.
0b1	Message signaled interrupts are enabled.

If the component does not support disabling message signaled interrupts, this bit is RES0.

The following resets apply:

- On ana~~a~~ Error recovery reset, this field resets to 0.
- On a Cold reset, this field resets to 0.

NSMSI, bit [6]

Security attribute.

Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Physical address space for message signaled interrupts is Secure.
0b1	Physical address space for message signaled interrupts is Non-secure.

If the component prohibits Non-secure writes and does not support configuring the Security attribute, then the Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

If the component allows Non-secure writes, then the Security attribute used for message signaled interrupts is Non-secure.

This bit is RES0 if any of the following are true:

- The component allows Non-secure writes.
- The component does not support configuring the Security attribute.

On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

SH, bits [5:4]

Shareability.

Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Message signaled interrupts are in the Not shared Shareability domain.
0b10	Message signaled interrupts are in the Outer Shareable Shareability domain.
0b11	Message signaled interrupts are in the Inner Shareable Shareability domain.

If the component does not support configuring the Shareability domain, this field is RES0, meaning the Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

The following resets apply:

- On ana Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MemAttr, bits [3:0]

Memory type.

Defines the memory type for message signaled interrupts. The values which correspond to each memory type are:

MemAttr	Meaning
0b0000	Device-nGnRnE.
0b0001	Device-nGnRE.
0b0010	Device-nGRE.
0b0011	Device-GRE.
0b0101	Outer Non-cacheable, Inner Non-cacheable.
0b0110	Outer Non-cacheable, Inner Write-Through Cacheable.
0b0111	Outer Non-cacheable, Inner Write-Back Cacheable.
0b1001	Outer Write-Through Cacheable, Inner Non-cacheable.
0b1010	Outer Write-Through Cacheable, Inner Write-Through Cacheable.
0b1011	Outer Write-Through Cacheable, Inner Write-Back Cacheable.
0b1101	Outer Write-Back Cacheable, Inner Non-cacheable.
0b1110	Outer Write-Back Cacheable, Inner Write-Through Cacheable.
0b1111	Outer Write-Back Cacheable, Inner Write-Back Cacheable.

If the component does not support configuring the memory type, this field is RES0, meaning the memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The following resets apply:

- On ana Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERRFHICR2

ERRFHICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE8C	ERRFHICR2

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

ERRGSR, Error Group Status Register

The ERRGSR characteristics are:

Purpose

ShowsERRGSR shows the status for the records in the group.

Configuration

This register is present only when RAS is implemented. Otherwise, direct accesses to ERRGSR are UNDEFINED.

This manual describes the memory-mapped view of a group with up to 56 records, the most that can be contained in a 4KB component. Extra records might be added by increasing the page size and extending ERRGSR into multiple registers.

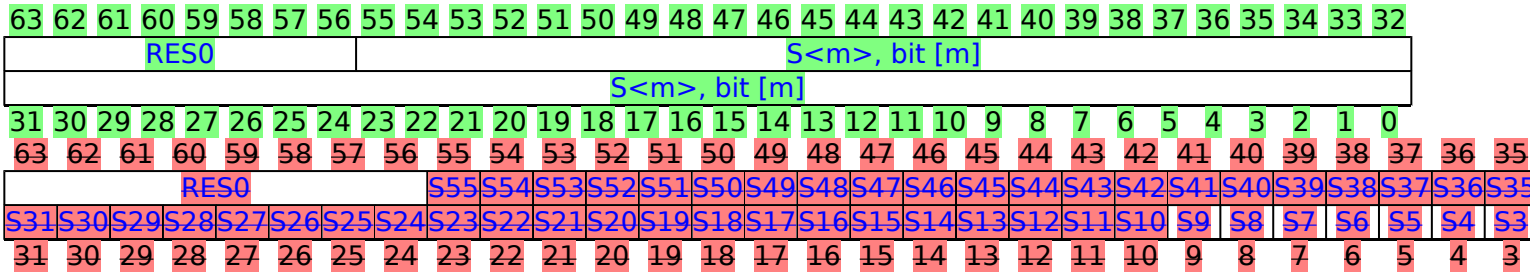
This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

Attributes

ERRGSR is a 64-bit register.

Field descriptions

The ERRGSR bit assignments are:



Bits [63:56]

Reserved, RES0.

S<m>, bit [m], for m = 0 to 55

The status for Error Record <m>. A read-only copy of ERR<m>STATUS.V.

S<m>	Meaning
0b0	No error.
0b1	One or more errors.

If the Commoncorresponding Faultrecord Injectionis Modelnot is implemented, up-toor 24the recordscorresponding canrecord bedoes implementednot meaningsupport bitsthis [55:24]type areof reporting, this bit is RES0.

This bit is RES0 if any of the following are true:

- The record is not implemented.
- The record does not support this type of reporting.

Accessing the ERRGSR

ERRGSR can be accessed through the memory-mapped interfaces:

Component	Offset
RAS	0xE00

Component	Offset	Instance
RAS	0xE00	ERRGSR

Accesses on this interface are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

ERRIRQCR<n>, Generic Error Interrupt Configuration Register, n = 0 - 15

The ERRIRQCR<n> characteristics are:

Purpose

The ERRIRQCR<n> registers are IMPLEMENTATION DEFINED interrupt configuration registers.

The architecture provides a recommended format for the ERRIRQCR<n> registers. The registers provided by the recommended layout are:

- ERRFHICR0, ERRFHICR1, and ERRFHICR2, the fault-handling interrupt configuration registers. ERRFHICR<m> maps to ERRIRQCR0 and ERRIRQCR1.
- ERRERICR0, ERRERICR1, and ERRERICR2, the error recovery interrupt configuration registers. ERRERICR<m> maps to ERRIRQCR2 and ERRIRQCR3.
- If ARMv8.4-RAS is implemented, ERRCRICR0, ERRCRICR1, and ERRCRICR2, the critical error interrupt configuration registers. ERRFHICR<m> maps to ERRIRQCR4 and ERRIRQCR5.
- ERRIRQSR, the error interrupt status register. ERRIRQSR maps to ERRIRQCR15.

This register describes the generic IMPLEMENTATION DEFINED format of the interrupt configuration registers, when the recommended layout is not used.

Configuration

~~Present only if the interrupt configuration registers are implemented. Otherwise, this register is RES0.~~

This register is present only when the interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQCR<n> are RES0.

Attributes

ERRIRQCR<n> is a 64-bit register.

Field descriptions

The ERRIRQCR<n> bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED

ERRIRQSR, Error Interrupt Status Register

The ERRIRQSR characteristics are:

Purpose

Interrupt status register.

Configuration

External register ERRIRQSR is architecturally mapped to External register ERRIRQCR15.

~~Present only if interrupt configuration registers use the recommended format. Otherwise, this register is RES0.~~

This~~RW~~ register~~fields~~ is~~in~~ present~~this~~ only when~~register~~ interrupt~~reset~~ configuration registers use the recommended format. Otherwise, direct accesses to ERRIRQSR are~~architecturally~~ RES0~~UNKNOWN~~.~~values.~~

Attributes

ERRIRQSR is a 64-bit register.

Field descriptions

The ERRIRQSR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																										CRIERR	CRI	ERIERR	ERI	FHIERR	FHI
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:6]

Reserved, RES0.

CRIERR, bit [5]

When Critical Error Interrupt is implemented:

Critical Error~~error~~ Interrupt~~interrupt~~ error.

CRIERR	Meaning
0b0	Critical Error Interrupt write has not returned an error since this bit was last cleared to zero.~~0.~~
0b1	Critical Error Interrupt write has returned an error since this bit was last cleared to zero.~~0.~~

This bit is read/write-one-to-clear.

The following resets apply:

- On ana Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~CRI, bit [4]~~

Otherwise:

Reserved,~~Critical error interrupt write in progress.~~ RES0.

CRI, bit [4]

When Critical Error Interrupt is implemented:

Critical Error Interrupt write in progress.

CRI	Meaning
0b0	Critical Error Interrupt write not in progress.
0b1	Critical Error Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

~~This bit is read-only.~~

Note

This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

~~ERIERR, bit [3]~~

~~Error recovery interrupt error.~~

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

ERIERR, bit [3]

When Error Recovery Interrupt is implemented:

Error Recovery Interrupt error.

ERIERR	Meaning
0b0	Error Recovery Interrupt write has not returned an error since this bit was last cleared to zero.~~0.~~
0b1	Error Recovery Interrupt write has returned an error since this bit was last cleared to zero.~~0.~~

This bit is read/write-one-to-clear.

The following resets apply:

- On ana Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~ERI, bit [2]~~

Otherwise:

Reserved,~~Error recovery interrupt write in progress.~~ RES0.

ERI, bit [2]

When Error Recovery Interrupt is implemented:

Error Recovery Interrupt write in progress.

ERI	Meaning
0b0	Error Recovery Interrupt write not in progress.
0b1	Error Recovery Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

~~This bit is read-only.~~

Note

This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

~~FHIERR, bit [1]~~

~~Fault handling interrupt error.~~

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

FHIERR, bit [1]

When Fault Handling Interrupt is implemented:

Fault Handling Interrupt error.

FHIERR	Meaning
0b0	Fault Handling Interrupt write has not returned an error since this bit was last cleared to zero.~~0.~~
0b1	Fault Handling Interrupt write has returned an error since this bit was last cleared to zero.~~0.~~

This bit is read/write-one-to-clear.

The following resets apply:

- On ana Error recovery reset, this field resets to an architecturally UNKNOWN value.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~FHI, bit [0]~~

Otherwise:

Reserved,~~Fault handling interrupt write in progress.~~ RES0.

FHI, bit [0]

When Fault Handling Interrupt is implemented:

Fault Handling Interrupt write in progress.

FHI	Meaning
0b0	Fault Handling Interrupt write not in progress.
0b1	Fault Handling Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

~~This bit is read-only.~~

Note

This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Accessing the ERRIRQSR

ERRIRQSR can be accessed through the memory-mapped interfaces:

Component	Offset
RAS	0xEF8

~~Component~~	~~Offset~~	~~Instance~~
~~RAS~~	~~0xEF8~~	~~ERRIRQSR~~

Accesses on this interface are **RW**.

ERR<n>ADDR, Error Record Address Register, n = 0 - 65534

The ERR<n>ADDR characteristics are:

Purpose

Software might have to reconstruct the actual physical addresses using the identity of the node and knowledge of the system.

If an addresserror ishas an associated with a detected erroraddress, then this must be written to the address register when the error is recorded. It is IMPLEMENTATION DEFINED how the recorded addresses map to the software-visible physical addresses. Software might have to reconstruct the actual physical addresses using the identity of the node and knowledge of the system.

Configuration

This register is present only when RAS is implemented. Otherwise, direct accesses to ERR<n>ADDR are UNDEFINED.

The number of error records that are implemented is IMPLEMENTATION DEFINED.

If error record <n> is not implemented, ERR<n>ADDR is RES0.

ThisSome registeror isall presentRW only whenfields errorof recordthis <n>register ishave implementeddefined andreset the error record includes an address associated with an error. Otherwise, direct accesses to ERR<n>ADDR arevalues. RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

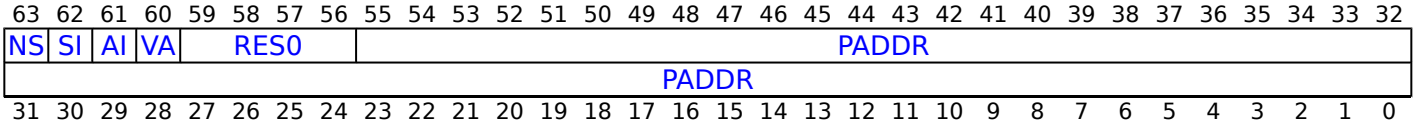
If the error record does not record the fault address, this register is RES0.

Attributes

ERR<n>ADDR is a 64-bit register.

Field descriptions

The ERR<n>ADDR bit assignments are:



NS, bit [63]

Non-secure attribute.

NS	Meaning
0b0	The address is Secure.
0b1	The address is Non-secure.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SI, bit [62]

~~Indicates whether the NS bit is valid.~~

Secure Incorrect. Indicates whether the NS bit is valid.

SI	Meaning
0b0	The NS bit is correct. That is, it matches the programmers' view of the Non-secure attribute for this recorded location.
0b1	The NS bit might not be correct, and might not match the programmers' view of the Non-secure attribute for the recorded location.

It is IMPLEMENTATION DEFINED whether this bit is read-only or read/write.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

AI, bit [61]

~~Indicates whether the PADDR field is a valid physical address that is known to match the programmers' view of the physical address for the recorded location.~~

Address Incorrect. Indicates whether the PADDR field is a valid physical address that is known to match the programmers' view of the physical address for the recorded location.

AI	Meaning
0b0	The PADDR field is a valid physical address. That is, it matches the programmers' view of the physical address for the recorded location.
0b1	The PADDR field might not be a valid physical address, and might not match the programmers' view of the physical address for the recorded location.

It is IMPLEMENTATION DEFINED whether this bit is read-only or read/write.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

VA, bit [60]

~~Indicates whether the PADDR field is a virtual address.~~

Virtual Address. Indicates whether the PADDR field is a virtual address.

VA	Meaning
0b0	The PADDR field is not a virtual address.
0b1	The PADDR field is a virtual address.

No context information is provided for the virtual address. When ~~this bit is set to 1,~~ ERR<n>ADDR.VA~~ADDR.{NS,SI,AI}~~ ==~~must read as {0,1,1}.~~ 0b1, ERR<n>ADDR.{NS,SI,AI} must read as {0,1,1}.

Support for this bit is optional. If this bit is not implemented and the PADDR field is a virtual address, then ERR<n>ADDR.{NS,SI,AI} must read as {0,1,1}.

It is IMPLEMENTATION DEFINED whether this bit is read-only or read/write.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [59:56]

Reserved, RES0.

PADDR, bits [55:0]

~~If the physical address size implemented by this component is smaller than the size of this field, then high-order bits are unimplemented and either RES0 or have a fixed read-only IMPLEMENTATION DEFINED value.~~

~~Low-order address bits might also be unimplemented and RES0, for example, if the physical address is always aligned to the size of a protection granule.~~

Physical Address. Address of the recorded location. If the physical address size implemented by this component is smaller than the size of this field, then high-order bits are unimplemented and either RES0 or have a fixed read-only IMPLEMENTATION DEFINED value. Low-order address bits might also be unimplemented and RES0, for example, if the physical address is always aligned to the size of a protection granule.

The following resets apply:

- On~~This~~ an~~field~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERR<n>ADDR

ERR<n>ADDR ignores writes if ~~ERR<n>STATUS.AV is set to 1.~~ ERR<n>STATUS.AV == 0b1.

ERR<n>ADDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x018 + 64n	ERR<n>ADDR

Accesses on this interface are **RW**.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f211~~6134483bd14dc8c12a99c984cbfe3431cc1c9707~~

(old) htmldiff from- (new)

ERR<n>CTLR, Error Record Control Register, n = 0 - 65534

The ERR<n>CTLR characteristics are:

Purpose

The error control register contains enable bits for the node that writes to this record~~, which~~:

- ~~Enable error recovery reporting as a read or write error response.~~
- ~~When ARMv.4-RAS is implemented, enable a critical error interrupt.~~
- ~~Enable error detection and correction.~~

  Enabling error detection and correction.
- ~~Enable an error recovery interrupt.~~

  Enabling the critical error, error recovery, and fault handling interrupts.
- ~~Enable a fault handling interrupt.~~

  Enabling in-band error response for Uncorrected errors.

For each bit, if the selected node does not support the feature, then the bit is RES0. The definition of each record is IMPLEMENTATION DEFINED.

Configuration

~~The number of error records that are implemented is IMPLEMENTATION DEFINED.~~

~~If error record <n> is not implemented, or error record <n> is not the first error record owned by the node, ERR<n>CTLR is RES0.~~

This~~Some~~ register~~or~~ is~~all~~ present~~RW~~ only when~~fields~~ error~~of~~ record~~this~~ <n>~~register~~ is~~have~~ implemented~~defined~~ and~~reset~~ error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>CTLR are~~values.~~ RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>CTLR is a 64-bit register.

Field descriptions

The ERR<n>CTLR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																															
RES0																			CI	RES0	WDUI	DUI	WCFI	CFI	WUE	WFI	WUI	UE	FI	UI	IMPLEMENTATION DEFINED							ED
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IMPLEMENTATION DEFINED, bits [63:32]

IMPLEMENTATION DEFINED.

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

~~This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.~~

Bits [31:14]

Reserved, RES0.

CI, bit [13]

When ERR<n>FR.CI == 0b10:

~~When enabled, the critical error interrupt is generated for a critical error condition.~~

Critical error interrupt enable. When enabled, the critical error interrupt is generated for a critical error condition.

CI	Meaning
0b0	Critical error interrupt not generated for critical errors. Critical errors are treated as Uncontained errors.
0b1	Critical error interrupt generated for critical errors.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [12]

Reserved, RES0.

WDUI, bit [11]

When ERR<n>FR.DUI == 0b11:

Error recovery interrupt for deferred errors on writes enable.

When enabled, the error recovery interrupt is generated for ~~all~~ detected Deferred errors on writes.

WDUI	Meaning
0b0	Error recovery interrupt not generated for deferred errors on writes.
0b1	Error recovery interrupt generated for deferred errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DUI, bit [10]

When ERR<n>FR.DUI == 0b10:

Error recovery interrupt for deferred errors enable. ~~This control applies to errors arising from both reads and writes.~~

When ~~enabled, an error recovery interrupt is generated for all detected Deferred errors.~~ ERR<n>FR.DUI == 0b10, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all detected Deferred errors.

DUI	Meaning
0b0	Error recovery interrupt not generated for deferred errors.
0b1	Error recovery interrupt generated for deferred errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.DUI == 0b11:

~~When ERR<n>FR.DUI == 0b11, this field is named RDUI.~~

Error recovery interrupt for deferred errors on reads enable.

When ~~enabled, the error recovery interrupt is generated for all detected Deferred errors on reads.~~ ERR<n>FR.DUI == 0b11, this bit is named RDUI.

When enabled, the error recovery interrupt is generated for detected Deferred errors on reads.

RDUI	Meaning
0b0	Error recovery interrupt not generated for deferred errors on reads.
0b1	Error recovery interrupt generated for deferred errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WCFI, bit [9]

When ERR<n>FR.CFI == 0b11:

Fault handling interrupt for Corrected errors on writes enable.

When enabled:

- If the node implements Corrected error counters for writes, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to ~~1. For more information, see~~ 0b1. For more information, see ERR<n>MISC0.
- Otherwise, the fault handling interrupt is also generated for ~~all~~ detected Corrected errors onwrites.~~on writes.~~

WCFI	Meaning
0b0	Fault handling interrupt not generated for Corrected errors on writes.
0b1	Fault handling interrupt generated for Corrected errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CFI, bit [8]

When ERR<n>FR.CFI == 0b10:

Fault handling interrupt for Corrected errors enable. This control applies to errors arising from both reads and writes.

When ERR<n>FR.CFI == 0b10, this control applies to errors arising from both reads and writes.

When enabled:

- If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see 0b1. For more information, see ERR<n>MISC0.
- Otherwise, the fault handling interrupt is also generated for all detected Corrected errors.

CFI	Meaning
0b0	Fault handling interrupt not generated for Corrected errors.
0b1	Fault handling interrupt generated for Corrected errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.CFI == 0b11:

When ERR<n>FR.CFI == 0b11, this field is named RCFI.

Fault handling interrupt for Corrected errors on reads enable.

When ERR<n>FR.CFI == 0b11, this bit is named RCFI.

When enabled:

- If the node implements Corrected error counters for reads, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see 0b1. For more information, see ERR<n>MISC0.
- Otherwise, the fault handling interrupt is also generated for all detected Corrected errors onreads.on reads.

RCFI	Meaning
0b0	Fault handling interrupt not generated for Corrected errors on reads.
0b1	Fault handling interrupt generated for Corrected errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUE, bit [7]

When ERR<n>FR.UE == 0b11:

In-band Uncorrected error reporting on writes enable.

When enabled, responses to writes that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External Abort~~abort~~).

WUE	Meaning
0b0	External Abort~~abort~~ response for Uncorrected errors on~~disabled~~ writes~~for~~ disabled.~~writes.~~
0b1	External Abort~~abort~~ response for Uncorrected errors on~~enabled~~ writes~~for~~ enabled.~~writes.~~

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WFI, bit [6]

When ERR<n>FR.FI == 0b11:

Fault handling interrupt on writes enable.

When enabled:

- The fault handling interrupt is generated for ~~all~~ detected Deferred errors and Uncorrected errors.~~errors on writes.~~
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters for writes, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to ~~1.~~ 0b1.
  - Otherwise, the fault handling interrupt is also generated for ~~all~~ detected Corrected errors on writes.

WFI	Meaning
0b0	Fault handling interrupt ~~disabled~~ on writes disabled.~~writes.~~
0b1	Fault handling interrupt ~~enabled~~ on writes enabled.~~writes.~~

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUI, bit [5]

When ERR<n>FR.UI == 0b11:

Uncorrected error recovery interrupt on writes enable.

When enabled, the error recovery interrupt is generated for ~~all~~ detected Uncorrected errors on writes that are not deferred.

WUI	Meaning
0b0	Error recovery interrupt ~~disabled~~ on writes disabled.~~writes.~~
0b1	Error recovery interrupt ~~enabled~~ on writes enabled.~~writes.~~

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UE, bit [4]

When ERR<n>FR.UE == 0b10:

In-band Uncorrected error reporting enable.

When ~~enabled, responses to transactions that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External abort).~~ ERR<n>FR.UE == 0b10, this control applies to errors arising from both reads and writes.

When enabled, responses to transactions that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External Abort).

UE	Meaning
0b0	External Abort~~abort~~ response for Uncorrected errors disabled.
0b1	External Abort~~abort~~ response for Uncorrected errors enabled.

~~**Note**~~

~~This control applies to errors arising from both reads and writes.~~

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.UE == 0b11:

~~When ERR<n>FR.UE == 0b11, this field is named RUE.~~

In-band Uncorrected error reporting on reads enable.

When enabled, responses to reads that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External abort). ERR<n>FR.UE == 0b11, this bit is named RUE.

When enabled, responses to reads that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External Abort).

RUE	Meaning
0b0	External Abortabort response for Uncorrected errors ondisabled readsfor disabled.reads.
0b1	External Abortabort response for Uncorrected errors onenabled readsfor enabled.reads.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FI, bit [3]

When ERR<n>FR.FI == 0b10:

Fault handling interrupt enable. This control applies to errors arising from both reads and writes.

When ERR<n>FR.FI == 0b10, this control applies to errors arising from both reads and writes.

When enabled:

- The fault handling interrupt is generated for all detected Deferred errors and Uncorrected errors.
- If the fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1. 0b1.
  - Otherwise, the fault handling interrupt is also generated for all detected Corrected errors.

FI	Meaning
0b0	Fault handling interrupt disabled.
0b1	Fault handling interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.FI == 0b11:

When ERR<n>FR.FI == 0b11, this field is named RFI.

Fault handling interrupt on reads enable.

When ERR<n>FR.FI == 0b11, this bit is named RFI.

When enabled:

- The fault handling interrupt is generated for all detected Deferred errors and Uncorrected errors.errors on reads.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters for reads, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1. 0b1.
  - Otherwise, the fault handling interrupt is also generated for all detected Corrected errors on reads.

RFI	Meaning
0b0	Fault handling interrupt disabled on reads disabled.reads.
0b1	Fault handling interrupt enabled on reads enabled.reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UI, bit [2]

When ERR<n>FR.UI == 0b10:

Uncorrected error recovery interrupt enable. This control applies to errors arising from both reads and writes.

When ERR<n>FR.UI == 0b10, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all detected Uncorrected errors that are not deferred.

UI	Meaning
0b0	Error recovery interrupt disabled.
0b1	Error recovery interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.UI == 0b11:

When ERR<n>FR.UI == 0b11, this field is named RUI.

Uncorrected error recovery interrupt on reads enable.

When enabled, the error recovery interrupt is generated for all detected Uncorrected errors on reads that are not deferred. ERR<n>FR.UI == 0b11, this bit is named RUI.

When enabled, the error recovery interrupt is generated for detected Uncorrected errors on reads that are not deferred.

RUI	Meaning
0b0	Error recovery interrupt disabled on reads disabled.reads.
0b1	Error recovery interrupt enabled on reads enabled.reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMPLEMENTATION DEFINED, bit [1]

IMPLEMENTATION DEFINED.

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

~~This bit reads as an IMPLEMENTATION DEFINED value and writes to this bit have IMPLEMENTATION DEFINED behavior.~~

ED, bit [0]

When ERR<n>FR.ED == 0b10:

~~When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an IMPLEMENTATION DEFINED control for error injection.~~

Error reporting and logging enable. When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an IMPLEMENTATION DEFINED control for error injection.

ED	Meaning
0b0	Error reporting disabled.
0b1	Error reporting enabled.

It is IMPLEMENTATION DEFINED whether the node fully disables error detection and correction when reporting is disabled. That is, even with error reporting disabled, the node might continue to silently correct errors. Uncorrectable errors might result in corrupt data being silently propagated by the node.

Note

If this node requires initialization after Cold reset to prevent signaling false errors, then Arm recommends this bit is set to ~~0 on Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error reporting after the node is initialized. If the Cold reset value is 1, the reset values of other controls in this register are~~ 0b0 on Cold reset, meaning errors are not reported from Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error reporting after the node is initialized. Otherwise, the Cold reset value is IMPLEMENTATION DEFINED. If the Cold reset value is 0b1, the reset values of other controls in this register are also IMPLEMENTATION DEFINED and should not be UNKNOWN.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

Accessing the ERR<n>CTLR

ERR<n>CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x008 + 64n	ERR<n>CTLR

Accesses on this interface are **RW**.

ERR<n>FR, Error Record Feature Register, n = 0 - 65534

The ERR<n>FR characteristics are:

Purpose

Defines whether <n> is the first record owned by a ~~node. If <n> is the first record owned by the~~ node~~, also defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.~~

- If <n> is the first error record owned by a node, then ERR<n>FR.ED != 0b00.
- If <n> is not the first error record owned by a node, then ERR<n>FR.ED == 0b00.

If <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

Configuration

~~This register is present only when RAS is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.~~

~~Present only if error record <n> is implemented. Otherwise, this register is RES0.~~

~~The number of error records that are implemented is IMPLEMENTATION DEFINED.~~

~~If <n> is the first error record owned by a node, then ERR<n>FR.ED != 0b00.~~

~~If <n> is not the first error record owned by a node, then ERR<n>FR.ED == 0b00.~~

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.

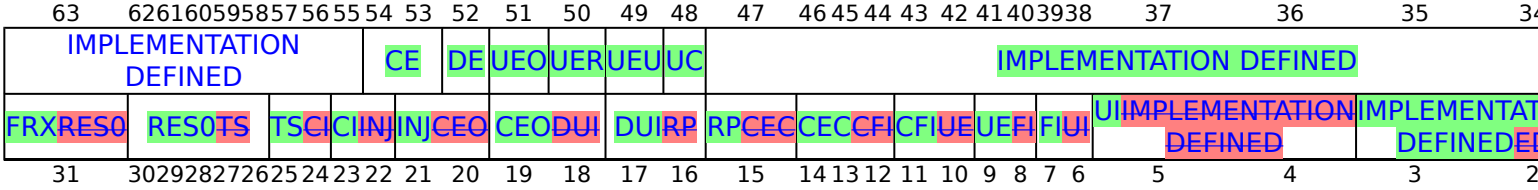
Attributes

ERR<n>FR is a 64-bit register.

Field descriptions

The ERR<n>FR bit assignments are:

When ERR<n>FR.ED != 0b00:



IMPLEMENTATION DEFINED, bits [63:55~~32~~]

When ERR<n>FR.FRX == 0b0:

IMPLEMENTATION DEFINED.

Reserved for identifying IMPLEMENTATION DEFINED controls.

This field reads as an IMPLEMENTATION DEFINED value.

Bits [31:26]

Otherwise:

Reserved, RES0.

Indicates whether, for each error record <m> owned by this node, ERR<m>MISC3 is used as the timestamp register, and, if it is, the timebase used by the timestamp.

CETS, bits [54:53]

When ERR<n>FR.FRX==0b1:

CorrectedTimestamp Error recording. Describes the types of Corrected Error the node can record.Extension.

CETS	Meaning
0b00	The node does not recordsupport anya typetimestamp of Corrected Error.register.
0b01	**Note** For an error record which has an affinity to a PE, this is the same timer that is visible through CNTPCT_EL0 at the highest Exception level on that PE. The node canimplements recorda transienttimestamp orregister. persistentThe Correctedtimestamp Errorsuses (Correctedthe Errorssame thattimebase areas recordedthe assystem Generic Timer. ERR<n>STATUS.CE == 0b01 and 0b11).
0b10	The node can record of a non-specific Corrected Error (a Corrected Error that is recorded as ERR<n>STATUS.CE == 0b10). The node implements a timestamp register. The timebase for the timestamp is IMPLEMENTATION DEFINED.
0b11	The node can record any type of Corrected Error.

All other values are reserved.

When ERR<n>FR.FRX == 0b0:

IMPLEMENTATION DEFINED.

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

DE, bit [52]

When ERR<n>FR.FRX == 0b1:

Deferred Error recording. Describes whether the node can record this type of error.

DE	Meaning
0b0	The node does not record this type of error.
0b1	The node can record this type of error.

When ERR<n>FR.FRX == 0b0:

IMPLEMENTATION DEFINED.

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

UEO, bit [51]

When ERR<n>FR.FRX == 0b1:

Latent or Restartable Error recording. Describes whether the node can record this type of error.

UEO	Meaning
0b0	The node does not record this type of error.
0b1	The node can record this type of error.

When ERR<n>FR.FRX == 0b0:

IMPLEMENTATION DEFINED.

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

UER, bit [50]

When ERR<n>FR.FRX == 0b1:

Signaled or Recoverable Error recording. Describes whether the node can record this type of error.

UER	Meaning
0b0	The node does not record this type of error.
0b1	The node can record this type of error.

When ERR<n>FR.FRX == 0b0:

IMPLEMENTATION DEFINED.

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

UEU, bit [49]

When ERR<n>FR.FRX == 0b1:

Unrecoverable Error recording. Describes whether the node can record this type of error.

UEU	Meaning
0b0	The node does not record this type of error.
0b1	The node can record this type of error.

When ERR<n>FR.FRX == 0b0:

IMPLEMENTATION DEFINED.

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

UC, bit [48]

When ERR<n>FR.FRX == 0b1:

Uncontainable Error recording. Describes whether the node can record this type of error.

UC	Meaning
0b0	The node does not record this type of error.
0b1	The node can record this type of error.

When ERR<n>FR.FRX == 0b0:

IMPLEMENTATION DEFINED.

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [47:32]

IMPLEMENTATION DEFINED.

Reserved for identifying IMPLEMENTATION DEFINED controls.

FRX, bit [31]

Feature Register extension. Defines whether ERR<n>FR[63:48] are architecturally defined.

FRX	Meaning
0b0	ERR<n>FR[63:48] are IMPLEMENTATION DEFINED.
0b1	ERR<n>FR[63:48] are defined by the architecture.

Bits [30:26]

Reserved, RES0.

TS, bits [25:24]

Timestamp Extension. Indicates whether, for each error record <m> owned by this node, ERR<m>MISC3 is used as the timestamp register, and, if it is, the timebase used by the timestamp.

TS	Meaning
0b00	The node does not support a timestamp register.
0b01	The node implements a timestamp register. The timestamp uses the same timebase as the system Generic Timer. **Note** For an error record which has an affinity to a PE, this is the same timer that is visible through CNTPCT_EL0 at the highest Exception level on that PE.
0b10	The node implements a timestamp register. The timebase for the timestamp is IMPLEMENTATION DEFINED.

All other values are reserved.

CI, bits [23:22]

~~Indicates whether the critical error interrupt and associated controls are implemented.~~

Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented.

CI	Meaning
0b00	Does not support the critical error interrupt. ERR<n>CTLR.CI is RES0.
0b01	Critical error interrupt is supported and ~~is~~ always enabled. ERR<n>CTLR.CI is RES0.
0b10	Critical error interrupt is supported and controllable~~it can be enabled~~ using ~~associated controls.~~ ERR<n>CTLR.CI.

All other values are reserved.

~~Indicates whether the RAS Common Fault Injection Model Extension is implemented.~~

INJ, bits [21:20]

~~When ARMv8.4-RAS is implemented:~~

Fault Injection Extension. Indicates whether the RAS Common Fault Injection Model Extension is implemented.

INJ	Meaning
0b00	The node does not support the RAS Common Fault Injection Model Extension.
0b01	The node implements the RAS Common Fault Injection Model Extension. See ERR<n>PFGF for more information.

All other values are reserved.

~~Otherwise:~~

~~Reserved, RES0.~~

CEO, bits [19:18]

When ERR<n>FR.CEC != 0b00:

~~Indicates the behavior when a second Corrected error is detected after a first Corrected error has been recorded by an error record <m> owned by the node.~~

Corrected Error overwrite. Indicates the behavior when a second Corrected error is detected after a first Corrected error has been recorded by an error record <m> owned by the node.

CEO	Meaning
0b00	Counts Corrected errors if a counter is implemented. Keeps the previous error syndrome. If the counter overflows, or no counter is implemented, then ERR<m>STATUS.OF is set to ~~1.~~ 0b1.
0b01	Counts Corrected errors. If ERR<m>STATUS.OF == ~~1 before the Corrected error is counted, then keeps the previous syndrome. Otherwise, the previous syndrome is overwritten. If the counter overflows, then~~ 0b1 before the Corrected error is counted, then keeps the previous syndrome. Otherwise the previous syndrome is overwritten. If the counter overflows, then ERR<m>STATUS.OF is set to 0b1.~~OF is set to 1.~~

All other values are reserved.

Otherwise:

Reserved, RES0.

DUI, bits [17:16]

When ERR<n>FR.UI != 0b00:

~~Indicates whether the node implements a control for enabling error recovery interrupts on deferred errors.~~

Error recovery interrupt for deferred errors control. Indicates whether the control for enabling error recovery interrupts on deferred errors are implemented.~~errors.~~

DUI	Meaning
0b00	Does not support the control for enabling error recovery interrupts on deferred errors.~~feature.~~ ERR<n>CTLR.DUI is RES0.
0b10	Control~~Feature~~ for enabling error recovery interrupts on deferred errors is supported and controllable using ERR<n>CTLR.DUI.
0b11	Control~~Feature~~ for enabling error recovery interrupts on deferred errors is supported and controllable using ERR<n>CTLR.WDUI for writes and ERR<n>CTLR.RDUI for reads.

All other values are reserved.

Otherwise:

Reserved, RES0.

RP, bit [15]

When ERR<n>FR.CEC != 0b00:

~~Indicates whether the node implements a repeat Corrected error counter in ERR<m>MISC0 for each error record <m> owned by the node that implements a standard Corrected error counter.~~

Repeat counter. Indicates whether the node implements the repeat Corrected error counter in ERR<m>MISC0 for each error record <m> owned by the node that implements the standard Corrected error counter.

RP	Meaning
0b0	A single CE counter is implemented.
0b1	A first (repeat) counter and a second (other) counter are implemented. The repeat counter is the same size as the primary error counter.

Otherwise:

Reserved, RES0.

CEC, bits [14:12]

~~Indicates whether the node implements standard Corrected error counter (CE counter) mechanisms in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.~~

Corrected Error Counter. Indicates whether the node implements the standard Corrected error counter (CE counter) mechanisms in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.

CEC	Meaning
0b000	Does not implement the standard Corrected error counter model.
0b010	Implements an 8-bit Corrected error counter in ERR<m>MISC0[39:32].
0b100	Implements a 16-bit Corrected error counter in ERR<m>MISC0[47:32].

All other values are reserved.

Note

Implementations might include other error counter models, or might include the standard model and not indicate this in ERR<n>FR.

CFI, bits [11:10]

When ERR<n>FR.FI != 0b00:

~~Indicates whether the node implements a control for enabling fault handling interrupts on corrected errors.~~

Fault handling interrupt for corrected errors. Indicates whether the control for enabling fault handling interrupts on corrected errors are implemented.

CFI	Meaning
0b00	Does not support the control for enabling fault handling interrupts on corrected errors.~~feature.~~ ERR<n>CTLR.CFI is RES0.
0b10	Control~~Feature~~ for enabling fault handling interrupts on corrected errors is supported and controllable using ERR<n>CTLR.CFI.
0b11	Control~~Feature~~ for enabling fault handling interrupts on corrected errors is supported and controllable using ERR<n>CTLR.WCFI for writes and ERR<n>CTLR.RCFI for reads.

All other values are reserved.

Otherwise:

Reserved, RES0.

UE, bits [9:8]

~~Indicates whether the node implements in-band uncorrected error reporting (External aborts), and, if so, whether the node implements controls for enabling and disabling the reporting.~~

In-band uncorrected error reporting. Indicates whether the in-band uncorrected error reporting (External Aborts) and associated controls are implemented.

UE	Meaning
0b00	Does not support the in-band uncorrected error reporting (External Aborts).~~feature.~~ ERR<n>CTLR.UE is RES0.
0b01	In-band uncorrected error reporting (External Aborts) is supported and~~Feature~~ always enabled. ERR<n>CTLR.UE is RES0.
0b10	In-band~~Feature~~ uncorrected error reporting (External Aborts) is supported and controllable using ERR<n>CTLR.UE.
0b11	In-band~~Feature~~ uncorrected error reporting (External Aborts) is supported and controllable using ERR<n>CTLR.WUE for writes and ERR<n>CTLR.RUE for reads.

FI, bits [7:6]

~~Indicates whether the node implements a fault handling interrupt, and, if so, whether the node implements controls for enabling and disabling the interrupt.~~

Fault handling interrupt. Indicates whether the fault handling interrupt and associated controls are implemented.

FI	Meaning
0b00	Does not support the fault handling interrupt.~~feature.~~ ERR<n>CTLR.FI is RES0.
0b01	Fault handling interrupt is supported and~~Feature~~ always enabled. ERR<n>CTLR.FI is RES0.
0b10	Fault~~Feature~~ handling interrupt is supported and controllable using ERR<n>CTLR.FI.
0b11	Fault~~Feature~~ handling interrupt is supported and controllable using ERR<n>CTLR.WFI for writes and ERR<n>CTLR.RFI for reads.

UI, bits [5:4]

~~Indicates whether the node implements an error recovery interrupt, and, if so, whether the node implements controls for enabling and disabling the interrupt.~~

Error recovery interrupt for uncorrected errors. Indicates whether the error handling interrupt and associated controls are implemented.

UI	Meaning
0b00	Does not support the error handling interrupt.~~feature.~~ ERR<n>CTLR.UI is RES0.
0b01	Error handling interrupt is supported and~~Feature~~ always enabled. ERR<n>CTLR.UI is RES0.
0b10	Error~~Feature~~ handling interrupt is supported and controllable using ERR<n>CTLR.UI.
0b11	Error~~Feature~~ handling interrupt is supported and controllable using ERR<n>CTLR.WUI for writes and ERR<n>CTLR.RUI for reads.

IMPLEMENTATION DEFINED, bits [3:2]

IMPLEMENTATION DEFINED.

~~This field reads as an IMPLEMENTATION DEFINED value.~~

ED, bits [1:0]

~~Indicates whether <n> is the first record owned by the node, and, if it is, whether the node implements controls for enabling and disabling error reporting and logging.~~

Error reporting and logging. Indicates whether error record <n> is the first record owned the node, and, if so, whether it implements the controls for enabling and disabling error reporting and logging.

ED	Meaning
0b01	Error reporting and loggingFeature always enabled. ERR<n>CTLR.ED is RES0.
0b10	Error reporting and loggingFeature is controllable using ERR<n>CTLR.ED.

All other values are reserved.

The value 0b11 is reserved.

When ERR<n>FR.ED == 0b00:

ERR<n>MISC0, Error Record Miscellaneous Register 0, n = 0 - 65534

The ERR<n>MISC0 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- ~~A Corrected error counter or counters.~~

  Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.

- ~~Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.~~

  A Corrected error counter or counters.

- ~~Other state information not present in the corresponding status and address registers.~~

  Other state information not present in the corresponding status and address registers.

If the node ~~<q>~~ that owns error record <n> implements architecturally-defined error counters~~,~~ (~~so that~~ERR<q>FR.CEC != `0b000`)~~,~~ and error record <n> can record countable errors, then ERR<n>MISC0 implements the architecturally-defined error counter or counters.

Configuration

~~The number of error records that are implemented is IMPLEMENTATION DEFINED.~~

~~If error record <n> is not implemented, ERR<n>MISC0 is RES0.~~

This~~Some~~ register~~or~~ is~~all~~ present~~RW~~ only when~~fields~~ error~~of~~ record~~this~~ <n>~~register~~ is~~have~~ implemented. Otherwise,~~defined~~ direct~~reset~~ accesses to ERR<n>MISC0 are~~values.~~ RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC0~~this register~~, writing zero must always be supported to return the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL.~~CTRL, where q is the index of the first error record owned by the same node as error record n. If the node owns a single record then q = n.~~

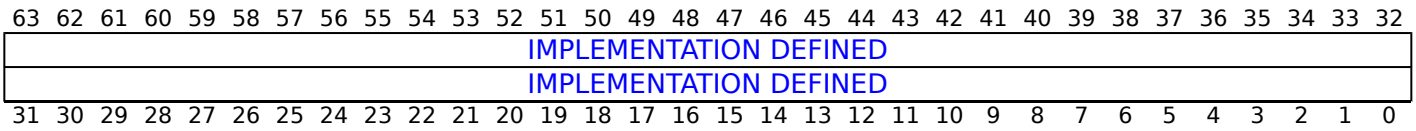
Attributes

ERR<n>MISC0 is a 64-bit register.

Field descriptions

The ERR<n>MISC0 bit assignments are:

When ERR<q>FR.CEC == 0b000:



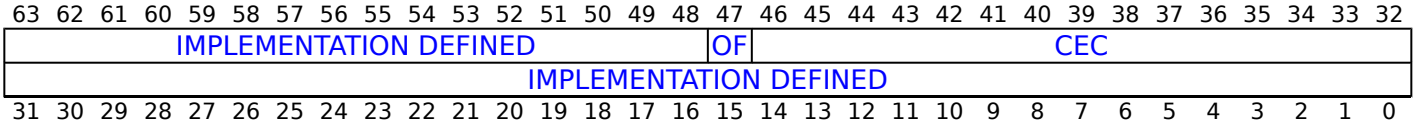
IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome.

~~IMPLEMENTATION DEFINED~~ syndrome. ~~This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.~~

When ERR<q>FR.CEC == 0b100 and ERR<q>FR.RP == 0:



IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome.

~~IMPLEMENTATION DEFINED~~ syndrome. ~~This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.~~

OF, bit [47]

~~Set to 1 when the Corrected error count field is incremented and wraps through zero.~~

Sticky overflow bit. Set to 1 when the Corrected error count field is incremented and wraps through zero.

OF	Meaning
0b0	Counter has not overflowed.
0b1	Counter has overflowed.

A direct write that modifies this bit might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this bit to an UNKNOWN value.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ thean value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [46:32]

~~Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.~~

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

The following resets apply:

- On~~This~~ an~~field~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

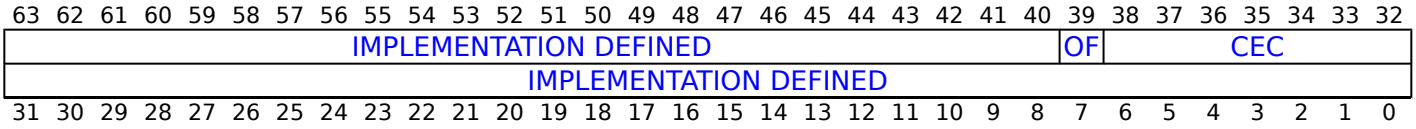
IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome.

~~IMPLEMENTATION DEFINED syndrome. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.~~

When ERR<q>FR.CEC == 0b010 and ERR<q>FR.RP == 0:



IMPLEMENTATION DEFINED, bits [63:40]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome.

~~IMPLEMENTATION DEFINED syndrome. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.~~

OF, bit [39]

~~Set to 1 when the Corrected error count field is incremented and wraps through zero.~~

Sticky overflow bit. Set to 1 when the Corrected error count field is incremented and wraps through zero.

OF	Meaning
0b0	Counter has not overflowed.
0b1	Counter has overflowed.

A direct write that modifies this bit might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this bit to an UNKNOWN value.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [38:32]

~~Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.~~

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

The following resets apply:

- OnThis anfield Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

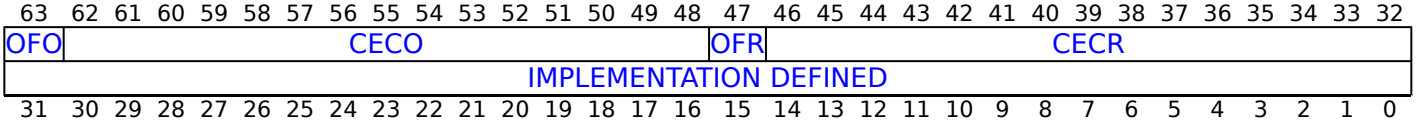
IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome.

IMPLEMENTATION DEFINED syndrome. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

When ERR<q>FR.CEC == 0b100 and ERR<q>FR.RP == 1:



OFO, bit [63]

Set to 1 when the Corrected error count, other, field is incremented and wraps through zero.

Sticky overflow bit, other. Set to 1 when the Corrected error count, other, field is incremented and wraps through zero.

OFO	Meaning
0b0	Other counter has not overflowed.
0b1	Other counter has overflowed.

A direct write that modifies this bit might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this bit to an UNKNOWN value.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [62:48]

Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing CECR.

The following resets apply:

- OnThis anfield Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [47]

Set to 1 when the Corrected error count, repeat, field is incremented and wraps through zero.

Sticky overflow bit, repeat. Set to 1 when the Corrected error count, repeat, field is incremented and wraps through zero.

OFR	Meaning
0b0	Repeat counter has not overflowed.
0b1	Repeat counter has overflowed.

A direct write that modifies this bit might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this bit to an UNKNOWN value.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [46:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. CECR is then incremented for each subsequent Corrected Error in the same set and way.

The following resets apply:

- OnThis anfield Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

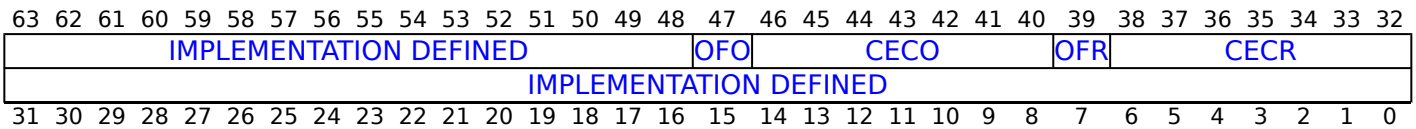
IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome.

