On a Warm reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

### Bits [59:48]

Reserved, RES0.

### PMG\_D, bits [47:40]

Performance monitoring group for data accesses.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PMG\_I, bits [39:32]

Performance monitoring group for instruction accesses.

### PARTID\_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL3.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

PARTID\_I, bits [15:0]

Partition ID for instruction accesses made from EL3.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

Accessing the MPAM3\_EL3

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

MRS <Xt>, MPAM3\_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MPAM3_EL3;
```

MSR MPAM3\_EL3, <Xt>

op0	op1	CRn	CRm	op2

# MPAMHCR\_EL2, MPAM Hypervisor Control Register (EL2)

The MPAMHCR\_EL2 characteristics are:

## Purpose

Controls the PARTID virtualization features of MPAM. It controls the mapping of virtual PARTIDs into physical PARTIDs in [MPAM0\\_EL1](#) when EL0\_VPMEN == 1 and in [MPAM1\\_EL1](#) when EL1\_VPMEN == 1.

## Configuration

This register is present only when FEAT\_MPAM is implemented and MPAMIDR\_EL1.HAS\_HCR == 1. Otherwise, direct accesses to MPAMHCR\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MPAMHCR\_EL2 is a 64-bit register.

## Field descriptions

The MPAMHCR\_EL2 bit assignments are:

63	62616059585756555453525150494847464544434241	40	393837363534	33	32
RES0					
TRAP_MPAMIDR_EL1	RES0	GSTAPP_PLK	RES0	EL1_VPMEN	ELO_VPMEN
31	3029282726252423222120191817161514131211109	8	765432	1	0

### Bits [63:32]

Reserved, RES0.

### TRAP\_MPAMIDR\_EL1, bit [31]

Trap accesses from EL1 to [MPAMIDR\\_EL1](#) to EL2.

TRAP_MPAMIDR_EL1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Direct accesses to <a href="#">MPAMIDR_EL1</a> from EL1 are trapped to EL2.

On a Warm reset, when ~~When~~ EL3 is not implemented, this field resets to 1.

On a Warm reset, when ~~When~~ EL3 is implemented, this field resets to an architecturally UNKNOWN value.

### Bits [30:9]

Reserved, RES0.

**GSTAPP\_PLK, bit [8]**

Make the PARTIDs at EL0 the same as the PARTIDs at EL1. When executing at EL0, EL2 is enabled, [HCR\\_EL2.TGE](#) == 0 and [GSTAPP\\_PLK](#) = 1, [MPAM1\\_EL1](#) is used instead of [MPAM0\\_EL1](#) to generate MPAM labels for memory requests.

<b>GSTAPP_PLK</b>	<b>Meaning</b>
0b0	<a href="#">MPAM0_EL1</a> is used to generate MPAM labels when executing at EL0.
0b1	<a href="#">MPAM1_EL1</a> is used to generate MPAM labels when executing at EL0 with EL2 enabled and <a href="#">HCR_EL2.TGE</a> == 0. Otherwise <a href="#">MPAM0_EL1</a> is used.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**Bits [7:2]**

Reserved, RES0.

**EL1\_VPMEN, bit [1]**

Enable the virtual PARTID mapping of the PARTID fields in [MPAM1\\_EL1](#) when executing at EL1. This bit also enables virtual PARTID mapping when [MPAM1\\_EL1](#) is used to generate MPAM labels for memory requests at EL0 due to [GSTAPP\\_PLK](#) == 1.

<b>EL1_VPMEN</b>	<b>Meaning</b>
0b0	<a href="#">MPAM1_EL1</a> .PARTID_I and <a href="#">MPAM1_EL1</a> .PARTID_D are physical PARTIDs that are used to label memory system requests.
0b1	<a href="#">MPAM1_EL1</a> .PARTID_I and <a href="#">MPAM1_EL1</a> .PARTID_D are virtual PARTIDs that are used to index the PhyPARTID fields of <a href="#">MPAMVPM0_EL2</a> to <a href="#">MPAMVPM7_EL2</a> registers to map the virtual PARTID into a physical PARTID to label memory system requests.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**EL0\_VPMEN, bit [0]**

Enable the virtual PARTID mapping of the PARTID fields of [MPAM0\\_EL1](#) unless [HCR\\_EL2.E2H](#) == 1 and [HCR\\_EL2.TGE](#) == 1.

When [HCR\\_EL2.E2H](#) == 1 and [HCR\\_EL2.TGE](#) == 1, [EL0\\_VPMEN](#) is ignored and [MPAM0\\_EL1](#) PARTID fields are not mapped.

When [MPAMHCR\\_EL2.GSTAPP\\_PLK](#) == 1 and [HCR\\_EL2.TGE](#) == 0, [MPAM1\\_EL1](#) is used as the source of PARTIDs and the virtual PARTID mapping of [MPAM1\\_EL1](#) PARTIDs is controlled by [MPAMHCR\\_EL2.EL1\\_VPMEN](#).

<b>EL0_VPMEN</b>	<b>Meaning</b>
0b0	<a href="#">MPAM0_EL1</a> .PARTID_I and <a href="#">MPAM0_EL1</a> .PARTID_D are physical PARTIDs that are used to label memory system requests.
0b1	<a href="#">MPAM0_EL1</a> .PARTID_I and <a href="#">MPAM0_EL1</a> .PARTID_D are virtual PARTIDs that are used to index the PhyPARTID fields of <