IMPLEMENTATION DEFINED syndrome. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

When ERR<q>FR.CEC == 0b010 and ERR<q>FR.RP == 1:



IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome.

IMPLEMENTATION DEFINED syndrome. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

OFO, bit [47]

~~Set to 1 when the Corrected error count, other, field is incremented and wraps through zero.~~

Sticky overflow bit, other. Set to 1 when the Corrected error count, other, field is incremented and wraps through zero.

OFO	Meaning
0b0	Other counter has not overflowed.
0b1	Other counter has overflowed.

A direct write that modifies this bit might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this bit to an UNKNOWN value.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [46:40]

~~Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.~~

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing CECR.

The following resets apply:

- On~~This~~ an~~field~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [39]

~~Set to 1 when the Corrected error count, repeat, field is incremented and wraps through zero.~~

Sticky overflow bit, repeat. Set to 1 when the Corrected error count, repeat, field is incremented and wraps through zero.

OFR	Meaning
0b0	Repeat counter has not overflowed.
0b1	Repeat counter has overflowed.

A direct write that modifies this bit might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this bit to an UNKNOWN value.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [38:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

~~Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.~~

~~Note~~

~~For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the~~

IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. CECR is then incremented for each subsequent Corrected Error in the same set and way.

The following resets apply:

- OnThis anfield Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome.

IMPLEMENTATION DEFINED syndrome. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

Accessing the ERR<n>MISC0

ReadsArm fromrecommends ERR<n>MISC0that returna anmiscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write. IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

Arm recommends that miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.WhenERR<n>STATUS.MV is set to 1, the miscellaneous syndrome for the most recently recorded error should ignore writes.

When ERR<n>STATUS.MV == 0b1, the miscellaneous syndrome specific to the most recently recorded error should ignore writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x020 + 64n	ERR<n>MISC0

Accesses on this interface are **RW**.

ERR<n>MISC1, Error Record Miscellaneous Register 1, n = 0 - 65534

The ERR<n>MISC1 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers mightcan contain:

- A Corrected error counter or counters.

  Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.

- Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.

  A Corrected error counter or counters.

- Other state information not present in the corresponding status and address registers.

  Other state information not present in the corresponding status and address registers.

Configuration

This register is present only when RAS is implemented. Otherwise, direct accesses to ERR<n>MISC1 are UNDEFINED.

The number of error records that are implemented is IMPLEMENTATION DEFINED.

If error record <n> is not implemented, ERR<n>MISC1 is RES0.

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC1 are RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC1this register, writing zero must always be supported to return the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL.CTRL, where q is the index of the first error record owned by the same node as error record n. If the node owns a single record then q = n.

Attributes

ERR<n>MISC1 is a 64-bit register.

Field descriptions

The ERR<n>MISC1 bit assignments are:

ERR<n>MISC2, Error Record Miscellaneous Register 2, n = 0 - 65534

The ERR<n>MISC2 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers mightcan contain:

- A Corrected error counter or counters.

  Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.

- Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.

  A Corrected error counter or counters.

- Other state information not present in the corresponding status and address registers.

  Other state information not present in the corresponding status and address registers.

Configuration

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERR<n>MISC2 are RES0.

The number of error records that are implemented is IMPLEMENTATION DEFINED.

If error record <n> is not implemented, ERR<n>MISC2 is RES0.

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC2 are RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC2this register, writing zero must always be supported to return the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL, where q is the index of the first error record owned by the same node as error record n. If the node owns a single record then q = n.

If RAS System Architecture v1.1 is not implemented, Arm recommendeds that ERR<n>MISC2 does not require zeroing to return the record to a quiescent state.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL.

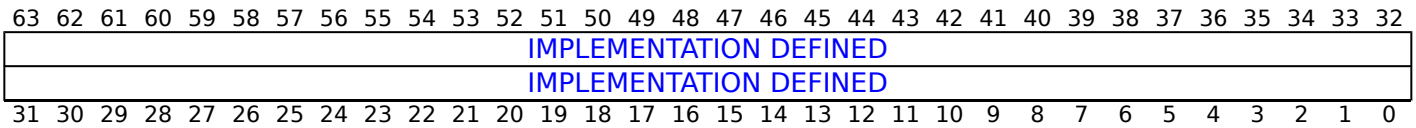
It is IMPLEMENTATION DEFINED whether ERR<n>MISC2 is present if RAS System Architecture v1.1 is not implemented. ERR<n>MISC2 is RES0 if not present.

Attributes

ERR<n>MISC2 is a 64-bit register.

Field descriptions

The ERR<n>MISC2 bit assignments are:



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome.

~~IMPLEMENTATION DEFINED syndrome. This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.~~

Accessing the ERR<n>MISC2

Reads~~Arm~~ from~~recommends~~ ERR<n>MISC2~~that~~ return~~a~~ an~~miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.~~ IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

Arm recommends that miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.~~When~~ERR<n>STATUS.~~MV is set to 1, the miscellaneous syndrome for the most recently recorded error should ignore writes.~~

When ERR<n>STATUS.MV == 0b1, the miscellaneous syndrome specific to the most recently recorded error should ignore writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC2 can be accessed through the memory-mapped interfaces:

(old) htmldiff from- (new)

ERR<n>MISC3, Error Record Miscellaneous Register 3, n = 0 - 65534

The ERR<n>MISC3 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers mightcan contain:

- A Corrected error counter or counters.

  Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.

- Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.

  A Corrected error counter or counters.

- Other state information not present in the corresponding status and address registers.

  Other state information not present in the corresponding status and address registers.

If the node <q> that owns error record <n> supports the RAS Timestamp Extension, (then ERR<n>MISC3 contains the timestamp value for error record <n> when the error was detected. Otherwise the contents of ERR<n>MISC3 areERR<q>FR.TS != 0b00), then ERR<n>MISC3 contains the timestamp value for error record n when the error was detected. Otherwise the contents of ERR<n>MISC3 are IMPLEMENTATION DEFINED.

Configuration

External register ERR<n>MISC3 bits [31:0] are architecturally mapped to AArch32 System register ERXMISC6[31:0] when ERRSELR_EL1.SEL == n.

External register ERR<n>MISC3 bits [63:32] are architecturally mapped to AArch32 System register ERXMISC7[31:0] when ERRSELR_EL1.SEL == n.

RW fields in this register reset to architecturally UNKNOWN values.

This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERR<n>MISC3 are RES0.

The number of error records that are implemented is IMPLEMENTATION DEFINED.

If error record <n> is not implemented, ERR<n>MISC3 is RES0.

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC3 are RES0.

External register ERR<n>MISC3 is architecturally mapped to AArch64 System register ERXMISC3_EL1 when ERRSELR_EL1.SEL == n.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC3this register, writing zero must always be supported to return the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL, where q is the index of the first error record owned by the same node as error record n. If the node owns a single record then q = n.

If RAS System Architecture v1.1 is not implemented, Arm recommendeds that ERR<n>MISC3 does not require zeroing to return the record to a quiescent state.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL.

It is IMPLEMENTATION DEFINED whether ERR<n>MISC3 is present if RAS System Architecture v1.1 is not implemented. ERR<n>MISC3 is RES0 if not present.

Attributes

ERR<n>MISC3 is a 64-bit register.

Field descriptions

The ERR<n>MISC3 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

IMPLEMENTATION DEFINED syndrome.

~~IMPLEMENTATION DEFINED~~ syndrome. ~~This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.~~

Accessing the ERR<n>MISC3

ReadsArm fromrecommends ERR<n>MISC3that returna anmiscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write. IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

Arm recommends that miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.WhenERR<n>STATUS.MV is set to 1, the miscellaneous syndrome for the most recently recorded error should ignore writes.

When ERR<n>STATUS.MV == 0b1, the miscellaneous syndrome specific to the most recently recorded error should ignore writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x038 + 64n	ERR<n>MISC3

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

ERR<n>PFGCDN, Pseudo-fault Generation Countdown Register, n = 0 - 65534

The ERR<n>PFGCDN characteristics are:

Purpose

Generates one of the errors enabled in the corresponding ERR<n>PFGCTL register.

Configuration

~~This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERR<n>PFGCDN are RES0.~~

~~Present only when the RAS Common Fault Injection Model Extension is implemented by this node so that ERR<n>FR.INJ != 0b00, error record <n> is implemented, and error record <n> is the first error record owned by a node. Otherwise, RES0.~~

This~~RW~~ register~~fields~~ is~~in~~ present~~this~~ only when~~register~~ error~~reset~~ record <n> is implemented, the node implements the RAS Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCDN are~~architecturally~~ RES0~~UNKNOWN~~.~~values.~~

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGCDN is a 64-bit register.

Field descriptions

The ERR<n>PFGCDN bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0

Bits [63:32]

Reserved, RES0.

CDN, bits [31:0]

Countdown value.

This field is copied to Error Generation Counter when either:

- Software writes ERR<n>PFGCTL.CDNEN with 1.
- The Error Generation Counter decrements to zero and ERR<n>PFGCTL.R ==~~ 1.~~ 0b1.

While ERR<n>PFGCTL.CDNEN ==~~ 1 and the Error Generation Counter is nonzero, the counter decrements by 1 for each cycle at an~~ 0b1 and the Error Generation Counter is nonzero, the counter decrements by 1 for each cycle at an IMPLEMENTATION DEFINED clock rate. When the counter reaches 0, one of the errors enabled in the ERR<n>PFGCTL register is generated.

Note

The current Error Generation Counter value is not visible to software.

The following resets apply:

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERR<n>PFGCDN

ERR<n>PFGCDN can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x810 + 64n	ERR<n>PFGCDN

Accesses on this interface are **RW**.

ERR<n>PFGCTL, Pseudo-fault Generation Control Register, n = 0 - 65534

The ERR<n>PFGCTL characteristics are:

Purpose

Enables controlled fault generation.

Configuration

~~This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERR<n>PFGCTL are RES0.~~

~~Present only when the RAS Common Fault Injection Model Extension is implemented by this node so that ERR<n>FR.INJ != 0b00, error record <n> is implemented, and error record <n> is the first error record owned by a node. Otherwise, RES0.~~

This~~Some~~ register~~or~~ is~~all~~ present~~RW~~ only when~~fields~~ error~~of~~ record~~this~~ <n>~~register~~ is~~have~~ implemented,~~defined~~ the~~reset~~ node implements the RAS Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCTL are~~values.~~ RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGCTL is a 64-bit register.

Field descriptions

The ERR<n>PFGCTL bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
CDNEN	R	RES0																		MV	AV	PN	ER	CI	CE		DE	UEO	UER	UEU	UC	OF
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

CDNEN, bit [31]

Countdown Enable. Controls transfers from the value that is held in the ERR<n>PFGCDN into the Error Generation Counter~~,~~ and enables this counter.

CDNEN	Meaning
0b0	The Error Generation Counter is disabled.
0b1	The Error Generation Counter is enabled. On a write of ~~1 to this bit, the Error Generation Counter is set to~~ 0b1 to this bit, the Error Generation Counter is set to ERR<n>PFGCDN.CDN.

The following resets apply:

~~On a Cold reset, this field resets to 0.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to `0`.

R, bit [30]

Restart. Controls whether, upon~~on~~ reaching zero, the Error Generation Counter restarts from the ERR<n>PFGCDN value~~,~~ or stops.

R	Meaning
`0b0`	On reaching 0, the Error Generation Counter will stop.~~stops.~~
`0b1`	On reaching 0, the Error Generation Counter is set to ERR<n>PFGCDN.CDN.

This bit is RES0 if the node does not support this control.

The following resets apply:

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [29:13]

Reserved, RES0.

MV, bit [12]

Miscellaneous syndrome. The value that is written to ERR<n>STATUS.MV when an injected error is recorded.

MV	Meaning
`0b0`	ERR<n>STATUS.MV is set to ~~0 when an injected error is recorded.~~ `0b0` when an injected error is recorded.
`0b1`	ERR<n>STATUS.MV is set to ~~1 when an injected error is recorded.~~ `0b1` when an injected error is recorded.

This bit reads-as-one if the node always records some syndrome in ERR<n>MISC<m>, setting ERR<n>STATUS.MV to 1, when an injected error is recorded. This bit is RES0 if the node does not support this control.

The following resets apply:

~~This bit is RES0 if the node does not support this control.~~

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

AV, bit [11]

Address syndrome. The value that is written to ERR<n>STATUS.AV when an injected error is recorded.

AV	Meaning
`0b0`	ERR<n>STATUS.AV is set to ~~0 when an injected error is recorded.~~ `0b0` when an injected error is recorded.
`0b1`	ERR<n>STATUS.AV is set to ~~1 when an injected error is recorded,~~ `0b1` when an injected error is recorded.

This bit reads-as-one if the node always sets ERR<n>STATUS.AV to ~~1 when an injected error is recorded.~~ `0b1` when an injected error is recorded. This bit is RES0 if the node does not support this control.

The following resets apply:

~~This bit is RES0 if the node does not support this control.~~

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PN, bit [10]

Poison flag. The value that is written to ERR<n>STATUS.PN when an injected error is recorded.

PN	Meaning
0b0	ERR<n>STATUS.PN is set to ~~0 when an injected error is recorded.~~ 0b0 when an injected error is recorded.
0b1	ERR<n>STATUS.PN is set to ~~1 when an injected error is recorded.~~ 0b1 when an injected error is recorded.

This bit is RES0 if the node does not support this control.

The following resets apply:

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ER, bit [9]

Error Reported flag. The value that is written to ERR<n>STATUS.ER when an injected error is recorded.

ER	Meaning
0b0	ERR<n>STATUS.ER is set to ~~0 when an injected error is recorded.~~ 0b0 when an injected error is recorded.
0b1	ERR<n>STATUS.ER is set to ~~1 when an injected error is recorded.~~ 0b1 when an injected error is recorded.

This bit is RES0 if the node does not support this control.

The following resets apply:

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CI, bit [8]

Critical Error flag. The value that is written to ERR<n>STATUS.CI when an injected error is recorded.

CI	Meaning
0b0	ERR<n>STATUS.CI is set to ~~0 when an injected error is recorded.~~ 0b0 when an injected error is recorded.
0b1	ERR<n>STATUS.CI is set to ~~1 when an injected error is recorded.~~ 0b1 when an injected error is recorded.

This bit is RES0 if the node does not support this control.

The following resets apply:

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CE, bits [7:6]

Corrected Error generation enable. Controls the type of Corrected Error condition that might be generated.

CE	Meaning
0b00	No error of this type will beis generated.
0b01	A non-specific Corrected Error, that is, a Corrected Error that is recorded as ERR<n>STATUS.CE == 0b10, might be generated when the Error Generation Counter decrements to zero.
0b10	A transient Corrected Error, that is, a Corrected Error that is recorded as ERR<n>STATUS.CE == 0b01, might be generated when the Error Generation Counter decrements to zero.
0b11	A persistent Corrected Error, that is, a Corrected Error that is recorded as ERR<n>STATUS.CE == 0b11, might be generated when the Error Generation Counter decrements to zero.

The set of permitted values for this field is defined by ERR<n>PFGF.CE.

This field is RES0 if the node does not support this control.

The following resets apply:

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

DE, bit [5]

Deferred Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

DE	Meaning
0b0	No error of this type will beis generated.
0b1	An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.

The following resets apply:

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

UEO, bit [4]

Latent or Restartable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

UEO	Meaning
0b0	No error of this type will beis generated.
0b1	An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.

The following resets apply:

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

UER, bit [3]

Signaled or Recoverable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

UER	Meaning
0b0	No error of this type will beis generated.
0b1	An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.

The following resets apply:

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

UEU, bit [2]

Unrecoverable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

UEU	Meaning
0b0	No error of this type will beis generated.
0b1	An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.

The following resets apply:

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

UC, bit [1]

Uncontainable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

UC	Meaning
0b0	No error of this type will beis generated.
0b1	An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.

The following resets apply:

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OF, bit [0]

Overflow flag. The value that is written to ERR<n>STATUS.OF when an injected error is recorded.

OF	Meaning
0b0	ERR<n>STATUS.OF is set to ~~0 when an injected error is recorded.~~ 0b0 when an injected error is recorded.
0b1	ERR<n>STATUS.OF is set to ~~1 when an injected error is recorded.~~ 0b1 when an injected error is recorded.

This bit is RES0 if the node does not support this control.

The following resets apply:

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On an Error recovery reset, the value of this field is unchanged.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERR<n>PFGCTL

ERR<n>PFGCTL can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x808 + 64n	ERR<n>PFGCTL

Accesses on this interface are **RW**.

ERR<n>PFGF, Pseudo-fault Generation Feature Register, n = 0 - 65534

The ERR<n>PFGF characteristics are:

Purpose

Defines which common architecturally-defined fault generation features are implemented.

Configuration

~~This register is present only when ARMv8.4-RAS is implemented. Otherwise, direct accesses to ERR<n>PFGF are RES0.~~

~~Present only when the RAS Common Fault Injection Model Extension is implemented by this node so that ERR<n>FR.INJ != 0b00, error record <n> is implemented, and error record <n> is the first error record owned by a node. Otherwise, RES0.~~

This register is present only when error record <n> is implemented, the node implements the RAS Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGF are RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGF is a 64-bit register.

Field descriptions

The ERR<n>PFGF bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0	R	SYN	RES0																MV	AV	PN	ER	CI	CE		DE	UEO	UER	UEU	UC	OF
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:31]

Reserved, RES0.

R, bit [30]

Restartable. Support for Error Generation Counter restart mode.

R	Meaning
0b0	The node does not support this feature.
0b1	Feature controllable.

SYN, bit [29]

Syndrome. Fault syndrome injection.

SYN	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS.{IERR, SERR} to IMPLEMENTATION DEFINED values. ERR<n>STATUS.{IERR, SERR} are UNKNOWN when ERR<n>STATUS.V ==~~ 0.~~ 0b0.
0b1	When an injected error is recorded, the node does not update the ERR<n>STATUS.{IERR, SERR} fields. ERR<n>STATUS.{IERR, SERR} are writable when ERR<n>STATUS.V ==~~ 0.~~ 0b0.

Note

If ERR<n>PFGF.SYN~~this ==bit is 1, software can write specific values into the~~ 0b1, software can write specific values into the ERR<n>STATUS.{IERR, SERR} fields when setting up a fault injection event. The sets of values that can be written to these fields is IMPLEMENTATION DEFINED.

Bits [28:13]

Reserved, RES0.

MV, bit [12]

Miscellaneous syndrome.

Additional syndrome injection. Defines whether software can control all or part of the syndrome recorded in the ERR<n>MISC<m> registers when an injected error is recorded.

It is IMPLEMENTATION DEFINED which syndrome fields in ERR<n>MISC<m> this refers to, as some fields might always be recorded by an error. For example, a Corrected Error counter.

MV	Meaning
0b0	When an injected error is recorded, the node might record IMPLEMENTATION DEFINED additional syndrome in ERR<n>MISC<m>. If any syndrome is recorded in ERR<n>MISC<m>, then ERR<n>STATUS.MV is set to ~~1.~~ 0b1.
0b1	When an injected error is recorded, the node does not update all the syndrome fields in the ERR<n>MISC<m> and does one of: • The node does not update any fields in ERR<n>MISC<m> and sets ERR<n>STATUS.MV to ERR<n>PFGCTL.MV. • The node records some syndrome in ERR<n>MISC<m> and sets ERR<n>STATUS.MV to ~~1. ERR<n>PGFCTL.MV is RAO.~~ 0b1. ERR<n>PGFCTL.MV is RAO. The syndrome fields that the node does not update are unchanged and must be writable when ERR<n>STATUS.MV ==~~is set to 0.~~ 0b0.

Note

If ~~this bit is 1, software can write specific values into the~~ ERR<n>PFGF.MV~~MISC<m> ==registers when setting up a fault injection event. The values that can be written to these registers are~~ 0b1, software can write specific values into the ERR<n>MISC<m> registers when setting up a fault injection event. The values that can be written to these registers are IMPLEMENTATION DEFINED.

AV, bit [11]

Address syndrome. Address syndrome injection.

AV	Meaning
0b0	When an injected error is recorded, the node either sets ERR<n>ADDR and ERR<n>STATUS.AV for the access, or leaves these unchanged.
0b1	When an injected error is recorded, the node does not update ERR<n>ADDR and does one of: • Sets ERR<n>STATUS.AV to ERR<n>PFGCTL.AV. • Sets ERR<n>STATUS.AV to 0b1. ERR<n>PFGCTL.AV is RAO. • ~~Sets ERR<n>STATUS.AV to 1. ERR<n>PFGCTL.AV is RAO.~~ ~~ERR<n>ADDR must be writable when ERR<n>STATUS.AV is set to 0.~~ ERR<n>ADDR must be writable when ERR<n>STATUS.AV == 0b0.

Note

If ERR<n>PFGF.AV~~this~~ ==~~bit is 1, software can write a specific value into~~ 0b1, software can write a specific value into ERR<n>ADDR when setting up a fault injection event.

PN, bit [10]

Poison flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.PN status flag.

PN	Meaning
0b0	When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.PN to ~~1.~~ 0b1.
0b1	When an injected error is recorded, ERR<n>STATUS.PN is set to ERR<n>PFGCTL.PN.

This behavior replaces the architecture-defined rules for setting the PN bit.

This bit reads-as-zero if the node does not support this flag.

ER, bit [9]

Error Reported flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.ER status flag.

ER	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS.ER according to the architecture-defined rules for setting the ER bit.
0b1	~~This behavior replaces the architecture-defined rules for setting the ER bit.~~ When an injected error is recorded, ERR<n>STATUS.ER is set to ERR<n>PFGCTL.ER. This behavior replaces the architecture-defined rules for setting the ER bit.

This bit reads-as-zero if the node does not support this flag.

CI, bit [8]

Critical Error flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.CI status flag.

CI	Meaning
0b0	When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.CI to ~~1.~~ 0b1.
0b1	When an injected error is recorded, ERR<n>STATUS.CI is set to ERR<n>PFGCTL.CI.

This behavior replaces the architecture-defined rules for setting the CI bit.

This bit reads-as-zero if the node does not support this flag.

CE, bits [7:6]

Corrected Error generation. Describes the types of Corrected Error that the fault generation feature of the node can generate.

CE	Meaning
0b00	The fault generation feature of the node cannot generate this type of error.
0b01	The fault generation feature of the node allows generation of a non-specific Corrected Error, that is, a Corrected Error that is recorded as ERR<n>STATUS.CE == 0b10.
0b11	The fault generation feature of the node allows generation of transient or persistent Corrected Errors, that is, Corrected Errors that are recorded as ERR<n>STATUS.CE == 0b01 and 0b11.

All other values are reserved.

This fieldbit reads-as-zerosreads-as-zero if the node does not support this type of error.

DE, bit [5]

Deferred Error generation. Describes whether the fault generation feature of the node can generate this type of error.

DE	Meaning
0b0	The fault generation feature of the node cannot generate this type of error.
0b1	The fault generation feature of the node allows generation of this type of error.

This bit reads-as-zero if the node does not support this type of error.

UEO, bit [4]

Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

UEO	Meaning
0b0	The fault generation feature of the node cannot generate this type of error.
0b1	The fault generation feature of the node allows generation of this type of error.

This bit reads-as-zero if the node does not support this type of error.

UER, bit [3]

Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

UER	Meaning
0b0	The fault generation feature of the node cannot generate this type of error.
0b1	The fault generation feature of the node allows generation of this type of error.

This bit reads-as-zero if the node does not support this type of error.

UEU, bit [2]

Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

UEU	Meaning
0b0	The fault generation feature of the node cannot generate this type of error.
0b1	The fault generation feature of the node allows generation of this type of error.

This bit reads-as-zero if the node does not support this type of error.

UC, bit [1]

Uncontainable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

UC	Meaning
0b0	The fault generation feature of the node cannot generate this type of error.
0b1	The fault generation feature of the node allows generation of this type of error.

This bit reads-as-zero if the node does not support this type of error.

OF, bit [0]

Overflow flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.OF status flag.

OF	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS.OF according to the architecture-defined rules for setting the OF bit.
0b1	When an injected error is recorded, ERR<n>STATUS.OF is set to ERR<n>PFGCTL.OF. This behavior replaces the architecture-defined rules for setting the OF bit.

This bit reads-as-zero if the node does not support this flag.

Accessing the ERR<n>PFGF

ERR<n>PFGF can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x800 + 64n	ERR<n>PFGF

Accesses on this interface are **RO**.

ERR<n>STATUS, Error Record Primary Status Register, n = 0 - 65534

The ERR<n>STATUS characteristics are:

Purpose

Contains status information for the error record, including:

- ~~Whether any error has been detected (valid).~~

  Whether any error has been detected (valid).

- ~~Whether any detected error was not corrected, and returned to a master.~~

  Whether any detected error was not corrected, and returned to a master.

- ~~Whether any detected error was not corrected and deferred.~~

  Whether any detected error was not corrected and deferred.

- ~~Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).~~

  Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).

- ~~Whether any error has been reported.~~

  Whether any error has been reported.

- ~~Whether the other error record registers contain valid information.~~

  Whether the other error record registers contain valid information.

- ~~Whether the error was recorded because poison data was detected or because a corrupt value was detected by an error detection code.~~

  Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.

- ~~A primary error code.~~

  A primary error code.

- An IMPLEMENTATION DEFINED extended error code.

- ~~An IMPLEMENTATION DEFINED extended error code.~~

Within this register:

- ~~The {AV, V, MV} bits are valid bits that define whether the error record registers are valid.~~

  The {AV, V, MV} bits are valid bits that define whether the error record registers are valid.

- ~~The {UE, OF, CE, DE, UET} bits encode the type of error or errors recorded.~~

  The {UE, OF, CE, DE, UET} bits encode the types of error or errors recorded.

- ~~The {CI, ER, PN, IERR, SERR} fields are syndrome fields.~~

  The {CI, ER, PN, IERR, SERR} fields are syndrome fields.

Configuration

This register is present only when RAS is implemented. Otherwise, direct accesses to ERR<n>STATUS are UNDEFINED.

The number of error records that are implemented is IMPLEMENTATION DEFINED.

If error record <n> is not implemented, ERR<n>STATUS is RES0.

ThisSome registeror isall presentRW only whenfields errorof recordthis <n>register ishave implemented. Otherwise,defined directreset accesses to ERR<n>STATUS arevalues. RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>STATUSthis register, writing zero must always be supported to return the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome fields that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request are disabled at Cold reset and are enabled by software writing an IMPLEMENTATION DEFINED non-zero value to an IMPLEMENTATION DEFINED field in ERR<q>CTRL.CTRL, where q is the index of the first error record owned by the same node as error record n. If the node owns a single record then q = n.

Attributes

ERR<n>STATUS is a 64-bit register.

Field descriptions

The ERR<n>STATUS bit assignments are:

When RAS System Architecture v1.1ARMv8.4-RAS is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
AV	V	UE	ER	OF	MV	CE			DE	PN	UET		CI	RES0				IERR										SERR			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When the error record includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

This bit is read/write-one-to-clear.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

This bit is read/write-one-to-clear.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to 0.

UE, bit [29]

Uncorrected Error.error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this bit is nonzero, then software must write one to this bit to clear this bit to zero. 0b0, if this bit is nonzero, then software must write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V ==is set to 0. 0b0.

This bit is read/write-one-to-clear.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ER, bit [28]

Error Reported.

ER	Meaning
0b0	No in-band error (External Abortabort) reported.
0b1	An External Abortabort was signaled by the node to the master making the access or other transaction. This can be because any of the following are true: • The applicable one of the ERR<q>CTLR.{WUE,RUE,UE} bits is implemented and was set to 0b1 when an Uncorrected error was detected. • The applicable one of the ERR<q>CTLR.{WUE,RUE,UE} bits is implemented, and was set to 1 when an Uncorrected error was detected. • The applicable one of the ERR<q>CTLR.{WUE,RUE,UE} bits is not implemented. The applicable one of the ERR<q>CTLR.{WUE,RUE,UE} bits is not implemented and the node always reports errors.

It is IMPLEMENTATION DEFINED whether this bit can be set to 1 by a Deferred error. 0b1 by a Deferred error.

When clearing ERR<n>STATUS.V to 0, if this bit is nonzero, then software must write one to this bit to clear this bit to zero. 0b0, if this bit is nonzero, then software must write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V == 0b0.
- ERR<n>STATUS.V is set to 0.
- ERR<n>STATUS.UE == 0b0 and this bit is never set to 0b1 by a Deferred error.
- ERR<n>STATUS.UE is set to 0 and this bit is never set to 1 by a Deferred error.
- ERR<n>STATUS.{UE,DE} == {0,0} and this bit can be set to 0b1 by a Deferred error.
- ERR<n>STATUS.{UE, DE} are both set to 0, and this bit can be set to 1 by a Deferred error.

This bit is read/write-one-to-clear.

Note

An External Abortabort signaled by the node might be masked and not generate any exception.

The following resets apply:

- OnThis anbit Errorís recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This bit is set to 1 when one of the following occurs: 0b1 when one of the following occurs:

- A Corrected error counter is implemented, an error is counted, and the counter overflows.
- A Corrected error counter is implemented, an error is counted, and the counter overflows.
- ERR<n>STATUS.V was previously set to 0b1, a Corrected error counter is not implemented, and a Corrected error is recorded.
- ERR<n>STATUS.V was previously set to 1, a Corrected error counter is not implemented, and a Corrected error is recorded.
- ERR<n>STATUS.V was previously set to 0b1, and a type of error other than a Corrected error is recorded.
- ERR<n>STATUS.V was previously set to 1, and a type of error other than a Corrected error is recorded.

Otherwise, this bit is unchanged when an error is recorded.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this bit to an UNKNOWN value.
- A direct write that modifies the counter overflow flag indirectly might set this bit to an UNKNOWN value.
- A direct write to this bit that clears this bit to zero might indirectly set the counter overflow flag to an UNKNOWN value.
- A direct write to this bit that clears this bit to zero might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
0b0	Since this bit was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed.
0b1	Since this bit was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

WhenIf this bit is nonzero, then software must write 1 to this bit, to clear this bit to zero, when clearing ERR<n>STATUS.V to 0. 0b0, if this bit is nonzero, then software must write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V ==is set to 0. 0b0.

This bit is read/write-one-to-clear.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MV, bit [26]

When the error record includes an additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC0, ERR<n>MISC1, ERR<n>MISC2, and ERR<n>MISC3ERR<n>MISC<m>are not valid.
0b1	The IMPLEMENTATION DEFINED contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record.ERR<n>MISC0, ERR<n>MISC1, ERR<n>MISC2, and ERR<n>MISC3 registers contain additional information for an error recorded by this record.

This bit is read/write-one-to-clear.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.ERR<n>MISC0, ERR<n>MISC1, ERR<n>MISC2, and ERR<n>MISC3 registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a node detects whether a correctable error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when an error is corrected.

When clearing ERR<n>STATUS.V to ~~0, if this field is nonzero, then software must write ones to this field to clear this field to zero.~~ 0b0, if this field is nonzero, then software must write ones to this field to clear this field to zero.

This~~If ERR<n>STATUS.V is set to 0, this~~ field is not valid and reads UNKNOWN if ERR<n>STATUS.V ==~~.~~ 0b0.

This field is read/write-ones-to-clear.~~write-one-to-clear.~~ Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

The following resets apply:

- On~~This~~ an~~field~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

DE, bit [23]

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to ~~0, if this bit is nonzero, then software must write 1 to this bit to clear this bit to zero.~~ 0b0, if this bit is nonzero, then software must write 0b1 to this bit to clear this bit to zero.

This~~If ERR<n>STATUS.V is set to 0, this~~ bit is not valid and reads UNKNOWN if ERR<n>STATUS.V ==~~.~~ 0b0.

This bit is read/write-one-to-clear.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC). **Note** If a producer node detects a corrupt value and defers the error by producing a poison value, then this bit is set to ~~0 at the producer node.~~ 0b0 at the producer node.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected. **Note** This might only be an indication of poison, because, in some EDC schemes, a poison value is encoded as an unlikely form of corrupt data, meaning it is possible to mistake a corrupt value as a poison value.

It is IMPLEMENTATION DEFINED whether a node can distinguish a poison value from a corrupt value.

When clearing ERR<n>STATUS.V to ~~0, if this bit is nonzero, then software must write 1 to this bit to clear this bit to zero.~~ 0b0, if this bit is nonzero, then software must write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V == 0b0.
- ~~ERR<n>STATUS.V is set to 0.~~
- ~~ERR<n>STATUS.{DE, UE} are both set to 0.~~

  ERR<n>STATUS.{DE,UE} == {0,0}.

This bit is read/write-one-to-clear.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

UET, bits [21:20]

~~Describes the state of the component after detecting or consuming an Uncorrected error.~~

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

When clearing ERR<n>STATUS.V to ~~0, if this field is nonzero, then software must write ones to this field to clear this field to zero.~~ 0b0, if this field is nonzero, then software must write ones to this field to clear this field to zero.

This field is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V == 0b0.
- ~~ERR<n>STATUS.V is set to 0.~~
- ERR<n>STATUS.UE == 0b0.
- ~~ERR<n>STATUS.UE is set to 0.~~

This field is read/write-ones-to-clear.~~write-one-to-clear.~~ Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

Note

Software might use the information in the error record registers to determine what recovery is necessary.

The following resets apply:

- OnThis anfield Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CI, bit [19]

Indicates whether a critical error condition has been recorded.

Critical Error. Indicates whether a critical error condition has been recorded.error.

CI	Meaning
0b0	No critical error condition.condition recorded.
0b1	Critical error condition.condition recorded.

When clearing ERR<n>STATUS.V to 0, if this bit is nonzero, then software must write 1 to this bit to clear this bit to zero. 0b0, if this bit is nonzero, then software must write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V ==is set to 0. 0b0.

This bit is read/write-one-to-clear.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [18:16]

Reserved, RES0.

IERR, bits [15:8]

This field is not valid and reads UNKNOWN if ERR<n>STATUS.V is set to 0.

IMPLEMENTATION DEFINED error code. Used with any primary error code SERR value. Further IMPLEMENTATION DEFINED information can be placed in the MISC registers.

ThisUsed fieldwith isany notprimary validerror andcode readsSERR value. Further UNKNOWNIMPLEMENTATION DEFINED if ERR<n>STATUS.V == 0b0.information can be placed in the MISC registers.

The following resets apply:

- OnThis anfield Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SERR, bits [7:0]

Indicates the type of error. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, **nSEI** pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.
0x11	Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.
0x12	Error response from slave. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another node.
0x14	Internal timeout. For example, timeout on interface within the node.
0x15	Deferred error from slave not supported at master. For example, poisoned data received from a slave by a master that cannot defer the error further.
0x16	Deferred error from master not supported at slave. For example, poisoned data received from a master by a slave that cannot defer the error further.
0x17	Deferred error from slave passed through. For example, poisoned data received from a slave and returned to a master.
0x18	Deferred error from master passed through. For example, poisoned data received from a master and deferred to a slave.
0x19	Error recorded by PCIe error logs. Indicates that the node has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.

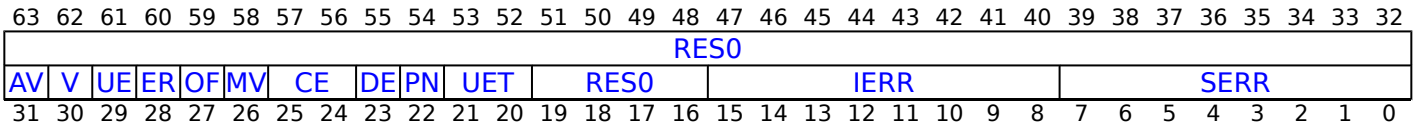
All other values are reserved. ~~Reserved values might be defined in a future version of the architecture.~~

This field is not valid and reads UNKNOWN if ERR<n>STATUS.V ==~~is set to 0.~~ 0b0.

The following resets apply:

- On~~This~~ an~~field~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When RAS System Architecture v1.0 is implemented~~Otherwise~~:



Bits [63:32]

Reserved, RES0.

AV, bit [31]

When the error record includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

This bit ignores writes if ~~any of~~ ERR<n>STATUS.{CE, DE, UE} !=~~are~~ ~~{set to 1, and the highest priority of these is not being cleared to 0 in the same write.~~0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

This bit is read/write-one-to-clear.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to 0.

~~Otherwise:~~

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

This bit ignores writes if ~~any of~~ ERR<n>STATUS.{CE, DE, UE} !=~~are~~ ~~{set to 1, and and is not being cleared to 0 in the same write.~~0b00,0,0}, and is not being cleared to 0b0 in the same write.

This bit is read/write-one-to-clear.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to 0.

UE, bit [29]

Uncorrected Error.~~error.~~

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V is set to 0.

When clearing ERR<n>STATUS.V to 0, if this bit is nonzero, then software must write one to this bit to clear this bit to zero. 0b0, if this bit is nonzero, then software must write 0b1 to this bit to clear this bit to zero.

ThisIf bitERR<n>STATUS.OF is notset validto 1 and readsis not being cleared to 0 in the same write, this bit ignores writes. UNKNOWN if ERR<n>STATUS.V == 0b0. This bit ignores writes if ERR<n>STATUS.OF == 0b1 and is not being cleared to 0b0 in the same write.

This bit is read/write-one-to-clear.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ER, bit [28]

Error Reported.

ER	Meaning
0b0	No in-band error (External Abortabort) reported.
0b1	An External Abortabort was signaled by the node to the master making the access or other transaction. This can be because any of the following are true: • The applicable one of the ERR<q>CTLR.{WUE,RUE,UE} bits is implemented and was set to 0b1 when an Uncorrected error was detected. • The applicable one of the ERR<q>CTLR.{WUE,RUE,UE} bits is implemented, and was set to 1 when an Uncorrected error was detected. • The applicable one of the ERR<q>CTLR.{WUE,RUE,UE} bits is not implemented. The applicable one of the ERR<q>CTLR.{WUE,RUE,UE} bits is not implemented and the node always reports errors.

It is IMPLEMENTATION DEFINED whether this bit can be set to 1 by a Deferred error. 0b1 by a Deferred error.

If this bit is nonzero, then software must write 1 to this bit, to clear this bit to zero, when: 0b1 to this bit to clear this bit to zero, when any of:

- Clearing ERR<n>STATUS.V to 0b0.
- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0b0, if this bit is never set to 0b1 by a Deferred error.
- Clearing ERR<n>STATUS.UE to 0, if this bit is never set to 1 by a Deferred error.
- Clearing ERR<n>STATUS.{UE,DE} to {0,0}, if this bit can be set to 0b1 by a Deferred error.
- Clearing both ERR<n>STATUS.{UE, DE} to 0, if this bit can be set to 1 by a Deferred error.

This bit is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V == 0b0.
- ERR<n>STATUS.V is set to 0.
- ERR<n>STATUS.UE == 0b0 and this bit is never set to 0b1 by a Deferred error.
- ERR<n>STATUS.UE is set to 0 and this bit is never set to 1 by a Deferred error.
- ERR<n>STATUS.{UE,DE} == {0,0} and this bit can be set to 0b1 by a Deferred error.

- ~~ERR<n>STATUS.{UE, DE} are both set to 0, and this bit can be set to 1 by a Deferred error.~~

This bit ignores writes if ~~any of~~ ERR<n>STATUS.{CE, DE, UE} !=~~are~~ {~~set to 1, and the highest priority of these is not being cleared to 0 in the same write.~~`0b00`,0,0}, and the highest priority of these is not being cleared to zero in the same write.

This bit is read/write-one-to-clear.

Note

An External Abort~~abort~~ signaled by the node might be masked and not generate any exception.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This bit is set to ~~1 when one of the following occurs:~~ `0b1` when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == `0b1`.
  - ~~An Uncorrected error is detected and ERR<n>STATUS.UE == 1.~~
- A Deferred error is detected, ERR<n>STATUS.UE == `0b0` and ERR<n>STATUS.DE == `0b1`.
  - ~~A Deferred error is detected, ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1.~~
- A Corrected error is detected, no Corrected error counter is implemented, ERR<n>STATUS.UE == `0b0`, ERR<n>STATUS.DE == `0b0`, and ERR<n>STATUS.CE != `0b00`. ERR<n>STATUS.CE might be updated for the new Corrected error.
  - ~~A Corrected error is detected, no Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE != `0b00`. ERR<n>STATUS.CE might be updated for the new Corrected error.~~
- A Corrected error counter is implemented, ERR<n>STATUS.UE == `0b0`, ERR<n>STATUS.DE == `0b0`, and the counter overflows.
  - ~~A Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and the counter overflows.~~

It is IMPLEMENTATION DEFINED whether this bit is set to ~~1 when one of the following occurs:~~ `0b1` when one of the following occurs:

- A Deferred error is detected and ERR<n>STATUS.UE == `0b1`.
  - ~~A Deferred error is detected and ERR<n>STATUS.UE == 1.~~
- A Corrected error is detected, no Corrected error counter is implemented, and either or both the ERR<n>STATUS.UE or ERR<n>STATUS.DE bits are set to `0b1`.
  - ~~A Corrected error is detected, no Corrected error counter is implemented, and either or both the ERR<n>STATUS.UE or ERR<n>STATUS.DE bits are set to 1.~~
- A Corrected error counter is implemented, either or both the ERR<n>STATUS.UE or ERR<n>STATUS.DE bits are set to `0b1`, and the counter overflows.
  - ~~A Corrected error counter is implemented, either or both the ERR<n>STATUS.UE or ERR<n>STATUS.DE bits are set to 1, and the counter overflows.~~

It is IMPLEMENTATION DEFINED whether this bit is cleared~~set~~ to ~~0 when one of the following occurs:~~ `0b0` when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 0b0.
- ~~An Uncorrected error is detected and ERR<n>STATUS.UE == 0.~~
- A Deferred error is detected, ERR<n>STATUS.UE == 0b0 and ERR<n>STATUS.DE == 0b0.
- ~~A Deferred error is detected, ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 0.~~
- A Corrected error is detected, ERR<n>STATUS.UE == 0b0, ERR<n>STATUS.DE == 0b0 and ERR<n>STATUS.CE == 0b00.
- ~~A Corrected error is detected, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0 and ERR<n>STATUS.CE == 0b00.~~

The IMPLEMENTATION DEFINED clearing of this bit might also depend on the value of the other error status bits.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this bit to an UNKNOWN value.
- ~~A direct write that modifies the counter overflow flag indirectly might set this bit to an UNKNOWN value.~~
- A direct write to this bit that clears this bit to 0b0 might indirectly set the counter overflow flag to an UNKNOWN value.
- ~~A direct write to this bit that clears this bit to 0 might indirectly set the counter overflow flag to an UNKNOWN value.~~

OF	Meaning
0b0	If ERR<n>STATUS.UE == ~~1, then no error syndrome for an Uncorrected error has been discarded.~~ 0b1, then no error syndrome for an Uncorrected error has been discarded. If ERR<n>STATUS.UE == ~~0 and ERR<n>STATUS.DE == 1, then no error syndrome for a Deferred error has been discarded.~~ 0b0 and ERR<n>STATUS.DE == 0b1, then no error syndrome for a Deferred error has been discarded. If ERR<n>STATUS.UE == ~~0, ERR<n>STATUS.DE == 0, and a Corrected error counter is implemented, then the counter has not overflowed.~~ 0b0, ERR<n>STATUS.DE == 0b0, and a Corrected error counter is implemented, then the counter has not overflowed. If ERR<n>STATUS.UE == ~~0, ERR<n>STATUS.DE == 0, ERR<n>STATUS.CE !=~~ 0b0, ERR<n>STATUS.DE == 0b0, ERR<n>STATUS.CE != 0b00, and no Corrected error counter is implemented, then no error syndrome for a Corrected error has been discarded. **Note** This bit might have been set to ~~1 when an error syndrome was discarded and later cleared to 0 when a higher priority syndrome was recorded.~~ 0b1 when an error syndrome was discarded and later cleared to 0b0 when a higher priority syndrome was recorded.
0b1	At least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When~~If this bit is nonzero, then software must write 1 to this bit, to clear this bit to zero, when~~ clearing ERR<n>STATUS.V to ~~0.~~ 0b0, if this bit is nonzero, then software must write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V ==~~is set to 0.~~ 0b0.

This bit is read/write-one-to-clear.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MV, bit [26]

When the error record includes an additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC0 and ERR<n>MISC1ERR<n>MISC<m> not valid.
0b1	The IMPLEMENTATION DEFINED contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record.ERR<n>MISC0 and ERR<n>MISC1 registers contains additional information for an error recorded by this record.

This bit ignores writes if any of ERR<n>STATUS.{CE, DE, UE} !=are {set to 1, and the highest priority of these is not being cleared to 0 in the same write.0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

This bit is read/write-one-to-clear.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.ERR<n>MISC0 and ERR<n>MISC1 registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a node detects whether a correctable error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when an error is corrected.

If ERR<n>STATUS.V is set to 0, this field is not valid and reads UNKNOWN.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then software must write ones to this field to clear this field to zero. 0b0, if this field is nonzero, then software must write ones to this field to clear this field to zero.

ThisIf fieldERR<n>STATUS.OF is notset validto 1 and readsis not being cleared to 0 in the same write, this field ignores writes. UNKNOWN if ERR<n>STATUS.V == 0b0. This field ignores writes if ERR<n>STATUS.OF == 0b1 and is not being cleared to 0b0 in the same write.

This field is read/write-ones-to-clear. Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

The following resets apply:

- OnThis anfield Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

DE, bit [23]

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

If ERR<n>STATUS.V is set to 0, this bit is not valid and reads UNKNOWN.

When clearing ERR<n>STATUS.V to 0, if this bit is nonzero, then software must write 1 to this bit to clear this bit to zero. 0b0, if this bit is nonzero, then software must write 0b1 to this bit to clear this bit to zero.

ThisIf bitERR<n>STATUS.OF is notset validto 1 and readsis not being cleared to 0 in the same write, this bit ignores writes. UNKNOWN if ERR<n>STATUS.V == 0b0. This bit ignores writes if ERR<n>STATUS.OF == 0b1 and is not being cleared to 0b0 in the same write.

This bit is read/write-one-to-clear.

The following resets apply:

- OnThis anbit Erroris recoverypreserved reset,on thean valueError ofRecovery this field is unchanged.reset.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC). **Note** If a producer node detects a corrupt value and defers the error by producing a poison value, then this bit is set to 0 at the producer node. 0b0 at the producer node.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected. **Note** This might only be an indication of poison, because, in some EDC schemes, a poison value is encoded as an unlikely form of corrupt data, meaning it is possible to mistake a corrupt value as a poison value.

It is IMPLEMENTATION DEFINED whether a node can distinguish a poison value from a corrupt value.

IfWhen clearing ERR<n>STATUS.V to 0, if this bit is nonzero, then software must write 1 to this bit to clear this bit to zero. 0b1 to this bit to clear this bit to zero, when any of:

When clearing both ERR<n>STATUS.{DE, UE} to 0, if this bit is nonzero, then software must write 1 to this bit to clear this bit to zero.

- Clearing ERR<n>STATUS.V to 0b0.
- Clearing both ERR<n>STATUS.{DE, UE} to 0b0.

This bit is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V == 0b0.
  - ~~ERR<n>STATUS.V is set to 0.~~
  - ~~ERR<n>STATUS.{DE, UE} are both set to 0.~~

  ERR<n>STATUS.{DE,UE} == {0,0}.

This~~When~~ bit~~any~~ ignores~~of~~ writes if ERR<n>STATUS.{CE, DE, UE} !=~~are~~ {~~set to 1, and the highest priority of these is not being cleared to 0 in the same write, this bit ignores writes.~~0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

This bit is read/write-one-to-clear.

The following resets apply:

- On~~This~~ an~~bit~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

UET, bits [21:20]

~~Describes the state of the component after detecting or consuming an Uncorrected error.~~

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

If~~When~~ ~~clearing ERR<n>STATUS.V to 0, if~~ this field is nonzero, then software must write ones to this field to clear this field to zero, when any of:~~zero.~~

~~When clearing ERR<n>STATUS.UE to 0, if this field is nonzero, then software must write ones to this field to clear this field to zero.~~

- Clearing ERR<n>STATUS.V to 0b0.
- Clearing ERR<n>STATUS.UE to 0b0.

This field is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V == 0b0.
  - ~~ERR<n>STATUS.V is set to 0.~~
- ERR<n>STATUS.UE == 0b0.
  - ~~ERR<n>STATUS.UE is set to 0.~~

This~~When~~ field~~any~~ ignores~~of~~ writes if ERR<n>STATUS.{CE, DE, UE} !=~~are~~ {~~set to 1, and the highest priority of these is not being cleared to 0 in the same write, this field ignores writes.~~0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

This field is read/write-ones-to-clear. Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

Note

Software might use the information in the error record registers to determine what recovery is necessary.

The following resets apply:

- On~~This~~ an~~field~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [19:16]

Reserved, RES0.

IERR, bits [15:8]

~~This field is not valid and reads UNKNOWN if ERR<n>STATUS.V is set to 0.~~

~~When any of ERR<n>STATUS.{CE, DE, UE} are set to 1, and the highest priority of these is not being cleared to 0 in the same write, this field ignores writes.~~

IMPLEMENTATION DEFINED error code. Used with any primary error code SERR value. Further IMPLEMENTATION DEFINED information can be placed in the MISC registers.

~~This~~Used ~~field~~with ~~is~~any ~~not~~primary ~~valid~~error ~~and~~code ~~reads~~SERR value. Further ~~UNKNOWN~~IMPLEMENTATION DEFINED if ERR<n>STATUS.V == `0b0`. This field ignores writes if ERR<n>STATUS.{CE,DE,UE} != {`0b00`,0,0}, ~~information~~ ~~and~~can ~~the~~be highest~~placed~~ priority of these is not being cleared to zero in the same ~~MISC~~ write. ~~registers.~~

The following resets apply:

- On~~This~~ an~~field~~ Error~~is~~ recovery~~preserved~~ reset, ~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged. ~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SERR, bits [7:0]

~~Indicates the type of error. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.~~

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, **nSEI** pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, ~~and~~ SIMD&FP, and SVE registers are data registers.
0x11	Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, ~~and~~ SIMD&FP, and SVE registers are control registers.
0x12	Error response from slave. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another node.
0x14	Internal timeout. For example, timeout on interface within the node.
0x15	Deferred error from slave not supported at master. For example, poisoned data received from a slave by a master that cannot defer the error further.
0x16	Deferred error from master not supported at slave. For example, poisoned data received from a master by a slave that cannot defer the error further.
0x17	Deferred error from slave passed through. For example, poisoned data received from a slave and returned to a master.
0x18	Deferred error from master passed through. For example, poisoned data received from a master and deferred to a slave.
0x19	Error recorded by PCIe error logs. Indicates that the node has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.

~~When any of ERR<n>STATUS.{CE, DE, UE} are set to 1, and the highest priority of these is not being cleared to 0 in the same write, this field ignores writes.~~

All other values are reserved. ~~Reserved values might be defined in a future version of the architecture.~~

This field is not valid and reads UNKNOWN if ERR<n>STATUS.V ==~~is set to 0.~~ 0b0. This field ignores writes if ERR<n>STATUS.{CE,DE,UE} != {0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

The following resets apply:

- On~~This~~ an~~field~~ Error~~is~~ recovery~~preserved~~ reset,~~on~~ the~~an~~ value~~Error~~ of~~Recovery~~ this field is unchanged.~~reset.~~
- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERR<n>STATUS

TheAfter {AV,reading V,the UE,status ERregister, OF,software MV,must CE,clear DE,the PN,valid UET,bits CI} fields are write-one-to-clear, meaning writes of zero are ignored, and a write of one or all-ones to theallow fieldnew clearserrors the field to zero. The {IERR, SERR} fields are read/write fields, although the set of permitted values that can be written to the fields isrecorded. IMPLEMENTATION DEFINED.

AfterBetween reading ERR<n>STATUS, software must clear the valid bits in the register to allow new errors to be recorded. However, between reading the register and clearing the valid bits, a new error might have overwritten the register. To prevent this new error being lost by software, the register prevents updates to fields that might have been updated by a new error.:

When RAS System Architecture v1.0 is implemented:

- When ARMv8.4-RAS is not implemented, some control bits use a form of read/write-one-to-clear and ignore writes depending on the values of other bits and which bits are being cleared.

  Writes to the {UE, DE, CE} fields are ignored if the OF bit is set and is not being cleared.

- When ARMv8.4-RAS is implemented, a write to ERR<n>STATUS is ignored if both:
  - Any of the ERR<n>STATUS.{V, UE, OF, CE, DE} fields are nonzero before the write.
  - The write does not clear the nonzero ERR<n>STATUS.{V, UE, OF, CE, DE} field(s) to zero by writing one(s) to the applicable field(s).

  Writes to the V bit are ignored if any of the {UE, DE, CE} fields are nonzero and are not being cleared.
- Writes to the {AV, MV} bits and {ER, PN, UET, IERR, SERR} syndrome fields are ignored if the highest priority error status field is nonzero and not being cleared. The error status fields in priority order from highest to lowest, are UE, DE, and CE.

WhenSoftware RASmust Systemwrite Architectureones v1.1to isthe implemented{ER, aPN, writeUET, toCI} thefields registerwhen isclearing ignoredERR<n>STATUS.{V, ifUE, allOF, of:CE, DE}.

- Any of {V, UE, OF, CE, DE} fields are nonzero before the write.
- The write does not clear the nonzero {V, UE, OF, CE, DE} fields to zero by writing ones to the applicable field or fields.

To ensure correct and portable operation, when software is clearing the valid bits in the register to allow new errors to be recorded, software must:

- Determine which fields must be cleared to zero by reading ERR<n>STATUS.
- Write ones to all the write-one-to-clear fields that are nonzero.
- Write zero to all the read/write fields.
- Write zero to all the write-one-to-clear fields that are zero.

ERR<n>STATUS can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x010 + 64n`	ERR<n>STATUS

Accesses on this interface are **RW**.

IMPLEMENTATION DEFINED.~~Part number, bits [15:12]~~

Part~~The part~~ number~~,~~ bits~~is~~ [15:12].~~selected by the designer of the component. It is stored in this field,~~ERRPIDR1.PART_1 ~~and~~ ERRPIDR0.PART_0.

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

~~This field reads as an IMPLEMENTATION DEFINED value.~~

- If a 12-bit part number is used, it is stored in ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 8 bits, ERRPIDR2.REVISION and ERRPIDR3.REVAND, available to define the revision of the component.
- If a 16-bit part number is used, it is stored in ERRPIDR2.PART_2, ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 4 bits, ERRPIDR3.REVISION, available to define the revision of the component.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.~~ This bit is RAO.~~

This bit reads as one.

DES_1, bits [2:0]

IMPLEMENTATION DEFINED.

~~Designer, JEP106 identification code, bits [6:4]. ERRPIDR1.DES_0 and this field together form the JEDEC-assigned JEP106 identification code for the designer of the component.~~

Designer, JEP106 identification code, bits [6:4]. ERRPIDR1.DES_0 and ERRPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be not the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

~~This field reads as an IMPLEMENTATION DEFINED value.~~

Note

For a component designed by Arm Limited, the JEP106 identification code is `0x3B`.

Accessing the ERRPIDR2

ERRPIDR2 can be accessed through the memory-mapped interfaces:

Component	Offset
RAS	0xFE8

~~Component~~	~~Offset~~	~~Instance~~
~~RAS~~	~~0xFE8~~	~~ERRPIDR2~~

Accesses on this interface are **RO**.

ERRPIDR3, Peripheral Identification Register 3

The ERRPIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.~~in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.~~

Configuration

Implementation of this register is OPTIONAL.

~~This register is present only when RAS is implemented. Otherwise, direct accesses to ERRPIDR3 are RES0.~~

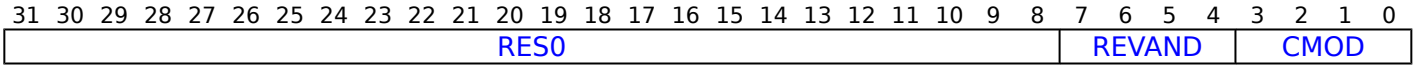
Attributes

ERRPIDR3 is a 32-bit register.

Field descriptions

The ERRPIDR3 bit assignments are:

When the component uses a 12-bit part number:



Bits [31:8]

Reserved, RES0.

~~**When the component uses a 16-bit part number:**~~

~~Component revision.~~

~~This field reads as an IMPLEMENTATION DEFINED value.~~

~~**Otherwise:**~~

~~Reserved, RES0.~~

REVAND, bits [7:4]

~~**When the component uses a 12-bit part number:**~~

IMPLEMENTATION DEFINED.

~~Component minor revision. ERRPIDR2.REVISION and this field together form the revision number of the component, with REVISION being the most significant part and REVAND the least significant part.~~

Component minor revision. ERRPIDR2.REVISION and ERRPIDR3.REVAND together form the revision number of the component, with ERRPIDR2.REVISION being the most significant part and ERRPIDR3.REVAND the least significant part. When a component is changed, ERRPIDR2.REVISION or ERRPIDR3.REVAND must be increased to ensure that software can differentiate the different revisions of the component. If ERRPIDR2.REVISION is increased then ERRPIDR3.REVAND should be set to `0b0000`.

~~This field reads as an IMPLEMENTATION DEFINED value.~~

CMOD, bits [3:0]

~~Customer Modified. If the value of this field is non-zero, then the component has~~ IMPLEMENTATION DEFINED. ~~modifications.~~

Customer Modified.

Indicates the component has been modified.

A value of `0b0000` means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

When the component uses a 16-bit part number:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								REVISION				CMOD			

~~CMOD~~	~~Meaning~~
~~0b0000~~	~~The component is not modified from the original design.~~

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

IMPLEMENTATION DEFINED.

Component revision. When a component is changed, ERRPIDR3.REVISION must be increased to ensure that software can differentiate the different revisions of the component.

CMOD, bits [3:0]

IMPLEMENTATION DEFINED.

Customer Modified.

Indicates the component has been modified.

A value of `0b0000` means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- ~~If the value of the CMOD fields of both components equals zero, the components are identical.~~

  If the value of the CMOD fields of both components equals zero, the components are identical.

- ~~If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.~~

  If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.

- ~~If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.~~

  If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

~~This field reads as an IMPLEMENTATION DEFINED value.~~

Accessing the ERRPIDR3

ERRPIDR3 can be accessed through the memory-mapped interfaces:

Component	**Offset**
RAS	0xFEC

~~**Component**~~	~~**Offset**~~	~~**Instance**~~
~~RAS~~	~~0xFEC~~	~~ERRPIDR3~~

Accesses on this interface are **RO**.

ERRPIDR4, Peripheral Identification Register 4

The ERRPIDR4 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

Configuration

Implementation of this register is OPTIONAL.

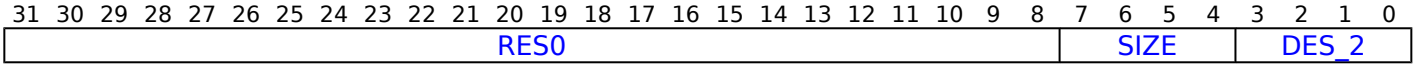
This register is present only when RAS is implemented. Otherwise, direct accesses to ERRPIDR4 are RES0.

Attributes

ERRPIDR4 is a 32-bit register.

Field descriptions

The ERRPIDR4 bit assignments are:



Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

IMPLEMENTATION DEFINED.Size of the component. The distance from the start of the address space used by this component to the end of the component identification registers.

Size of the component.

If the value of this field is non-zero, then the component occupies $2^{ERRPIDR4.SIZE}$ 4KB blocks.

SIZE	Meaning
0b0000	One of the following is true: • The component uses a single 4KB block. • The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.

Using this bit field to indicate the size of the component is deprecated. This bit field might not correctly indicate the size of the component.

Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

This register reads as an IMPLEMENTATION DEFINED value.

The distance from the start of the address space used by this component to the end of the component identification registers.

A value of `0b0000` means one of the following is true:

- The component uses a single 4KB block.
- The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.

Any other value means the component occupies $2^{ERRPIDR4.SIZE}$ 4KB blocks.

Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

DES_2, bits [3:0]

~~This field reads as an IMPLEMENTATION DEFINED value.~~

IMPLEMENTATION DEFINED.~~Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1.~~

Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1. The code identifies the designer of the component, which might not be not the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

Note

For a component designed by Arm Limited, the JEP106 bank is 5, meaning this field has the value `0x4`.

Accessing the ERRPIDR4

ERRPIDR4 can be accessed through the memory-mapped interfaces:

Component	Offset
RAS	`0xFD0`

~~Component~~	~~Offset~~	~~Instance~~
~~RAS~~	~~`0xFD0`~~	~~ERRPIDR4~~

Accesses on this interface are **RO**.

(old) htmldiff from- (new)

GICC_ABPR, CPU Interface Aliased Binary Point Register

The GICC_ABPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

In systems that support two Security states:

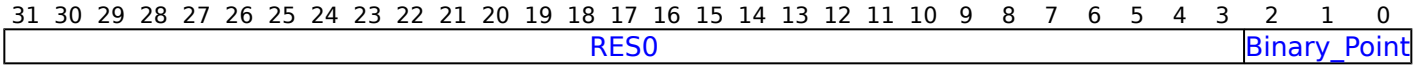
- This register is an alias of the Non-secure copy of GICC_BPR.
- Non-secure accesses to this register return a shifted value of the binary point.
- If ICC_CTLR_EL3.CBPR_EL1NS == 1, Secure accesses to this register access ICC_BPR0_EL1.

Attributes

The reset value of this register is defined as (minimum GICC_BPR.Binary_Point + 1), resulting in a permitted range of `0x1-0x4`.

Field descriptions

The GICC_ABPR bit assignments are:



Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- Priority grouping for Group 1 interrupts when CBPR==0, for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when GICC_CTLR.CBPR == 0.
- Priority grouping for Group 0 interrupts, or Group 1 interrupts when CBPR==1, for all other cases.

This field resets to an architecturally UNKNOWN value.

Accessing the GICC_ABPR

This register is used only when System register access is not enabled. When System register access is enabled, the System registers ICC_BPR0_EL1 and ICC_BPR1_EL1 provide equivalent functionality.

GICC_ABPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x001C	GICC_ABPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICC_BPR, CPU Interface Binary Point Register

The GICC_BPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

In systems that support two Security states:

- This register is Banked.
- The Secure instance of this register determines Group 0 interrupt preemption.
- The Non-secure instance of this register determines Group 1 interrupt preemption.

In systems that support only one Security state, when GICC_CTLR.CBPR == 0, this register determines only Group 0 interrupt preemption.

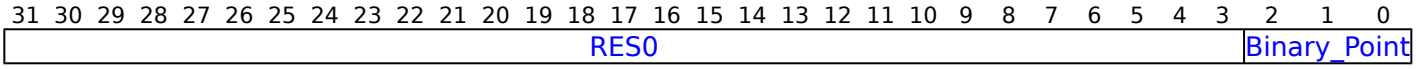
When GICC_CTLR.CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

Attributes

GICC_BPR is a 32-bit register.

Field descriptions

The GICC_BPR bit assignments are:



Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- Priority grouping for Group 1 interrupts when CBPR==0, for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when GICC_CTLR.CBPR == 0.
- Priority grouping for Group 0 interrupts, or Group 1 interrupts when CBPR==1, for all other cases.

This field resets to an architecturally UNKNOWN value.

Note

Aliasing the Non-secure GICC_BPR as GICC_ABPR in a multiprocessor system permits a PE that can make only Secure accesses to configure the preemption setting for Group 1 interrupts by accessing GICC_ABPR.

Accessing the GICC_BPR

This register is used only when System register access is not enabled. When System register access is enabled this register is RAZ/WI, and the System registers ICC_BPR0_EL1 and ICC_BPR1_EL1 provide equivalent functionality.

GICC_BPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0008	GICC_BPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99e984cbfe3431cc1e9707

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

GICC_CTLR, CPU Interface Control Register

The GICC_CTLR characteristics are:

Purpose

Controls the CPU interface, including enabling of interrupt groups, interrupt signal bypass, binary point registers used, and separation of priority drop and interrupt deactivation.

Note

If the GIC implementation supports two Security states, independent EOI controls are provided for accesses from each Security state. Secure accesses handle both Group 0 and Group 1 interrupts, and Non-secure accesses handle Group 1 interrupts only.

Configuration

In a GIC implementation that supports two Security states:

- This register is Banked.
- The register bit assignments are different in the Secure and Non-secure copies.

Attributes

GICC_CTLR is a 32-bit register.

Field descriptions

The GICC_CTLR bit assignments are:

When GICD_CTLR.DS==0, Non-secure access:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																						EOImodeNS	RES0	IRQBypDisGrp1	FIQBypDisGrp1	RES0	EnableGrp1				

Bits [31:10]

Reserved, RES0.

EOImodeNS, bit [9]

Controls the behavior of Non-secure accesses to GICC_EOIR, GICC_AEOIR, and GICC_DIR.

EOImodeNS	Meaning
0b0	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
0b1	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

This field resets to `0`.

Bits [8:7]

Reserved, RES0.

IRQBypDisGrp1, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
`0b0`	The bypass IRQ signal is signaled to the PE.
`0b1`	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

See Interrupt signal bypass and bypass disable for more information.

This field resets to `0`.

FIQBypDisGrp1, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQBypDisGrp1	Meaning
`0b0`	The bypass FIQ signal is signaled to the PE.
`0b1`	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DFB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

See Interrupt signal bypass and bypass disable for more information.

This field resets to `0`.

Bits [4:1]

Reserved, RES0.

EnableGrp1, bit [0]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
`0b0`	Group 1 interrupt signaling is disabled.
`0b1`	Group 1 interrupt signaling is enabled.

This field resets to `0`.

When GICD_CTLR.DS==0, Secure access:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6
RES0																					EOImodeNS	EOImodeS	IRQBypDisGrp1	FIQBypDisGrp1	IRQBypDisGrp0	F

Bits [31:11]

Reserved, RES0.

EOImodeNS, bit [10]

Controls the behavior of Non-secure accesses to GICC_EOIR, GICC_AEOIR, and GICC_DIR.

EOImodeNS	Meaning
0b0	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
0b1	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

This field resets to 0.

EOImodeS, bit [9]

Controls the behavior of Secure accesses to GICC_EOIR, GICC_AEOIR, and GICC_DIR.

EOImodeS	Meaning
0b0	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
0b1	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

This field shares state with GICC_CTLR.EOImode.

This field resets to 0.

IRQBypDisGrp1, bit [8]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

See Interrupt signal bypass and bypass disable for more information.

This field resets to 0.

FIQBypDisGrp1, bit [7]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQBypDisGrp1	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DFB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

See Interrupt signal bypass and bypass disable for more information.

This field resets to 0.

IRQBypDisGrp0, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:

IRQBypDisGrp0	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

See Interrupt signal bypass and bypass disable for more information.

This field resets to 0.

FIQBypDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

FIQBypDisGrp0	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

See Interrupt signal bypass and bypass disable for more information.

This field resets to 0.

CBPR, bit [4]

Controls whether GICC_BPR provides common control of preemption to Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	GICC_BPR determines preemption for Group 0 interrupts only. GICC_ABPR determines preemption for Group 1 interrupts.
0b1	GICC_BPR determines preemption for both Group 0 and Group 1 interrupts.

This field is an alias of ICC_CTLR_EL3.CBPR_EL1NS.

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of GICC_BPR returns the value of Secure GICC_BPR.Binary_Point~~BinaryPoint~~, incremented by 1, and saturated to 0b111.
- Non-secure writes of GICC_BPR are ignored.

This field resets to 0.

FIQEn, bit [3]

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

FIQEn	Meaning
0b0	Group 0 interrupts are signaled using the IRQ signal.
0b1	Group 0 interrupts are signaled using the FIQ signal.

Group 1 interrupts are signaled using the IRQ signal only.

If an implementation supports two Security states, this bit is permitted to be RAO/WI.

This field resets to 0.

Bit [2]

Reserved, RES0.

EnableGrp1, bit [1]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
0b0	Group 1 interrupt signaling is disabled.
0b1	Group 1 interrupt signaling is enabled.

This field resets to 0.

EnableGrp0, bit [0]

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

EnableGrp0	Meaning
0b0	Group 0 interrupt signaling is disabled.
0b1	Group 0 interrupt signaling is enabled.

This field resets to 0.

When GICD_CTLR.DS == 0b1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5
RES0																						EOImode	IRQBypDisGrp1	FIQBypDisGrp1	IRQBypDisGrp0	FIQBypDisGr

Bits [31:10]

Reserved, RES0.

EOImode, bit [9]

Controls the behavior of accesses to GICC_EOIR, GICC_AEOIR, and GICC_DIR.

EOImode	Meaning
0b0	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
0b1	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

This field shares state with GICC_CTLR.EOImodeS.

This field resets to 0.

IRQBypDisGrp1, bit [8]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

See Interrupt signal bypass and bypass disable for more information.

This field resets to 0.

FIQBypDisGrp1, bit [7]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQBypDisGrp1	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DFB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

See Interrupt signal bypass and bypass disable for more information.

This field resets to 0.

IRQBypDisGrp0, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:

IRQBypDisGrp0	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

See Interrupt signal bypass and bypass disable for more information.

This field resets to `0`.

FIQBypDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

FIQBypDisGrp0	Meaning
`0b0`	The bypass FIQ signal is signaled to the PE.
`0b1`	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

See Interrupt signal bypass and bypass disable for more information.

This field resets to `0`.

CBPR, bit [4]

Controls whether GICC_BPR provides common control of preemption to Group 0 and Group 1 interrupts:

CBPR	Meaning
`0b0`	GICC_BPR determines preemption for Group 0 interrupts only. GICC_ABPR determines preemption for Group 1 interrupts.
`0b1`	GICC_BPR determines preemption for both Group 0 and Group 1 interrupts.

This field is an alias of ICC_CTLR_EL3.CBPR_EL1NS.

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of GICC_BPR returns the value of Secure GICC_BPR.Binary_Point~~BinaryPoint~~, incremented by 1, and saturated to `0b111`.
- Non-secure writes of GICC_BPR are ignored.

This field resets to `0`.

FIQEn, bit [3]

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

FIQEn	Meaning
`0b0`	Group 0 interrupts are signaled using the IRQ signal.
`0b1`	Group 0 interrupts are signaled using the FIQ signal.

Group 1 interrupts are signaled using the IRQ signal only.

If an implementation supports two Security states, this bit is permitted to be RAO/WI.

This field resets to `0`.

Bit [2]

Reserved, RES0.

EnableGrp1, bit [1]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
0b0	Group 1 interrupt signaling is disabled.
0b1	Group 1 interrupt signaling is enabled.

This field resets to 0.

EnableGrp0, bit [0]

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

EnableGrp0	Meaning
0b0	Group 0 interrupt signaling is disabled.
0b1	Group 0 interrupt signaling is enabled.

This field resets to 0.

Accessing the GICC_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_CTLR and ICC_MCTLR provide equivalent functionality.
- For AArch64 implementations, ICC_CTLR_EL1 and ICC_CTLR_EL3 provide equivalent functionality.

GICC_CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0000	GICC_CTLR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICC_PMR, CPU Interface Priority Mask Register

The GICC_PMR characteristics are:

Purpose

This register provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Note

Higher interrupt priority corresponds to a lower value of the Priority field.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

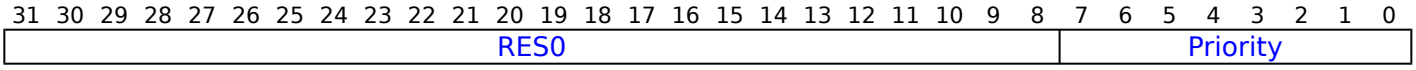
This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

Attributes

GICC_PMR is a 32-bit register.

Field descriptions

The GICC_PMR bit assignments are:



Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = `0b0`.
- For 64 supported levels, bits [1:0] = `0b00`.
- For 32 supported levels, bits [2:0] = `0b000`.
- For 16 supported levels, bits [3:0] = `0b0000`.

See Interrupt prioritization for more information.

This field resets to an architecturally UNKNOWN value.

Accessing the GICC_PMR

If the GIC implementation supports two Security states:

- Non-secure accesses to this register can only read or write values corresponding to the lower half of the priority range.
- If a Secure write has programmed the register with a value that corresponds to a value in the upper half of the priority range then:
    - Any Non-secure read of the register returns `0x00`, regardless of the value held in the register.
    - Non-secure writes are ignored.

See 'Priority control of Secure and Non-secure interrupts' in the GICv3 Architecture Specification for more information.

GICC_PMR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	`0x0004`	GICC_PMR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICD_ICACTIVER<n>E, Interrupt Clear-Active Registers (extended SPI range), n = 0 - 31

The GICD_ICACTIVER<n>E characteristics are:

Purpose

Removes the active state from the corresponding SPI in the extended SPI range.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_ICACTIVER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

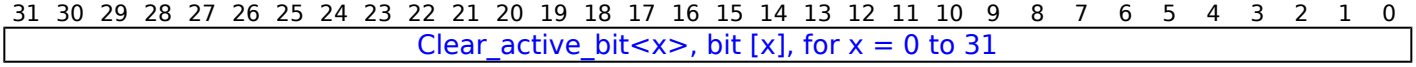
When GICD_TYPER.ESPI==1, the number of implemented GICD_ICACTIVER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ICACTIVER<n>E is a 32-bit register.

Field descriptions

The GICD_ICACTIVER<n>E bit assignments are:



Clear_active_bit<x>, bit [x], for x = 0 to 31

For the extended SPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICACTIVER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ICACTIVER<n>E is (0x1C00 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing the GICD_ICACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	0x1C00 + 4n	GICD_ICACTIVER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99e984cbfe3431cc1e9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICD_ICENABLER<n>, Interrupt Clear-Enable Registers, n = 0 - 31

The GICD_ICENABLER<n> characteristics are:

Purpose

Disables forwarding of the corresponding interrupt to the CPU interfaces.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ICENABLER<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ICENABLER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICENABLER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ICENABLER<n> is a 32-bit register.

Field descriptions

The GICD_ICENABLER<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Clear_enable_bit<x>, bit [x], for x = 0 to 31																															

Clear_enable_bit<x>, bit [x], for x = 0 to 31

For SPIs and PPIs, controls the forwarding of interrupt number 32n + x to the CPU interfaces. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICENABLER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ICENABLER is (`0x180` + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Note

Writing a 1 to a GICD_ICENABLER<n> bit only disables the forwarding of the corresponding interrupt from the Distributor to any CPU interface. It does not prevent the interrupt from changing state, for example becoming pending or active and pending if it is already active.

Accessing the GICD_ICENABLER<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICENABLER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When GICD_CTLR.DS==0, bits corresponding to Group 0 and Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to GICD_ISENABLER<n> and GICD_ICENABLER<n> where n=0.

Completion of a write to this register does not guarantee that the effects of the write are visible throughout the affinity hierarchy. To ensure an enable has been cleared, software must write to the register with bits set to 1 to clear the required enables. Software must then poll GICD_CTLR.RWP until it has the value zero.

GICD_ICENABLER<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	`0x0180` + 4n	GICD_ICENABLER<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICD_ICENABLER<n>E, Interrupt Clear-Enable Registers, n = 0 - 31

The GICD_ICENABLER<n>E characteristics are:

Purpose

Disables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

Configuration

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICD_ICENABLER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

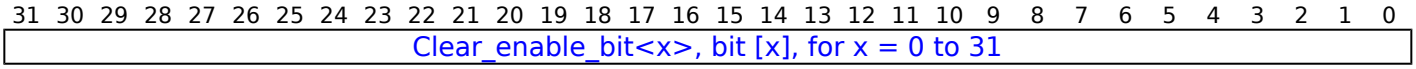
When GICD_TYPER.ESPI==1, the number of implemented GICD_ICENABLER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ICENABLER<n>E is a 32-bit register.

Field descriptions

The GICD_ICENABLER<n>E bit assignments are:



Clear_enable_bit<x>, bit [x], for x = 0 to 31

For the extended SPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICENABLER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ICENABLER<n>E is (0x1400 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing the GICD_ICENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICENABLER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	`0x1400 + 4n`	GICD_ICENABLER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

GICD_ICFGR<n>, Interrupt Configuration Registers, n = 0 - 63

The GICD_ICFGR<n> characteristics are:

Purpose

Determines whether the corresponding interrupt is edge-triggered or level-sensitive.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

These registers are available in all GIC configurations. If the GIC implementation supports two Security states, these registers are Common.

GICD_ICFGR1 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICFGR1 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICFGR<n>

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

For SGIs, Int_config fields are RO, meaning that GICD_ICFGR0 is RO.

Changing Int_config when the interrupt is individually enabled is UNPREDICTABLE.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

Fields corresponding to unimplemented interrupts are RAZ/WI.

Attributes

GICD_ICFGR<n> is a 32-bit register.

Field descriptions

The GICD_ICFGR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Int_config<x>, bits [2x+1:2x], for x = 0 to 15																															

Int_config<x>, bits [2x+1:2x], for x = 0 to 15

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int_config[0] (bit [2x]) is RES0.

Possible values of Int_config[1] (bit [2x+1]) are:

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b01	Corresponding interrupt is edge-triggered.

For SGIs, Int_config[1] is RAO/WI.

For SPIs and PPIs, Int_config[1] is programmable unless the implementation supports two Security states and the bit corresponds to a Group 0 or Secure Group 1 interrupt, in which case the bit is RAZ/WI to Non-secure accesses.

This field resets to an architecturally UNKNOWN value.

Accessing the GICD_ICFGR<n>

GICD_ICFGR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	0x0C00 + 4n	GICD_ICFGR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICD_ICFGR<n>E, Interrupt Configuration Registers (Extended SPI Range), n = 0 - 63

The GICD_ICFGR<n>E characteristics are:

Purpose

Determines whether the corresponding SPI in the extended SPI range is edge-triggered or level-sensitive.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICD_ICFGR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

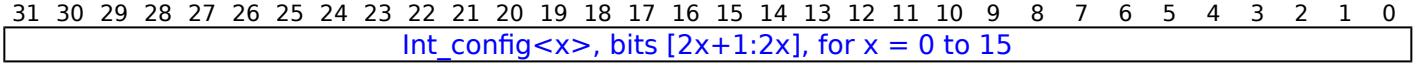
When GICD_TYPER.ESPI==1, the number of implemented GICD_ICFGR<n>E registers is ((GICD_TYPER.ESPI_range+1)*2). Registers are numbered from 0.

Attributes

GICD_ICFGR<n>E is a 32-bit register.

Field descriptions

The GICD_ICFGR<n>E bit assignments are:



Int_config<x>, bits [2x+1:2x], for x = 0 to 15

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int_config[0] (bit[2x]) is RES0.

Possible values of Int_config[1] (bit[2x+1]) are:

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b01	Corresponding interrupt is edge-triggered.

This field resets to an architecturally UNKNOWN value.

Accessing the GICD_ICFGR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICFGR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICFGR<n>E can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	0x3000 + 4n	GICD_ICFGR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICD_ICPENDR<n>E, Interrupt Clear-Pending Registers (extended SPI range), n = 0 - 31

The GICD_ICPENDR<n>E characteristics are:

Purpose

Removes the pending state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICD_ICPENDR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICPENDR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ICPENDR<n>E is a 32-bit register.

Field descriptions

The GICD_ICPENDR<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Clear_pending_bit<x>, bit [x], for x = 0 to 31																															

Clear_pending_bit<x>, bit [x], for x = 0 to 31

For the extended PPIs, removes the pending state to interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: • If the interrupt is not pending and is not active and pending. • If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICPENDR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ICPENDR<n>E is (`0x1800` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing the GICD_ICPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICPENDR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	`0x1800 + 4n`	GICD_ICPENDR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICD_IGROUPR<n>, Interrupt Group Registers, n = 0 - 31

The GICD_IGROUPR<n> characteristics are:

Purpose

Controls whether the corresponding interrupt is in Group 0 or Group 1.

Configuration

~~GICD_IGROUPR0 resets to an IMPLEMENTATION DEFINED value, that might be UNKNOWN.~~

~~GICD_IGROUPR<n> where n is greater than 0 resets to 0x00000000.~~

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Secure.

The number of implemented GICD_IGROUPR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_IGROUPR0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_IGROUPR0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_IGROUPR<n> is a 32-bit register.

Field descriptions

The GICD_IGROUPR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Group_status_bit<x>, bit [x], for x = 0 to 31																															

Group_status_bit<x>, bit [x], for x = 0 to 31

Group status bit.

Group_status_bit<x>	Meaning
0b0	When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.
0b1	When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGRPMODR<n> to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICD_IGRPMODR<n>.

If affinity routing is disabled for the Security state of an interrupt, then:

- The corresponding GICD_IGRPMODR<n> bit is RES0.
- For Secure interrupts, the interrupt is Secure Group 0.
- For Non-secure interrupts, the interrupt is Non-secure Group 1.

This field resets to:

- If n == 0, an UNKNOWN value.
- If n > 0, 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGROUP<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_IGROUP is (0x080 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Accessing the GICD_IGROUPR<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_IGROUPR0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Accesses to GICD_IGROUPR0 when affinity routing is not enabled for a Security state access the same state as GICR_IGROUPR0, and must update Redistributor state associated with the PE performing the accesses. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IGROUPR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	0x0080 + 4n	GICD_IGROUPR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICD_IGROUPR<n>E, Interrupt Group Registers (extended SPI range), n = 0 - 31

The GICD_IGROUPR<n>E characteristics are:

Purpose

Controls whether the corresponding SPI in the extended SPI range is in Group 0 or Group 1.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_IGROUPR<n>E are RES0.

GICD_IGROUPR<n>E resets to `0x00000000`.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1:

- The number of implemented GICD_IGROUPR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.
- When GICD_CTLRGICD_CLTR.DS==0, this register is Secure.

Attributes

GICD_IGROUPR<n>E is a 32-bit register.

Field descriptions

The GICD_IGROUPR<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Group_status_bit<x>, bit [x], for x = 0 to 31																															

Group_status_bit<x>, bit [x], for x = 0 to 31

Group status bit.

Group_status_bit<x>	Meaning
0b0	When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.
0b1	When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGRPMODR<n>E to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICD_IGRPMODR<n>E.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0:

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGROUPR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_IGROUPR<n>E is (`0x1000` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing the GICD_IGROUPR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGROUPR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IGROUPR<n>E can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	`0x1000` + 4n	GICD_IGROUPR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICD_IGRPMODR<n>, Interrupt Group Modifier Registers, n = 0 - 31

The GICD_IGRPMODR<n> characteristics are:

Purpose

When GICD_CTLR.DS==0, this register together with the GICD_IGROUPR<n> registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- Secure Group 1.

Configuration

When ~~GICD_CLTR.DS==0, these registers are Secure.~~ GICD_CTLR.DS==0, these registers are Secure.

The number of implemented GICD_IGROUPR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

When GICD_CTLR.ARE_S==0 or GICD_CTLR.DS==1, the GICD_IGRPMODR<n> registers are RES0. An implementation can make these registers RAZ/WI in this case.

Attributes

GICD_IGRPMODR<n> is a 32-bit register.

Field descriptions

The GICD_IGRPMODR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Group_modifier_bit<x>, bit [x], for x = 0 to 31																															

Group_modifier_bit<x>, bit [x], for x = 0 to 31

Group modifier bit. When affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGROUPR<n> to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGRPMODR<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_IGRPMODR is (0x080 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

See GICD_IGROUPR<n> for information about the GICD_IGRPMODR0 reset value.

Accessing the GICD_IGRPMODR<n>

When affinity routing is enabled for Secure state, GICD_IGRPMODR0 is RES0 and equivalent functionality is proved by GICR_IGRPMODR0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IGRPMODR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	`0x0D00 + 4n`	GICD_IGRPMODR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.

GICD_IGRPMODR<n>E, Interrupt Group Modifier Registers (extended SPI range), n = 0 - 31

The GICD_IGRPMODR<n>E characteristics are:

Purpose

When GICD_CTLR.DS==0, this register together with the GICD_IGROUPR<n>E registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_IGRPMODR<n>E are RES0.

GICD_IGRPMODR<n>E resets to `0x00000000`.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1:

- The number of implemented GICD_IGRPMODR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.
- When GICD_CTLR~~GICD_CLTR~~.DS==0, this register is Secure.

Attributes

GICD_IGRPMODR<n>E is a 32-bit register.

Field descriptions

The GICD_IGRPMODR<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Group_modifier_bit<x>, bit [x], for x = 0 to 31																															

Group_modifier_bit<x>, bit [x], for x = 0 to 31

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGROUPR<n>E to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGRPMODR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_IGRPMODR<n>E is (`0x3400` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing the GICD_IGRPMODR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGRPMODR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IGRPMODR<n>E can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	`0x3400` + 4n	GICD_IGRPMODR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99e984cbfe3431cc1c9707

GICD_IPRIORITYR<n>E, Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC., n = 0 - 255

The GICD_IPRIORITYR<n>E characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICD_IPRIORITYR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_IPRIORITYR<n>E registers is ((GICD_TYPER.ESPI_range+1)*8). Registers are numbered from 0.

Attributes

GICD_IPRIORITYR<n>E is a 32-bit register.

Field descriptions

The GICD_IPRIORITYR<n>E bit assignments are:

31 30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0
Priority_offset_3B	Priority_offset_2B	Priority_offset_1B	Priority_offset_0B

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IPRIORITYR<n> number, n, is given by n = (m-4096) DIV 4.
- The offset of the required GICD_IPRIORITYR<n>E register is (`0x2000` + (4*n)).
- The byte offset of the required Priority field in this register is m MOD 4, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Accessing the GICD_IPRIORITYR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

GICD_IPRIORITYR<n>E can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	`0x2000` + 4n	GICD_IPRIORITYR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICD_IROUTER<n>, Interrupt Routing Registers, n = 32 - 1019

The GICD_IROUTER<n> characteristics are:

Purpose

When affinity routing is enabled, provides routing information for the SPI with INTID n.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

These registers are available in all configurations of the GIC. If the GIC implementation supports two Security states, these registers are Common.

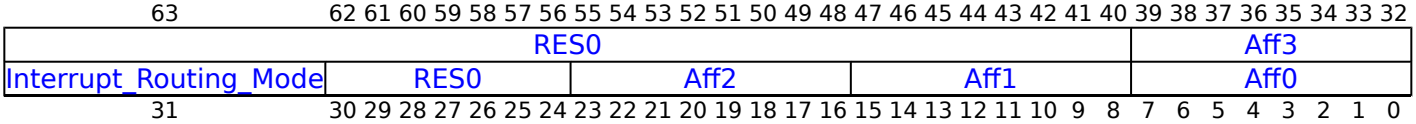
The maximum value of n is given by (32*(GICD_TYPER.ITLinesNumber+1) - 1). GICD_IROUTER<n> registers where n=0 to 31 are reserved.

Attributes

GICD_IROUTER<n> is a 64-bit register.

Field descriptions

The GICD_IROUTER<n> bit assignments are:



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3, the least significant affinity level field.

This field resets to an architecturally UNKNOWN value.

Interrupt_Routing_Mode, bit [31]

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

Interrupt_Routing_Mode	Meaning
0b0	Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.
0b1	Interrupts routed to any PE defined as a participating node.

If GICD_IROUTER<n>.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending it will not be forwarded to any PE and will remain pending.

In implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI.

When this bit is set to 1, GICD_IROUTER<n>.{Aff3, Aff2, Aff1, Aff0} are UNKNOWN.

Note

An implementation might choose to make the Aff<n> fields RO when this field is 1.

This field resets to an architecturally UNKNOWN value.

Bits [30:24]

Reserved, RES0.

Aff2, bits [23:16]

Affinity level 2, an intermediate affinity level field.

This field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1, an intermediate affinity level field.

This field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0, the most significant affinity level field.

This field resets to an architecturally UNKNOWN value.

For an SPI with INTID m:

- The corresponding GICD_IROUTER<n> register number, n, is given by n = m.
- The offset of the GICD_IROUTER<n> register is `0x6000` + 8n.

Accessing the GICD_IROUTER<n>

These registers are used only when affinity routing is enabled. When affinity routing is not enabled:

- These registers are RES0. An implementation is permitted to make the register RAZ/WI in this case.
- The GICD_ITARGETSR<n> registers provide interrupt routing information.

Note

When affinity routing becomes enabled for a Security state (for example, following a reset or following a write to GICD_CTLR) the value of all writeable fields in this register is UNKNOWN for that Security state. When the group of an interrupt changes so the ARE setting for the interrupt changes to 1, the value of this register is UNKNOWN for that interrupt.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any GICD_IROUTER<n> registers that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

Note

For each interrupt, a GIC implementation might support fewer than 256 values for an affinity level. In this case, some bits of the corresponding affinity level field might be RO. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IROUTER<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	0x6000 + 8n	GICD_IROUTER<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICD_IROUTER<n>E, Interrupt Routing Registers (Extended SPI Range), n = 0 - 1023

The GICD_IROUTER<n>E characteristics are:

Purpose

When affinity routing is enabled, provides routing information for the corresponding SPI in the extended SPI range.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_IROUTER<n>E are RES0.

RW fields in this register reset to architecturally UNKNOWN values.

When GICD_TYPER.ESPI==0, these registers are RES0.

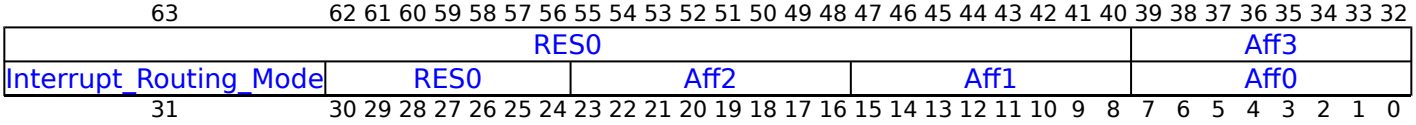
When GICD_TYPER.ESPI==1, the number of implemented GICD_IROUTER<n>E registers is (((GICD_TYPER.ESPI_range+1)*32)-1). Registers are numbered from 0.

Attributes

GICD_IROUTER<n>E is a 32-bit register.

Field descriptions

The GICD_IROUTER<n>E bit assignments are:



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3, the least significant affinity level field.

Interrupt_Routing_Mode, bit [31]

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

Interrupt_Routing_Mode	Meaning
0b0	Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.
0b1	Interrupts routed to any PE defined as a participating node.

If GICD_IROUTER<n>E.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending it will not be forwarded to any PE and will remain pending.

In implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI.

When this bit is set to 1, GICD_IROUTER<n>E.{Aff3, Aff2, Aff1, Aff0} are UNKNOWN.

Note

An implementation might choose to make the Aff<n> fields RO when this field is 1.

Bits [30:24]

Reserved, RES0.

Aff2, bits [23:16]

Affinity level 2, an intermediate affinity level field.

Aff1, bits [15:8]

Affinity level 1, an intermediate affinity level field.

Aff0, bits [7:0]

Affinity level 0, the most significant affinity level field.

For an SPI with INTID m:

- The corresponding GICD_IROUTER<n>E register number, n, is given by n = m.
- The offset of the GICD_IROUTER<n>E register is `0x6000` + 8n.

Accessing the GICD_IROUTER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IROUTER<n>E, the register is RES0.

When GICD_CTLR.DS==0, a register that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IROUTER<n>E can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	`0x8000` + 8n	GICD_IROUTER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICD_ISACTIVER<n>E, Interrupt Set-Active Registers (extended SPI range), n = 0 - 31

The GICD_ISACTIVER<n>E characteristics are:

Purpose

Adds the active state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_ISACTIVER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISACTIVER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ISACTIVER<n>E is a 32-bit register.

Field descriptions

The GICD_ISACTIVER<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Set_active_bit<x>, bit [x], for x = 0 to 31																															

Set_active_bit<x>, bit [x], for x = 0 to 31

For the extended SPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISACTIVER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ISACTIVER<n>E is (0x1A00 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing the GICD_ISACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	0x1A00 + 4n	GICD_ISACTIVER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99e984cbfe3431cc1e9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICD_ISENABLER<n>, Interrupt Set-Enable Registers, n = 0 - 31

The GICD_ISENABLER<n> characteristics are:

Purpose

Enables forwarding of the corresponding interrupt to the CPU interfaces.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ISENABLER<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ISENABLER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ISENABLER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ISENABLER<n> is a 32-bit register.

Field descriptions

The GICD_ISENABLER<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Set_enable_bit<x>, bit [x], for x = 0 to 31																															

Set_enable_bit<x>, bit [x], for x = 0 to 31

For SPIs and PPIs, controls the forwarding of interrupt number 32n + x to the CPU interfaces. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISENABLER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ISENABLER is (`0x100` + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

At start-up, and after a reset, a PE can use this register to discover which peripheral INTIDs the GIC supports. If GICD_CTLR.DS==0 in a system that supports EL3, the PE must do this for the Secure view of the available interrupts, and Non-secure software running on the PE must do this discovery after the Secure software has configured interrupts as Group 0/Secure Group 1 and Non-secure Group 1.

Accessing the GICD_ISENABLER<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ISENABLER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When GICD_CTLR.DS==0, bits corresponding to Group 0 or Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to GICD_ISENABLER<n> and GICD_ICENABLER<n> where n=0.

For SPIs and PPIs, each bit controls the forwarding of the corresponding interrupt from the Distributor to the CPU interfaces.

GICD_ISENABLER<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	`0x0100 + 4n`	GICD_ISENABLER<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICD_ISENABLER<n>E, Interrupt Set-Enable Registers, n = 0 - 31

The GICD_ISENABLER<n>E characteristics are:

Purpose

Enables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

Configuration

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICD_ISENABLER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISENABLER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ISENABLER<n>E is a 32-bit register.

Field descriptions

The GICD_ISENABLER<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Set_enable_bit<x>, bit [x], for x = 0 to 31																															

Set_enable_bit<x>, bit [x], for x = 0 to 31

For the extended SPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISENABLER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ISENABLER<n>E is (0x1200 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing the GICD_ISENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISENABLER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	0x1200 + 4n	GICD_ISENABLER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99e984cbfe3431cc1e9707

(old) htmldiff from- (new)

GICD_ISPENDR<n>E, Interrupt Set-Pending Registers (extended SPI range), n = 0 - 31

The GICD_ISPENDR<n>E characteristics are:

Purpose

Adds the pending state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICD_ISPENDR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISPENDR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ISPENDR<n>E is a 32-bit register.

Field descriptions

The GICD_ISPENDR<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Set_pending_bit<x>, bit [x], for x = 0 to 31																															

Set_pending_bit<x>, bit [x], for x = 0 to 31

For the extended SPIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: • If the interrupt is already pending because of a write to GICD_ISPENDR<n>E. • If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISPENDR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ISPENDR<n>E is (`0x1600` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing the GICD_ISPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISPENDR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	`0x1600 + 4n`	GICD_ISPENDR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICD_ITARGETSR<n>, Interrupt Processor Targets Registers, n = 0 - 254

The GICD_ITARGETSR<n> characteristics are:

Purpose

When affinity routing is not enabled, holds the list of target PEs for the interrupt. That is, it holds the list of CPU interfaces to which the Distributor forwards the interrupt if it is asserted and has sufficient priority.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

These registers are available in all configurations of the GIC. When GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ITARGETSR<n> registers is 8*(GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ITARGETSR0 to GICD_ITARGETSR7 are Banked for each connected PEwith GICR_TYPER.Processor_Number < 8.

Accessing GICD_ITARGETSR0 to GICD_ITARGETSR7 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

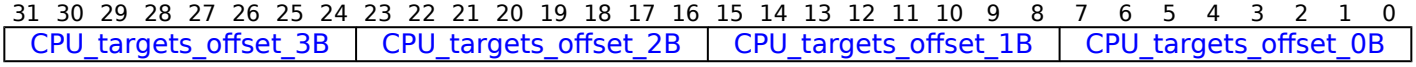
- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ITARGETSR<n> is a 32-bit register.

Field descriptions

The GICD_ITARGETSR<n> bit assignments are:



PEs in the system number from 0, and each bit in a PE targets field refers to the corresponding PE. For example, a value of 0x3 means that the Pending interrupt is sent to PEs 0 and 1. For GICD_ITARGETSR0-GICD_ITARGETSR7, a read of any targets field returns the number of the PE performing the read.

CPU_targets_offset_3B, bits [31:24]

PE targets for an interrupt, at byte offset 3.

This field resets to an architecturally UNKNOWN value.

CPU_targets_offset_2B, bits [23:16]

PE targets for an interrupt, at byte offset 2.

This field resets to an architecturally UNKNOWN value.

CPU_targets_offset_1B, bits [15:8]

PE targets for an interrupt, at byte offset 1.

This field resets to an architecturally UNKNOWN value.

CPU_targets_offset_0B, bits [7:0]

PE targets for an interrupt, at byte offset 0.

This field resets to an architecturally UNKNOWN value.

The bits that are set to 1 in the PE targets field determine which PEs are targeted:

Value of PE targets field	Interrupt targets
0bxxxxxxx1	CPU interface 0
0bxxxxxx1x	CPU interface 1
0bxxxxx1xx	CPU interface 2
0bxxxx1xxx	CPU interface 3
0bxxx1xxxx	CPU interface 4
0bxx1xxxxx	CPU interface 5
0bx1xxxxxx	CPU interface 6
0b1xxxxxxx	CPU interface 7

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ITARGETSR<n> number, n, is given by n = m DIV 4.
- The offset of the required GICD_ITARGETSR<n> register is (0x800 + (4*n)).
- The byte offset of the required Priority field in this register is m MOD 4, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Software can write to these registers at any time. Any change to a targets field value:

- Has no effect on any active interrupt. This means that removing a CPU interface from a targets list does not cancel an active state for interrupts on that CPU interface. There is no effect on interrupts that are active and pending until the active status is cleared, at which time it is treated as a pending interrupt.
- Has an effect on any pending interrupts. This means:
  - Enables the CPU interface to be chosen as a target for the pending interrupt using an IMPLEMENTATION DEFINED mechanism.
  - Removing a CPU interface from the target list of a pending interrupt removes the pending state of the interrupt on that CPU interface.

Accessing the GICD_ITARGETSR<n>

These registers are used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt, the target PEs for an interrupt are defined by GICD_IROUTER<n> and the associated byte in GICD_ITARGETSR<n> is RES0. An implementation is permitted to make the byte RAZ/WI in this case.

- These registers are byte-accessible.
- A register field corresponding to an unimplemented interrupt is RAZ/WI.
- A field bit corresponding to an unimplemented CPU interface is RAZ/WI.
- GICD_ITARGETSR0-GICD_ITARGETSR7 are read-only. Each field returns a value that corresponds only to the PE reading the register.
- It is IMPLEMENTATION DEFINED which, if any, SPIs are statically configured in hardware. The field for such an SPI is read-only, and returns a value that indicates the PE targets for the interrupt.
- If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

In a single connected PE implementation, all interrupts target one PE, and these registers are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_ITARGETSR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	0x0800 + 4n	GICD_ITARGETSR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICD_NSACR<n>E, Non-secure Access Control Registers, n = 0 - 63

The GICD_NSACR<n>E characteristics are:

Purpose

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

Configuration

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICD_NSACR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICFGR<n>E registers is ((GICD_TYPER.ESPI_range+1)*2). Registers are numbered from 0.

Attributes

GICD_NSACR<n>E is a 32-bit register.

Field descriptions

The GICD_NSACR<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NS_access<x>, bits [2x+1:2x], for x = 0 to 15																															

NS_access<x>, bits [2x+1:2x], for x = 0 to 15

Controls Non-secure access of the interrupt with ID 16n + x.

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:

NS_access<x>	Meaning
0b00	No Non-secure access is permitted to fields associated with the corresponding interrupt.
0b01	Non-secure read and write access is permitted to set-pending bits in GICD_ISPENDR<n>E associated with the corresponding interrupt. A Non-secure write access to GICD_SETSPI_NSR is permitted to set the pending state of the corresponding interrupt.
0b10	As 0b01, but adds Non-secure read and write access permission to fields associated with the corresponding interrupt in the GICD_ICPENDR<n>E registers. A Non-secure write access to GICD_CLRSPI_NSR is permitted to clear the pending state of the corresponding interrupt. Also adds Non-secure read access permission to fields associated with the corresponding interrupt in the GICD_ISACTIVER<n>E and GICD_ICACTIVER<n>E registers.
0b11	This encoding is treated as 0b10, but adds Non-secure read and write access permission to GICD_IROUTER<n>E fields associated with the corresponding interrupt.

This field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_NSACR<n>E number, n, is given by n = (m - 4096) DIV 16.
- The offset of the required GICD_NSACR<n>E register is (0x3600 + (4*n)).

Accessing the GICD_NSACR<n>E

GICD_NSACR<n>E can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	0x3600 + 4n	GICD_NSACR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RAZ/WI**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RAZ/WI**.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICD_TYPER, Interrupt Controller Type Register

The GICD_TYPER characteristics are:

Purpose

Provides information about what features the GIC implementation supports. It indicates:

- Whether the GIC implementation supports two Security states.
- The maximum number of INTIDs that the GIC implementation supports.
- The number of PEs that can be used as interrupt targets.

Configuration

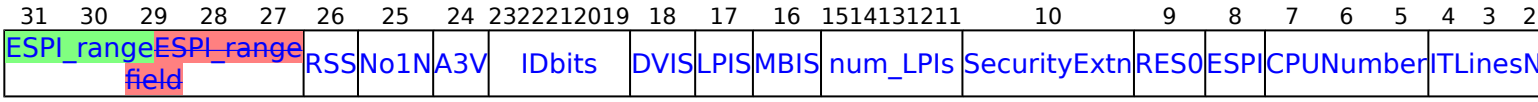
This register is available in all configurations of the GIC. When GICD_CTLR.DS==0, this register is Common.

Attributes

GICD_TYPER is a 32-bit register.

Field descriptions

The GICD_TYPER bit assignments are:



ESPI_range ~~field~~, bits [31:27]

When GICD_TYPER.ESPI == 1:

Indicates the maximum INTID in the Extended SPI range.

- Maximum Extended SPI INTID is (32*(ESPI_range + 1) + 4095)

Otherwise:

Reserved, RES0.

RSS, bit [26]

Range Selector Support. ~~Possible values are:~~

RSS	Meaning
0b0	The IRI supports targeted SGIs with affinity level 0 values of 0 - 15.
0b1	The IRI supports targeted SGIs with affinity level 0 values of 0 - 255.

No1N, bit [25]

Indicates whether 1 of N SPI interrupts are supported.

No1N	Meaning
0b0	1 of N SPI interrupts are supported.
0b1	1 of N SPI interrupts are not supported.

A3V, bit [24]

Affinity 3 valid. Indicates whether the Distributor supports nonzero values of Affinity level 3. ~~Possible values are:~~

A3V	Meaning
0b0	The Distributor only supports zero values of Affinity level 3.
0b1	The Distributor supports nonzero values of Affinity level 3.

IDbits, bits [23:19]

The number of interrupt identifier bits supported, minus one.

DVIS, bit [18]

Indicates whether the implementation supports Direct Virtual LPI injection.

DVIS	Meaning
0b0	The implementation does not support Direct Virtual LPI injection.
0b1	The implementation supports Direct Virtual LPI injection.

For GICv3, this field is RES0.

LPIS, bit [17]

Indicates whether the implementation supports LPIs.

LPIS	Meaning
0b0	The implementation does not support LPIs.
0b1	The implementation supports LPIs.

MBIS, bit [16]

Indicates whether the implementation supports message-based interrupts by writing to Distributor registers.

MBIS	Meaning
0b0	The implementation does not support message-based interrupts by writing to Distributor registers. The GICD_CLRSPI_NSR, GICD_SETSPI_NSR, GICD_CLRSPI_SR, and GICD_SETSPI_SR registers are reserved.
0b1	The implementation supports message-based interrupts by writing to the GICD_CLRSPI_NSR, GICD_SETSPI_NSR, GICD_CLRSPI_SR, or GICD_SETSPI_SR registers.

num_LPIs, bits [15:11]

Number of supported LPIs.

- 0b00000 Number of LPIs as indicated by GICD_TYPER.IDbits.
- All other values Number of LPIs supported is 2^(num_LPIs+1) .
    - Available LPI INTIDs are 8192..(8192 + 2^(num_LPIs+1) - 1).
    - This field cannot indicate a maximum LPI INTID greater than that indicated by GICD_TYPER.IDbits.

When the supported INTID width is less than 14 bits, this field is RES0 and no LPIs are supported.

SecurityExtn, bit [10]

Indicates whether the GIC implementation supports two Security states:

When GICD_CTLR.DS == 1, this field is RAZ.

SecurityExtn	Meaning
0b0	The GIC implementation supports only a single Security state.
0b1	The GIC implementation supports two Security states.

Bit [9]

Reserved, RES0.

ESPI, bit [8]

Extended SPI

ESPI	Meaning
0b0	Extended SPI range not implemented.
0b1	Extended SPI range implemented.

CPUNumber, bits [7:5]

Reports the number of PEs that can be used when affinity routing is not enabled, minus 1.

These PEs must be numbered contiguously from zero, but the relationship between this number and the affinity hierarchy from MPIDR is IMPLEMENTATION DEFINED. If the implementation does not support ARE being zero, this field is 000.

ITLinesNumber, bits [4:0]

Indicates the maximum SPI INTID that the GIC implementation supports. If the value of this field is N, the maximum SPI INTID is 32(N+1)-1. For example, 00011 specifies that the maximum SPI INTID is 127.

The maximum SPI INTID an implementation might support is 1019 (field value 11111). Regardless of the range of INTIDs defined by this field, interrupt IDs 1020-1023 are reserved for special purposes.

A value of 0 indicates no SPIs are support.

Note

The value derived from this field specifies the maximum number of SPIs that the GIC implementation might support. An implementation might not implement all SPIs up to this maximum.

The ITLinesNumber field only indicates the maximum number of SPIs that the GIC implementation might support. This value determines the number of instances of the following interrupt registers:

- GICD_IGROUPR<n>.
- GICD_ISENABLER<n>.
- GICD_ICENABLER<n>.
- GICD_ISPENDR<n>.
- GICD_ICPENDR<n>.
- GICD_ISACTIVER<n>.
- GICD_ICACTIVER<n>.
- GICD_IPRIORITYR<n>.
- GICD_ITARGETSR<n>.
- GICD_ICFGR<n>.

The GIC architecture does not require a GIC implementation to support a continuous range of SPI interrupt IDs. Software must check which SPI INTIDs are supported, up to the maximum value indicated by GICD_TYPER.ITLinesNumber.

Accessing the GICD_TYPER

GICD_TYPER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	0x0004	GICD_TYPER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99c984cbfe3431cc1c9707

GICD_TYPER2, Interrupt Controller Type Register 2

The GICD_TYPER2 characteristics are:

Purpose

Provides information about which features the GIC implementation supports.

Configuration

This register is present only when GICv4.1 is implemented. Otherwise, direct accesses to GICD_TYPER2 are RES0.

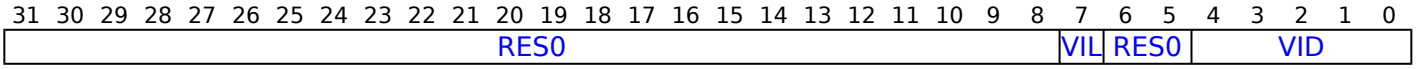
When GICD_CTLR.DS == 0, this register is Common.

Attributes

GICD_TYPER2 is a 32-bit register.

Field descriptions

The GICD_TYPER2 bit assignments are:



Bits [31:8]

Reserved, RES0.

VIL, bit [7]

Indicates whether 16 bits of vPEID are implemented.

VIL	Meaning
0b0	GIC supports 16-bit vPEID.
0b1	GIC supports GICD_TYPER2.VID + 1 bits of vPEID.

Bits [6:5]

Reserved, RES0.

VID, bits [4:0]

When GICD_TYPER2.VIL == 1, the number of bits is equal to the bits of vPEID minus one.

When GICD_TYPER2.VIL == 0, this field is RES0.

Accessing the GICD_TYPER2

GICD_TYPER2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance

GIC Distributor	0x000C	GICD_TYPER2

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.

13/12/2019 15:13; 391b5248b29fb2f001ef74792eaacbd6fc72f211

GICH_EISR, End Interrupt Status Register

The GICH_EISR characteristics are:

Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

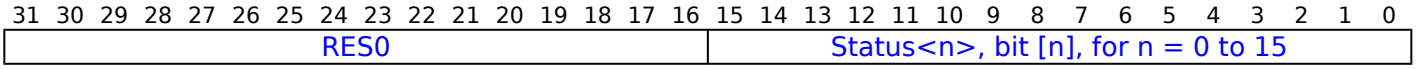
This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_EISR is a 32-bit register.

Field descriptions

The GICH_EISR bit assignments are:



Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 0 to 15

EOI maintenance interrupt status for List register <n>:

Status<n>	Meaning
0b0	GICH_LR<n> does not have an EOI maintenance interrupt.
0b1	GICH_LR<n> has an EOI maintenance interrupt that has not been handled.

For any GICH_LR<n> register, the corresponding status bit is set to 1 if all of the following are true:

- GICH_LR<n>.State is 0b00.
- GICH_LR<n>.HW == 0.
- GICH_LR<n>.EOI == 1.

This field resets to an architecturally UNKNOWN value.

Accessing the GICH_EISR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_EISR provides equivalent functionality.
- For AArch64 implementations, ICH_EISR_EL2 provides equivalent functionality.

Bits corresponding to unimplemented List registers are RAZ.

GICH_EISR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0020	GICH_EISR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICH_HCR, Hypervisor Control Register

The GICH_HCR characteristics are:

Purpose

Controls the virtual CPU interface.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_HCR is a 32-bit register.

Field descriptions

The GICH_HCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EOICount					RES0																			VGrp1DIE	VGrp1EIE	VGrp0DIE	VGrp0EIE	NPIE	LRENPIE	UIE	En

EOICount, bits [31:27]

Counts the number of EOIs received that do not have a corresponding entry in the List registers. The virtual CPU interface increments this field automatically when a matching EOI is received. EOIs that do not clear a bit in GICH_APR<n> do not cause an increment. If an EOI occurs when the value of this field is 31, then the field wraps to 0.

The maintenance interrupt is asserted whenever this field is nonzero and GICH_HCR.LRENPIE == 1.

This field resets to an architecturally UNKNOWN value.

Bits [26:8]

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is disabled:

VGrp1DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp1 == 0.

This field resets to an architecturally UNKNOWN value.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is enabled:

VGrp1EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp1 == 1.

This field resets to an architecturally UNKNOWN value.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is disabled:

VGrp0DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp0 == 0.

This field resets to an architecturally UNKNOWN value.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is enabled:

VGrp0EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp0 == 1.

This field resets to an architecturally UNKNOWN value.

NPIE, bit [3]

No Pending Interrupt Enable.

Enables the signaling of a maintenance interrupt while no pending interrupts are present in the List registers:

NPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

This field resets to an architecturally UNKNOWN value.

LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable.

Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register for an EOI request:

LRENPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while GICH_HCR.EOICount is not 0.

This field resets to an architecturally UNKNOWN value.

UIE, bit [1]

Underflow Interrupt Enable.

Enables the signaling of a maintenance interrupt when the List registers are either empty or hold only one valid entry.

UIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	A maintenance interrupt is signaled if zero or one of the List register entries are marked as a valid interrupt.

This field resets to an architecturally UNKNOWN value.

En, bit [0]

Enable.

Global enable bit for the virtual CPU interface.

En	Meaning
0b0	Virtual CPU interface operation is disabled.
0b1	Virtual CPU interface operation is enabled.

When this field is 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of GICV_IAR or GICV_AIAR returns a spurious interrupt ID.

This field resets to an architecturally UNKNOWN value.

The VGrp1DIE, VGrp1EIE, VGrp0DIE, and VGrp0EIE fields permit the hypervisor to track the virtual CPU interfaces that are enabled. The hypervisor can then route interrupts that have multiple targets correctly and efficiently, without having to read the virtual CPU interface status.

See Maintenance interrupts and GICH_MISR for more information.

Accessing the GICH_HCR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_HCR provides equivalent functionality.
- For AArch64 implementations, ICH_HCR_EL2 provides equivalent functionality.

GICH_HCR.En must be set to 1 for any virtual or maintenance interrupt to be asserted.

GICH_HCR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0000	GICH_HCR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICH_LR<n>, List Registers, n = 0 - 15

The GICH_LR<n> characteristics are:

Purpose

These registers provide context information for the virtual CPU interface.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is available when the GIC implementation supports interrupt virtualization.

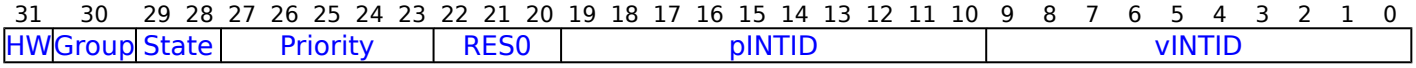
A maximum of 16 List registers can be provided. GICH_VTR.ListRegs defines the number implemented. Unimplemented List registers are RAZ/WI.

Attributes

GICH_LR<n> is a 32-bit register.

Field descriptions

The GICH_LR<n> bit assignments are:



HW, bit [31]

Indicates whether this virtual interrupt is a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt corresponding to the INTID:

HW	Meaning
0b0	This interrupt is triggered entirely in software. No notification is sent to the Distributor when the virtual interrupt is deactivated.
0b1	A hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using GICH_LR<n>.pINTID to indicate the physical interrupt identifier. If GICV_CTLR.EOImode == 0, this request corresponds to a write to GICV_EOIR or GICV_AEOIR, otherwise it corresponds to a write to GICV_DIR.

This field resets to an architecturally UNKNOWN value.

Group, bit [30]

Indicates whether the interrupt is Group 0 or Group 1:

Group	Meaning
0b0	Group 0 virtual interrupt. GICV_CTLR.FIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and GICV_CTLR.EnableGrp0 enables signaling of this interrupt to the virtual machine.
0b1	Group 1 virtual interrupt, signaled as a virtual IRQ. GICV_CTLR.EnableGrp1 enables signaling of this interrupt to the virtual machine.

Note

GICV_CTLR.CBPR controls whether GICV_BPR or GICV_ABPR determines if a pending Group 1 interrupt has sufficient priority to preempt current execution.

This field resets to an architecturally UNKNOWN value.

State, bits [29:28]

The state of the interrupt. This field has one of the following values:

State	Meaning
0b00	Inactive
0b01	Pending
0b10	Active
0b11	Active and pending

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the inactive state are ignored, except for the purpose of generating virtual maintenance interrupts.

Note

For hardware interrupts, the active and pending state is held in the Distributor rather than the virtual CPU interface. A hypervisor must only use the active and pending state for software originated interrupts, which are typically associated with virtual devices, or for SGIs.

This field resets to an architecturally UNKNOWN value.

Priority, bits [27:23]

The priority of this interrupt.

This field resets to an architecturally UNKNOWN value.

Bits [22:20]

Reserved, RES0.

pINTID, bits [19:10]

The function of this field depends on the value of GICH_LR<n>.HW.

When GICH_LR<n>.HW == 0:

- Bit [19] indicates whether the interrupt triggers an EOI maintenance interrupt. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits [18:13] are reserved, SBZ.
- If the vINTID field value corresponds to an SGI (that is, 0-15), bits [12:10] contain the number of the requesting PE. This appears in the corresponding field of GICV_IAR or GICV_AIAR. If the vINTID field value is not 0-15, this field must be cleared to 0.

When GICH_LR<n>.HW == 1:

- This field indicates the pINTID that the hypervisor forwards to the Distributor. This field is only required to implement enough bits to hold a valid value for the ID configuration. Any unused higher order bits are RAZ/WI.
- If the value of pINTID is 0-15 or 1020-1023, behavior is UNPREDICTABLE. If the value of pINTID is 16-31, this field applies to the PPI associated with this same PE as the virtual CPU interface requesting the deactivation.

This field resets to an architecturally UNKNOWN value.

vINTID, bits [9:0]

This INTID is returned to the VM when the interrupt is acknowledged through GICV_IAR. Each valid interrupt stored in the List registers must have a unique vINTID for that virtual CPU interface. If the value of vINTID is 1020-1023, behavior is UNPREDICTABLE.

This field resets to an architecturally UNKNOWN value.

Accessing the GICH_LR<n>

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_LR<n> provides equivalent functionality.
- For AArch64 implementations, ICH_LR<n>_EL2 provides equivalent functionality.

GICH_LR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0100 + 4n	GICH_LR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICH_VMCR, Virtual Machine Control Register

The GICH_VMCR characteristics are:

Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state. This register is updated when a virtual machine updates the virtual CPU interface registers.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

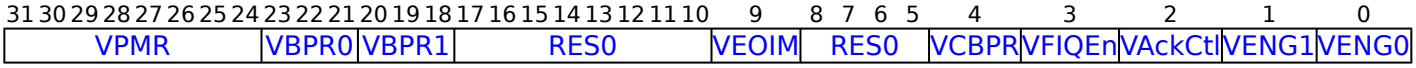
This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_VMCR is a 32-bit register.

Field descriptions

The GICH_VMCR bit assignments are:



VPMR, bits [31:24]

Virtual priority mask. The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

This alias field is updated when a VM updates GICV_PMR.Priority.

This field resets to an architecturally UNKNOWN value.

VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 1.

This alias field is updated when a VM updates GICV_BPR.Binary_Point.

This field resets to an architecturally UNKNOWN value.

VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 0.

This alias field is updated when a VM updates GICV_ABPR.Binary_Point.

This field resets to an architecturally UNKNOWN value.

Bits [17:10]

Reserved, RES0.

VEOIM, bit [9]

Virtual EOImode. Possible values of this bit are:

VEOIM	Meaning
0b0	A write of an INTID to GICV_EOIR or GICV_AEOIR drops the priority of the interrupt with that INTID, and also deactivates that interrupt.
0b1	A write of an INTID to GICV_EOIR or GICV_AEOIR only drops the priority of the interrupt with that INTID. Software must write to GICV_DIR to deactivate the interrupt.

This alias field is updated when a VM updates GICV_CTLR.EOImode.

This field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

VCBPR	Meaning
0b0	GICV_ABPR determines the preemption group for Group 1 interrupts.
0b1	GICV_BPR determines the preemption group for Group 1 interrupts.

This alias field is updated when a VM updates GICV_CTLR.CBPR.

This field resets to an architecturally UNKNOWN value.

VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

VFIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

This alias field is updated when a VM updates GICV_CTLR.FIQEn.

This field resets to an architecturally UNKNOWN value.

VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

VAckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.

This alias field is updated when a VM updates GICV_CTLR.AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

This field resets to an architecturally UNKNOWN value.

VENG1, bit [1]

Virtual interrupt enable, Group 1. Possible values of this bit are:

VENG1	Meaning
0b0	Group 1 virtual interrupts are disabled.
0b1	Group 1 virtual interrupts are enabled.

This alias field is updated when a VM updates GICV_CTLR.EnableGrp1.

This field resets to an architecturally UNKNOWN value.

VENG0, bit [0]

Virtual interrupt enable, Group 0. Possible values of this bit are:

VENG0	Meaning
0b0	Group 0 virtual interrupts are disabled.
0b1	Group 0 virtual interrupts are enabled.

This alias field is updated when a VM updates GICV_CTLR.EnableGrp0.

This field resets to an architecturally UNKNOWN value.

Note

A List register is in the pending state only if the corresponding GICH_LR<n> value is 0b01, that is, pending. The active and pending state is not included.

Accessing the GICH_VMCR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_VMCR provides equivalent functionality.
- For AArch64 implementations, ICH_VMCR_EL2 provides equivalent functionality.

GICH_VMCR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0008	GICH_VMCR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICR_CLRLPIR, Clear LPI Pending Register

The GICR_CLRLPIR characteristics are:

Purpose

Clears the pending state of the specified LPI.

Configuration

This register is present only when GICv4.1 is implemented. Otherwise, direct accesses to GICR_CLRLPIR are RES0.

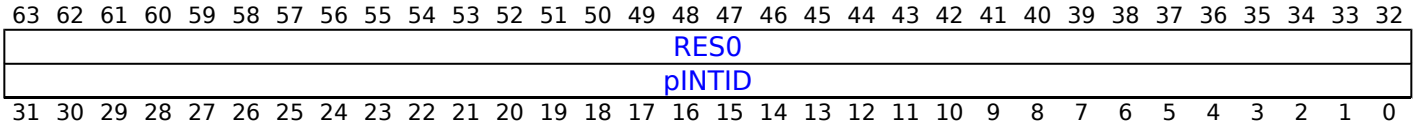
A copy of this register is provided for each Redistributor.

Attributes

GICR_CLRLPIR is a 64-bit register.

Field descriptions

The GICR_CLRLPIR bit assignments are:



Bits [63:32]

Reserved, RES0.

pINTID, bits [31:0]

The INTID of the physical LPI.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER.IDbits~~Idbits~~ field. Unimplemented bits are RES0.

Accessing the GICR_CLRLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality of this register is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if any of the following apply:

- GICR_CTLR.EnableLPIs == 0.
- The pINTID value specifies an unimplemented LPI.
- The pINTID value specifies an LPI that is not pending.

GICR_CLRLPIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0048	GICR_CLRLPIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

GICR_CTLR, Redistributor Control Register

The GICR_CTLR characteristics are:

Purpose

Controls the operation of a Redistributor, and enables the signaling of LPIs by the Redistributor to the connected PE.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_CTLR is a 32-bit register.

Field descriptions

The GICR_CTLR bit assignments are:

31	30:27	26	25	24	23:22:21:20:19:18:17:16:15:14:13:12:11:10:9	8	7	6	5	4	3	2	1	0
UWP	RES0	DPG1S	DPG1NS	DPG0	RES0						RWP	RES0	CES	EnableLPIs

UWP, bit [31]

Upstream Write Pending. Read-only. Indicates whether all upstream writes have been communicated to the Distributor.

UWP	Meaning
0b0	The effects of all upstream writes have been communicated to the Distributor, including any Generate SGI packets.
0b1	Not all the effects of upstream writes, including any Generate SGI packets, have been communicated to the Distributor.

Bits [30:27]

Reserved, RES0.

DPG1S, bit [26]

Disable Processor selection for Group 1 Secure interrupts. When GICR_TYPER.DPGS == 1:

DPG1S	Meaning
0b0	A Group 1 Secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Secure Group 1 interrupts are enabled.
0b1	A Group 1 Secure SPI configured to use the 1 of N distribution model cannot select this PE.

When GICR_TYPER.DPGS == 0 this bit is RAZ/WI.

When GICD_CTLR.DS==1, this field is RAZ/WI. In GIC implementations that support two Security states, this field is only accessible by Secure accesses, and is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether these~~this~~ bits affect the selection of PEs for interrupts using the 1 of N distribution model when GICD_CTLR.ARE_S==0.

This field resets to 0.

DPG1NS, bit [25]

Disable Processor selection for Group 1 Non-secure interrupts. When GICR_TYPER.DPGS == 1:

DPG1NS	Meaning
0b0	A Group 1 Non-secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Non-secure Group 1 interrupts are enabled.
0b1	A Group 1 Non-secure SPI configured to use the 1 of N distribution model cannot select this PE.

When GICR_TYPER.DPGS == 0 this bit is RAZ/WI.

It is IMPLEMENTATION DEFINED whether thesethis bits affect the selection of PEs for interrupts using the 1 of N distribution model when GICD_CTLR.ARE_NS==0.

This field resets to 0.

DPG0, bit [24]

Disable Processor selection for Group 0 interrupts. When GICR_TYPER.DPGS == 1:

DPG0	Meaning
0b0	A Group 0 SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Group 0 interrupts are enabled.
0b1	A Group 0 SPI configured to use the 1 of N distribution model cannot select this PE.

When GICR_TYPER.DPGS == 0 this bit is RAZ/WI.

When GICD_CTLR.DS == 1, this field is always accessible. In GIC implementations that support two Security states, this field is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether thesethis bits affect the selection of PEs for interrupts using the 1 of N distribution model when GICD_CTLR.ARE_S == 0.

This field resets to 0.

Bits [23:4]

Reserved, RES0.

RWP, bit [3]

Register Write Pending. This bit indicates whether a register write for the current Security state is in progress or not.

RWP	Meaning
0b0	The effect of all previous writes to the following registers are visible to all agents in the system: • GICR_ICENABLER0 • GICR_CTLR.DPG1S • GICR_CTLR.DPG1NS • GICR_CTLR.DPG0 • GICR_CTLR, which clears EnableLPIs from 1 to 0. • In GICv4.1, GICR_VPROPBASER, which clears Valid from 1 to 0.
0b1	The effect of all previous writes to the following registers are not guaranteed by the architecture to be visible ~~yet~~ to ~~the~~ all agents in the system ~~while~~as the changes are still being propagated: • GICR_ICENABLER0 • GICR_CTLR.DPG1S • GICR_CTLR.DPG1NS • GICR_CTLR.DPG0 • GICR_CTLR, which clears EnableLPIs from 1 to 0. • In GICv4.1, GICR_VPROPBASER, which clears Valid from 1 to 0.

Bit [2]

Reserved, RES0.

CES, bit [1]

Clear Enable Supported.

This bit is read-only.

CES	Meaning
0b0	The IRI does not indicate whether GICR_CTLR.EnableLPIs is RES1 once set.
0b1	GICR_CTLR.EnableLPIs is not RES1 once set.

Implementing GICR_CTLR.EnableLPIs as programmable and not reporting GICR_CLTR.CES~~CES~~ == 1 is deprecated.

Implementing GICR_CTLR.EnableLPIs as RES1 once set is deprecated.

When GICR_CLTR.CES == 0, software cannot assume that GICR_CTLR.EnableLPIs is programmable without observing the bit being cleared.

EnableLPIs, bit [0]

In implementations where affinity routing is enabled for the Security state:

EnableLPIs	Meaning
0b0	LPI support is disabled. Any doorbell interrupt generated as a result of a write to a virtual LPI register must be discarded, and any ITS translation requests or commands involving LPIs in this Redistributor are ignored.
0b1	LPI support is enabled.

Note

If GICR_TYPER.PLPIS~~LPIS~~ == 0, this field is RES0. If GICD_CTLR.ARE_NS is written from 1 to 0 when this bit is 1, behavior is an IMPLEMENTATION DEFINED choice between clearing GICR_CTLR.EnableLPIs to 0 or maintaining its current value.

When affinity routing is not enabled for the Non-secure state, this bit is RES0.

When written from 0 to 1, the Redistributor loads the LPI Pending table from memory to check for any pending interrupts.

After it has been written to 1, it is IMPLEMENTATION DEFINED whether the bit becomes RES1 or can be cleared by to 0.

Where the bit remains programmable:

- Software must observe GICR_CTLR.RWP==0 after clearing GICR_CTLR.EnableLPIs from 1 to 0 before writing GICR_PENDBASER or GICR_PROPBASER, otherwise behavior is UNPREDICTABLE.
- Software must observe GICR_CTLR.RWP==0 after clearing GICR_CTLR.EnableLPIs from 1 to 0 before setting GICR_CTLR.EnableLPIs to 1, otherwise behavior is UNPREDICTABLE.

Note

If one or more ITS is implemented, Arm strongly recommends that all LPIs are mapped to another Redistributor before GICR_CTLR.EnableLPIs is cleared to 0.

This field resets to `0`.

The participation of a PE in the 1 of N distribution model for a given interrupt group is governed by the concatenation of GICR_WAKER.ProcessorSleep, the appropriate GICR_CTLR.DPG{1, 0} bit, and the PE interrupt group enable. The behavior options are:

PS	DPG{1S, 1NS, 0}	Enable	PE Behavior
0b0	0b0	0b0	The PE cannot be selected.
0b0	0b0	0b1	The PE can be selected.
0b0	0b1	*	The PE cannot be selected.
0b1	*	*	The PE cannot be selected when GICD_CTLR.E1NWF == 0. When GICD_CTLR.E1NWF == 1, the mechanism by which PEs are selected is IMPLEMENTATION DEFINED.

If an SPI using the 1 of N distribution model has been forwarded to the PE, and a write to GICR_CTLR occurs that changes the DPG bit for the interrupt group of the SPI, the IRI must attempt to select a different target PE for the SPI. This might have no effect on the forwarded SPI if it has already been activated.

Accessing the GICR_CTLR

GICR_CTLR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0000	GICR_CTLR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICR_ICACTIVER0, Interrupt Clear-Active Register 0

The GICR_ICACTIVER0 characteristics are:

Purpose

Deactivates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICACTIVER0 is a 32-bit register.

Field descriptions

The GICR_ICACTIVER0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Clear_active_bit<x>, bit [x], for x = 0 to 31																															

Clear_active_bit<x>, bit [x], for x = 0 to 31

Removes the active state from interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

This field resets to an architecturally UNKNOWN value.

Accessing the GICR_ICACTIVER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ICACTIVER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ICACTIVER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ICACTIVER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0380	GICR_ICACTIVER0

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICR_ICACTIVER<n>E, Interrupt Clear-Active Registers, n = 1 - 2

The GICR_ICACTIVER<n>E characteristics are:

Purpose

Removes the active state from the corresponding PPI.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICR_ICACTIVER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICACTIVER<n>E is a 32-bit register.

Field descriptions

The GICR_ICACTIVER<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Clear_active_bit<x>, bit [x], for x = 0 to 31																															

Clear_active_bit<x>, bit [x], for x = 0 to 31

For the extended PPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

This field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICACTIVER<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ICACTIVER<n>E is (0x200 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing the GICR_ICACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0380 + 4n	GICR_ICACTIVER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99e984cbfe3431cc1e9707

GICR_ICENABLER0, Interrupt Clear-Enable Register 0

The GICR_ICENABLER0 characteristics are:

Purpose

Disables forwarding of the corresponding SGI or PPI to the CPU interfaces.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICENABLER0 is a 32-bit register.

Field descriptions

The GICR_ICENABLER0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Clear_enable_bit<x>, bit [x], for x = 0 to 31																															

Clear_enable_bit<x>, bit [x], for x = 0 to 31

For PPIs and SGIs, controls the forwarding of interrupt number x to the CPU interfaces. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

This field resets to an architecturally UNKNOWN value.

Accessing the GICR_ICENABLER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICENABLER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ICENABLER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ICENABLER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ICENABLER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0180	GICR_ICENABLER0

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

GICR_ICFGR0, Interrupt Configuration Register 0

The GICR_ICFGR0 characteristics are:

Purpose

Determines whether the corresponding SGI is edge-triggered or level-sensitive.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICFGR0 is a 32-bit register.

Field descriptions

The GICR_ICFGR0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Int_config<x>, bits [2x+1:2x], for x = 0 to 15																															

Int_config<x>, bits [2x+1:2x], for x = 0 to 15

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int_config[0] (bit [2x]) is RES0.

Possible values of Int_config[1] (bit [2x+1]) are:

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b01	Corresponding interrupt is edge-triggered.

For SGIs, Int_config[1] is RAO/WI.

A read of this bit always returns the correct value to indicate the interrupt triggering method.

This field resets to an architecturally UNKNOWN value.

Accessing the GICR_ICFGR0

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=0.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICR_ICFGR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0C00	GICR_ICFGR0

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICR_ICFGR1, Interrupt Configuration Register 1

The GICR_ICFGR1 characteristics are:

Purpose

Determines whether the corresponding PPI is edge-triggered or level-sensitive.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

A copy of this register is provided for each Redistributor.

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

Changing Int_config when the interrupt is individually enabled is UNPREDICTABLE.

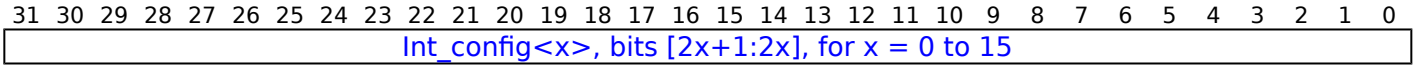
Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

Attributes

GICR_ICFGR1 is a 32-bit register.

Field descriptions

The GICR_ICFGR1 bit assignments are:



Int_config<x>, bits [2x+1:2x], for x = 0 to 15

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int_config[0] (bit [2x]) is RES0.

Possible values of Int_config[1] (bit [2x+1]) are:

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b01	Corresponding interrupt is edge-triggered.

A read of this bit always returns the correct value to indicate the interrupt triggering method.

For PPIs, Int_config[1] is programmable unless the implementation supports two Security states and the bit corresponds to a Group 0 or Secure Group 1 interrupt, in which case the bit is RAZ/WI to Non-secure accesses.

This field resets to an architecturally UNKNOWN value.

Accessing the GICR_ICFGR1

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=1 .

GICR_ICFGR1 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0C04	GICR_ICFGR1

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICR_ICPENDR0, Interrupt Clear-Pending Register 0

The GICR_ICPENDR0 characteristics are:

Purpose

Removes the pending state from the corresponding SGI or PPI.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

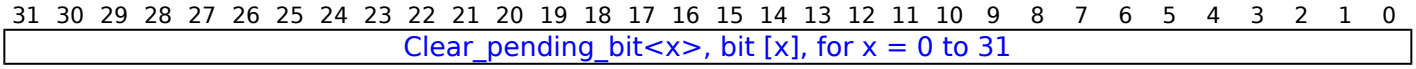
A copy of this register is provided for each Redistributor.

Attributes

GICR_ICPENDR0 is a 32-bit register.

Field descriptions

The GICR_ICPENDR0 bit assignments are:



Clear_pending_bit<x>, bit [x], for x = 0 to 31

Removes the pending state from interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: • If the interrupt is not pending and is not active and pending. • If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

This field resets to an architecturally UNKNOWN value.

Accessing the GICR_ICPENDR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ICPENDR<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ICENABLER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ICPENDR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0280	GICR_ICPENDR0

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

GICR_ICPENDR<n>E, Interrupt Clear-Pending Registers, n = 1 - 2

The GICR_ICPENDR<n>E characteristics are:

Purpose

Removes the pending state from the corresponding PPI.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICR_ICPENDR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICPENDR<n>E is a 32-bit register.

Field descriptions

The GICR_ICPENDR<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Clear_pending_bit<x>, bit [x], for x = 0 to 31																															

Clear_pending_bit<x>, bit [x], for x = 0 to 31

For the extended PPIs, removes the pending state to interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: • If the interrupt is not pending and is not active and pending. • If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICR_ISPENDR<n>E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

This field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICPENDR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ICPENDR<n>E is (0x200 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing the GICR_ICPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICPENDR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0280 + 4n	GICR_ICPENDR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99c984cbfe3431cc1c9707

GICR_IGROUPR0, Interrupt Group Register 0

The GICR_IGROUPR0 characteristics are:

Purpose

Controls whether the corresponding SGI or PPI is in Group 0 or Group 1.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is available in all GIC configurations. If the GIC implementation supports two Security states, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGROUPR0 is a 32-bit register.

Field descriptions

The GICR_IGROUPR0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Redistributor_group_status_bit<x>, bit [x], for x = 0 to 31																															

Redistributor_group_status_bit<x>, bit [x], for x = 0 to 31

Group status bit. In this register:

- Bits [31:16] are group status bits for PPIs.
- Bits [15:0] are group status bits for SGIs.

Redistributor_group_status_bit<x>	Meaning
0b0	When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.
0b1	When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.

When GICD_CTLR.DS == 0, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGRPMODR0 to form a 2-bit field that defines an interrupt group. The encoding of this field is at GICR_IGRPMODR0.

This field resets to an architecturally UNKNOWN value.

The considerations for the reset value of this register are the same as those for GICD_IGROUPR<n> with n=0.

Accessing the GICR_IGROUPR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGROUPR0, the corresponding bit is RES0 and equivalent functionality is provided by GICD_IGROUPR<n> with n=0.

When GICD_CTLR.DS == 0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IGROUPR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0080	GICR_IGROUPR0

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICR_IGROUPR<n>E, Interrupt Group Registers, n = 1 - 2

The GICR_IGROUPR<n>E characteristics are:

Purpose

Controls whether the corresponding PPI is in Group 0 or Group 1.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICR_IGROUPR<n>E are RES0.

When ~~GICD_CLTR.DS==0, this register is Secure.~~ GICD_CTLR.DS==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGROUPR<n>E is a 32-bit register.

Field descriptions

The GICR_IGROUPR<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Group_status_bit<x>, bit [x], for x = 0 to 31																															

Group_status_bit<x>, bit [x], for x = 0 to 31

Group status bit.

Group_status_bit<x>	Meaning
0b0	When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.
0b1	When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.

This field resets to an architecturally UNKNOWN value.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGRPMODR<n>E to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICR_IGRPMODR<n>E.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGROUPR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_IGROUPR<n>E is (0x080 + (4*n)).

- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing the GICR_IGROUPR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGROUPR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_IGROUPR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0080 + 4n	GICR_IGROUPR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICR_IGRPMODR0, Interrupt Group Modifier Register 0

The GICR_IGRPMODR0 characteristics are:

Purpose

When GICD_CTLR.DS==0, this register together with the GICR_IGROUPR0 register, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

When ~~GICD_CLTR.DS==0, this register is Secure.~~ GICD_CTLR.DS==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGRPMODR0 is a 32-bit register.

Field descriptions

The GICR_IGRPMODR0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Group_modifier_bit<x>, bit [x], for x = 0 to 31																															

Group_modifier_bit<x>, bit [x], for x = 0 to 31

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGROUPR0 to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

This field resets to an architecturally UNKNOWN value.

Accessing the GICR_IGRPMODR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR0, the corresponding bit is RES0 and equivalent functionality is provided by GICD_IGRPMODR<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_IGRPMODR<n>.

When GICD_CTLR.ARE_S == 0 or GICD_CTLR.DS == 1, GICR_IGRPMODR0 is RES0. An implementation can make this register RAZ/WI in this case.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IGRPMODR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0D00	GICR_IGRPMODR0

This interface is accessible as follows:

- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICR_IGRPMODR<n>E, Interrupt Group Modifier Registers, n = 1 - 2

The GICR_IGRPMODR<n>E characteristics are:

Purpose

When GICD_CTLR.DS==0, this register together with the GICR_IGROUPR<n>E registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICR_IGRPMODR<n>E are RES0.

When ~~GICD_CLTR.DS==0, this register is Secure.~~ GICD_CTLR.DS==0, this register is Secure.

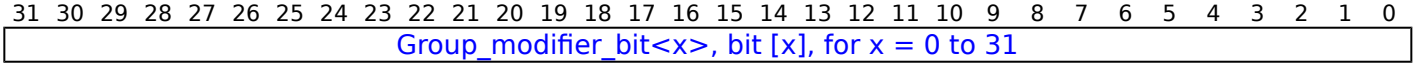
A copy of this register is provided for each Redistributor.

Attributes

GICR_IGRPMODR<n>E is a 32-bit register.

Field descriptions

The GICR_IGRPMODR<n>E bit assignments are:



Group_modifier_bit<x>, bit [x], for x = 0 to 31

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGROUPR<n>E to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

This field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGRPMODR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_IGRPMODR<n>E is (0xD00 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing the GICR_IGRPMODR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_IGRPMODR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0D00 + 4n	GICR_IGRPMODR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99e984cbfe3431cc1e9707

GICR_INVALLR, Redistributor Invalidate All Register

The GICR_INVALLR characteristics are:

Purpose

Invalidates any cached configuration data of all physical LPIs, causing the GIC to reload the interrupt configuration from the physical LPI Configuration table at the address specified by GICR_PROPBASER.

Configuration

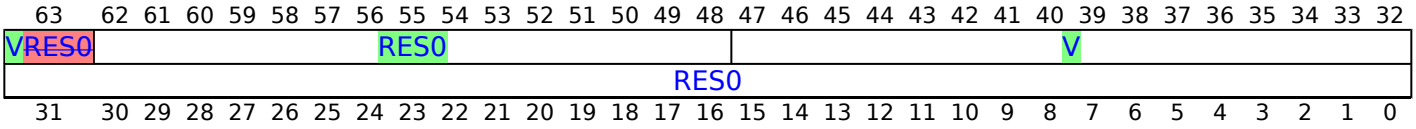
A copy of this register is provided for each Redistributor.

Attributes

GICR_INVALLR is a 64-bit register.

Field descriptions

The GICR_INVALLR bit assignments are:



V,Bits bit [63:0]

When GICv4.1 is implemented:

Indicates whether the INTID is virtual or physical.

V	Meaning
0b0	Invalidate is for a physical INTID.
0b1	Invalidate is for a virtual INTID.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

V, bits [47:32]

When GICv4.1 is implemented:

When GICR_INVLPIR.V == 0, this field is RES0

When GICR_INVLPIR.V == 1, this field is the target vPEID of the invalidate.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are RES0.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

Note

If any LPI has been forwarded to the PE and a valid write to GICR_INVALLR is received, the Redistributor must ensure it reloads its properties from memory. This has no effect on the forwarded LPI if it has already been activated.

Accessing the GICR_INVALLR

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if no physical LPIs are currently stored in the local Redistributor cache.

GICR_INVALLR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x00B0	GICR_INVALLR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

GICR_INVLPIR, Redistributor Invalidate LPI Register

The GICR_INVLPIR characteristics are:

Purpose

Invalidates the cached configuration data of a specified LPI, causing the GIC to reload the interrupt configuration from the physical LPI Configuration table at the address specified by GICR_PROPBASER.

Configuration

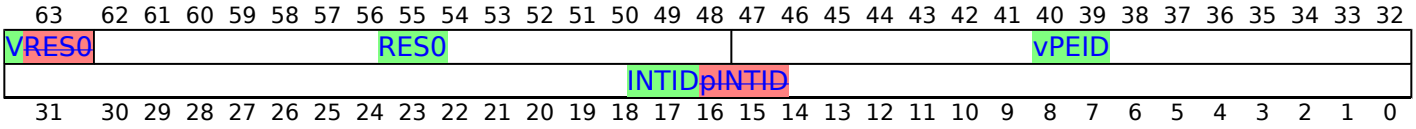
A copy of this register is provided for each Redistributor.

Attributes

GICR_INVLPIR is a 64-bit register.

Field descriptions

The GICR_INVLPIR bit assignments are:



V,Bits bit [63:32]

When GICv4.1 is implemented:

Indicates whether the INTID is virtual or physical.

V	Meaning
0b0	Invalidate is for a physical INTID.
0b1	Invalidate is for a virtual INTID.

Otherwise:

Reserved, RES0.

BitspINTID, bits [6231:480]

Reserved, RES0.

vPEID, bits [47:32]

When GICv4.1 is implemented:

When GICR_INVLPIR.V == 0, this field is RES0

When GICR_INVLPIR.V == 1, this field is the target vPEID of the invalidate.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are RES0.

Otherwise:

Reserved, RES0.

INTID, bits [31:0]

The INTID of the physical LPI to be cleaned.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER.IDbits field. Unimplemented bits are RES0.

Note

If any LPI has been forwarded to the PE and a valid write to GICR_INVLPIR is received, the Redistributor must ensure it reloads its properties from memory and apply any changes by retrieving and reforwarding the LPI as required. This has no effect on the forwarded LPI if it has already been activated.

Accessing the GICR_INVLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if either:

- The specified LPI is not currently stored in the local Redistributor.
- The pINTID field corresponds to an unimplemented LPI.

GICR_INVLPIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x00A0	GICR_INVLPIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.

(old) htmldiff from- (new)

GICR_IPRIORITYR<n>, Interrupt Priority Registers, n = 0 - 7

The GICR_IPRIORITYR<n> characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each SGI and PPI supported by the GIC.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

A copy of these registers is provided for each Redistributor.

These registers are configured as follows:

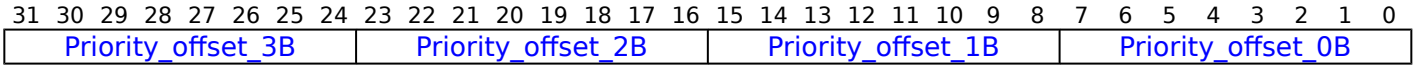
- GICR_IPRIORITYR0-GICR_IPRIORITYR3 store the priority of SGIs.
- GICR_IPRIORITYR4-GICR_IPRIORITYR7 store the priority of PPIs.

Attributes

GICR_IPRIORITYR<n> is a 32-bit register.

Field descriptions

The GICR_IPRIORITYR<n> bit assignments are:



Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

Accessing the GICR_IPRIORITYR<n>

These registers are used when affinity routing is enabled for the Security state of the interrupt. When affinity routing is not enabled the bits corresponding to the interrupt are RAZ/WI and GICD_IPRIORITYR<n> provides equivalent functionality.

These registers are used for SGIs and PPIs only. Equivalent functionality for SPIs is provided by GICD_IPRIORITYR<n>.

These registers are byte-accessible.

When GICD_CTLR.DS == 0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IPRIORITYR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0400 + 4n	GICR_IPRIORITYR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICR_IPRIORITYR<n>E, Interrupt Priority Registers (extended PPI range), n = 8 - 23

The GICR_IPRIORITYR<n>E characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each extended PPI supported by the GIC.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICR_IPRIORITYR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IPRIORITYR<n>E is a 32-bit register.

Field descriptions

The GICR_IPRIORITYR<n>E bit assignments are:

31 30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0
Priority_offset_3B	Priority_offset_2B	Priority_offset_1B	Priority_offset_0B

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

This field resets to an architecturally UNKNOWN value.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IPRIORITYR<n> number, n, is given by n = (m-1024) DIV 4.
- The offset of the required GICR_IPRIORITYR<n>E register is (`0x400` + (4*n)).
- The byte offset of the required Priority field in this register is m MOD 4, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Accessing the GICR_IPRIORITYR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

GICR_IPRIORITYR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0400` + 4n	GICR_IPRIORITYR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICR_ISACTIVER0, Interrupt Set-Active Register 0

The GICR_ISACTIVER0 characteristics are:

Purpose

Activates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISACTIVER0 is a 32-bit register.

Field descriptions

The GICR_ISACTIVER0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Set_active_bit<x>, bit [x], for x = 0 to 31																															

Set_active_bit<x>, bit [x], for x = 0 to 31

Adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

This field resets to an architecturally UNKNOWN value.

Accessing the GICR_ISACTIVER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ISACTIVER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ISACTIVER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISACTIVER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0300	GICR_ISACTIVER0

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICR_ISACTIVER<n>E, Interrupt Set-Active Registers, n = 1 - 2

The GICR_ISACTIVER<n>E characteristics are:

Purpose

Adds the active state to the corresponding PPI.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICR_ISACTIVER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISACTIVER<n>E is a 32-bit register.

Field descriptions

The GICR_ISACTIVER<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Set_active_bit<x>, bit [x], for x = 0 to 31																															

Set_active_bit<x>, bit [x], for x = 0 to 31

For the extended PPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

This field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISACTIVER<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ISACTIVER<n>E is (0x200 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing the GICR_ISACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ISACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0300 + 4n	GICR_ISACTIVER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99e984cbfe3431cc1e9707

GICR_ISENABLER<n>E, Interrupt Set-Enable Registers, n = 1 - 2

The GICR_ISENABLER<n>E characteristics are:

Purpose

Enables forwarding of the corresponding PPI to the CPU interfaces.

Configuration

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICR_ISENABLER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISENABLER<n>E is a 32-bit register.

Field descriptions

The GICR_ISENABLER<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Set_enable_bit<x>, bit [x], for x = 0 to 31																															

Set_enable_bit<x>, bit [x], for x = 0 to 31

For the extended PPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

This field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISENABLER<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ISENABLER<n>E is (0x100 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing the GICR_ISENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISENABLER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ISENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0100 + 4n	GICR_ISENABLER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICR_ISPENDR0, Interrupt Set-Pending Register 0

The GICR_ISPENDR0 characteristics are:

Purpose

Adds the pending state to the corresponding SGI or PPI.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISPENDR0 is a 32-bit register.

Field descriptions

The GICR_ISPENDR0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Set_pending_bit<x>, bit [x], for x = 0 to 31																															

Set_pending_bit<x>, bit [x], for x = 0 to 31

For PPIs and SGIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: • If the interrupt is already pending because of a write to GICR_ISPENDR0. • If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

This field resets to an architecturally UNKNOWN value.

Accessing the GICR_ISPENDR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ISPENDR<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ISPENDR<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISPENDR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0200	GICR_ISPENDR0

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99e984cbfe3431cc1c9707

GICR_ISPENDR<n>E, Interrupt Set-Pending Registers, n = 1 - 2

The GICR_ISPENDR<n>E characteristics are:

Purpose

Adds the pending state to the corresponding PPI.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICR_ISPENDR<n>E are RES0.

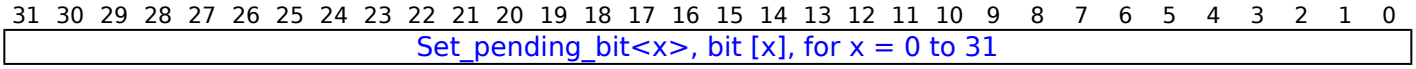
A copy of this register is provided for each Redistributor.

Attributes

GICR_ISPENDR<n>E is a 32-bit register.

Field descriptions

The GICR_ISPENDR<n>E bit assignments are:



Set_pending_bit<x>, bit [x], for x = 0 to 31

For the extended PPIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: • If the interrupt is already pending because of a write to GICR_ISPENDR<n>E. • If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

This field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISPENDR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ISPENDR<n>E is (`0x200` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing the GICR_ISPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISPENDR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ISPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0200` + 4n	GICR_ISPENDR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICR_MPAMIDR, Report maximum PARTID and PMG Register

The GICR_MPAMIDR characteristics are:

Purpose

Reports the maximum support PARTID and PMG values.

Configuration

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICR_MPAMIDR are RES0.

A copy of this register is provided for each Redistributor.

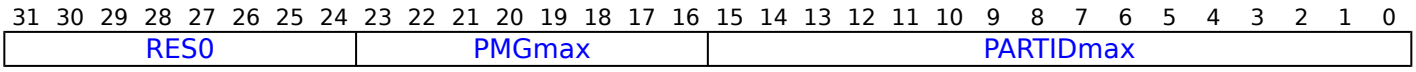
When GICR_TYPER.MPAM==0, this register is RES0.

Attributes

GICR_MPAMIDR is a 32-bit register.

Field descriptions

The GICR_MPAMIDR bit assignments are:



Bits [31:24]

Reserved, RES0.

PMGmax, bits [23:16]

Maximum PMG value supported.

PARTIDmax, bits [15:0]

Maximum PARTID value supported.

Accessing the GICR_MPAMIDR

GICR_MPAMIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0018	GICR_MPAMIDR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.

- When !IsAccessSecure() accesses to this register are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICR_NSACR, Non-secure Access Control Register

The GICR_NSACR characteristics are:

Purpose

Enables Secure software to permit Non-secure software to create SGIs targeting the PE connected to this Redistributor by writing to ICC_SGI1R_EL1, ICC_ASGI1R_EL1 or ICC_SGI0R_EL1.

See Forwarding an SGI to a target PE for more information.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

For a description on when a write to ICC_SGI0R_EL1, ICC_SGI1R_EL1 or ICC_ASGI1R_EL1 is permitted to generate an interrupt see Use of control registers for SGI forwarding.

Attributes

GICR_NSACR is a 32-bit register.

Field descriptions

The GICR_NSACR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NS_access<x>, bits [2x+1:2x], for x = 0 to 15																															

NS_access<x>, bits [2x+1:2x], for x = 0 to 15

Configures the level of Non-secure access permitted when the SGI is in Secure Group 0 or Secure Group 1, as defined from GICR_IGROUPR0 and GICR_IGRPMODR0. A field is provided for each SGI. The possible values of each 2-bit field are:

NS_access<x>	Meaning
0b00	Non-secure writes are not permitted to generate Secure Group 0 SGIs or Secure Group 1 SGIs.
0b01	Non-secure writes are permitted to generate a Secure Group 0 SGI.
0b10	As 0b01, but additionally Non-secure writes to are permitted to generate a Secure Group 1 SGI.
0b11	Reserved. If the field is programmed to the reserved value, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the valid values. However, to maintain the principle that as the value increases additional accesses are permitted Arm strongly recommends that implementations treat this value as 0b10. It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the valid value chosen.

This field resets to an architecturally UNKNOWN value.

Accessing the GICR_NSACR

When GICD_CTLR.DS == 1, this register is RAZ/WI.

When GICD_CTLR.DS == 0, this register is Secure, and is RAZ/WI to Non-secure accesses.

This register is used when affinity routing is enabled. When affinity routing is not enabled for the Security state of the interrupt, GICD_NSACR<n> with n=0 provides equivalent functionality.

This register does not support PPIs.

GICR_NSACR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0E00	GICR_NSACR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

GICR_PARTIDR, Set PARTID and PMG Register

The GICR_PARTIDR characteristics are:

Purpose

Sets the PARTID and PMG values used for memory accesses by the Redistributor.

Configuration

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GICR_PARTIDR are RES0.

A copy of this register is provided for each Redistributor.

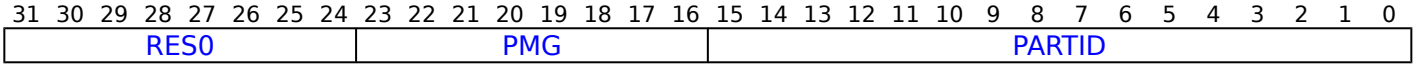
When GICR_TYPER.MPAM==0, this register is RES0.

Attributes

GICR_PARTIDR is a 32-bit register.

Field descriptions

The GICR_PARTIDR bit assignments are:



Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

PMG value used when Redistributor accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PMG values in the range 0 to PMG_MAX are stateful or RES0.

PARTID, bits [15:0]

PARTID value used when Redistributor accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PARTID values in the range 0 to PARTID_MAX are stateful or RES0.

Accessing the GICR_PARTIDR

GICR_PARTIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x001C	GICR_PARTIDR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

GICR_PENDBASER, Redistributor LPI Pending Table Base Address Register

The GICR_PENDBASER characteristics are:

Purpose

Specifies the base address of the LPI Pending table, and the Shareability and Cacheability of accesses to the LPI Pending table.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

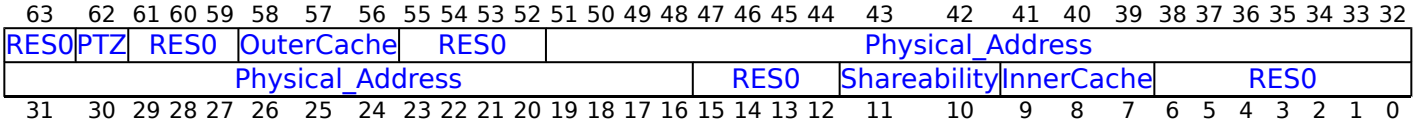
A copy of this register is provided for each Redistributor.

Attributes

GICR_PENDBASER is a 64-bit register.

Field descriptions

The GICR_PENDBASER bit assignments are:



Bit [63]

Reserved, RES0.

PTZ, bit [62]

Pending Table Zero. Indicates to the Redistributor whether the LPI Pending table is zero when GICR_CTLR.EnableLPIs == 1.

This field is WO, and reads as 0.

PTZ	Meaning
0b0	The LPI Pending table is not zero, and contains live data.
0b1	The LPI Pending table is zero. Software must ensure the LPI Pending table is zero before this value is written.

Bits [61:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Pending table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:16]

Bits [51:16] of the physical address containing the LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

This field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Pending table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Pending table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

This field resets to an architecturally UNKNOWN value.

Bits [6:0]

Reserved, RES0.

Accessing the GICR_PENDBASER

Having the GICR_PENDBASER OuterCache, Shareability or InnerCache fields programmed to different values on different Redistributors with GICR_CTLR.EnableLPIs == 1 in the system is UNPREDICTABLE.

Changing GICR_PENDBASER with GICR_CTLR.EnableLPIs == 1 is UNPREDICTABLE.

GICR_PENDBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0078	GICR_PENDBASER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICR_PROPBASER, Redistributor Properties Base Address Register

The GICR_PROPBASER characteristics are:

Purpose

Specifies the base address of the LPI Configuration table, and the Shareability and Cacheability of accesses to the LPI Configuration table.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

A copy of this register is provided for each Redistributor.

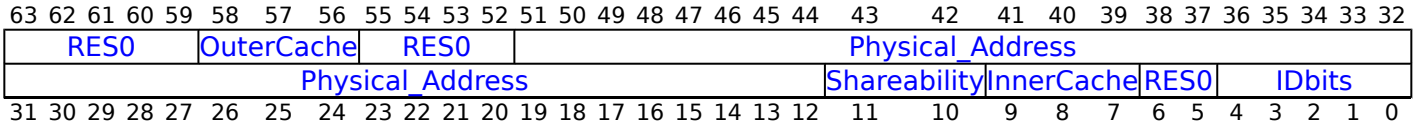
An implementation might make this register RO, for example to correspond to an LPI Configuration table in read-only memory.

Attributes

GICR_PROPBASER is a 64-bit register.

Field descriptions

The GICR_PROPBASER bit assignments are:



Bits [63:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

This field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

This field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IDbits, bits [4:0]

The number of bits of LPI INTID supported, minus one, by the LPI Configuration table starting at Physical_Address.

If the value of this field is larger than the value of GICD_TYPER.IDbits, the GICD_TYPER.IDbits value applies.

If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all physical LPIs are out of range.

This field resets to an architecturally UNKNOWN value.

Accessing the GICR_PROPBASER

It is IMPLEMENTATION DEFINED whether GICR_PROPBASER can be set to different values on different Redistributors. GICR_TYPER.CommonLPIAff identifies the Redistributors that must have GICR_PROPBASER set to the same values whenever GICR_CTLR.EnableLPIs == 1.

Setting different values in different copies of GICR_PROPBASER on Redistributors that are required to use a common LPI Configuration table when GICR_CTLR.EnableLPIs == 1 leads to UNPREDICTABLE behavior.

Other restrictions apply when a Redistributor caches information from GICR_PROPBASER. See LPI Configuration tables for more information.

GICR_PROPBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0070	GICR_PROPBASER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f211~~6134483bd14dc8e12a99e984cbfe3431cc1e9707~~

GICR_SETLPIR, Set LPI Pending Register

The GICR_SETLPIR characteristics are:

Purpose

Generates an LPI by setting the pending state of the specified LPI.

Configuration

This register is present only when GICv4.1 is implemented. Otherwise, direct accesses to GICR_SETLPIR are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_SETLPIR is a 64-bit register.

Field descriptions

The GICR_SETLPIR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
pINTID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

pINTID, bits [31:0]

The INTID of the physical LPI to be generated.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER.IDbits field. Unimplemented bits are RES0.

Accessing the GICR_SETLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if either:

- The pINTID field corresponds to an LPI that is already pending.
- The pINTID field corresponds to an unimplemented LPI.
- GICR_CTLR.EnableLPIs == 0.

GICR_SETLPIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0040	GICR_SETLPIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICR_SYNCR, Redistributor Synchronize Register

The GICR_SYNCR characteristics are:

Purpose

Indicates completion of register~~physical~~ based invalidate~~Redistributor~~ operations.

Configuration

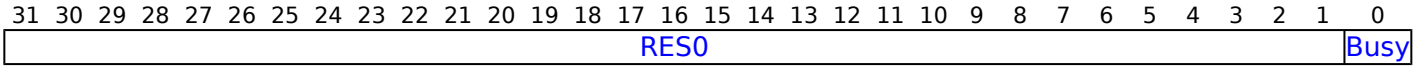
A copy of this register is provided for each Redistributor.

Attributes

GICR_SYNCR is a 32-bit register.

Field descriptions

The GICR_SYNCR bit assignments are:



Bits [31:1]

Reserved, RES0.

Busy, bit [0]

Indicates completion of invalidation~~any~~ ~~Redistributor~~ operations ~~as follows:~~

Busy	Meaning
0b0	No operations are in progress.
0b1	A write is in progress to one or more of the following registers: • GICR_INVLPIR~~GICR_CLRLPIR~~. • GICR_INVALLR~~GICR_INVLPIR~~. • ~~GICR_INVALLR~~GICv3, GICR_CLRLPIR.

This field tracks~~also indicates completion of any~~ operations initiated on~~by~~ the~~writes~~ same Redistributor.~~to~~GICR_PENDBASER ~~or~~ GICR_PROPBASER.

Accessing the GICR_SYNCR

When~~Optionally,~~ ~~when~~ this register is accessed, it is optional that an implementation might wait until all operations are complete before returning a value, in which case GICR_SYNCR.Busy is always 0.

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

GICR_SYNCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x00C0	GICR_SYNCR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICR_TYPER, Redistributor Type Register

The GICR_TYPER characteristics are:

Purpose

Provides information about the configuration of this Redistributor.

Configuration

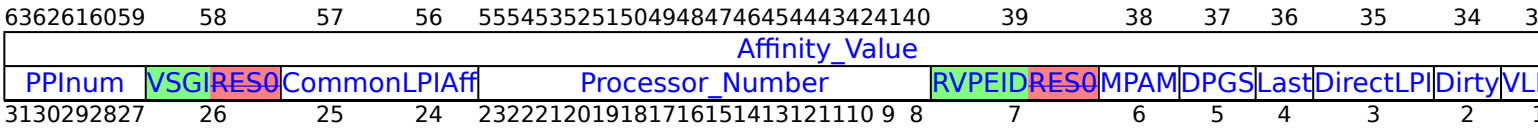
A copy of this register is provided for each Redistributor.

Attributes

GICR_TYPER is a 64-bit register.

Field descriptions

The GICR_TYPER bit assignments are:



Affinity_Value, bits [63:32]

The identity of the PE associated with this Redistributor.

Bits [63:56] provide Aff3, the Affinity level 3 value for the Redistributor.

Bits [55:48] provide Aff2, the Affinity level 2 value for the Redistributor.

Bits [47:40] provide Aff1, the Affinity level 1 value for the Redistributor.

Bits [39:32] provide Aff0, the Affinity level 0 value for the Redistributor.

PPInum, bits [31:27]

When GICv3.1~~GIC, >=3.1~~ is implemented:

The value derived from this field specifies the maximum PPI INTID that a GIC implementation can~~might~~ support. An implementation might not implement all PPIs up to this maximum.

PPInum	Meaning
0b00000	Maximum PPI INTID is 31.
0b00001	Maximum PPI INTID is 1087.
0b00010	Maximum PPI INTID is 1119.

All other values are reserved.

Otherwise:

Reserved, RES0.

VSGI, bitBit [26]

When GICv4.1 is implemented:

Indicates whether vSGIs are supported.

VSGI	Meaning
0b0	Direct injection of SGIs not supported.
0b1	Direct injection of SGIs supported.

Otherwise:

Reserved, RES0.

CommonLPIAff, bits [25:24]

The affinity level at which Redistributors share ana LPI Configuration table.

CommonLPIAff	Meaning
0b00	All Redistributors must share an LPI Configuration table.
0b01	All Redistributors with the same Aff3 value must share an LPI Configuration table.
0b10	All Redistributors with the same Aff3.Aff2 value must share an LPI Configuration table.
0b11	All Redistributors with the same Aff3.Aff2.Aff1 value must share an LPI Configuration table.

Processor_Number, bits [23:8]

A unique identifier for the PE. When GITS_TYPER.PTA == 0, an ITS uses this field to identify the interrupt target.

When affinity routing is disabled for a Security state, this field indicates which GICD_ITARGETSR<n> corresponds to this Redistributor.

RVPEID, bitBit [7]

When GICv4.1 is implemented:

Indicates how the resident vPE is specified.

RVPEID	Meaning
0b0	GICR_VPENDBASER records the address of the vPE's Virtual Pending Table.
0b1	GICR_VPENDBASER records vPEID.

Otherwise:

Reserved, RES0.

MPAM, bit [6]

When GICv3.1GIC, >=3.1 is implemented:

MPAM

MPAM	Meaning
0b0	MPAM not supported.
0b1	MPAM supported.

Otherwise:

Reserved, RES0.

DPGS, bit [5]

Sets support for GICR_CTLR.DPG* bits.

DPGS	Meaning
0b0	GICR_CTLR.DPG* bits are not supported.
0b1	GICR_CTLR.DPG* bits are supported.

Last, bit [4]

Indicates whether this Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

Last	Meaning
0b0	This Redistributor is not the highest-numbered Redistributor in a series of contiguous Redistributor pages.
0b1	This Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

DirectLPI, bit [3]

Indicates whether this Redistributor supports direct injection of LPIs.

DirectLPI	Meaning
0b0	This Redistributor does not support direct injection of LPIs. The GICR_SETLPIR, GICR_CLRLPIR, GICR_INVLPIR, GICR_INVALLR, and GICR_SYNCR registers are either not implemented, or have an IMPLEMENTATION DEFINED purpose.
0b1	This Redistributor supports direct injection of LPIs. The GICR_SETLPIR, GICR_CLRLPIR, GICR_INVLPIR, GICR_INVALLR, and GICR_SYNCR registers are implemented.

Dirty, bit [2]

Controls the functionality of GICR_VPENDBASER.Dirty.

Dirty	Meaning
0b0	GICR_VPENDBASER.Dirty is UNKNOWN when GICR_VPENDBASER.Valid == 1.
0b1	GICR_VPENDBASER.Dirty indicates when the Virtual Pending Table has been parsed when GICR_VPENDBASER.Valid is written from 0 to 1.

When GICR_TYPER.VLPIS == 0, this field is RES0.

Note

In GICv4.1 implementations this field is RES1.

VLPIS, bit [1]

Indicates whether the GIC implementation supports virtual LPIs and the direct injection of virtual LPIs.

VLPIS	Meaning
0b0	The implementation does not support virtual LPIs or the direct injection of virtual LPIs.
0b1	The implementation supports virtual LPIs and the direct injection of virtual LPIs.

Note

In GICv3 implementations this field is RES0.

PLPIS, bit [0]

Indicates whether the GIC implementation supports physical LPIs.

PLPIS	Meaning
0b0	The implementation does not support physical LPIs.
0b1	The implementation supports physical LPIs.

Accessing the GICR_TYPER

GICR_TYPER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0008	GICR_TYPER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICR_VPENDBASER, Virtual Redistributor LPI Pending Table Base Address Register

The GICR_VPENDBASER characteristics are:

Purpose

Specifies the base address of the memory that holds the virtual LPI Pending table for the currently scheduled virtual machine.

Configuration

~~This register is provided only in GICv4 implementations.~~

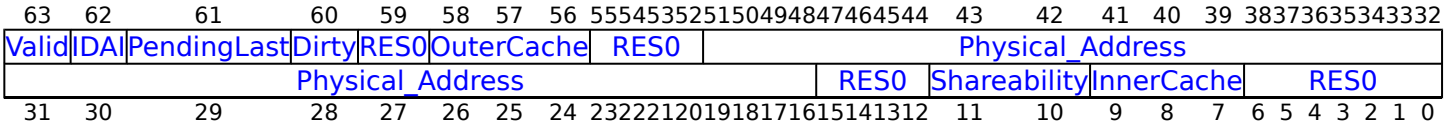
Attributes

GICR_VPENDBASER is a 64-bit register.

Field descriptions

The GICR_VPENDBASER bit assignments are:

When GICv4 is implemented:



Valid, bit [63]

This bit controls whether the virtual LPI Pending table is valid:

Valid	Meaning
0b0	The virtual LPI Pending table is not valid. No vPE is scheduled.
0b1	The virtual LPI Pending table is valid. A vPE is scheduled.

Setting GICR_VPENDBASER.Valid == 1 when the associated CPU interface does not implement GICv4 is UNPREDICTABLE.

Note

Software can determine whether a PE supports GICv3 or GICv4 by reading ID_AA64PFR0_EL1.

Writing a new value to any bit of GICR_VPENDBASER, other than GICR_VPENDBASER.Valid, when GICR_VPENDBASER.Valid==1 is UNPREDICTABLE.

This field resets to 0.

IDAI, bit [62]

Implementation Defined Area Invalid. Indicates whether the IMPLEMENTATION DEFINED area in the virtual LPI Pending table is valid:

IDAI	Meaning
0b0	The IMPLEMENTATION DEFINED area is valid.
0b1	The IMPLEMENTATION DEFINED area is invalid and all pending interrupt information is held in the architecturally defined part of the virtual LPI Pending table.

For more information, see LPI Pending tables and Virtual LPI Configuration tables and virtual LPI Pending tables.

This field resets to an architecturally UNKNOWN value.

PendingLast, bit [61]

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR_VPENDBASER.Valid has been written from 1 to 0 and is otherwise UNKNOWN.

PendingLast	Meaning
0b0	There are no pending and enabled interrupts for the last scheduled vPE.
0b1	There is at least one pending interrupt for the last scheduled vPE. It is IMPLEMENTATION DEFINED whether this bit is set when the only pending interrupts for the last scheduled vPE are not enabled. Arm deprecates setting PendingLast to 1 when the only pending interrupts for the last scheduled virtual machine are not enabled.

When the GICR_VPENDBASER.Valid bit is written from 0 to 1, this bit is RES1.

This field resets to 0.

Dirty, bit [60]

When GICR_VPENDBASER.Valid == 0b0:

~~This is field is read-only.~~ Indicates whether a de-scheduling operation is in progress.

This field is read-only.

Dirty	Meaning
0b0	No de-scheduling operation in process.
0b1	De-scheduling operation in process.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty==1.

This field resets to 0.

When GICR_VPENDBASER.Valid == 0b1 and GICR_TYPER.Dirty == 0b1:

This field is read-only. Reports whether the Virtual Pending table has been parsed.

Dirty	Meaning
0b0	Parsing of the Virtual Pending Table has completed.
0b1	Parsing of the Virtual Pending Table has not completed.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

This field resets to 0.

Otherwise:

This field is read-only. This fields is UNKNOWN.

This field resets to 0.

Bit [59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to virtual LPI Pending tables of vPEs targeting this Redistributor. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the OuterCacheabilty attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

This field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:16]

Bits [51:16] of the physical address containing the virtual LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

This field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the virtual LPI Pending table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the Shareability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

This field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the virtual LPI Pending table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

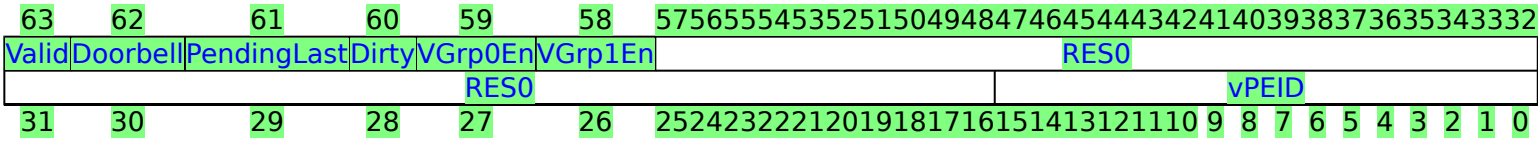
If the InnerCacheabilty attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

This field resets to an architecturally UNKNOWN value.

Bits [6:0]

Reserved, RES0.

When GICv4.1 is implemented:



Valid, bit [63]

This bit controls whether a vPE is scheduled:

Valid	Meaning
0b0	The virtual LPI Pending table is not valid. No vPE is scheduled.
0b1	The virtual LPI Pending table is valid. A vPE is scheduled.

Setting GICR_VPENDBASER.Valid == 1 when the associated CPU interface does not implement GICv4 is UNPREDICTABLE.

Note

Software can determine whether a PE supports GICv3 or GICv4 by reading ID_AA64PFR0_EL1.

Writing a new value to any bit of GICR_VPENDBASER, other than GICR_VPENDBASER.Valid, when GICR_VPENDBASER.Valid==1 is UNPREDICTABLE.

Setting GICR_VPENDBASER.Valid to 1 is UNPREDICTABLE if GICR_VPROPBASER.Valid == 0.

This field resets to 0.

Doorbell, bit [62]

When GICR_VPENDBASER.Valid is written from 1 to 0, this bit controls whether a default doorbell interrupt is requested for the descheduled vPE.

Doorbell	Meaning
0b0	Default doorbell requested.
0b1	No default doorbell requested.

When GICR_VPENDBASER.Valid is written from 1 to 0, if there are outstanding enabled pending interrupts then this bit is treated as 0.

When GICR_VPENDBASER.Valid is written from 1 to 0, if GICR_VPENDBASER.PendingLast is written as 1 then this bit is treated as 0.

When GICR_VPENDBASER.Valid == 1, reads return an UNKNOWN value.

This field resets to an UNKNOWN value.

PendingLast, bit [61]

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR_VPENDBASER.Valid is written from 1 to 0 and is otherwise UNKNOWN.

PendingLast	Meaning
0b0	There are no pending and enabled interrupts for the last scheduled vPE.
0b1	There is at least one pending and enabled interrupt for the last scheduled vPE.

When the GICR_VPENDBASER.Valid bit is written from 0 to 1, this bit is RES1.

When GICR_VPENDBASER.Valid is written from 1 to 0, if GICR_VPENDBASER.PendingLast is written as 1, then this bit is set to an UNKNOWN value.

This field resets to an UNKNOWN value.

Dirty, bit [60]

When GICR_VPENDBASER.Valid == 0b0:

Read-only. Indicates whether a de-scheduling operation is in progress.

Dirty	Meaning
0b0	No de-scheduling operation in progess.
0b1	De-scheduling operation in progess.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

This field resets to 0.

Otherwise:

Read-only. Reports whether the Virtual Pending table has been parsed.

Dirty	Meaning
0b0	Parsing of the Virtual Pending Table is complete.
0b1	Parsing of the Virtual Pending Table has not completed.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

This field resets to 0.

VGrp0En, bit [59]

Enable virtual Group 0 interrupts.

VGrp0En	Meaning
0b0	Forwarding of virtual Group 0 interrupts disabled.
0b1	Forwarding of virtual Group 0 interrupts enabled.

This field resets to an UNKNOWN value.

VGrp1En, bit [58]

Enable virtual Group 1 interrupts.

VGrp1En	Meaning
0b0	Forwarding of virtual Group 1 interrupts disabled.
0b1	Forwarding of virtual Group 1 interrupts enabled.

This field resets to an UNKNOWN value.

Bits [57:16]

Reserved, RES0.

vPEID, bits [15:0]

When GICR_VPENDBASER.Valid == 1, ID of scheduled vPE.

When GICR_VPENDBASER.Valid == 1, if GICR_VPENDBASER.vPEID is set to a value greater than the configured vPEID width, the behavior of this field is CONSTRAINED UNPREDICTABLE:

- GICR_VPENDBASER.vPEID is treated as having an UNKNOWN valid value for all purposes other than a direct read of the register.
- GICR_VPENDBASER.Valid is treated as being set to 0 for all purposes other than a direct read of the register.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields, unimplemented bits are RES0.

Accessing the GICR_VPENDBASER

The effect of a write to this register is not guaranteed to be visible throughout the affinity hierarchy, as indicated by GICR_CTLR.RWP == 0.

GICR_VPENDBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	VLPI_base	0x0078	GICR_VPENDBASER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

GICR_VPROPBASER, Virtual Redistributor Properties Base Address Register

The GICR_VPROPBASER characteristics are:

Purpose

Specifies the base address of the memory that holds the virtual LPI Configuration table for the currently scheduled virtual machine.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is provided in GICv4 implementations only.

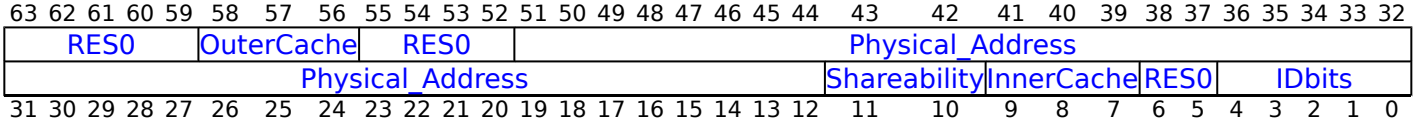
Attributes

GICR_VPROPBASER is a 64-bit register.

Field descriptions

The GICR_VPROPBASER bit assignments are:

When GICv4 is implemented:



Bits [63:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the virtual LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

This field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

This field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

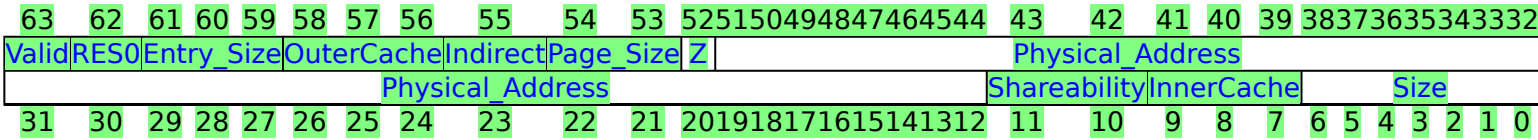
IDbits, bits [4:0]

The number of bits of virtual LPI INTID supported, minus one.

If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all virtual LPIs are out of range.

This field resets to an architecturally UNKNOWN value.

When GICv4.1 is implemented:



Valid, bit [63]

This bit controls whether the vPE Configuration Table is valid:

Valid	Meaning
0b0	The vPE Configuration table is not valid.
0b1	The vPE Configuration table is valid.

TBC

This field resets to 0.

Bit [62]

Reserved, RES0.

Entry_Size, bits [61:59]

Specifies the number of bytes per table entry, minus one.

This bit is read-only.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an UNKNOWN value.

Indirect, bit [55]

This field indicates whether GICR_VPROPBASER specifies a single, flat table or a two-level table where the first level contains a list of descriptors.

Indirect	Meaning
0b0	Single Level. The Size field indicates the number of pages used to store data associated with each table entry.
0b1	Two Level. The Size field indicates the number of pages that contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used.

This field is RES0 for GIC implementations that only support flat tables.

This field resets to an UNKNOWN value.

Page_Size, bits [54:53]

The following values indicate the size of page that the translation table uses:

Page_Size	Meaning
0b00	4KB.
0b01	16KB.
0b10	64KB.
0b11	Reserved. Treated as 0b10.

Note

If the GIC implementation supports only a single, fixed page size, this field might be RO.

This field resets to an UNKNOWN value.

Z, bit [52]

When GICR_VPROPBASER.Valid is written from 0 to 1, GICR_VPROPBASER.Z indicates whether the vPE Configuration table is known to contain all zeros.

Z	Meaning
0b0	The vPE Configutation table is not zero, and contains live data.
0b1	The vPE Configuration table is zero.

Setting GICR_VPROPBASER.Z to 0 causes the IRI to reload configuration from memory

When GICR_VPROPBASER.Valid is written from 0 to 1, if GICR_VPROPBASER.Z==1 behavior is UNPREDICTABLE if the allocated memory does not contain all zeros.

This field is WO, and reads as 0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

This field resets to an UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

This field resets to an UNKNOWN value.

Size, bits [6:0]

The number of pages of physical memory allocated to the table, minus one.

GICR_VPROPBASER.Page_Size specifies the size of each page.

This field resets to an UNKNOWN value.

Accessing the GICR_VPROPBASER

GICR_VPROPBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	VLPI_base	0x0070	GICR_VPROPBASER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f211~~6134483bd14dc8e12a99e984cbfe3431cc1e9707~~

GICR_VSGIPENDR, Redistributor virtual SGI pending state register

The GICR_VSGIPENDR characteristics are:

Purpose

Requests the pending state of virtual SGIs for a specified vPE.

Configuration

This register is present only when GICv4.1 is implemented. Otherwise, direct accesses to GICR_VSGIPENDR are RES0.

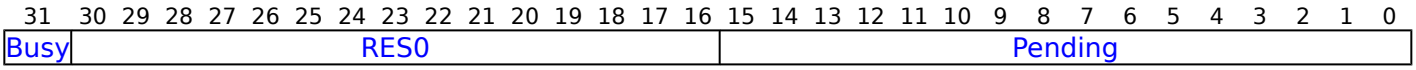
A copy of this register is provided for each Redistributor.

Attributes

GICR_VSGIPENDR is a 32-bit register.

Field descriptions

The GICR_VSGIPENDR bit assignments are:



Busy, bit [31]

ID of target vPEID

Busy	Meaning
0b0	Query of virtual SGI state not in progress.
0b1	Query of virtual SGI state in progress.

Bits [30:16]

Reserved, RES0.

Pending, bits [15:0]

Pending state of virtual SGIs for requested vPEID.

This field is UNKNOWN when GICR_VSGIPENDR.Busy == 1

Accessing the GICR_VSGIPENDR

64-bit access only.

GICR_VSGIPENDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

GIC Redistributor	VLPI_base	0x0088	GICR_VSGIPENDR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.

GICR_VSGIR, Redistributor virtual SGI pending state request register

The GICR_VSGIR characteristics are:

Purpose

Requests the pending state of virtual SGIs for a specified vPE.

Configuration

This register is present only when GICv4.1 is implemented. Otherwise, direct accesses to GICR_VSGIR are RES0.

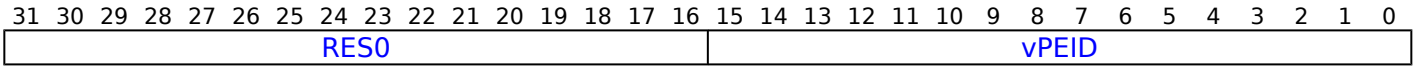
A copy of this register is provided for each Redistributor.

Attributes

GICR_VSGIR is a 32-bit register.

Field descriptions

The GICR_VSGIR bit assignments are:



Bits [31:16]

Reserved, RES0.

vPEID, bits [15:0]

ID of target vPE

Writing this field is CONSTRAINED UNPREDICTABLE when GICR_VSGIPENDR.Busy == 1, with either the write ignored or a new query started.

Writing a value greater than the configured vPEID width behaviur is CONSTRAINED UNPREDICTABLE:

- GICR_VPENDBASER.vPEID is treated as having an UNKNOWN valid value for all purposes other than a direct read of the register.
- GICR_VPENDBASER.Valid is treated as being set to 0 for all purposes other than a direct read of the register.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are RES0.

Accessing the GICR_VSGIR

64-bit access only.

GICR_VSGIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	VLPI_base	0x0080	GICR_VSGIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.

13/12/2019 15:13; 391b5248b29fb2f001ef74792eaacbd6fc72f211

GICV_BPR, Virtual Machine Binary Point Register

The GICV_BPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

This register corresponds to GICC_BPR in the physical CPU interface.

Note

GICH_LR<n>.Group determines whether a virtual interrupt is Group 0 or Group 1.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is available when the GIC implementation supports interrupt virtualization.

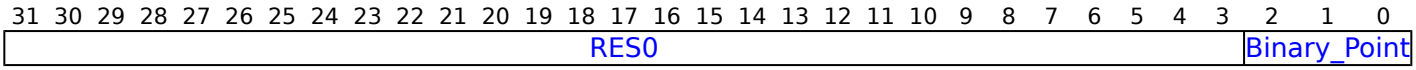
When GICV_CTLR.CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

Attributes

GICV_BPR is a 32-bit register.

Field descriptions

The GICV_BPR bit assignments are:



Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see Priority grouping for Group 0 interrupts, or Group 1 interrupts when CBPR==1

This field resets to an architecturally UNKNOWN value.

The Binary_Point field of this register is aliased to GICH_VMCR.VBPR0.

Accessing the GICV_BPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_BPR0 provides equivalent functionality.
- For AArch64 implementations, ICC_BPR0_EL1 provides equivalent functionality.

GICV_BPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0008	GICV_BPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GICV_CTLR, Virtual Machine Control Register

The GICV_CTLR characteristics are:

Purpose

Controls the behavior of virtual interrupts.

This register corresponds to the physical CPU interface register GICC_CTLR.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

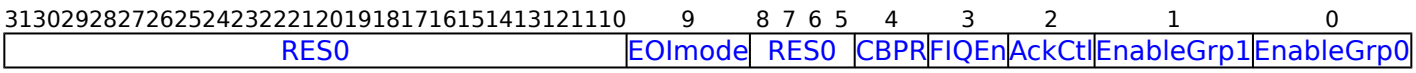
This register is available when a GIC implementation supports interrupt virtualization.

Attributes

GICV_CTLR is a 32-bit register.

Field descriptions

The GICV_CTLR bit assignments are:



Bits [31:10]

Reserved, RES0.

EOImode, bit [9]

Controls the behavior associated with the GICV_EOIR, GICV_AEOIR, and GICV_DIR registers:

EOImode	Meaning
0b0	Writes to GICV_EOIR and GICV_AEOIR perform priority drop and deactivate interrupt operations simultaneously. Behavior on a write to GICV_DIR is unpredictable. When it has completed processing the interrupt, the virtual machine writes to GICV_EOIR or GICV_AEOIR to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the physical Distributor.
0b1	Writes to GICV_EOIR and GICV_AEOIR perform priority drop operation only. Writes to GICV_DIR perform deactivate interrupt operation only. When it has completed processing the interrupt, the virtual machine writes to GICV_DIR to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the Distributor.

This field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

CBPR, bit [4]

Controls whether GICV_BPR affects both Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	GICV_BPR affects Group 0 virtual interrupts only. GICV_ABPR affects Group 1 virtual interrupts only.
0b1	GICV_BPR affects both Group 0 and Group 1 virtual interrupts.

See Priority grouping for more information.

This field resets to an architecturally UNKNOWN value.

FIQEn, bit [3]

FIQ Enable. Controls whether Group 0 virtual interrupts are presented as virtual FIQs:

FIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

This field resets to an architecturally UNKNOWN value.

AckCtl, bit [2]

Arm deprecates use of this bit. Arm strongly recommends that software is written to operate with this bit always cleared to 0.

Acknowledge control. When the highest priority interrupt is Group 1, determines whether GICV_IAR causes the CPU interface to acknowledge the interrupt or returns the spurious identifier 1022, and whether GICV_HPPIR returns the interrupt ID or the special identifier 1022.

AckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an interrupt ID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the interrupt ID of the corresponding interrupt.

This field resets to an architecturally UNKNOWN value.

EnableGrp1, bit [1]

Enables the signaling of Group 1 virtual interrupts by the virtual CPU interface to the virtual machine:

EnableGrp1	Meaning
0b0	Signaling of Group 1 interrupts is disabled.
0b1	Signaling of Group 1 interrupts is enabled.

This field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enables the signaling of Group 0 virtual interrupts by the virtual CPU interface to the virtual machine:

EnableGrp0	Meaning
0b0	Signaling of Group 0 interrupts is disabled.
0b1	Signaling of Group 0 interrupts is enabled.

This field resets to an architecturally UNKNOWN value.

Accessing the GICV_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_CTLR provides equivalent functionality.
- For AArch64 implementations, ICC_CTLR_EL1 provides equivalent functionality.

GICV_CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0000	GICV_CTLR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICV_DIR, Virtual Machine Deactivate Interrupt Register

The GICV_DIR characteristics are:

Purpose

Deactivates a specified virtual interrupt in the GICH_LR<n> List registers.

This register corresponds to the physical CPU interface register GICC_DIR.

Configuration

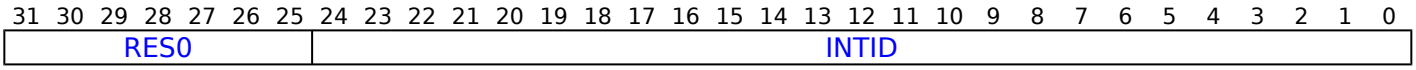
This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_DIR is a 32-bit register.

Field descriptions

The GICV_DIR bit assignments are:



Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

When the virtual machine writes to this register, the specified interrupt in the List registers is changed from active to inactive, or from active and pending to pending. If the specified interrupt is present in the List registers but is not in either the active or active and pending states, the effect is UNPREDICTABLE. If the specified interrupt is not present in the List registers, GICH_HCR.EOICount~~EOIcount~~ is incremented, potentially generating a maintenance interrupt.

Note

If the specified interrupt is not present in the List registers, the virtual machine cannot recover the INTID. Therefore, the hypervisor must ensure

---

that, when GICV_CTLR.EOImode == 1, no more than one active interrupt is transferred from the List registers into a software list. If more than one active interrupt that is not stored in the List registers exists, the hypervisor must handle accesses to GICV_DIR in software, typically by trapping these accesses.

If the corresponding GICH_LR<n>.HW == 1, indicating a hardware interrupt, then a deactivate request is sent to the physical Distributor, identifying the physical INTID from the corresponding field in the List register. This effect is identical to a Non-secure write to GICC_DIR from the PE having that physical INTID. This means that if the corresponding physical interrupt is marked as Group 0, the request is ignored.

Note

Interrupt deactivation using this register is based on the provided INTID, with no requirement to deactivate interrupts in any particular order. A single register is therefore used to deactivate both Group 0 and Group 1 interrupts.

Accessing the GICV_DIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_DIR provides equivalent functionality.
- For AArch64 implementations, ICC_DIR_EL1 provides equivalent functionality.

Writes to this register are valid only when GICV_CTLR.EOImode == 1. Writes to this register are otherwise UNPREDICTABLE.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_DIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x1000	GICV_DIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GICV_PMR, Virtual Machine Priority Mask Register

The GICV_PMR characteristics are:

Purpose

This register provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

Note

Higher interrupt priority corresponds to a lower value of the Priority field.

This register corresponds to the physical CPU interface register GICC_PMR.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

This register is available when the GIC implementation supports interrupt virtualization.

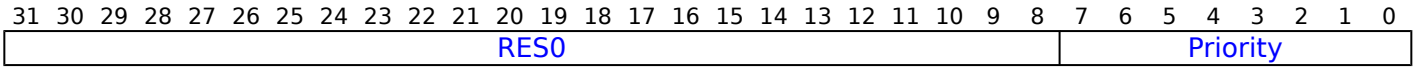
The Priority field of this register is aliased to GICH_VMCR.VMPR, to enable state to be switched easily between virtual machines during context-switching.

Attributes

GICV_PMR is a 32-bit register.

Field descriptions

The GICV_PMR bit assignments are:



Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = `0b0`.
- For 64 supported levels, bits [1:0] = `0b00`.
- For 32 supported levels, bits [2:0] = `0b000`.
- For 16 supported levels, bits [3:0] = `0b0000`.

See Interrupt prioritization, section 4.8 of the GICv3 Architecture Specification for more information.

This field resets to an architecturally UNKNOWN value.

Accessing the GICV_PMR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_PMR provides equivalent functionality.
- For AArch64 implementations, ICC_PMR_EL1 provides equivalent functionality.

GICV_PMR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0004	GICV_PMR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GITS_BASER<n>, ITS Translation Table Descriptors, n = 0 - 7

The GITS_BASER<n> characteristics are:

Purpose

Specifies the base address and size of the ITS translation tables.

Configuration

A copy of this register is provided for each ITS translation table.

Bits [63:32] and bits [31:0] are accessible independently.

A maximum of 8 GITS_BASER<n> registers can be provided. Unimplemented registers are RES0.

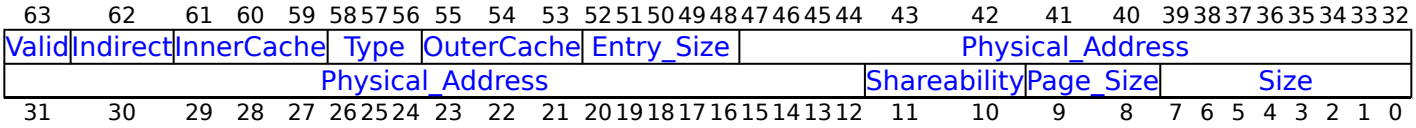
When GITS_CTLR.Enabled == 1 or GITS_CTLR.Quiescent == 0, writing this register is UNPREDICTABLE.

Attributes

GITS_BASER<n> is a 64-bit register.

Field descriptions

The GITS_BASER<n> bit assignments are:



Valid, bit [63]

Indicates whether software has allocated memory for the translation table:

Valid	Meaning
0b0	No memory is allocated for the translation table. The ITS discards any writes to the interrupt translation page when either: • GITS_BASER<n>.Type specifies any valid table entry type other than interrupt collections, that is, any value other than 0b100. • GITS_BASER<n>.Type specifies an interrupt collection and GITS_TYPER.HCC == 0.
0b1	Memory is allocated to the translation table.

This field resets to 0.

Indirect, bit [62]

This field indicates whether an implemented register specifies a single, flat table or a two-level table where the first level contains a list of descriptors.

Indirect	Meaning
0b0	Single Level. The Size field indicates the number of pages used by the ITS to store data associated with each table entry.
0b1	Two Level. The Size field indicates the number of pages which contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used.

See The ITS tables for more information.

This field is RAZ/WI for GIC implementations that only support flat tables. If the maximum width of the scaling factor that is identified by GITS_BASER<n>.Type and the smallest page size that is supported result in a single level table that requires multiple pages, then implementing this bit as RAZ/WI is DEPRECATED.

This field resets to an architecturally UNKNOWN value.

InnerCache, bits [61:59]

Indicates the Inner Cacheability attributes of accesses to the table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

This field resets to an architecturally UNKNOWN value.

Type, bits [58:56]

Read only. Specifies the type of entity that requires entries in the corresponding translation table. The possible values of the field are:

Type	Meaning
0b000	Unimplemented. This register does not correspond to a translation table.
0b001	Devices. This register corresponds to a translation table that scales with the width of the DeviceID. Only a single GITS_BASER<n> register reports this type.
0b010	vPEs. GICv4 only. This register corresponds to a translation table that scales with the number of vPEs in the system. The translation table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of vPEs in the system. Only a single GITS_BASER<n> register reports this type.
0b100	Interrupt collections. This register corresponds to a translation table that scales with the number of interrupt collections in the system. The translation table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of interrupt collections. Not more than one GITS_BASER<n> register will report this type.

Other values are reserved.

Note

The minimum number of entries that an ITS must support is N+1, where N is the number of physical PEs in the system.

Arm recommends that the GITS_BASER<n> registers are allocated as follows:

For GICv4.1, the registers are allocated as follows:

- GITS_BASER0.Type is `0b001` (Device).
- GITS_BASER1.Type is either `0b100` (Collection Table) or `0b000` (Unimplemented).
- GITS_BASER2.Type is either `0b010` (vPE) or `0b000` (Unimplemented).
- GITS_BASER<n>.Type, where 'n' is in the range 3 to 7, is `0b000` (Unimplemented).

For GICv3.x and GICv4.0, Arm recommends that the GITS_BASER<n> use the same allocations.

Other allocations of Type values are deprecated.

This field resets to an architecturally UNKNOWN value.

OuterCache, bits [55:53]

Indicates the Outer Cacheability attributes of accesses to the table. The possible values of this field are:

OuterCache	Meaning
`0b000`	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
`0b001`	Normal Outer Non-cacheable.
`0b010`	Normal Outer Cacheable Read-allocate, Write-through.
`0b011`	Normal Outer Cacheable Read-allocate, Write-back.
`0b100`	Normal Outer Cacheable Write-allocate, Write-through.
`0b101`	Normal Outer Cacheable Write-allocate, Write-back.
`0b110`	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
`0b111`	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

Entry_Size, bits [52:48]

Read-only. Specifies the number of bytes per translation table entry, minus one.

Physical_Address, bits [47:12]

Physical Address. When Page_Size is 4KB or 16KB:

- Bits [51:48] of the base physical address are zero.
- This field provides bits[47:12] of the base physical address of the table.
- Bits[11:0] of the base physical address are zero.
- The address must be aligned to the size specified in the Page Size field. Otherwise the effect is CONSTRAINED UNPREDICTABLE, and can be one of the following:
  - Bits[X:12], where X is derived from the page size, are treated as zero.
  - The value of bits[X:12] are used when calculating the address of a table access.

When Page_Size is 64KB:

- Bits[47:16] of the register provide bits[47:16] of the base physical address of the table.
- Bits[15:12] of the register provide bits[51:48] of the base physical address of the table.
- Bits[15:0] of the base physical address are 0.

In implementations that support fewer than 52 bits of physical address, any unimplemented upper bits might be RAZ/WI.

This field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

This field resets to an architecturally UNKNOWN value.

Page_Size, bits [9:8]

The size of page that the translation table uses:

Page_Size	Meaning
0b00	4KB.
0b01	16KB.
0b10	64KB.
0b11	Reserved. Treated as 0b10.

Note

If the GIC implementation supports only a single, fixed page size, this field might be RO.

This field resets to an architecturally UNKNOWN value.

Size, bits [7:0]

The number of pages of physical memory allocated to the table, minus one. GITS_BASER<n>.Page_Size specifies the size of each page.

If GITS_BASER<n>.Type == 0, this field is RAZ/WI.

This field resets to an architecturally UNKNOWN value.

Accessing the GITS_BASER<n>

GITS_BASER<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0100 + 8n	GITS_BASER<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

GITS_CTLR, ITS Control Register

The GITS_CTLR characteristics are:

Purpose

Controls the operation of an ITS.

Configuration

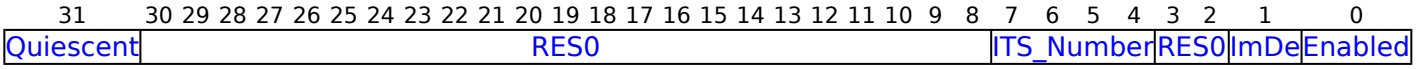
The ITS_Number (bits [7:4]) and bit [1] fields apply only in GICv4 implementations, and are RES0 in GICv3 implementations.

Attributes

GITS_CTLR is a 32-bit register.

Field descriptions

The GITS_CTLR bit assignments are:



Quiescent, bit [31]

Read-only. Indicates completion of all ITS operations when GITS_CTLR.Enabled == 0.

Quiescent	Meaning
0b0	The ITS is not quiescent and cannot be powered down.
0b1	The ITS is quiescent and can be powered down.

For the ITS to be considered inactive~~quiescent~~, there must be no transactions in progress. In addition, all operations required to ensure that mapping data is consistent with external memory must be complete.

Note

In distributed GIC implementations, this bit is set to 1 only after the ITS forwards any operations that have not yet been completed to the Redistributors and receives confirmation that all such operations have reached the appropriate Redistributor.

In GICv4.0 and GICv3.x, when~~When~~ GITS_CTLR.Enabled==1 the value of GITS_CTLR.Quiescent is UNKNOWN.

In GICv4.1, when GITS_CTLR.Enabled==1 the value of GITS_CTLR.Quiescent reads as 1 until the write to Enabled has taken effect and then reads as 0.

This field resets to 1.

Bits [30:8]

Reserved, RES0.

ITS_Number, bits [7:4]

In GICv3 implementations this field is RES0.

In GICv4 implementations with more than one ITS instance, this field indicates the ITS number for use with VMOVP.

It is IMPLEMENTATION DEFINED whether this field is programmable or RO.

If this field is programmable, changing this field when GITS_CTLR.Quiescent == 0 or GITS_CTLR.Enabled == 1 is UNPREDICTABLE.

This field resets to an architecturally UNKNOWN value.

Bits [3:2]

Reserved, RES0.

ImDe, bit [1]

In GICv3 implementations this bit is RES0.

In GICv4 implementations this bit is IMPLEMENTATION DEFINED.

This field resets to `0`.

Enabled, bit [0]

Controls whether the ITS is enabled:

Enabled	Meaning
`0b0`	The ITS is not enabled. Writes to GITS_TRANSLATER are ignored and no further command queue entries are processed.
`0b1`	The ITS is enabled. Writes to GITS_TRANSLATER result in interrupt translations and the command queue is processed.

If a write to this register changes this field from 1 to 0, the ITS must ensure that both:

- Any caches containing mapping data are made consistent with external memory.
- GITS_CTLR.Quiescent == 0 until all caches are consistent with external memory.

Changing GITS_CTLR.Enabled from 0 to 1 when GITS_CTLR.Quiescent is 0 results in UNPREDICTABLE behavior.

This field resets to `0`.

Accessing the GITS_CTLR

GITS_CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	`0x0000`	GITS_CTLR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

GITS_CWRITER, ITS Write Register

The GITS_CWRITER characteristics are:

Purpose

Specifies the offset from GITS_CBASER where software writes the next ITS command.

Configuration

~~RW fields in this register reset to architecturally UNKNOWN values.~~

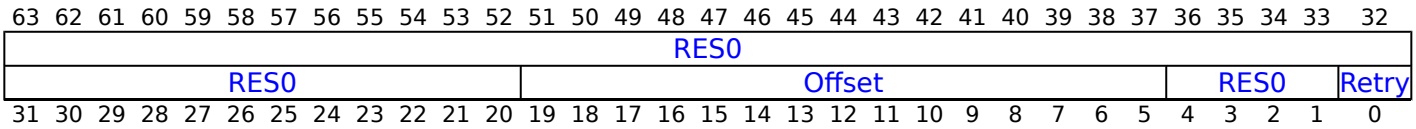
Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CWRITER is a 64-bit register.

Field descriptions

The GITS_CWRITER bit assignments are:



Bits [63:20]

Reserved, RES0.

Offset, bits [19:5]

Bits [19:5] of the offset from GITS_CBASER. Bits [4:0] of the offset are zero.

This field resets to an architecturally UNKNOWN value.

Bits [4:1]

Reserved, RES0.

Retry, bit [0]

Writing this bit has the following effects:

Retry	Meaning
0b0	No effect on the processing commands by the ITS.
0b1	Restarts the processing of commands by the ITS if it stalled because of a command error. **Note** If the processing of commands is not stalled because of a command error, writing 1 to this bit has no effect.

When read, this bit is RES0.

See The ITS Command Interface for more information.

If GITS_CWRITER is written with a value outside of the valid range specified by GITS_CBASER.Physical_Address and GITS_CBASER.Size, behavior is a CONSTRAINED UNPREDICTABLE choice, as follows:

- The command queue is considered invalid, and no further commands are processed until GITS_CWRITER is written with a value that is in the valid range.
- The value is treated as a valid UNKNOWN value.

An implementation might choose to report a system error in an IMPLEMENTATION DEFINED manner.

Accessing the GITS_CWRITER

GITS_CWRITER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0088	GITS_CWRITER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99e984cbfe3431cc1e9707

GITS_MPAMIDR, Report maximum PARTID and PMG Register

The GITS_MPAMIDR characteristics are:

Purpose

Reports the maximum support PARTID and PMG values.

Configuration

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GITS_MPAMIDR are RES0.

A copy of this register is provided for each ITS.

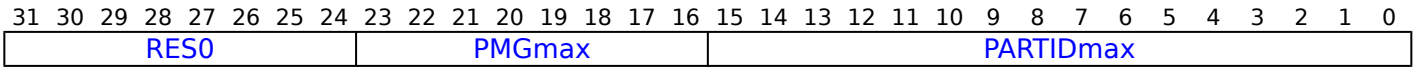
When GITS_TYPER.MPAM==0, this register is RES0.

Attributes

GITS_MPAMIDR is a 32-bit register.

Field descriptions

The GITS_MPAMIDR bit assignments are:



Bits [31:24]

Reserved, RES0.

PMGmax, bits [23:16]

Maximum PMG value supported.

PARTIDmax, bits [15:0]

Maximum PARTID value supported.

Accessing the GITS_MPAMIDR

GITS_MPAMIDR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x0010

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GITS_MPIDR, Report ITS's affinity.

The GITS_MPIDR characteristics are:

Purpose

Reports ITS's affinity when the vPE Table is shared with Redistributors.

Configuration

This register is present only when GICv4.1 is implemented. Otherwise, direct accesses to GITS_MPIDR are RES0.

A copy of this register is provided for each ITS.

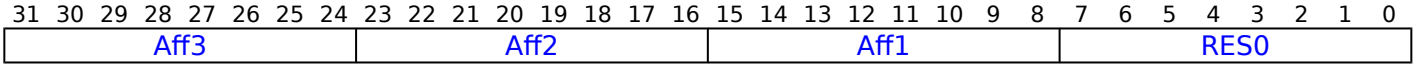
When GITS_TYPER.SVPET==0, this register is RES0.

Attributes

GITS_MPIDR is a 32-bit register.

Field descriptions

The GITS_MPIDR bit assignments are:



Aff3, bits [31:24]

Aff2, bits [23:16]

Aff1, bits [15:8]

Bits [7:0]

Reserved, RES0.

Accessing the GITS_MPIDR

GITS_MPIDR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x0018

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.

GITS_PARTIDR, Set PARTID and PMG Register

The GITS_PARTIDR characteristics are:

Purpose

Sets the PARTID and PMG values used for memory accesses by the ITS.

Configuration

This register is present only when GICv3.1~~GIC, >=3.1~~ is implemented. Otherwise, direct accesses to GITS_PARTIDR are RES0.

A copy of this register is provided for each ITS.

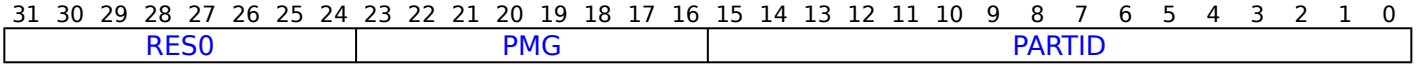
When GITS_TYPER.MPAM==0, this register is RES0.

Attributes

GITS_PARTIDR is a 32-bit register.

Field descriptions

The GITS_PARTIDR bit assignments are:



Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

PMG value used when ITS accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PMG values in the range 0 to PMG_MAX are stateful or RES0.

PARTID, bits [15:0]

PARTID value used when ITS accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PARTID values in the range 0 to PARTID_MAX are stateful or RES0.

Accessing the GITS_PARTIDR

GITS_PARTIDR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x0014

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RW**.
- When IsAccessSecure() accesses to this register are **RW**.
- When !IsAccessSecure() accesses to this register are **RW**.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

GITS_SGIR, ITS SGI Register

The GITS_SGIR characteristics are:

Purpose

Written by software to signal a virtual SGI for translation by the ITS.

Configuration

This register is present only when GICv4.1 is implemented. Otherwise, direct accesses to GITS_SGIR are RES0.

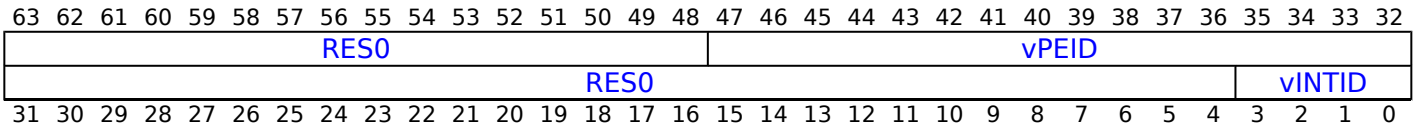
This register is provided only in GICv4.1 implementations.

Attributes

GITS_SGIR is a 64-bit register.

Field descriptions

The GITS_SGIR bit assignments are:



Bits [63:48]

Reserved, RES0.

vPEID, bits [47:32]

ID of target vPEID.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are RES0.

Bits [31:4]

Reserved, RES0.

vINTID, bits [3:0]

INTID of virtual SGI.

Accessing the GITS_SGIR

64-bit access only.

GITS_SGIR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x20020

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **WO**.
- When IsAccessSecure() accesses to this register are **WO**.
- When !IsAccessSecure() accesses to this register are **WO**.

GITS_TYPER, ITS Type Register

The GITS_TYPER characteristics are:

Purpose

Specifies the features that an ITS supports.

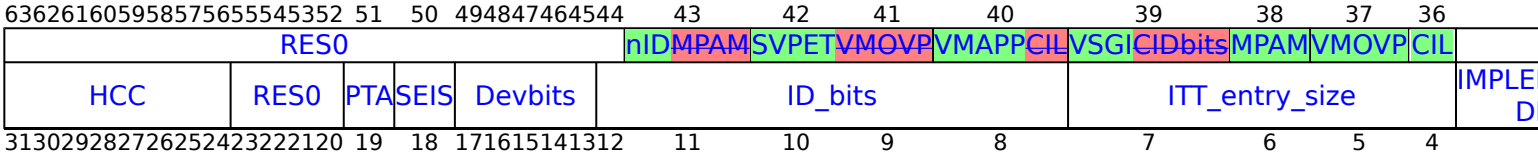
Configuration

Attributes

GITS_TYPER is a 64-bit register.

Field descriptions

The GITS_TYPER bit assignments are:



Bits [63:4439]

Reserved, RES0.

nID, bit [43]

When GICv4.1 is implemented:

nID

nID	Meaning
0b0	Individual doorbell interrupt supported.
0b1	Individual doorbell interrupt not supported.

Otherwise:

Reserved, RES0.

SVPET, bits [42:41]

When GICv4.1 is implemented:

SVPET

SVPET	Meaning
0b00	vPE Table is not shared with Redistributors.
0b01	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR.Aff3.
0b10	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3 and Aff2.
0b11	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3, Aff2 and Aff1.

Otherwise:

Reserved, RES0.

VMAPP, bit [40]

When GICv4.1 is implemented:

VMAPP

VMAPP	Meaning
0b0	GICv4.0 VMAPP command layout.
0b1	GICv4.1 VMAPP command layout.

Otherwise:

Reserved, RES0.

VSGI, bit [39]

When GICv4.1 is implemented:

VSGI

VSGI	Meaning
0b0	Direct injection of SGIs is not supported.
0b1	Direct injection of SGIs is supported.

Otherwise:

Reserved, RES0.

MPAM, bit [38]

When GIC, >=3.1 is implemented:

MPAM

MPAM	Meaning
0b0	MPAM is not supported.
0b1	MPAM is supported.

Otherwise:

Reserved, RES0.

VMOVP, bit [37]

Indicates the form of the VMOVP command.

VMOVP	Meaning
0b0	When moving a vPE, software must issue a VMOVP on all ITSs that have mappings for that vPE. The ITSList and Sequence Number fields in the VMOVP command must ensure synchronization, otherwise behavior is UNPREDICTABLE.
0b1	When moving a vPE, software must only issue a VMOVP on one of the ITSs that has a mapping for that vPE. The ITSList and Sequence Number fields in the VMOVP command are RES0.

CIL, bit [36]

Collection ID Limit.

CIL	Meaning
0b0	ITS supports 16-bit Collection ID, GITS_TYPER.CIDbits is RES0.
0b1	GITS_TYPER.CIDbits indicates supported Collection ID size

In implementations that do not support Collections in external memory, this bit is RES0 and the number of Collections supported is reported by GITS_TYPER.HCC.

CIDbits, bits [35:32]

Number of Collection ID bits.

- The number of bits of Collection ID minus- one.~~1.~~
- When GITS_TYPER.CIL == 0, this field is RES0.

HCC, bits [31:24]

Hardware Collection Count. The number of interrupt collections supported by the ITS without provisioning of external memory.

Note

Collections held in hardware are unmapped at reset.

Bits [23:20]

Reserved, RES0.

PTA, bit [19]

Physical Target Addresses. Indicates the format of the target address:

PTA	Meaning
0b0	The target address corresponds to the PE number specified by GICR_TYPER.Processor_Number.
0b1	The target address corresponds to the base physical address of the required Redistributor.

See Target addresses for more information.

SEIS, bit [18]

SEI support. Indicates whether the virtual CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The ITS does not support local generation of SEIs.
0b1	The ITS supports local generation of SEIs.

Devbits, bits [17:13]

The number of DeviceID bits implemented, minus one.

ID_bits, bits [12:8]

The number of EventID bits implemented, minus one.

ITT_entry_size, bits [7:4]

Read-only. Indicates the number of bytes per translation table entry, minus one.

See the ITS command 'MAPD' for more information.

IMPLEMENTATION DEFINED, bit [3]

IMPLEMENTATION DEFINED.

CCT, bit [2]

Cumulative Collection Tables.

CCT	Meaning
0b0	The total number of supported collections is determined by the number of collections held in memory only.
0b1	The total number of supported collections is determined by number of collections that are held in memory and the number indicated by GITS_TYPER.HCC.

If GITS_TYPER.HCC == 0, or if memory backed collections are not supported (all GITS_BASER<n>.Type != 100), this bit is RES0.

Virtual, bit [1]

Indicates whether the ITS supports virtual LPIs and direct injection of virtual LPIs:

Virtual	Meaning
0b0	The ITS does not support virtual LPIs or direct injection of virtual LPIs.
0b1	The ITS supports virtual LPIs and direct injection of virtual LPIs.

This field is RES0 in GICv3 implementations.

Physical, bit [0]

Indicates whether the ITS supports physical LPIs:

Physical	Meaning
0b0	The ITS does not support physical LPIs.
0b1	The ITS supports physical LPIs.

This field is RES1, indicating that the ITS supports physical LPIs.

Accessing the GITS_TYPER

GITS_TYPER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0008	GITS_TYPER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0b0 accesses to this register are **RO**.
- When IsAccessSecure() accesses to this register are **RO**.
- When !IsAccessSecure() accesses to this register are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

MPAMCFG_CPBM, MPAM Cache Portion Bitmap Partition Configuration Register

The MPAMCFG_CPBM characteristics are:

Purpose

The MPAMCFG_CPBM register is a read-write register that configures the cache portions that a PARTID is allowed to allocate. After setting MPAMCFG_PART_SEL with a PARTID, software (usually a hypervisor) writes to the MPAMCFG_CPBM register to configure which cache portions the PARTID is allowed to allocate.

MPAMCFG_CPBM_s controls cache portions for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_CPBM_ns controls the cache portions for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

Configuration

The power domain of MPAMCFG_CPBM is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_CPOR_PART~~MPAMF_IDR.HAS_CPOR~~ == 1. Otherwise, direct accesses to MPAMCFG_CPBM are RES0.

Attributes

MPAMCFG_CPBM is a 32768-bit register.

Field descriptions

The MPAMCFG_CPBM bit assignments are:

CPBM<n>, bit [n], for n = 0 to 32767

Each bit, CPBM<n>, grants permission to the PARTID to allocate cache lines within cache portion n.

CPBM<n>	Meaning
0b0	The PARTID is not permitted to allocate into cache portion n.
0b1	The PARTID is permitted to allocate within cache portion n.

The number of bits in the cache portion partitioning bit map of this component is given in MPAMF_CPOR_IDR.CPBM_WD. CPBM_WD contains a value from 1 to 2^{15}, inclusive. Values of CPBM_WD greater than 32 require a group of 32-bit registers to access the CPBM, up to 1024 registers.

Bits CPBM<n>, where n is greater than CPBM_WD, are not required to be implemented.

Accessing the MPAMCFG_CPBM

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_CPBM_s must be accessible from the Secure MPAM feature page. MPAMCFG_CPBM_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_CPBM_s and MPAMCFG_CPBM_ns must be separate registers. The Secure instance (MPAMCFG_CPBM_s) accesses the cache portion bitmaps used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_CPBM_ns) accesses the cache portion bitmaps used for Non-secure PARTIDs.

MPAMCFG_CPBM can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x1000	MPAMCFG_CPBM_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x1000	MPAMCFG_CPBM_ns

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

MPAMCFG_PART_SEL, MPAM Partition Configuration Selection Register

The MPAMCFG_PART_SEL characteristics are:

Purpose

Selects a partition ID to configure. MPAMCFG_PART_SEL_s selects a Secure PARTID to configure. MPAMCFG_PART_SEL_ns selects a Non-secure PARTID to configure.

After setting this register with a PARTID, software (usually a hypervisor) can perform a series of accesses to MPAMCFG registers to configure parameters for MPAM resource controls to use when requests have that PARTID.

Configuration

The power domain of MPAMCFG_PART_SEL is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_CCAP_PART == 1, or MPAMF_IDR.HAS_CPOR_PART == 1, or MPAMF_IDR.HAS_MBW_PART == 1, or MPAMF_IDR.HAS_PRI_PART == 1, or MPAMF_IDR.HAS_PARTID_NRW == 1, or (MPAMF_IDR.EXT == 0 and MPAMF_IDR.HAS_IMPL_IDR == 1) or (MPAMF_IDR.EXT == 1, MPAMF_IDR.HAS_IMPL_IDR == 1 and MPAMF_IDR.NO_IMPL_PART == 0). Otherwise, direct accesses to MPAMCFG_PART_SEL are RES0.

Attributes

MPAMCFG_PART_SEL is a 32-bit register.

Field descriptions

The MPAMCFG_PART_SEL bit assignments are:

31 30 29 28	27 26 25 24	23 22 21 20 19 18 17	16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	RIS	RES0	INTERNAL	PARTID_SEL

Bits [31:28]

Reserved, RES0.

RIS, bits [27:24]

When ARMv8.6-MPAM is implemented, MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RISMAPMF_IDR.HAS_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MPAMCFG registers and describe with MPAMF ID registers.

Otherwise:

Reserved, RES0.

Bits [23:17]

Reserved, RES0.

INTERNAL, bit [16]

Internal PARTID.

If MPAMF_IDR.HAS_PARTID_NRW =0, this field is RAZ/WI.

If MPAMF_IDR.HAS_PARTID_NRW = 1:

INTERNAL	Meaning
0b0	PARTID_SEL is interpreted as a request PARTID and ignored except for use with MPAMCFG_INTPARTID register access.
0b1	PARTID_SEL is interpreted as an internal PARTID and used for access to MPAMCFG control settings except for MPAMCFG_INTPARTID.

If PARTID narrowing is implemented as indicated by MPAMF_IDR.HAS_PARTID_NRW = 1, when accessing other MPAMCFG registers the value of the MPAMCFG_PART_SEL.INTERNAL bit is checked for these conditions:

- When the MPAMCFG_INTPARTID register is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 0, an Unexpected_INTERNAL error is set in MPAMF_ESR.
- When an MPAMCFG register other than MPAMCFG_INTPARTID is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 1, MPAMF_ESR is set to indicate an intPARTID_Range error.

In either error case listed here, the value returned by a read operation is UNPREDICTABLE, and the control settings are not affected by a write.

PARTID_SEL, bits [15:0]

Selects the partition ID to configure.

Reads and writes to other MPAMCFG registers are indexed by PARTID_SEL and by the NS bit used to access MPAMCFG_PART_SEL to access the configuration for a single partition.

Accessing the MPAMCFG_PART_SEL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_PART_SEL_s must be accessible from the Secure MPAM feature page. MPAMCFG_PART_SEL_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_PART_SEL_s and MPAMCFG_PART_SEL_ns must be separate registers. The Secure instance (MPAMCFG_PART_SEL_s) accesses the PARTID selector used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_PART_SEL_ns) accesses the PARTID selector used for Non-secure PARTIDs.

MPAMCFG_PART_SEL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0100	MPAMCFG_PART_SEL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0100	MPAMCFG_PART_SEL_ns

Accesses on this interface are **RW**.

MPAMCFG_PRI, MPAM Priority Partition Configuration Register

The MPAMCFG_PRI characteristics are:

Purpose

Controls~~MPAMCFG_PRI is a 32-bit read-write register that controls~~ the internal and downstream priority of requests attributed to the PARTID selected by MPAMCFG_PART_SEL. MPAMCFG_PRI_s controls the priorities for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_PRI_ns controls the priorities for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

Configuration

The power domain of MPAMCFG_PRI is IMPLEMENTATION DEFINED.

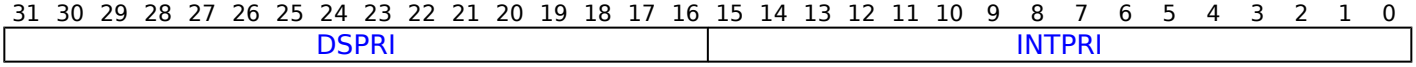
This register is present only when MPAMF_IDR.HAS_PRI_PART == 1. Otherwise, direct accesses to MPAMCFG_PRI are RES0.

Attributes

MPAMCFG_PRI is a 32-bit register.

Field descriptions

The MPAMCFG_PRI bit assignments are:



DSPRI, bits [31:16]

Downstream priority.

If MPAMF_PRI_IDR.HAS_DSPRI == 0, bits of this field are RES0 ~~,~~as this field is not used.

If MPAMF_PRI_IDR.HAS_DSPRI == 1, this field is a priority value applied to downstream communications from this MSC for transactions of the partition selected by MPAMCFG_PART_SEL.

The implemented width of this field is MPAMF_PRI_IDR.DSPRI_WD bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of MPAMF_PRI_IDR.DSPRI_0_IS_LOW.

INTPRI, bits [15:0]

Internal priority.

If MPAMF_PRI_IDR.HAS_INTPRI == 0, bits of this field are RES0 as this field is not used.

If MPAMF_PRI_IDR.HAS_INTPRI == 1, this field is a priority value applied internally inside this MSC for transactions of the partition selected by Mext-PAMCFG_PART_SEL.

The implemented width of this field is MPAMF_PRI_IDR.INTPRI_WD bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of MPAMF_PRI_IDR.INTPRI_0_IS_LOW.

Accessing the MPAMCFG_PRI

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_PRI_s must be accessible from the Secure MPAM feature page. MPAMCFG_PRI_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_PRI_s and MPAMCFG_PRI_ns must be separate registers. The Secure instance (MPAMCFG_PRI_s) accesses the priority partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_PRI_ns) accesses the priority partitioning used for Non-secure PARTIDs.

MPAMCFG_PRI can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0400	MPAMCFG_PRI_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0400	MPAMCFG_PRI_ns

Accesses on this interface are **RW**.

MPAMF_CCAP_IDR, MPAM Features Cache Capacity Partitioning ID register

The MPAMF_CCAP_IDR characteristics are:

Purpose

IndicatesThe MPAMF_CCAP_IDR is a 32-bit read-only register that indicates the number of fractional bits in MPAMCFG_CMAX for this MSC. MPAMF_CCAP_IDR_s indicates the number of fractional bits in the Secure instance of MPAMCFG_CMAX. MPAMF_CCAP_IDR_ns indicates the number of fractional bits in the Non-secure instance of MPAMCFG_CMAX.

Configuration

The power domain of MPAMF_CCAP_IDR is IMPLEMENTATION DEFINED.

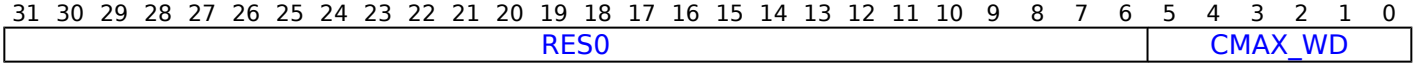
This register is present only when MPAMF_IDR.HAS_CCAP_PART == 1. Otherwise, direct accesses to MPAMF_CCAP_IDR are RES0.

Attributes

MPAMF_CCAP_IDR is a 32-bit register.

Field descriptions

The MPAMF_CCAP_IDR bit assignments are:



Bits [31:6]

Reserved, RES0.

CMAX_WD, bits [5:0]

Number of fractional bits implemented in the cache capacity partitioning control, MPAMCFG_CMAX.CMAX, of this device. See MPAMCFG_CMAX.

This field must contain a value from 1 to 16, inclusive.

Accessing the MPAMF_CCAP_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_CCAP_IDR is read-only.

MPAMF_CCAP_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_CCAP_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_CCAP_IDR_s) and Non-secure (MPAMF_CCAP_IDR_ns) MPAM feature pages.

MPAMF_CCAP_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0038	MPAMF_CCAP_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0038	MPAMF_CCAP_IDR_ns

Accesses on this interface are **RO**.

MPAMF_CPOR_IDR, MPAM Features Cache Portion Partitioning ID register

The MPAMF_CPOR_IDR characteristics are:

Purpose

IndicatesThe MPAMF_CPOR_IDR is a 32-bit read-only register that indicates the number of bits in MPAMCFG_CPBM for this MSC. MPAMF_CPOR_IDR_s indicates the number of bits in the Secure instance of MPAMCFG_CPBM. MPAMF_CPOR_IDR_ns indicates the number of bits in the Non-secure instance of MPAMCFG_CPBM.

Configuration

The power domain of MPAMF_CPOR_IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_CPOR_PARTMPAMF_IDR.HAS_CPOR == 1. Otherwise, direct accesses to MPAMF_CPOR_IDR are RES0.

Attributes

MPAMF_CPOR_IDR is a 32-bit register.

Field descriptions

The MPAMF_CPOR_IDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																CPBM_WD															

Bits [31:16]

Reserved, RES0.

CPBM_WD, bits [15:0]

Number of bits in the cache portion partitioning bit map of this device. See MPAMCFG_CPBM.

This field must contain a value from 1 to 32768, inclusive. Values greater than 32 require a group of 32-bit registers to access the CPBM, up to 1024 if CPBM_WD is the largest value.

Accessing the MPAMF_CPOR_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_CPOR_IDR is read-only.

MPAMF_CPOR_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_CPOR_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_CPOR_IDR_s) and Non-secure (MPAMF_CPOR_IDR_ns) MPAM feature pages.

MPAMF_CPOR_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0030	MPAMF_CPOR_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0030	MPAMF_CPOR_IDR_ns

Accesses on this interface are **RO**.

MPAMF_CSUMON_IDR, MPAM Features Cache Storage Usage Monitoring ID register

The MPAMF_CSUMON_IDR characteristics are:

Purpose

IndicatesThe MPAMF_CSUMON_IDR is a 32-bit read-only register that indicates the number of cache storage usage monitors for this MSC. MPAMF_CSUMON_IDR_s indicates the number of Secure cache storage usage monitors. MPAMF_CSUMON_IDR_ns indicates the number of Non-secure cache storage usage monitors.

Configuration

The power domain of MPAMF_CSUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MPAMF_CSUMON_IDR are RES0.

Attributes

MPAMF_CSUMON_IDR is a 32-bit register.

Field descriptions

The MPAMF_CSUMON_IDR bit assignments are:

31	30 29 28 27 26 25 24 23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
HAS_CAPTURE	RES0	NUM_MON

HAS_CAPTURE, bit [31]

The implementation of this MSC supports copying an MSMON_CSU to the corresponding MSMON_CSU_CAPTURE on a capture event.

HAS_CAPTURE	Meaning
0b0	MSMON_CSU_CAPTURE is not implemented and there is no support for capture events in the CSU monitor.
0b1	The MSMON_CSU_CAPTURE register is implemented and the CSU monitor supports the capture event behavior.

Bits [30:16]

Reserved, RES0.

NUM_MON, bits [15:0]

The number of cache storage usage monitors implemented in this MSC.

Accessing the MPAMF_CSUMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_CSUMON_IDR is read-only.

MPAMF_CSUMON_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_CSUMON_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_CSUMON_IDR_s) and Non-secure (MPAMF_CSUMON_IDR_ns) MPAM feature pages.

MPAMF_CSUMON_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0088	MPAMF_CSUMON_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0088	MPAMF_CSUMON_IDR_ns

Accesses on this interface are **RO**.

MPAMF_IDR, MPAM Features Identification Register

The MPAMF_IDR characteristics are:

Purpose

Indicates which memory partitioning and monitoring features are present on this MSC. MPAMF_IDR_s indicates the MPAM features accessed from the Secure MPAM feature page. MPAMF_IDR_ns indicates the MPAM features accessed from the Non-secure MPAM feature page.

Configuration

The power domain of MPAMF_IDR is IMPLEMENTATION DEFINED.

Attributes

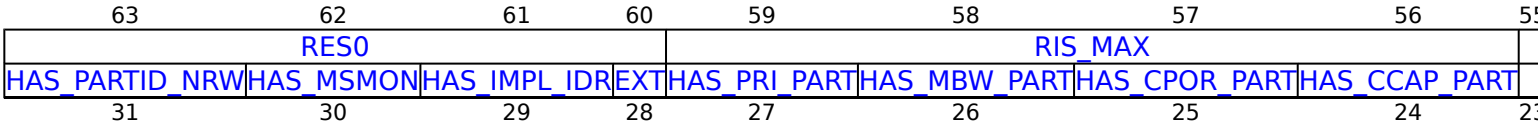
MAMPF_IDR is 64-bit register when ARMv8.6-MPAM is implemented.

Otherwise, MAMPF_IDR is a 32-bit register.

Field descriptions

The MPAMF_IDR bit assignments are:

When ARMv8.6-MPAM is implemented:



Bits [63:60]

Reserved, RES0.

RIS_MAX, bits [59:56]

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Maximum RIS value supported in MPAMCFG_PART_SEL. Must be `0b0000` if MPAMF_IDR.HAS_RIS == 0.

Otherwise:

Reserved, RES0.

Bits [55:40]

Reserved, RES0.

HAS_ESR, bit [39]

When MPAMF_IDR.EXT == 1:

MPAMF_ESR is implemented.

HAS_ESR	Meaning
0b0	MPAMF_ESR, MPAM_ECR and MPAM error handling are not implemented.
0b1	MPAMF_ESR, MPAM_ECR and MPAM error handling are implemented.

Otherwise:

Reserved, RES0.

HAS_EXTD_ESR, bit [38]

When MPAMF_IDR.EXT == 1:

MPAMF_ESR is 64 bits.

HAS_EXTD_ESR	Meaning
0b0	MPAMF_ESR is 32 bits.
0b1	MPAMF_ESR is 64 bits.

Otherwise:

Reserved, RES0.

NO_IMPL_MSMON, bit [37]

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_IMPL_IDR == 1:

MPAMF_IMPL_IDR defines no IMPLEMENTATION DEFINED resource monitors.

NO_IMPL_MSMON	Meaning
0b0	MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource monitor.
0b1	MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource monitors.

Otherwise:

Reserved, RES0.

NO_IMPL_PART, bit [36]

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_IMPL_IDR == 1:

MPAMF_IMPL_IDR defines no IMPLEMENTATION DEFINED resource controls.

NO_IMPL_PART	Meaning
0b0	MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource control.
0b1	MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource controls.

Otherwise:

Reserved, RES0.

Bits [35:33]

Reserved, RES0.

HAS_RIS, bit [32]

When MPAMF_IDR.EXT == 1:

Has resource instance selector. Indicates that MPAMCFG_PART_SEL contains the RIS field that selects a resource instance to control.

HAS_RIS	Meaning
0b0	MPAMCFG_PART_SEL does not implement the MPAMFCFG_PART_SEL.RIS field or multiple resource instance suport.
0b1	MPAMCFG_PART_SEL implements the MPAMFCFG_PART_SEL.RIS field and MPAM resource instance numbers up to and including MPAMF_IDR.RIS_MAX.

Otherwise:

Reserved, RES0.

HAS_PARTID_NRW, bit [31]

Has PARTID narrowing.

HAS_PARTID_NRW	Meaning
0b0	Does not have MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID or intPARTID mapping support.
0b1	Supports the MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID registers.

HAS_MSMON, bit [30]

Has resource monitors. Indicates whether this MSC has MPAM resource monitors.

HAS_MSMON	Meaning
0b0	Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR.
0b1	Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR.

HAS_IMPL_IDR, bit [29]

Has MPAMF_IMPL_IDR. Indicates whether this MSC has the implementation-specific MPAM features register, MPAMF_IMPL_IDR.

HAS_IMPL_IDR	Meaning
0b0	Does not have MPAMF_IMPL_IDR.
0b1	Has MPAMF_IMPL_IDR.

EXT, bit [28]

From Armv8.6:

Extended MPAMF_IDR.

EXT	Meaning
0b0	MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits.
0b1	MPAMF_IDR has bits defined in [63:32]. The register is 64-bits.

Otherwise:

Reserved, RES0.

HAS_PRI_PART, bit [27]

Has priority partitioning. Indicates whether this MSC implements MPAM priority partitioning and MPAMF_PRI_IDR.

HAS_PRI_PART	Meaning
0b0	Does not support priority partitioning or have MPAMF_PRI_IDR.
0b1	Has MPAMF_PRI_IDR.

HAS_MBW_PART, bit [26]

Has memory bandwidth partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and MPAMF_MBW_IDR.

HAS_MBW_PART	Meaning
0b0	Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register.
0b1	Has MPAMF_MBW_IDR register.

HAS_CPOR_PART, bit [25]

Has cache portion partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and MPAMF_CPOR_IDR.

HAS_CPOR_PART	Meaning
0b0	Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPBM registers.
0b1	Has MPAMF_CPOR_IDR and MPAMCFG_CPBM registers.

HAS_CCAP_PART, bit [24]

Has cache capacity partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

HAS_CCAP_PART	Meaning
0b0	Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.
0b1	Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

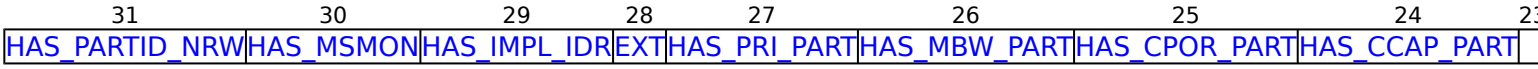
PMG_MAX, bits [23:16]

Maximum value of Non-secure PMG supported by this component.

PARTID_MAX, bits [15:0]

Maximum value of Non-secure PARTID supported by this component.

Otherwise:



HAS_PARTID_NRW, bit [31]

Has PARTID narrowing.

HAS_PARTID_NRW	Meaning
0b0	Does not have MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID or intPARTID mapping support.
0b1	Supports the MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID registers.

HAS_MSMON, bit [30]

Has resource monitors. Indicates whether this MSC has MPAM resource monitors.

HAS_MSMON	Meaning
0b0	Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR.
0b1	Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR.

HAS_IMPL_IDR, bit [29]

Has MPAMF_IMPL_IDR. Indicates whether this MSC has the implementation-specific MPAM features register, MPAMF_IMPL_IDR.

HAS_IMPL_IDR	Meaning
0b0	Does not have MPAMF_IMPL_IDR.
0b1	Has MPAMF_IMPL_IDR.

EXT, bit [28]

From Armv8.6:

Extended MPAMF_IDR.

EXT	Meaning
0b0	MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits.
0b1	MPAMF_IDR has bits defined in [63:32]. The register is 64-bits.

Otherwise:

Reserved, RES0.

HAS_PRI_PART, bit [27]

Has priority partitioning. Indicates whether this MSC implements MPAM priority partitioning and MPAMF_PRI_IDR.

HAS_PRI_PART	Meaning
0b0	Does not support priority partitioning or have MPAMF_PRI_IDR.
0b1	Has MPAMF_PRI_IDR.

HAS_MBW_PART, bit [26]

Has memory bandwidth partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and MPAMF_MBW_IDR.

HAS_MBW_PART	Meaning
0b0	Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register.
0b1	Has MPAMF_MBW_IDR register.

HAS_CPOR_PART, bit [25]

Has cache portion partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and MPAMF_CPOR_IDR.

HAS_CPOR_PART	Meaning
0b0	Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPBM registers.
0b1	Has MPAMF_CPOR_IDR and MPAMCFG_CPBM registers.

HAS_CCAP_PART, bit [24]

Has cache capacity partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

HAS_CCAP_PART	Meaning
0b0	Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.
0b1	Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

PMG_MAX, bits [23:16]

Maximum value of Non-secure PMG supported by this component.

PARTID_MAX, bits [15:0]

Maximum value of Non-secure PARTID supported by this component.

Accessing the MPAMF_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_IDR is read-only.

MPAMF_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_IDR_s) and Non-secure (MPAMF_IDR_ns) MPAM feature pages.

MPAMF_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0000	MPAMF_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance

MPAM	MPAMF_BASE_ns	0x0000	MPAMF_IDR_ns

Accesses on this interface are **RO**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

MPAMF_IMPL_IDR, MPAM Implementation-Specific Partitioning Feature Identification Register

The MPAMF_IMPL_IDR characteristics are:

Purpose

IndicatesThe MPAMF_IMPL_IDR is a 32-bit read-only register that indicates the implementation-defined partitioning and monitoring features and parameters of the MSC. MPAMF_IMPL_IDR_s indicates implementation-defined partitioning and monitoring features accessed from the Secure MPAM feature page. MPAMF_IMPL_IDR_ns indicates those accessed from the Non-secure MPAM feature page.

Configuration

The power domain of MPAMF_IMPL_IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_IMPL_IDR == 1. Otherwise, direct accesses to MPAMF_IMPL_IDR are RES0.

Attributes

MPAMF_IMPL_IDR is a 32-bit register.

Field descriptions

The MPAMF_IMPL_IDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINEDIMP DEF																															

IMPLEMENTATIONIMP DEFINEDDEF, bits [31:0]

IMPLEMENTATION DEFINED.

All 32 bits of this register are available to be used as the implementer sees fit to indicate the presence of implementation-defined MPAM features in this MSC and to give additional implementation-specific read-only information about the parameters of implementation-specific MPAM features to software.

Accessing the MPAMF_IMPL_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_IMPL_IDR is read-only.

MPAMF_IMPL_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_IMPL_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_IMPL_IDR_s) and Non-secure (MPAMF_IMPL_IDR_ns) MPAM feature pages.

MPAMF_IMPL_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

MPAM	MPAMF_BASE_s	0x0028	MPAMF_IMPL_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0028	MPAMF_IMPL_IDR_ns

Accesses on this interface are **RO**.

MPAMF_MBW_IDR, MPAM Memory Bandwidth Partitioning Identification Register

The MPAMF_MBW_IDR characteristics are:

Purpose

IndicatesThe MPAMF_MBW_IDR is a 32-bit read-only register that indicates which MPAM bandwidth partitioning features are present on this MSC. MPAMF_MBW_IDR_s indicates bandwidth partitioning features accessed from the Secure MPAM feature page. MPAMF_MBW_IDR_ns indicates bandwidth partitioning features accessed from the Non-secure MPAM feature page.

Configuration

The power domain of MPAMF_MBW_IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MBW_PART == 1. Otherwise, direct accesses to MPAMF_MBW_IDR are RES0.

Attributes

MPAMF_MBW_IDR is a 32-bit register.

Field descriptions

The MPAMF_MBW_IDR bit assignments are:

31	30:29	28:27	26:25	24:23	22:21	20:19	18:17	16	15	14	13	12	11	10	9:8	7:6	5:4	3:2	1:0
RES0	BWPBM_WD								RES0	WINDWR	HAS_PROP	HAS_PBM	HAS_MAX	HAS_MIN	RES0			BWA_WD	

Bits [31:29]

Reserved, RES0.

BWPBM_WD, bits [28:16]

Bandwidth portion bitmap width.

The number of bandwidth portion bits in MPAMCFG_MBW_PBM.BWPBM.

This field must contain a value from 1 to 4096, inclusive. Values greater than 32 require a group of 32-bit registers to access the BWPBM, up to 128 if BWPBM_WD is the largest value.

Bit [15]

Reserved, RES0.

WINDWR, bit [14]

Indicates the bandwidth accounting period register is writable.

WINDWR	Meaning
0b0	The bandwidth accounting period is readable from MPAMCFG_MBW_WINWD which might be fixed or vary due to clock rate reconfiguration of the memory channel or memory controller.
0b1	The bandwidth accounting width is readable and writable per partition in MPAMCFG_MBW_WINWD.

HAS_PROP, bit [13]

Indicates that this MSC implements proportional stride bandwidth partitioning and the MPAMCFG_MBW_PROP register.

HAS_PROP	Meaning
0b0	There is no memory bandwidth proportional stride control and no MPAMCFG_MBW_PROP register.
0b1	The MPAMCFG_MBW_PROP register exists and the proportional stride memory bandwidth allocation scheme is supported.

HAS_PBM, bit [12]

Indicates that this MSC implements bandwidth portion partitioning and the MPAMCFG_MBW_PBM register.

HAS_PBM	Meaning
0b0	There is no memory bandwidth portion control and no MPAMCFG_MBW_PBM register.
0b1	The MPAMCFG_MBW_PBM register exists and the memory bandwidth portion allocation scheme exists.

HAS_MAX, bit [11]

Indicates that this MSC implements maximum bandwidth partitioning and the MPAMCFG_MBW_MAX register.

HAS_MAX	Meaning
0b0	There is no maximum memory bandwidth control and no MPAMCFG_MBW_MAX register.
0b1	The MPAMCFG_MBW_MAX register exists and the maximum memory bandwidth allocation scheme is supported.

HAS_MIN, bit [10]

Indicates that this MSC implements minimum bandwidth partitioning.

HAS_MIN	Meaning
0b0	There is no minimum memory bandwidth control and no MPAMCFG_MBW_MIN register.
0b1	The MPAMCFG_MBW_MIN register exists and the minimum memory bandwidth allocation scheme is supported.

Bits [9:6]

Reserved, RES0.

BWA_WD, bits [5:0]

Number of implemented bits in the bandwidth allocation fields: MIN, MAX and STRIDE. See MPAMCFG_MBW_MIN, MPAMCFG_MBW_MAX and MPAMCFG_MBW_PROP.

This field must have a value from 1 to 16, inclusive.

Accessing the MPAMF_MBW_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_MBW_IDR is read-only.

MPAMF_MBW_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_MBW_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_MBW_IDR_s) and Non-secure (MPAMF_MBW_IDR_ns) MPAM feature pages.

MPAMF_MBW_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0040	MPAMF_MBW_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0040	MPAMF_MBW_IDR_ns

Accesses on this interface are **RO**.

MPAMF_MBWUMON_IDR, MPAM Features Memory Bandwidth Usage Monitoring ID register

The MPAMF_MBWUMON_IDR characteristics are:

Purpose

IndicatesThe ~~MPAMF_MBWUMON_IDR is a 32-bit read-only register that indicates~~ the number of memory bandwidth usage monitors for this MSC. ThisMPAMF_MBWUMON_IDR_s register also indicates several~~the~~ propertiesnumber of theSecure MBWU~~memory~~ monitors,~~bandwidth~~ includingusage whether~~monitor~~ theyinstances. supportMPAMF_MBWUMON_IDR_ns capture,~~indicates~~ scalingthe or~~number~~ longof counters.~~Non-secure memory bandwidth usage monitor instances.~~

MPAMF_MBWUMON_IDR_s indicates the number of Secure memory bandwidth usage monitor instances.
MPAMF_MBWUMON_IDR_ns indicates the number of Non-secure memory bandwidth usage monitor instances.

Configuration

The power domain of MPAMF_MBWUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MPAMF_MBWUMON_IDR are RES0.

Attributes

MPAMF_MBWUMON_IDR is a 32-bit register.

Field descriptions

The MPAMF_MBWUMON_IDR bit assignments are:

31	30	29	28 27 26 25 24 23 22 21	20 19 18 17 16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
HAS_CAPTURE	HAS_LONG	LWD	RES0	SCALE	NUM_MON

HAS_CAPTURE, bit [31]

The implementation of this MSC supports copying an MSMON_MBWU to the corresponding MSMON_MBWU_CAPTURE on a capture event.

HAS_CAPTURE	Meaning
0b0	MSMON_MBWU_CAPTURE is not implemented and there is no support for capture events in the MBWU monitor.
0b1	The MSMON_MBWU_CAPTURE register is implemented and the MBWU monitor supports the capture event behavior.

HAS_LONG, bit [30]

When ARMv8.6-MPAM is implemented:

Indicates whether MSMON_MBWU_L is implemented.

If HAS_CAPTURE == 1, indicates whether MSMON_MBWU_L_CAPTURE is implemented.

HAS_LONG	Meaning
0b0	Does not implement MSMON_MBWU_L or MSMON_MBWU_L_CAPTURE.
0b1	Implements MSMON_MBWU_L. If HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE is also implemented.

Otherwise:

Reserved, RES0.

LWD, bit [29]

When ARMv8.6-MPAM is implemented:

Long register VALUE width.

If MPAMF_MBWUMON_IDR.HAS_LONG == 0, MPAMF_MBWUMON_IDR.LWD must also be 0.

LWD	Meaning
0b0	If MPAMF_MBWUMON_IDR.HAS_LONG == 1, MSMON_MBWU_L has 44-bit VALUE field in bits [43:0]. Bits [62:44] are RES0. If HAS_LONG == 1 and MSMON_MBWU_IDR.HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE also has 44-bit VALUE field in bits [43:0].
0b1	MSMON_MBWU_L has 63-bit VALUE field in bits [62:0]. If MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE also has 63-bit VALUE field in bits [62:0].

Otherwise:

Reserved, RES0.

Bits [28:21]

Reserved, RES0.

SCALE, bits [20:16]

Scaling of MSMON_MBWU.VALUE in bits. If scaling is enabled by MSMON_CFG_MBWU_CTL.SCLEN, the byte count in the VALUE field has been shifted by SCALE bits to the right.

SCALE	Meaning
0b00000	Scaling is not implemented.
0bxxxxx	Other values are right shift count when scaling is enabled.

NUM_MON, bits [15:0]

The number of memory bandwidth usage monitors implemented in this MSC.

Accessing the MPAMF_MBWUMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_MBWUMON_IDR is read-only.

MPAMF_MBWUMON_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_MBWUMON_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be

separate registers in the Secure (MPAMF_MBWUMON_IDR_s) and Non-secure (MPAMF_MBWUMON_IDR_ns) MPAM feature pages.

MPAMF_MBWUMON_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0090	MPAMF_MBWUMON_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0090	MPAMF_MBWUMON_IDR_ns

Accesses on this interface are **RO**.

MPAMF_MSMON_IDR, MPAM Resource Monitoring Identification Register

The MPAMF_MSMON_IDR characteristics are:

Purpose

IndicatesThe MPAMF_MSMON_IDR is a 32-bit read-only register that indicates which MPAM monitoring features are present on this MSC. MPAMF_MSMON_IDR_s indicates Secure monitoring features. MPAMF_MSMON_IDR_ns indicates Non-secure monitoring features.

Configuration

The power domain of MPAMF_MSMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1. Otherwise, direct accesses to MPAMF_MSMON_IDR are RES0.

Attributes

MPAMF_MSMON_IDR is a 32-bit register.

Field descriptions

The MPAMF_MSMON_IDR bit assignments are:

31	30:18	17	16	15:0
HAS_LOCAL_CAPT_EVNT	RES0	MSMON_MBWU	MSMON_CSU	RES0

HAS_LOCAL_CAPT_EVNT, bit [31]

Has local capture event generator. Indicates whether this MSC has the MPAM local capture event generator and the MSMON_CAPT_EVNT register.

HAS_LOCAL_CAPT_EVNT	Meaning
0b0	Does not support MPAM local capture event generator or MSMON_CAPT_EVNT.
0b1	Supports the MPAM local capture event generator and the MSMON_CAPT_EVNT register.

Bits [30:18]

Reserved, RES0.

MSMON_MBWU, bit [17]

Memory bandwidth usage monitoring. Indicates whether this MSC has MPAM monitoring for Memory Bandwidth Usage by PARTID and PMG and uses the following bandwidth usage registers:PMG.

- MPAMF_MBWUMON_IDR, MSMON_CFG_MBWU_CTL, MSMON_CFG_MBWU_FLT, MSMON_MBWU.
- The optional MSMON_MBWU_CAPTURE.

MSMON_MBWU	Meaning
0b0	Does not have monitoring for memory bandwidth usage and~~or~~ does not use the bandwidth usage registers.~~MPAMF_MBWUMON_IDR, MSMON_CFG_MBWU_CTL, MSMON_CFG_MBWU_FLT, MSMON_MBWU or MSMON_MBWU_CAPTURE registers.~~
0b1	Has monitoring of memory bandwidth~~bandwdith~~ usage and uses the bandwidth usage registers.~~MPAMF_MBWUMON_IDR, MSMON_CFG_MBWU_CTL, MSMON_CFG_MBWU_FLT, MSMON_MBWU and optional MSMON_MBWU_CAPTURE registers.~~

MSMON_CSU, bit [16]

Cache storage usage monitoring. Indicates whether this MSC has MPAM monitoring of cache storage usage by PARTID and PMG.

MSMON_CSU	Meaning
0b0	Does not have monitoring for cache storage usage or the MPAMF_CSUMON_IDR, MSMON_CFG_CSU_CTL, MSMON_CFG_CSU_FLT, MSMON_CSU or MSMON_CSU_CAPTURE registers.
0b1	Has monitoring of cache storage usage and the MPAMF_CSUMON_IDR, MSMON_CFG_CSU_CTL, MSMON_CFG_CSU_FLT, MSMON_CSU and optional MSMON_CSU_CAPTURE registers.

Bits [15:0]

Reserved, RES0.

Accessing the MPAMF_MSMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_MSMON_IDR is read-only.

MPAMF_MSMON_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_MSMON_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_MSMON_IDR_s) and Non-secure (MPAMF_MSMON_IDR_ns) MPAM feature pages.

MPAMF_MSMON_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0080	MPAMF_MSMON_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0080	MPAMF_MSMON_IDR_ns

Accesses on this interface are **RO**.

MPAMF_PARTID_NRW_IDR, MPAM PARTID Narrowing ID register

The MPAMF_PARTID_NRW_IDR characteristics are:

Purpose

Indicates~~The MPAMF_PARTID_NRW_IDR is a 32-bit read-only register that indicates~~ the largest internal PARTID for this MSC. MPAMF_PARTID_NRW_IDR_s indicates the largest Secure internal PARTID. MPAMF_PARTID_NRW_IDR_ns indicates the largest Non-secure internal PARTID.

Configuration

The power domain of MPAMF_PARTID_NRW_IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_PARTID_NRW == 1. Otherwise, direct accesses to MPAMF_PARTID_NRW_IDR are RES0.

Attributes

MPAMF_PARTID_NRW_IDR is a 32-bit register.

Field descriptions

The MPAMF_PARTID_NRW_IDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																INTPARTID_MAX															

Bits [31:16]

Reserved, RES0.

INTPARTID_MAX, bits [15:0]

The largest intPARTID supported in this MSC.

Accessing the MPAMF_PARTID_NRW_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_PARTID_NRW_IDR is read-only.

MPAMF_PARTID_NRW_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_PARTID_NRW_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_PARTID_NRW_IDR_s) and Non-secure (MPAMF_PARTID_NRW_IDR_ns) MPAM feature pages.

MPAMF_PARTID_NRW_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

MPAM	MPAMF_BASE_s	0x0050	MPAMF_PARTID_NRW_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0050	MPAMF_PARTID_NRW_IDR_ns

Accesses on this interface are **RO**.

MPAMF_PRI_IDR, MPAM Priority Partitioning Identification Register

The MPAMF_PRI_IDR characteristics are:

Purpose

Indicates~~The MPAMF_PRI_IDR is a 32-bit read-only register that indicates~~ which MPAM priority partitioning features are present on this MSC. MPAMF_PRI_IDR_s indicates priority partitioning features accessed from the Secure MPAM feature page. MPAMF_PRI_IDR_ns indicates priority partitioning features accessed from the Non-secure MPAM feature page.

Configuration

The power domain of MPAMF_PRI_IDR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_PRI_PART == 1. Otherwise, direct accesses to MPAMF_PRI_IDR are RES0.

Attributes

MPAMF_PRI_IDR is a 32-bit register.

Field descriptions

The MPAMF_PRI_IDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0						DSPRI_WD						RES0		DSPRI_0_IS_LOW	HAS_DSPRI	RES0						INTPRI_WD					RES0			INTPRI_0_IS_LOW	HAS_INTP

Bits [31:26]

Reserved, RES0.

DSPRI_WD, bits [25:20]

Number of implemented bits in the downstream priority field (DSPRI) of MPAMCFG_PRI.

If HAS_DSPRI == 1, this field must contain a value from 1 to 32, inclusive.

If HAS_DSPRI == 0, this field must be 0.

Bits [19:18]

Reserved, RES0.

DSPRI_0_IS_LOW, bit [17]

Indicates whether 0 in MPAMCFG_PRI.DSPRI is the lowest or the highest priority.

DSPRI_0_IS_LOW	Meaning
0b0	In the MPAMCFG_PRI.DSPRI field, a value of 0 means the highest priority.
0b1	In the MPAMCFG_PRI.DSPRI field, a value of 0 means the lowest priority.

HAS_DSPRI, bit [16]

Indicates that this MSC implements the DSPRI field in the MPAMCFG_PRI register.

HAS_DSPRI	Meaning
0b0	This MSC supports priority partitioning, but does not implement a downstream priority (DSPRI) field in the MPAMCFG_PRI register.
0b1	This MSC supports downstream priority partitioning and implements the downstream priority (DSPRI) field in the MPAMCFG_PRI register.

Bits [15:10]

Reserved, RES0.

INTPRI_WD, bits [9:4]

Number of implemented bits in the internal priority field (INTPRI) in the MPAMCFG_PRI register.

If HAS_INTPRI == 1, this field must contain a value from 1 to 32, inclusive.

If HAS_INTPRI == 0, this field must be 0.

Bits [3:2]

Reserved, RES0.

INTPRI_0_IS_LOW, bit [1]

Indicates whether 0 in MPAMCFG_PRI.INTPRI is the lowest or the highest priority.

INTPRI_0_IS_LOW	Meaning
0b0	In the MPAMCFG_PRI.INTPRI field, a value of 0 means the highest priority.
0b1	In the MPAMCFG_PRI.INTPRI field, a value of 0 means the lowest priority.

HAS_INTPRI, bit [0]

Indicates that this MSC implements the INTPRI field in the MPAMCFG_PRI register.

HAS_INTPRI	Meaning
0b0	This MSC supports priority partitioning, but does not implement the internal priority (INTPRI) field in the MPAMCFG_PRI register.
0b1	This MSC supports internal priority partitioning and implements the internal priority (INTPRI) field in the MPAMCFG_PRI register.

Accessing the MPAMF_PRI_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_PRI_IDR is read-only.

MPAMF_PRI_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_PRI_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF_PRI_IDR_s) and Non-secure (MPAMF_PRI_IDR_ns) MPAM feature pages.

MPAMF_PRI_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0048	MPAMF_PRI_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0048	MPAMF_PRI_IDR_ns

Accesses on this interface are **RO**.

(old) htmldiff from- (new)

MSMON_CAPT_EVNT, MPAM Capture Event Generation Register

The MSMON_CAPT_EVNT characteristics are:

Purpose

GeneratesMSMON_CAPT_EVNT is a 32-bit read-write register that generates a local capture event when written with bit[0] as 1. MSMON_CAPT_EVNT_s generates local capture events for Secure monitors only or for Secure and Non-secure monitors. MSMON_CAPT_EVNT_ns generates local capture events for Non-secure monitors only.

Configuration

The power domain of MSMON_CAPT_EVNT is IMPLEMENTATION DEFINED.

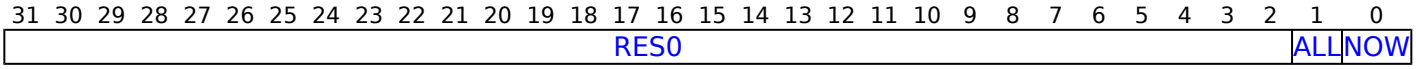
This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.HAS_LOCAL_CAPT_EVNT == 1. Otherwise, direct accesses to MSMON_CAPT_EVNT are RES0.

Attributes

MSMON_CAPT_EVNT is a 32-bit register.

Field descriptions

The MSMON_CAPT_EVNT bit assignments are:



Bits [31:2]

Reserved, RES0.

ALL, bit [1]

In the Secure instance of this register, if ALL written as 1 and NOW is also written as 1, signal a capture event to Secure and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.

If written as 0 and NOW is written as 1, signal a capture event to Secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.

In the Non-secure instance of this register, this bit is RAZ/WI.

This bit always reads as zero.

ALL	Meaning
0b0	Send capture event to Secure monitors only.
0b1	Send capture event to both Secure and Non-secure monitors.

NOW, bit [0]

When written as 1, this bit causes an event to all monitors in this MSC with CAPT_EVNT set to the value of 7.

When this bit is written as 0, no event is signaled.

This bit always reads as zero.

Accessing the MSMON_CAPT_EVNT

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CAPT_EVNT_s must be accessible from the Secure MPAM feature page. MSMON_CAPT_EVENT_ns must be accessible from the Non-secure MPAM feature page.

The two instances of MSMON_CAPT_EVNT must be separate registers. The Secure instance (MSMON_CAPT_EVNT_s) can generate capture events for both Secure and Non-secure PARTID monitors, and the Non-secure instance (MSMON_CAPT_EVNT_ns) can generate capture events for Non-secure PARTID monitors only.

MSMON_CAPT_EVNT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0808	MSMON_CAPT_EVNT_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0808	MSMON_CAPT_EVNT_ns

Accesses on this interface are **RW**.

MSMON_CFG_CSU_CTL, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Control Register

The MSMON_CFG_CSU_CTL characteristics are:

Purpose

Controls~~MSMON_CFG_CSU_CTL is a 32-bit read-write register that controls~~ the CSU monitor selected by MSMON_CFG_MON_SEL. MSMON_CFG_CSU_CTL_s controls the Secure cache storage usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CFG_CSU_CTL_ns controls Non-secure cache storage usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CFG_CSU_CTL is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CFG_CSU_CTL are RES0.

Attributes

MSMON_CFG_CSU_CTL is a 32-bit register.

Field descriptions

The MSMON_CFG_CSU_CTL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
EN	CAPT_EVNT			CAPT_RESET	OFLOW_STATUS	OFLOW_INTR	OFLOW_FRZ	SUBTYPE				RES0		MATCH_PMG	MATCH_PARTID		

EN, bit [31]

Enabled.

EN	Meaning
0b0	The monitor instance is disabled and must not collect any information.
0b1	The monitor instance is enabled to collect information according to the configuration of the instance.

CAPT_EVNT, bits [30:28]

Capture event selector.

Select the event that triggers capture from the following:

CAPT_EVNT	Meaning
0b000	No capture event is triggered.
0b001	External capture event 1 (optional but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must~~should~~ not trigger a capture event.

If capture is not implemented for the CSU monitor type as indicated by MPAMF_CSUMON_IDR.HAS_CAPTURE = 0, this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset after capture.

Controls whether the value of MSMON_CSU is reset to zero immediately after being copied to MSMON_CSU_CAPTURE.

CAPT_RESET	Meaning
0b0	Monitor is not reset on capture.
0b1	Monitor is reset on capture.

If capture is not implemented for the CSU monitor type as indicated by MPAMF_CSUMON_IDR.HAS_CAPTURE = 0, this field is RAZ/WI.

Because the CSU monitor type produces a measurement rather than a count, it might not make sense to ever reset the value after a capture. If there is no reason to ever reset a CSU monitor, this field is RAZ/WI.

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of MSMON_CSU has overflowed.

OFLOW_STATUS	Meaning
0b0	No overflow has occurred.
0b1	At least one overflow has occurred since this bit was last written to zero.

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

OFLOW_INTR, bit [25]

Overflow Interrupt.

Controls whether an overflow interrupt is generated when the value of MSMON_CSU has overflowed.

OFLOW_INTR	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_CSU.
0b1	On overflow, an implementation-specific interrupt is signaled.

If OFLOW_INTR is not supported by the implementation, this field is RAZ/WI.

OFLOW_FRZ, bit [24]

Freeze Monitor on Overflow.

Controls whether the value of MSMON_CSU freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	Monitor count wraps on overflow.
0b1	Monitor count freezes on overflow. The frozen value might be 0 or another value if the monitor overflowed with an increment larger than 1.

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

SUBTYPE, bits [23:20]

Subtype.

A monitor can have other event matching criteria.

This field is not currently used for CSU monitors, but reserved for future use.

This field is RAZ/WI.

Bits [19:18]

Reserved, RES0.

MATCH_PMG, bit [17]

Match PMG.

Controls whether the monitor measures only storage used with PMG matching MSMON_CFG_CSU_FLT.PMG.

MATCH_PMG	Meaning
0b0	The monitor measures storage used with any PMG value.
0b1	The monitor only measures storage used with the PMG value matching MSMON_CFG_CSU_FLT.PMG.

If MATCH_PMG == 1 and MATCH_PARTID == 0, it is CONSTRAINED UNPREDICTABLE whether the monitor instance:

- Measures the storage used with matching PMG and with any PARTID.
- Measures no storage usage, that is, MSMON_CSU.VALUE is zero.
- Measures the storage used with matching PMG and PARTID, that is, treats MATCH_PARTID as == 1.

MATCH_PARTID, bit [16]

Match PARTID.

Controls whether the monitor measures only storage used with PARTID matching MSMON_CFG_CSU_FLT.PARTID.

MATCH_PARTID	Meaning
0b0	The monitor measures storage used with any PARTID value.
0b1	The monitor only measures storage used with the PARTID value matching MSMON_CFG_CSU_FLT.PARTID.

Bits [15:8]

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code.

Constant type indicating the type of the monitor.

Read-only.

CSU monitor is TYPE = 0x43.

Accessing the MSMON_CFG_CSU_CTL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CFG_CSU_CTL_s must be accessible from the Secure MPAM feature page. MSMON_CFG_CSU_CTL_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CFG_CSU_CTL_s and MSMON_CFG_CSU_CTL_ns must be separate registers. The Secure instance (MSMON_CFG_CSU_CTL_s) accesses the cache storage usage monitor controls used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_CSU_CTL_ns) accesses the cache storage usage monitor controls used for Non-secure PARTIDs.

MSMON_CFG_CSU_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0818	MSMON_CFG_CSU_CTL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0818	MSMON_CFG_CSU_CTL_ns

Accesses on this interface are **RW**.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707~~~~

MSMON_CFG_CSU_FLT, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Filter Register

The MSMON_CFG_CSU_FLT characteristics are:

Purpose

Configures~~MSMON_CFG_CSU_FLT is a 32-bit read-write register that sets~~ PARTID and PMG to measure or count in the CSU monitor selected by MSMON_CFG_MON_SEL. MSMON_CFG_CSU_FLT_s sets filter conditions for the Secure cache storage usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CFG_CSU_CTL_ns sets filter conditions for the Non-secure cache storage usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CFG_CSU_FLT is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CFG_CSU_FLT are RES0.

Attributes

MSMON_CFG_CSU_FLT is a 32-bit register.

Field descriptions

The MSMON_CFG_CSU_FLT bit assignments are:

31 30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	PMG	PARTID

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter cache storage usage monitoring.

If MSMON_CFG_CSU_CTL.MATCH_PMG == 0, this field is not used to match cache storage to a PMG and the contents of this field is ignored.

If MSMON_CFG_CSU_CTL.MATCH_PMG == 1 and MSMON_CFG_CSU_CTL.MATCH_PARTID == 1, the monitor instance selected by MSMON_CFG_MON_SEL measures or counts cache storage labeled with PMG equal to this field and PARTID equal to the PARTID field.

If MSMON_CFG_CSU_CTL.MATCH_PMG == 1 and MSMON_CFG_CSU_CTL.MATCH_PARTID == 0, the behavior of the monitor instance selected by MSMON_CFG_MON_SEL is CONSTRAINED UNPREDICTABLE. See MSMON_CFG_CSU_CTL.MATCH_PMG for more information.

PARTID, bits [15:0]

Partition ID to filter cache storage usage monitoring.

If MSMON_CFG_CSU_CTL.MATCH_PARTID == 0 and MSMON_CFG_CSU_CTL.MATCH_PMG == 0, the monitor measures all allocated cache storage.

If MSMON_CFG_CSU_CTL.MATCH_PARTID == 0 and MSMON_CFG_CSU_CTL.MATCH_PMG == 1, the behavior of the monitor is CONSTRAINED UNPREDICTABLE. See the description of MSMON_CFG_CSU_CTL.MATCH_PMG.

If MSMON_CFG_CSU_CTL.MATCH_PARTID == 1 and MSMON_CFG_CSU_CTL.MATCH_PMG == 0, the monitor selected by MSMON_CFG_MON_SEL measures or counts cache storage labeled with PARTID equal to this field.

If MSMON_CFG_CSU_CTL.MATCH_PARTID == 1 and MSMON_CFG_CSU_CTL.MATCH_PMG == 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts cache storage labeled with PARTID equal to this field and PMG equal to the PMG field.

Accessing the MSMON_CFG_CSU_FLT

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CFG_CSU_FLT_s must be accessible from the Secure MPAM feature page. MSMON_CFG_CSU_FLT_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CFG_CSU_FLT_s and MSMON_CFG_CSU_FLT_ns must be separate registers. The Secure instance (MSMON_CFG_CSU_FLT_s) accesses the PARTID and PMG matching for a cache storage usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_CSU_FLT_ns) accesses the PARTID and PMG matching for a cache storage usage monitor used for Non-secure PARTIDs.

MSMON_CFG_CSU_FLT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0810	MSMON_CFG_CSU_FLT_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0810	MSMON_CFG_CSU_FLT_ns

Accesses on this interface are **RW**.

MSMON_CFG_MBWU_CTL, MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Control Register

The MSMON_CFG_MBWU_CTL characteristics are:

Purpose

Controls the MBWU monitor selected by MSMON_CFG_MON_SEL. MSMON_CFG_MBWU_CTL_s controls the Secure memory bandwidth usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CFG_MBWU_CTL_ns controls Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CFG_MBWU_CTL is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_CFG_MBWU_CTL are RES0.

Attributes

MSMON_CFG_MBWU_CTL is a 32-bit register.

Field descriptions

The MSMON_CFG_MBWU_CTL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EN	CAPT_EVNT			CAPT_RESET	OFLOW_STATUS	OFLOW_INTR	OFLOW_FRZ	SUBTYPE				SCLEN	RES0	MATCH_PMG	MATCH_PART

EN, bit [31]

Enabled.

EN	Meaning
0b0	The monitor instance is disabled and must not collect any information.
0b1	The monitor instance is enabled to collect information according to the configuration of the instance.

CAPT_EVNT, bits [30:28]

Capture event selector.

When the selected capture event occurs, MSMON_MBWU of the monitor instance is copied to MSMON_MBWU_CAPTURE of the same instance. If the long counter is also implemented, MSMON_MBWU_L is also copied to MSMON_MBWU_L_CAPTURE.

Select the event that triggers capture from the following:

CAPT_EVNT	Meaning
0b000	No capture event is triggered.
0b001	External capture event 1 (optional but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must~~should~~ not trigger a capture event.

If capture is not implemented for the MBWU monitor type as indicated by MPAMF_MBWUMON_IDR.HAS_CAPTURE = 0, this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset MSMON_MBWU.VALUE after capture.

Controls whether the VALUE field of the monitor instance is reset to zero immediately after being copied to the corresponding capture register.

CAPT_RESET	Meaning
0b0	MSMON_MBWU.VALUE field of the monitor instance is not reset on capture.
0b1	MSMON_MBWU.VALUE field of the monitor instance is reset on capture.

If capture is not implemented for the MBWU monitor type as indicated by MPAMF_MBWUMON_IDR.HAS_CAPTURE = 0, this field is RAZ/WI.

This control bit affects both MSMON_MBWU and MSMON_MBWU_L in implementations that include MSMON_MBWU_L.

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of MSMON_MBWU has overflowed.

OFLOW_STATUS	Meaning
0b0	MSMON_MBWU has not overflowed.
0b1	MSMON_MBUW has overflowed at least once since this bit was last written to zero.

If overflow is not possible for a MBWU monitor in the implementation, this field is RAZ/WI.

OFLOW_INTR, bit [25]

Overflow status of the MSMON_MBWU_L instance.

Indicates that the value of MSMON_MBWU overflow has overflowed.

OFLOW_INTR	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_MBWU.
0b1	An implementation-specific interrupt is signaled on an overflow of MSMON_MBWU.

OFLOW_FRZ, bit [24]

Freeze monitor instance on overflow.

Controls whether MSMON_MBWU.VALUE field of the monitor instance freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	MSMON_MBWU.VALUE field of the monitor instance wraps on overflow.
0b1	MSMON_MBWU.VALUE field of the monitor instance freezes on overflow. If the increment that caused the overflow was 1, the frozen value is the post-increment value of 0. If the increment that caused the overflow was larger than 1, the frozen value of the monitor might be 0 or a larger value less than the final increment.

If overflow is not possible for the instance of the MBWU monitor in the implementation, this field is RAZ/WI.

This control bit affects both MSMON_MBWU and MSMON_MBWU_L in implementations that include MSMON_MBWU_L.

SUBTYPE, bits [23:20]

Subtype.

A monitor can have other event matching criteria.

This field is not currently used for MBWU monitors, but reserved for future use.

This field is RAZ/WI.

SCLEN, bit [19]

MSMON_MBWU.VALUE Scaling Enable.

Enables scaling of MSMON_MBWU.VALUE by MPAMF_MBWUMON_IDR.SCALE.

SCLEN	Meaning
0b0	MSMON_MBWU.VALUE has bytes counted by the monitor instance.
0b1	MSMON_MBWU.VALUE has bytes counted by the monitor instance, shifted right by MPAMF_MBWUMON_IDR.SCALE.

Bit [18]

Reserved, RES0.

MATCH_PMG, bit [17]

Match PMG.

Controls whether the monitor instance only counts data transferred with PMG matching MSMON_CFG_MBWU_FLT.PMG.

MATCH_PMG	Meaning
0b0	The monitor instance counts data transferred with any PMG value.
0b1	The monitor instance only counts data transferred with the PMG value matching MSMON_CFG_MBWU_FLT.PMG.

MATCH_PARTID, bit [16]

Match PARTID.

Controls whether the monitor instance counts only data transferred with PARTID matching MSMON_CFG_MBWU_FLT.PARTID.

MATCH_PARTID	Meaning
0b0	The monitor instance counts data transferred with any PARTID value.
0b1	The monitor instance only counts data transferred with the PARTID value matching MSMON_CFG_MBWU_FLT.PARTID.

OFLOW_STATUS_L, bit [15]

When ARMv8.6-MPAM is implemented:

Overflow Status of the MSMON_MBWU_L instance.

Indicates whether an MPAM overflow interrupt is generated when the value of MSMON_MBWU_L has overflowed.

OFLOW_STATUS_L	Meaning
0b0	MSMON_MBWU_L has not overflowed.
0b1	MSMON_MBWU_L has overflowed at least once since this bit was last written to zero.

If MPAMF_MBWUMON_IDR.HAS_LONG == 0, this bit is RES0.

Otherwise:

Reserved, RES0.

OFLOW_INTR_L, bit [14]

When ARMv8.6-MPAM is implemented:

Overflow Interrupt for MSMON_MBWU_L.

Controls whether an MPAM overflow interrupt is generated when the value of MSMON_MBWU_L overflows.

OFLOW_INTR_L	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_MBWU_L.
0b1	An implementation-specific interrupt is signalled on overflow of MSMON_MBWU_L.

If OFLOW_INTR is not supported by the implementation, this field is RAZ/WI.

If MPAMF_MBWUMON_IDR.HAS_LONG == 0, this bit is RES0.

Otherwise:

Reserved, RES0.

Bits [13:8]

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code.

Constant type indicating the type of the monitor.

Read-only.

MBWU monitor is TYPE = 0x42.

Accessing the MSMON_CFG_MBWU_CTL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CFG_MBWU_CTL_s must be accessible from the Secure MPAM feature page. MSMON_CFG_MBWU_CTL_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CFG_MBWU_CTL_s and MSMON_CFG_MBWU_CTL_ns must be separate registers. The Secure instance (MSMON_CFG_MBWU_CTL_s) accesses the memory bandwidth usage monitor controls used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_MBWU_CTL_ns) accesses the memory bandwidth usage monitor controls used for Non-secure PARTIDs.

MSMON_CFG_MBWU_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0828	MSMON_CFG_MBWU_CTL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0828	MSMON_CFG_MBWU_CTL_ns

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

MSMON_CFG_MBWU_FLT, MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Filter Register

The MSMON_CFG_MBWU_FLT characteristics are:

Purpose

Controls~~MSMON_CFG_MBWU_FLT is a 32-bit read-write register that sets~~ PARTID and PMG to measure or count in the MBWU monitor selected by MSMON_CFG_MON_SEL. MSMON_CFG_MBWU_FLT_s sets filter conditions for the Secure memory bandwidth usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CFG_MBWU_CTL_ns sets filter conditions for the Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CFG_MBWU_FLT is IMPLEMENTATION DEFINED.

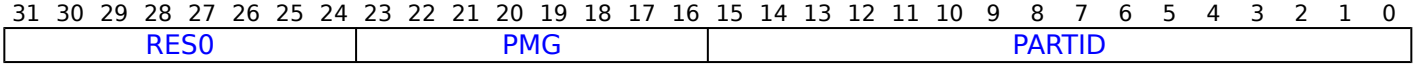
This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_CFG_MBWU_FLT are RES0.

Attributes

MSMON_CFG_MBWU_FLT is a 32-bit register.

Field descriptions

The MSMON_CFG_MBWU_FLT bit assignments are:



Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If MSMON_CFG_MBWU_CTL.MATCH_PMG == 0, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If MSMON_CFG_MBWU_CTL.MATCH_PMG == 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts memory bandwidth labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If MSMON_CFG_MBWU_CTL.MATCH_PARTID == 0, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If MSMON_CFG_MBWU_CTL.MATCH_PARTID == 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts memory bandwidth labeled with PARTID equal to this field.

Accessing the MSMON_CFG_MBWU_FLT

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CFG_MBWU_FLT_s must be accessible from the Secure MPAM feature page. MSMON_CFG_MBWU_FLT_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CFG_MBWU_FLT_s and MSMON_CFG_MBWU_FLT_ns must be separate registers. The Secure instance (MSMON_CFG_MBWU_FLT_s) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_MBWU_FLT_ns) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Non-secure PARTIDs.

MSMON_CFG_MBWU_FLT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0820	MSMON_CFG_MBWU_FLT_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0820	MSMON_CFG_MBWU_FLT_ns

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

MSMON_CFG_MON_SEL, MPAM Monitor Instance Selection Register

The MSMON_CFG_MON_SEL characteristics are:

Purpose

Selects a monitor instance to access through the MSMON configuration and counter registers.
MSMON_CFG_MON_SEL_s selects a Secure monitor instance to access via the Secure MPAM feature page.
MSMON_CFG_MON_SEL_ns selects a Non-secure monitor instance to access via the Non-secure MPAM feature page.

Note

Different performance monitoring features within a MSC could have different numbers of monitor instances. See the NUM_MON field in the corresponding ID register. This means that a monitor out-of-bounds error might be signaled when an MSMON_CFG register is accessed because the value in MSMON_CFG_MON_SEL.MON_SEL is too large for the particular monitoring feature.

To configure a monitor, set MON_SEL in this register to the index of the monitor instance to configure, then write to the MSMON_CFG_x register to set the configuration of the monitor. At a later time, read the monitor register (for example MSMON_MBWU) to get the value of the monitor.

Configuration

The power domain of MSMON_CFG_MON_SEL is IMPLEMENTATION DEFINED.

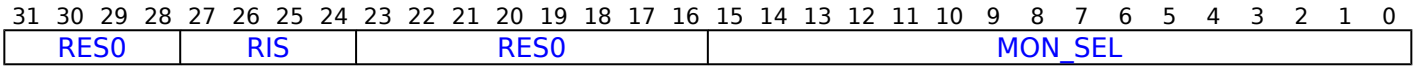
This register is present only when MPAMF_IDR.HAS_MSMON == 1, or (MPAMF_IDR.HAS_IMPL_IDR == 1 and MPAMF_IDR.EXT == 0) or (MPAMF_IDR.HAS_IMPL_IDR~~MPAMF_HAS_IMPL_IDR~~ == 1, MPAMF_IDR.EXT == 1 and MPAMF_IDR.NO_IMPL_MSMON == 01). Otherwise, direct accesses to MSMON_CFG_MON_SEL are RES0.

Attributes

MSMON_CFG_MON_SEL is a 32-bit register.

Field descriptions

The MSMON_CFG_MON_SEL bit assignments are:



Bits [31:28]

Reserved, RES0.

RIS, bits [27:24]

When ARMv8.6-MPAM is implemented, MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS~~MAPMF_IDR.HAS_RIS~~ == 1:

Resource Instance Selector. RIS selects one resource to configure through MSMON_CFG registers.

Otherwise:

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

MON_SEL, bits [15:0]

Selects the monitor instance to configure or read.

Reads and writes to other MSMON registers are indexed by MON_SEL and by the NS bit used to access MSMON_CFG_MON_SEL to access the configuration for a single monitor.

Accessing the MSMON_CFG_MON_SEL

This register is part of the MPAMF_BASE memory frame. In a system that supports Secure and Non-secure memory maps, the MPAMF_BASE frame must be accessible in both Secure and Non-secure memory address maps.

MSMON_CFG_MON_SEL must be accessible from the Non-secure and Secure address maps.

MSMON_CFG_MON_SEL must be banked for the Secure and Non-secure address maps. The Secure instance is used with accesses to other MSMON registers to configure monitors for Secure PARTIDs, and the Non-secure instance is used with accesses to other MSMON registers to configure monitors for Non-secure PARTIDs.

MSMON_CFG_MON_SEL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0800	MSMON_CFG_MON_SEL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0800	MSMON_CFG_MON_SEL_ns

Accesses on this interface are **RW**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

MSMON_CSU, MPAM Cache Storage Usage Monitor Register

The MSMON_CSU characteristics are:

Purpose

AccessesMSMON_CSU is a 32-bit read-write register that accesses the CSU monitor selected by MSMON_CFG_MON_SEL. MSMON_CSU_s is the Secure cache storage usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CSU_ns is the Non-secure cache storage usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CSU is IMPLEMENTATION DEFINED.

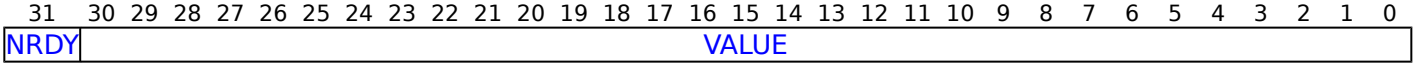
This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CSU are RES0.

Attributes

MSMON_CSU is a 32-bit register.

Field descriptions

The MSMON_CSU bit assignments are:



NRDY, bit [31]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor is not ready and the contents of the VALUE field might be inaccurate or otherwise not represent the actual cache storage usage.
0b1	The monitor is ready and the VALUE fields is accurate.

VALUE, bits [30:0]

Cache storage usage value if NRDY == 0. Invalid if NRDY == 1.

VALUE is the cache storage usage in bytes meeting the criteria set in MSMON_CFG_CSU_FLT and MSMON_CFG_CSU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing the MSMON_CSU

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CSU_s must be accessible from the Secure MPAM feature page. MSMON_CSU_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CSU_s and MSMON_CSU_ns must be separate registers. The Secure instance (MSMON_CSU_s) accesses the cache storage usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CSU_ns) accesses the cache storage usage monitor used for Non-secure PARTIDs.

MSMON_CSU can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0840	MSMON_CSU_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0840	MSMON_CSU_ns

Accesses on this interface are **RW**.

MSMON_MBWU, MPAM Memory Bandwidth Usage Monitor Register

The MSMON_MBWU characteristics are:

Purpose

AccessesMSMON_MBWU is a 32-bit read-write register that accesses the monitor instance selected by MSMON_CFG_MON_SEL. MSMON_MBWU_s is the Secure memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_s. MSMON_MBWU_ns is the Non-secure memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_ns.

Configuration

The power domain of MSMON_MBWU is IMPLEMENTATION DEFINED.

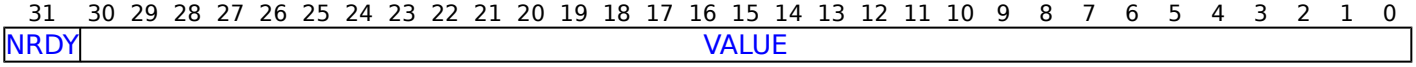
This register is present only when MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_MBWU are RES0.

Attributes

MSMON_MBWU is a 32-bit register.

Field descriptions

The MSMON_MBWU bit assignments are:



NRDY, bit [31]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor is not ready and the contents of the VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.
0b1	The monitor is ready and the VALUE fields is accurate.

VALUE, bits [30:0]

Memory bandwidth usage counter value if NRDY == 0. Invalid if NRDY == 1.

VALUE is the scaled count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

If MSMON_CFG_MBWU_CTL.SCLEN enables== scaling1, the count in VALUE is the number of bytes shifted right by MPAMF_MBWUMON_IDR.SCALE bit positions and rounded.

Accessing the MSMON_MBWU

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_s must be accessible from the Secure MPAM feature page. MSMON_MBWU_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_s and MSMON_MBWU_ns must be separate registers. The Secure instance (MSMON_MBWU_s) accesses the memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_ns) accesses the memory bandwidth usage monitor used for Non-secure PARTIDs.

MSMON_MBWU can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0860	MSMON_MBWU_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0860	MSMON_MBWU_ns

Accesses on this interface are **RW**.

MSMON_MBWU__L_CAPTURE, MPAM Long Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU__L_CAPTURE characteristics are:

Purpose

MSMON_MBWU_L_CAPTURE is a 64-bit read-write register that accesses the captured MSMON_MBWU_L monitor instance selected by MSMON_CFG_MON_SEL.

MSMON_MBWU_L_CAPTURE_s is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL.

MSMON_MBWU_L_CAPTURE_ns is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_MBWU__L_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1, MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1 and MPAMF_MBWUMON_IDR.HAS_LONG == 1. Otherwise, direct accesses to MSMON_MBWU__L_CAPTURE are IMPLEMENTATION DEFINED.

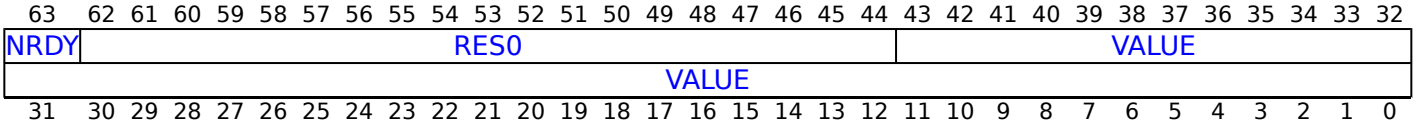
Attributes

MSMON_MBWU__L_CAPTURE is a 64-bit register.

Field descriptions

The MSMON_MBWU__L_CAPTURE bit assignments are:

When MPAMF_MBWUMON_IDR.LWD == 0:



NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor is not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.
0b1	The monitor is ready and the MSMON_MBWU_L_CAPTURE.VALUE field is accurate.

Bits [62:44]

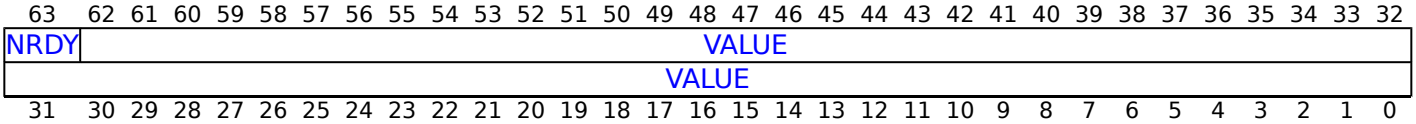
Reserved, RES0.

VALUE, bits [43:0]

Memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY == 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY == 1.

MSMON_MBWU_L_CAPTURE.VALUE is the 44-bit count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

When MPAMF_MBWUMON_IDR.LWD == 1:



NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor is not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.
0b1	The monitor is ready and the MSMON_MBWU_L_CAPTURE.VALUE fields is accurate.

VALUE, bits [62:0]

Memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY == 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY == 1.

MSMON_MBWU_L_CAPTURE.VALUE is the 63-bit count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing the MSMON_MBWU__L_CAPTURE

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_L_CAPTURE_s must be accessible from the Secure MPAM feature page.
MSMON_MBWU_L_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_L_CAPTURE_s and MSMON_MBWU_L_CAPTURE_ns must be separate registers. The Secure instance (MSMON_MBWU_L_CAPTURE_s) accesses the captured long memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_L_CAPTURE_ns) accesses the captured long memory bandwidth usage monitor used for Non-secure PARTIDs.

MSMON_MBWU__L_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0890	MSMON_MBWU_CAPTURE_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0890	MSMON_MBWU_CAPTURE_ns

Accesses on this interface are **RW**.

MSMON_MBWU_CAPTURE, MPAM Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU_CAPTURE characteristics are:

Purpose

AccessesMSMON_MBWU_CAPTURE is a 32-bit read-write register that accesses the captured MSMON_MBWU monitor instance selected by MSMON_CFG_MON_SEL. MSMON_MBWU_CAPTURE_s is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_MBWU_CAPTURE_ns is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_MBWU_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1 and MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1. Otherwise, direct accesses to MSMON_MBWU_CAPTURE are RES0.

Attributes

MSMON_MBWU_CAPTURE is a 32-bit register.

Field descriptions

The MSMON_MBWU_CAPTURE bit assignments are:

31	30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
NRDY	VALUE

NRDY, bit [31]

Not Ready. The captured NRDY bit from the corresponding instance of MSMON_MBWU. This bit indicates whether the captured monitor value has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor was not ready and the contents of the VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.
0b1	The captured monitor was ready and the VALUE fields is accurate.

VALUE, bits [30:0]

Captured memory bandwidth usage counter value if NRDY == 0. Invalid if NRDY == 1.

VALUE is the captured VALUE field from the corresponding instance of MSMON_MBWU, the count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

VALUE captures the MSMON_MBWU.VALUE and preserves any scaling that had been performed on the VALUE field in that register.

Accessing the MSMON_MBWU_CAPTURE

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_CAPTURE_s must be accessible from the Secure MPAM feature page. MSMON_MBWU_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_CAPTURE_s and MSMON_MBWU_CAPTURE_ns must be separate registers. The Secure instance (MSMON_MBWU_CAPTURE_s) accesses the captured memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_CAPTURE_ns) accesses the captured memory bandwidth usage monitor used for Non-secure PARTIDs.

MSMON_MBWU_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0868	MSMON_MBWU_CAPTURE_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0868	MSMON_MBWU_CAPTURE_ns

Accesses on this interface are **RW**.

MSMON_MBWU_L, MPAM Long Memory Bandwidth Usage Monitor Register

The MSMON_MBWU_L characteristics are:

Purpose

AccessesMSMON_MBWU_L is a 64-bit read-write register that accesses the monitor instance selected by MSMON_CFG_MON_SEL. MSMON_MBWU_L_s is the Secure memory bandwidth usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_MBWU_L_ns is the Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_MBWU_L is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1 and MPAMF_MBWUMON_IDR.HAS_LONG == 1. Otherwise, direct accesses to MSMON_MBWU_L are IMPLEMENTATION DEFINED.

Attributes

MSMON_MBWU_L is a 64-bit register.

Field descriptions

The MSMON_MBWU_L bit assignments are:

When MPAMF_MBWUMON_IDR.LWD == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NRDY	RES0																			VALUE											
VALUE																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor is not ready and the contents of the VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.
0b1	The monitor is ready and the VALUE fields is accurate.

Bits [62:44]

Reserved, RES0.

VALUE, bits [43:0]

Long (44-bit) memory bandwidth usage counter value if NRDY == 0. Invalid if NRDY == 1.

VALUE is the long count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

When MPAMF_MBWUMON_IDR.LWD == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NRDY	VALUE																														
VALUE																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor is not ready and the contents of the VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.
0b1	The monitor is ready and the VALUE fields is accurate.

VALUE, bits [62:0]

Long (63-bit) memory bandwidth usage counter value if NRDY == 0. Invalid if NRDY == 1.

VALUE is the long count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing the MSMON_MBWU_L

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_L_s must be accessible from the Secure MPAM feature page. MSMON_MBWU_L_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_L_s and MSMON_MBWU_L_ns must be separate registers. The Secure instance (MSMON_MBWU_L_s) accesses the long memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_L_ns) accesses the long memory bandwidth usage monitor used for Non-secure PARTIDs.

MSMON_MBWU_L can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0880	MSMON_MBWU_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0880	MSMON_MBWU_ns

Accesses on this interface are **RW**.

MSMON_MBWU_L_CAPTURE, MPAM Long Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU_L_CAPTURE characteristics are:

Purpose

Accesses the captured MSMON_MBWU_L monitor instance selected by MSMON_CFG_MON_SEL.

MSMON_MBWU_L_CAPTURE_s is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL.

MSMON_MBWU_L_CAPTURE_ns is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_MBWU_L_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1, MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1 and MPAMF_MBWUMON_IDR.HAS_LONG == 1. Otherwise, direct accesses to MSMON_MBWU_L_CAPTURE are IMPLEMENTATION DEFINED.

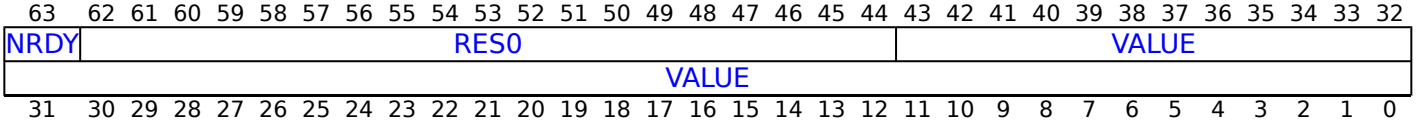
Attributes

MSMON_MBWU_L_CAPTURE is a 64-bit register.

Field descriptions

The MSMON_MBWU_L_CAPTURE bit assignments are:

When MPAMF_MBWUMON_IDR.LWD == 0:



NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor is not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.
0b1	The monitor is ready and the MSMON_MBWU_L_CAPTURE.VALUE field is accurate.

Bits [62:44]

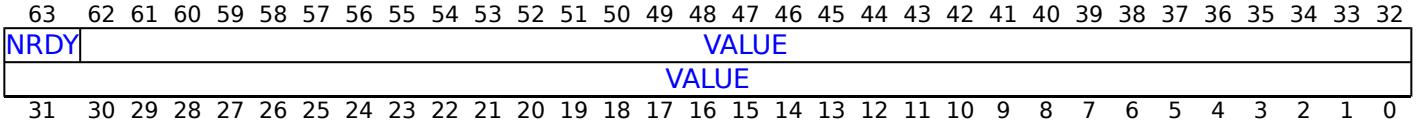
Reserved, RES0.

VALUE, bits [43:0]

Memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY == 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY == 1.

MSMON_MBWU_L_CAPTURE.VALUE is the 44-bit count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

When MPAMF_MBWUMON_IDR.LWD == 1:



NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor is not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.
0b1	The monitor is ready and the MSMON_MBWU_L_CAPTURE.VALUE fields is accurate.

VALUE, bits [62:0]

Memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY == 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY == 1.

MSMON_MBWU_L_CAPTURE.VALUE is the 63-bit count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing the MSMON_MBWU_L_CAPTURE

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_L_CAPTURE_s must be accessible from the Secure MPAM feature page.
MSMON_MBWU_L_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_L_CAPTURE_s and MSMON_MBWU_L_CAPTURE_ns must be separate registers. The Secure instance (MSMON_MBWU_L_CAPTURE_s) accesses the captured long memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_L_CAPTURE_ns) accesses the captured long memory bandwidth usage monitor used for Non-secure PARTIDs.

MSMON_MBWU_L_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0890	MSMON_MBWU_CAPTURE_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0890	MSMON_MBWU_CAPTURE_ns

Accesses on this interface are **RW**.

PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

Configuration

~~It is IMPLEMENTATION DEFINED whether PMAUTHSTATUS is implemented in the Core power domain or in the Debug power domain.~~

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

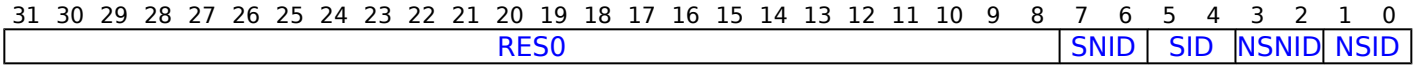
This register is OPTIONAL, and is required for CoreSight compliance. Arm recommends that this register is implemented.

Attributes

PMAUTHSTATUS is a 32-bit register.

Field descriptions

The PMAUTHSTATUS bit assignments are:



Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

Holds the same value as DBGAUTHSTATUS_EL1.SNID.

SID, bits [5:4]

Secure invasive debug. Possible values of this field are:

SID	Meaning
0b00	Not implemented.

All other values are reserved.

NSNID, bits [3:2]

Holds the same value as DBGAUTHSTATUS_EL1.NSNID.

NSID, bits [1:0]

Non-secure invasive debug. Possible values of this field are:

NSID	Meaning
0b00	Not implemented.

All other values are reserved.

Accessing the PMAUTHSTATUS

PMAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFB8	PMAUTHSTATUS

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

Configuration

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCCFILTR_EL0[31:0] .

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCCFILTR[31:0] .

PMCCFILTR_EL0 is in the Core power domain.

On a Warm or Cold reset, RW fields in this register reset:

- To architecturally UNKNOWN values if the reset is to an Exception level that is using AArch64.
- To 0 if the reset is to an Exception level that is using AArch32.

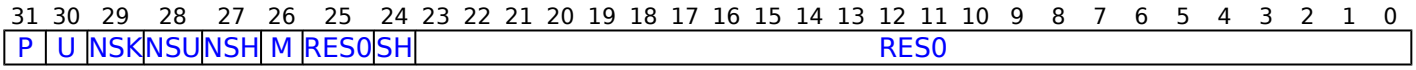
The register is not affected by an External debug reset.

Attributes

PMCCFILTR_EL0 is a 32-bit register.

Field descriptions

The PMCCFILTR_EL0 bit assignments are:



P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

P	Meaning
0b0	Count cycles in EL1.
0b1	Do not count cycles in EL1.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

U	Meaning
0b0	Count cycles in EL0.
0b1	Do not count cycles in EL0.

NSK, bit [29]

When ~~HaveEL(~~EL3 is implemented~~):~~

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When ~~HaveEL(~~EL3 is implemented~~):~~

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When ~~HaveEL(~~EL2 is implemented~~):~~

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

NSH	Meaning
0b0	Do not count cycles in EL2.
0b1	Count cycles in EL2.

Otherwise:

Reserved, RES0.

M, bit [26]

When ~~HaveEL(~~EL3 is implemented~~):~~

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

Note

This field is not visible in the AArch32 PMCCFILTR System register.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]

When ARMv8.4-SecEL2 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is not implemented or is disabled, this field is RES0.

Note

This field is not visible in the AArch32 PMCCFILTR System register.

Otherwise:

Reserved, RES0.

Bits [23:0]

Reserved, RES0.

Accessing the PMCCFILTR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCFILTR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x47C	PMCCFILTR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile for more information.

PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

Configuration

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0] .

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0] .

PMCCNTR_EL0 is in the Core power domain.

~~PMCCNTR_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.~~

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions

The PMCCNTR_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CCNT																															
CCNT																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMCCNTR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCNTR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x0F8	PMCCNTR_EL0	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x0FC	PMCCNTR_EL0	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

Purpose

Contains PMU-specific configuration data.

Configuration

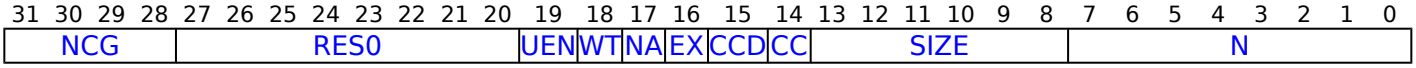
PMCFGR is in the Core power domain.

Attributes

PMCFGR is a 32-bit register.

Field descriptions

The PMCFGR bit assignments are:



NCG, bits [31:28]

This feature is not supported, so this field is RAZ.

Bits [27:20]

Reserved, RES0.

UEN, bit [19]

User-mode Enable Register supported. PMUSERENR_EL0 is not visible in the external debug interface, so this bit is RAZ.

WT, bit [18]

This feature is not supported, so this bit is RAZ.

NA, bit [17]

This feature is not supported, so this bit is RAZ.

EX, bit [16]

Export supported. Value is IMPLEMENTATION DEFINED.

EX	Meaning
0b0	PMCR_EL0.X is RES0.
0b1	PMCR_EL0.X is read/write.

CCD, bit [15]

Cycle counter has prescale.

~~Cycle counter has prescale. This is RES1 if AArch32 is supported at any EL, and RAZ otherwise.~~

This is RES1 if AArch32 is supported at any Exception level, and RAZ otherwise.

CCD	Meaning
0b0	PMCR_EL0.D is RES0.
0b1	PMCR_EL0.D is read/write.

CC, bit [14]

Dedicated cycle counter (counter 31) supported. This bit is RAO.

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8, the largest counter is 64-bits, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8, the counters are a doubleword-aligned addresses.

N, bits [7:0]

Number of counters implemented in addition to the cycle counter, PMCCNTR_EL0. The maximum number of event counters is 31.

N	Meaning
0x00	Only PMCCNTR_EL0 implemented.
0x01	PMCCNTR_EL0 plus one event counter implemented.

and so on up to 0b00011111, which indicates PMCCNTR_EL0 and 31 event counters implemented.

Accessing the PMCFGR

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCFGR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE00	PMCFGR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

(old) htmldiff from- (new)

PMCID1SR, CONTEXTIDR_EL1 Sample Register

The PMCID1SR characteristics are:

Purpose

Contains the sampled value of CONTEXTIDR_EL1, captured on reading PMPCSR[31:0].

Configuration

PMCID1SR is in the Core power domain.

~~PMCID1SR is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

This register is present only when ARMv8.2-PCSample is implemented. Otherwise, direct accesses to PMCID1SR are RES0.

Note

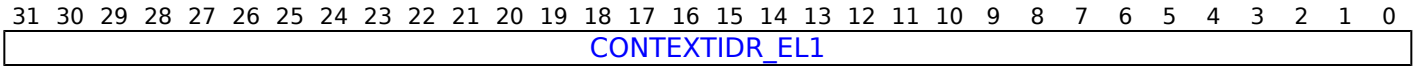
Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Attributes

PMCID1SR is a 32-bit register.

Field descriptions

The PMCID1SR bit assignments are:



CONTEXTIDR_EL1, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR. ~~If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register and PMCID1SR samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent PMPCSR sample.~~
- If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register and PMCID1SR samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent PMPCSR sample.

Because the value written to PMCID1SR is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether PMCID1SR is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The following resets apply:

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On an External debug reset, the value of this field is unchanged.
- On a Warm reset, the value of this field is unchanged.

Accessing the PMCID1SR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile

PMCID1SR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x208	PMCID1SR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance
PMU	0x228	PMCID1SR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

PMCID2SR, CONTEXTIDR_EL2 Sample Register

The PMCID2SR characteristics are:

Purpose

Contains the sampled value of CONTEXTIDR_EL2, captured on reading PMPCSR[31:0].

Configuration

PMCID2SR is in the Core power domain.

~~PMCID2SR is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

This register is present only when ARMv8.2-PCSample is implemented and ~~HaveEL(~~EL2 is implemented.~~).~~ Otherwise, direct accesses to PMCID2SR are RES0.

Note

~~If~~Before ARMv8.2-PCSample is not implemented~~Armv8.2~~, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Attributes

PMCID2SR is a 32-bit register.

Field descriptions

The PMCID2SR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CONTEXTIDR_EL2																															

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- If EL2 is using AArch64, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- If EL2 is using AArch32, then this field is set to an UNKNOWN value.

Because the value written to PMCID2SR is an indirect read of CONTEXTIDR_EL2, it is CONSTRAINED UNPREDICTABLE whether PMCID2SR is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR_EL2.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The following resets apply:

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On an External debug reset, the value of this field is unchanged.

- On a Warm reset, the value of this field is unchanged.

Accessing the PMCID2SR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile

PMCID2SR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x22C	PMCID2SR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether PMCIDR0 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR0 is a 32-bit register.

Field descriptions

The PMCIDR0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_0							

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble. Must read as `0x0D`.

Accessing the PMCIDR0

PMCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFF0	PMCIDR0

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMCIDR1, Performance Monitors Component Identification Register 1

The PMCIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see 'About the Component identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether PMCIDR1 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

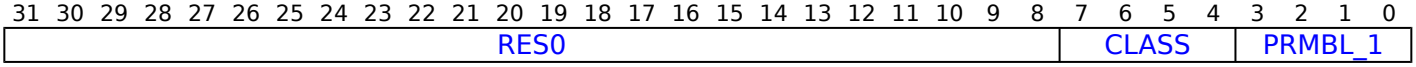
This register is required for CoreSight compliance.

Attributes

PMCIDR1 is a 32-bit register.

Field descriptions

The PMCIDR1 bit assignments are:



Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class. Reads as 0x9, debug component.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Accessing the PMCIDR1

PMCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFF4	PMCIDR1

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

Purpose

Disables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

Configuration

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0] .

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0] .

PMCNTENCLR_EL0 is in the Core power domain.

~~PMCNTENCLR_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.~~

Attributes

PMCNTENCLR_EL0 is a 32-bit register.

Field descriptions

The PMCNTENCLR_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P<n>, bit [n]																														

C, bit [31]

PMCCNTR_EL0 disable bit. Disables the cycle counter register. Possible values are:

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, disables the cycle counter.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter disable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
0b1	When read, means that PMEVCNTR<n>_EL0 is enabled. When written, disables PMEVCNTR<n>_EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMCNTENCLR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENCLR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC20	PMCNTENCLR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

Purpose

Enables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

Configuration

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[31:0] .

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0] .

PMCNTENSET_EL0 is in the Core power domain.

~~PMCNTENSET_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.~~

Attributes

PMCNTENSET_EL0 is a 32-bit register.

Field descriptions

The PMCNTENSET_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P<n>, bit [n]																														

C, bit [31]

PMCCNTR_EL0 enable bit. Enables the cycle counter register. Possible values are:

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, enables the cycle counter.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter enable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
0b1	When read, means that PMEVCNTR<n>_EL0 event counter is enabled. When written, enables PMEVCNTR<n>_EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMCNTENSET_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENSET_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC00	PMCNTENSET_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch32 System register PMCR[7:0] .

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch64 System register PMCR_EL0[7:0] .

PMCR_EL0 is in the Core power domain. ~~Some or all RW fields of this register have defined reset values. The field descriptions identify when the reset values apply.~~

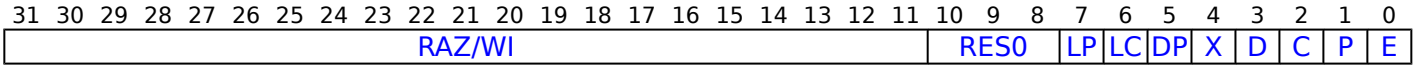
This register is only partially mapped to the internal PMCR System register. An external agent must use other means to discover the information held in PMCR[31:11], such as accessing PMCFGR and the ID registers.

Attributes

PMCR_EL0 is a 32-bit register.

Field descriptions

The PMCR_EL0 bit assignments are:



Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

Bits [10:8]

Reserved, RES0.

LP, bit [7]

When ARMv8.5-PMU is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[63:0].

If EL2 is implemented and MDCR_EL2.HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [orHDCR.HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [HDCR.HPMN..(PMCR_EL0.N-1)] or [MDCR_EL2.HPMN:(PMCR_EL0.N-1)].

If EL2 is implemented and HDCR.HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [HDCR.HPMN..(PMCR_EL0.N-1)].

Note

The effect of MDCR_EL2.HPMN or HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of MDCR_EL2.HPMN or HDCR.HPMN.

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

Otherwise:

Reserved, RES0.

LC, bit [6]

When AArch32 is supported at any Exception level:

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].

Arm deprecates use of PMCR_EL0.LC = 0.

In an AArch64 only implementation, this field is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

DP, bit [5]

When HaveEL(EL3) or (ARMv8.1-PMU is implemented and HaveEL(EL2)):

Otherwise:

Reserved, RES1.

DP, bit [5]

When EL3 is implemented or (ARMv8.1-PMU is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

DP	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this bit.
0b1	When event counting for counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited, cycle counting by PMCCNTR_EL0 is disabled.

For more information about the interaction between the Performance Monitors and EL3, see 'Effect of EL3 and EL2' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.

- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

When AArch32 is supported at any Exception level:

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR_EL0 counts every clock cycle.
0b1	When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR_EL0 to zero.

This bit is always RAZ.

Note

Resetting PMCCNTR_EL0 does not change the cycle counter overflow bit.

Access to this field is **WO**.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

P	Meaning
0b0	No action.
0b1	Reset all event counters, not including PMCCNTR_EL0, to zero.

This bit is always RAZ.

Note

Resetting the event counters does not change the event counter overflow bits.

If ARMv8.5-PMU is implemented, the value of MDCR_EL2.HLP, or PMCR_EL0.LP is ignored and bits [63:0] of all event counters are reset.

Access to this field is **WO**.

E, bit [0]

Enable.

E	Meaning
0b0	All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0, are disabled.
0b1	All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0, are enabled by PMCNTENSET_EL0.

If EL2 is implemented then:

- If EL2 is using AArch32, PMN is HDCR.HPMN.
- If EL2 is using AArch64, PMN is MDCR_EL2.HPMN.
- If PMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [PMN..(PMCR_EL0.N-1)].

If EL2 is not implemented, PMN is PMCR_EL0.N.

Note

The effect of the following fields on the operation of this bit applies if EL2 is implemented regardless of whether EL2 is enabled in the current Security state:~~MDCR_EL2.HPMN or HDCR.HPMN on the operation of this bit applies if EL2 is implemented regardless of whether EL2 is enabled in the current Security state. For more information, see the description of MDCR_EL2.HPMN or HDCR.HPMN.~~

- HDCR.HPMN. See the description of HDCR.HPMN for more information.
- MDCR_EL2.HPMN. See the description of MDCR_EL2.HPMN for more information.

On a Warm reset, this field resets to 0.

Accessing the PMCR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE04	PMCR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

~~It is IMPLEMENTATION DEFINED whether PMDEVAFF0 is implemented in the Core power domain or in the Debug power domain.~~

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

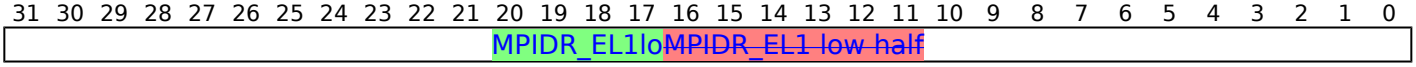
This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF0 is a 32-bit register.

Field descriptions

The PMDEVAFF0 bit assignments are:



MPIDR_EL1loMPIDR_EL1 low half, bits [31:0]

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing the PMDEVAFF0

PMDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFA8	PMDEVAFF0

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

~~It is IMPLEMENTATION DEFINED whether PMDEVAFF1 is implemented in the Core power domain or in the Debug power domain.~~

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

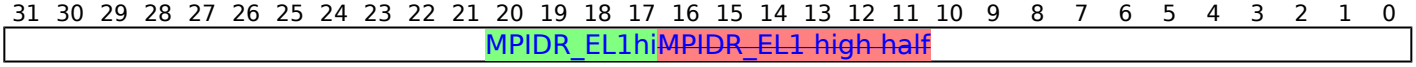
This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF1 is a 32-bit register.

Field descriptions

The PMDEVAFF1 bit assignments are:



MPIDR_EL1hi~~MPIDR_EL1 high half~~, bits [31:0]

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing the PMDEVAFF1

PMDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFAC	PMDEVAFF1

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

13~~27~~/12~~09~~/2019 15~~18~~:13~~48~~; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

(old) htmldiff from- (new)

PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the Performance Monitor component.

Configuration

~~It is IMPLEMENTATION DEFINED whether PMDEVARCH is implemented in the Core power domain or in the Debug power domain.~~

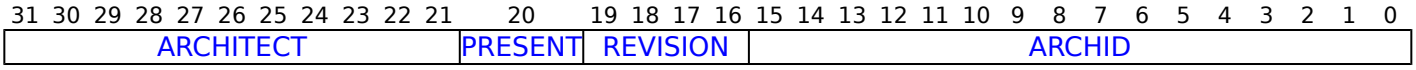
If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVARCH is a 32-bit register.

Field descriptions

The PMDEVARCH bit assignments are:



ARCHITECT, bits [31:21]

Defines the architecture of the component. For Performance Monitors, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, `0x4`.

Bits [27:21] are the JEP106 ID code, `0x3B`.

PRESENT, bit [20]

When set to 1, indicates that the DEVARCH is present.

This field is 1 in Armv8.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For Performance Monitors, the revision defined by Armv8 is `0x0`.

All other values are reserved.

ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For Performance Monitors:

- Bits [15:12] are the architecture version, `0x2`.
- Bits [11:0] are the architecture part number, `0xA16`.

This corresponds to Performance Monitors architecture version PMUv3.

Note

The PMUv3 memory-mapped programmers' model can be used by devices other than Armv8 processors. Software must determine whether the PMU is attached to an Armv8 processor by using the PMDEVAFF0 and PMDEVAFF1 registers to discover the affinity of the PMU to any Armv8 processors.

Accessing the PMDEVARCH

PMDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xFBC`	PMDEVARCH

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

(old) htmldiff from- (new)

PMDEVID, Performance Monitors Device ID register

The PMDEVID characteristics are:

Purpose

Provides information about features of the Performance Monitors implementation.

Configuration

~~It is IMPLEMENTATION DEFINED whether PMDEVID is implemented in the Core power domain or in the Debug power domain.~~

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

This register is required from Armv8.2 and in any implementation that includes ARMv8.2-PCSample. Otherwise, its location is RES0.

Note

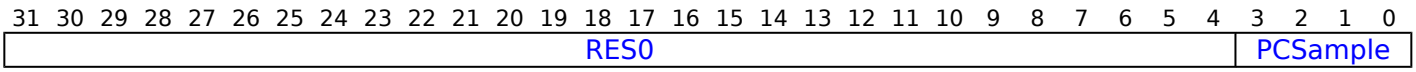
Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Attributes

PMDEVID is a 32-bit register.

Field descriptions

The PMDEVID bit assignments are:



Bits [31:4]

Reserved, RES0.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using Performance Monitors registers. Permitted values of this field are:

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the Performance Monitors register space.
0b0001	PC Sample-based Profiling Extension is implemented in the Performance Monitors register space.

All other values are reserved.

ARMv8.2-PCSample implements the functionality identified by the value 0b0001.

Accessing the PMDEVID

PMDEVID can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFC8	PMDEVID

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99c984cbfe3431cc1c9707

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PEs performance monitor interface.

Configuration

~~It is IMPLEMENTATION DEFINED whether PMDEVTYPE is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

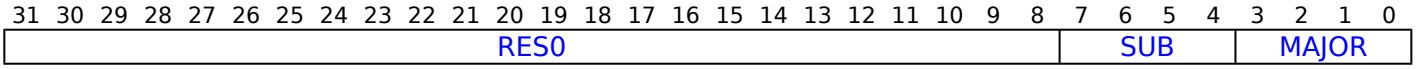
If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVTYPE is a 32-bit register.

Field descriptions

The PMDEVTYPE bit assignments are:



Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Must read as `0x1` to indicate this is a component within a PE.

MAJOR, bits [3:0]

Major type. Must read as `0x6` to indicate this is a performance monitor component.

Accessing the PMDEVTYPE

PMDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFCC	PMDEVTYPE

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMEVCNTR<n>_EL0[31:0] .

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVCNTR<n>[31:0] .

PMEVCNTR<n>_EL0 is in the Core power domain.

~~PMEVCNTR<n>_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. The field descriptions identify when the reset values apply.~~

Attributes

PMEVCNTR<n>_EL0 is a 64-bit register.

Field descriptions

The PMEVCNTR<n>_EL0 bit assignments are:

When ARMv8.5-PMU is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Event counter n																															
Event counter n																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If the highest implemented Exception level is using AArch32, the optional external interface to the performance monitors is implemented, and the PMCR.LP and HDCR.HLP bits are RAZ/WI, then locations in the external interface to the performance monitors that map to PMEVCNTR<n>_EL0[63:32] return UNKNOWN values on reads.

If the implementation does not support AArch64 at any Exception level, bits [63:32] of the event counters are not required to be implemented.

This field resets to an architecturally UNKNOWN value.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Event counter n																															

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

This field resets to an architecturally UNKNOWN value.

Accessing the PMEVCNTR<n>_EL0

External accesses to the performance monitors ignore PMUSERENR_EL0 and, if implemented, MDCR_EL2.{TPM, TPMCR, HPMN} and MDCR_EL3.TPM. This means that all counters are accessible regardless of the current Exception level or privilege of the access.

If ARMv8.5-PMU is not implemented, when IsCorePowered(), DoubleLockStatus(), OSLockStatus() or !AllowExternalPMUAccess(), 32-bit accesses to `0x004+8×n` have a CONSTRAINED UNPREDICTABLE behavior.

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVCNTR<n>_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0x000 + 8n`	PMEVCNTR<n>_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

Copyright © 2010-2019 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old) htmldiff from- (new)

(old) htmldiff from- (new)

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0[31:0] .

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVTYPER<n>[31:0] .

PMEVTYPER<n>_EL0 is in the Core power domain.

~~PMEVTYPER<n>_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.~~

If event counter n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

PMEVTYPER<n>_EL0 is a 32-bit register.

Field descriptions

The PMEVTYPER<n>_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23 22 21 20 19 18 17 16	15 14 13 12 11 10	9 8 7 6 5 4 3 2 1 0
P	U	NSK	NSU	NSH	M	MT	SH	RES0	evtCount[15:10]	evtCount[9:0]

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

P	Meaning
0b0	Count events in EL1.
0b1	Do not count events in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.

U	Meaning
0b0	Count events in EL0.
0b1	Do not count events in EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When ~~HaveEL(~~EL3 is implemented~~):~~

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When ~~HaveEL(~~EL3 is implemented~~):~~

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When ~~HaveEL(~~EL2 is implemented~~):~~

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.

NSH	Meaning
0b0	Do not count events in EL2.
0b1	Count events in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When ~~HaveEL(~~EL3 is implemented~~):~~

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Secure EL3 are counted.

Otherwise, events in Secure EL3 are not counted.

Most applications can ignore this field and set its value to `0b0`.

Note

This field is not visible in the AArch32 PMEVTYPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]

When (ARMv8.6-MTPMU is implemented and enabled) or an IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:

Multithreading.

MT	Meaning
`0b0`	Count events only on controlling PE.
`0b1`	Count events from any PE with the same affinity at level 1 and above as this PE.

Note

- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]

When ARMv8.4-SecEL2 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

Note

This field is not visible in the AArch32 PMEVTYPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When ARMv8.1-PMU is implemented:

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>_EL0.

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in Allocation of the PMU event number space.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range `0x0000` to `0x003F`, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range `0x4000` to `0x403F`, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMEVTYPER<n>_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVTYPER<n>_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0x400 + 4n`	PMEVTYPER<n>_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

Configuration

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0] .

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0] .

PMINTENCLR_EL1 is in the Core power domain.

~~PMINTENCLR_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.~~

Attributes

PMINTENCLR_EL1 is a 32-bit register.

Field descriptions

The PMINTENCLR_EL1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P<n>, bit [n]																														

C, bit [31]

PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow interrupt request disable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR<n>_EL0 interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMINTENCLR_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENCLR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC60	PMINTENCLR_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

Configuration

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[31:0] .

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENSET[31:0] .

PMINTENSET_EL1 is in the Core power domain.

~~PMINTENSET_EL1 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.~~

Attributes

PMINTENSET_EL1 is a 32-bit register.

Field descriptions

The PMINTENSET_EL1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P<n>, bit [n]																														

C, bit [31]

PMCCNTR_EL0 overflow interrupt request enable bit. Possible values are:

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow interrupt request enable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, enables the PMEVCNTR<n>_EL0 interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMINTENSET_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENSET_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC40	PMINTENSET_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

Purpose

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

It is IMPLEMENTATION DEFINED whether PMITCTRL is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:

- The register is not affected by a Warm reset.
- If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.
- If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.

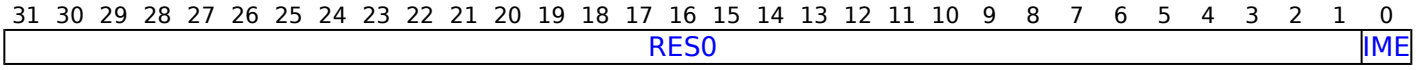
Implementation of this register is OPTIONAL.

Attributes

PMITCTRL is a 32-bit register.

Field descriptions

The PMITCTRL bit assignments are:



Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

On a Implementation reset, this field resets to 0.

Accessing the PMITCTRL

PMITCTRL can be accessed through the external debug interface:

Component	Offset	Instance

PMU	0xF00	PMITCTRL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

Purpose

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

~~If ARMv8.3-DoPD is implemented, then ARMv8.0-SoftwareLock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.~~

If ARMv8.3-DoPD is implemented, then ARMv8.0-SoftwareLock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

~~It is IMPLEMENTATION DEFINED whether PMLAR is implemented in the Core power domain or in the Debug power domain.~~

If ARMv8.3-DoPD is not implemented, then this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

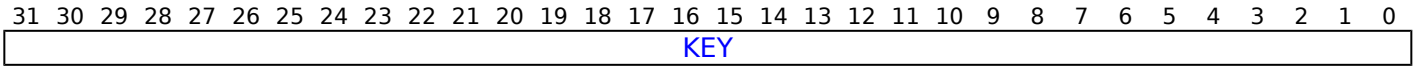
Attributes

PMLAR is a 32-bit register.

Field descriptions

The PMLAR bit assignments are:

When the Software Lock is implemented.:

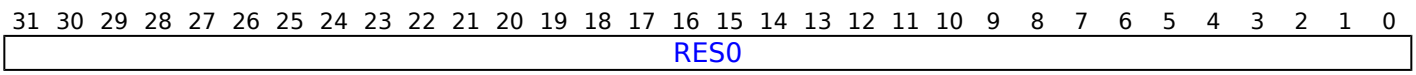


KEY, bits [31:0]

Lock Access control. Writing the key value `0xC5ACCE55` to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:



Otherwise

Bits [31:0]

Reserved, RES0.

Accessing the PMLAR

PMLAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
PMU	0xFB0	PMLAR

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

Purpose

Indicates the current status of the software lock for Performance Monitors registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

~~If ARMv8.3-DoPD is implemented, then ARMv8.0-SoftwareLock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.~~

If ARMv8.3-DoPD is implemented, then ARMv8.0-SoftwareLock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

~~It is IMPLEMENTATION DEFINED whether PMLSR is implemented in the Core power domain or in the Debug power domain. Some or all RW fields of this register have defined reset values, and:~~

- ~~The register is not affected by a Warm reset.~~
- ~~If the register is implemented in the Core power domain the reset values apply on a Cold reset, and the register is not affected by an External debug reset.~~
- ~~If the register is implemented in the Debug power domain the reset values apply on an External debug reset, and the register is not affected by a Cold reset.~~

If ARMv8.3-DoPD is not implemented, then this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

Attributes

PMLSR is a 32-bit register.

Field descriptions

The PMLSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																													nTT	SLK	SLI

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

When the Software Lock is implemented.:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the software lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The following resets apply:

- If Armv8.3-DoPD is implemented, this register is reset by Cold reset and not affected by External debug reset. If Armv8.3-DoPD is not implemented, this register is reset by External debug reset and not affected by Cold reset.
- On a Cold reset, this~~This~~ field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Accessing the PMLSR

PMLSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
PMU	0xFB4	PMLSR

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSCLR_EL0 characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>. Writing to this register clears these bits.

Configuration

External register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0] .

External register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0] .

PMOVSCLR_EL0 is in the Core power domain.

~~PMOVSCLR_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.~~

Attributes

PMOVSCLR_EL0 is a 32-bit register.

Field descriptions

The PMOVSCLR_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P<n>, bit [n]																														

C, bit [31]

Cycle counter overflow clear bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow clear bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, clears the PMEVCNTR<n>_EL0 overflow bit to 0.

If ARMv8.5-PMU is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMOVSCLR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSCLR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC80	PMOVSCLR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>.

Configuration

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0] .

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0] .

PMOVSSET_EL0 is in the Core power domain.

~~PMOVSSET_EL0 is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply on a Warm or Cold reset. The register is not affected by an External debug reset.~~

Attributes

PMOVSSET_EL0 is a 32-bit register.

Field descriptions

The PMOVSSET_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P<n>, bit [n]																														

C, bit [31]

Cycle counter overflow set bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow set bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, sets the PMEVCNTR<n>_EL0 overflow bit to 1.

If ARMv8.5-PMU is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMOVSSET_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSSET_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xCC0	PMOVSSET_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

(old) htmldiff from- (new)

PMPCSR, Program Counter Sample Register

The PMPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configuration

PMPCSR is in the Core power domain.

~~PMPCSR is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

This register is present only when ARMv8.2-PCSample is implemented. Otherwise, direct accesses to PMPCSR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

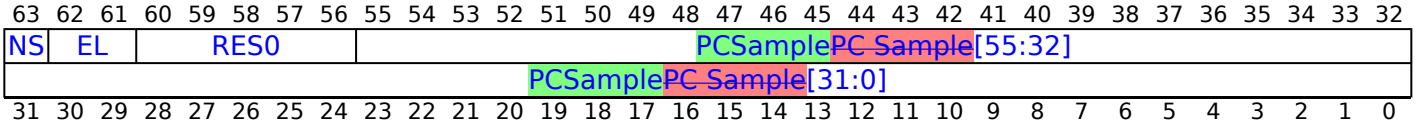
Support for 64-bit atomic reads is IMPLEMENTATION DEFINED. If 64-bit atomic reads are implemented, a 64-bit read of PMPCSR has the same side-effect as a 32-bit read of PMCSR[31:0] followed by a 32-bit read of PMPCSR[63:32], returning the combined value. For example, if the PE is in Debug state then a 64-bit atomic read returns bits[31:0] == `0xFFFFFFFF` and bits[63:32] UNKNOWN.

Attributes

PMPCSR is a 64-bit register.

Field descriptions

The PMPCSR bit assignments are:



NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
`0b0`	Sample is from Secure state.
`0b1`	Sample is from Non-secure state.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

EL	Meaning
0b00	Sample is from EL0.
0b01	Sample is from EL1.
0b10	Sample is from EL2.
0b11	Sample is from EL3.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [60:56]

Reserved, RES0.

PCSamplePC Sample[55:32], bits [55:32]

Bits[55:32] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

PCSamplePC Sample[31:0], bits [31:0]

Bits[31:0] of the sampled instruction address value.

PMPCSR[31:0] reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of PMPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

PMPCSR[31:0] reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of PMPCSR[31:0].

For the cases where a read of PMPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR to UNKNOWN values.

Otherwise, a read of PMPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

For a read of PMPCSR[31:0] from the memory-mapped interface, if PMLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR are unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile

PMPCSR can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x200	PMPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x204	PMPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x220	PMPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x224	PMPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether PMPIDR0 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

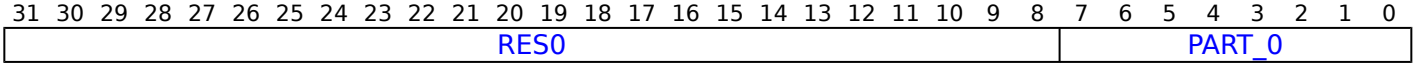
This register is required for CoreSight compliance.

Attributes

PMPIDR0 is a 32-bit register.

Field descriptions

The PMPIDR0 bit assignments are:



Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

Accessing the PMPIDR0

PMPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFE0	PMPIDR0

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether PMPIDR1 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

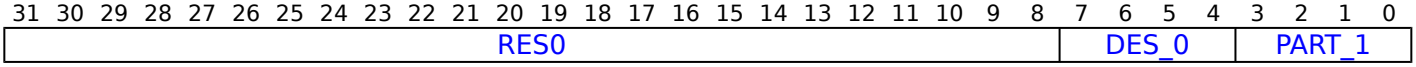
This register is required for CoreSight compliance.

Attributes

PMPIDR1 is a 32-bit register.

Field descriptions

The PMPIDR1 bit assignments are:



Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is `0b1011`.

PART_1, bits [3:0]

Part number, most significant nibble.

Accessing the PMPIDR1

PMPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFE4	PMPIDR1

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMPIDR2, Performance Monitors Peripheral Identification Register 2

The PMPIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether PMPIDR2 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

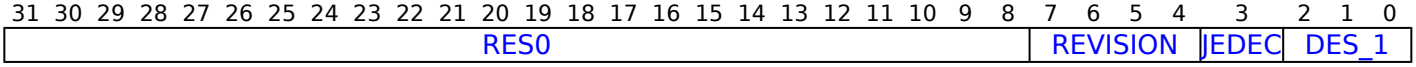
This register is required for CoreSight compliance.

Attributes

PMPIDR2 is a 32-bit register.

Field descriptions

The PMPIDR2 bit assignments are:



Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

JEDEC, bit [3]

RAO. Indicates a JEP106 identity code is used.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is `0b011`.

Accessing the PMPIDR2

PMPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFE8	PMPIDR2

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99c984cbfe3431cc1c9707

PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether PMPIDR3 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

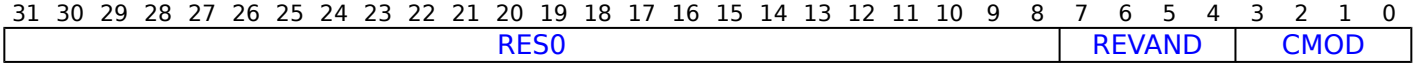
This register is required for CoreSight compliance.

Attributes

PMPIDR3 is a 32-bit register.

Field descriptions

The PMPIDR3 bit assignments are:



Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using PMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

Accessing the PMPIDR3

PMPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance

PMU	0xFEC	PMPIDR3

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information see 'About the Peripheral identification scheme' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section H8 (About the External Debug Registers).

Configuration

~~It is IMPLEMENTATION DEFINED whether PMPIDR4 is implemented in the Core power domain or in the Debug power domain.~~

Implementation of this register is OPTIONAL.

If ARMv8.3-DoPD is implemented, this register is in the Core power domain. If ARMv8.3-DoPD is not implemented, this register is in the Debug power domain.

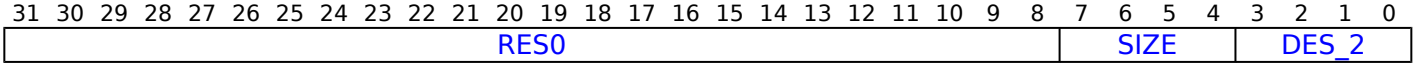
This register is required for CoreSight compliance.

Attributes

PMPIDR4 is a 32-bit register.

Field descriptions

The PMPIDR4 bit assignments are:



Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. RAZ. Log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is `0b0100`.

Accessing the PMPIDR4

PMPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance

PMU	0xFD0	PMPIDR4

This interface is accessible as follows:

- When ARMv8.3-DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8c12a99c984cbfe3431cc1c9707

PMVIDSR, VMID Sample Register

The PMVIDSR characteristics are:

Purpose

Contains the sampled VMID value that is captured on reading PMPCSR[31:0].

Configuration

PMVIDSR is in the Core power domain.

~~PMVIDSR is in the Core power domain. RW fields in this register reset to architecturally UNKNOWN values. These apply only on a Cold reset. The register is not affected by a Warm reset and is not affected by an External debug reset.~~

This register is present only when ARMv8.2-PCSample is implemented and ~~HaveEL(~~EL2 is implemented.~~).~~ Otherwise, direct accesses to PMVIDSR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Attributes

PMVIDSR is a 32-bit register.

Field descriptions

The PMVIDSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																VMID[15:8]								VMID							

Bits [31:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When ARMv8.1-VMID16 is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]

VMID sample. The VMID associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- This field is set to an UNKNOWN value if any of the following apply:
  - EL2 is disabled in the current Security state.
  - The PE is executing at EL2.
  - EL2 is enabled in the current Security state, the PE is executing at EL0, EL2 is using AArch64, HCR_EL2.E2H == 1, and HCR_EL2.TGE == 1.
- Otherwise:
  - If EL2 is using AArch64 and either ARMv8.1-VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
  - If EL2 is using AArch64, ARMv8.1-VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
  - If EL2 is using AArch32, this field is set to VTTBR.VMID.

Because the value written to PMVIDR is an indirect read of the VMID value, it is CONSTRAINED UNPREDICTABLE whether PMVIDSR is set to the original or new value if PMPCSR samples:

- An instruction that writes to the VMID value.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile

PMVIDSR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x20C	PMVIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

1327/1209/2019 1518:1348; 391b5248b29fb2f001ef74792eaacbd6fc72f2116134483bd14dc8e12a99c984cbfe3431cc1c9707
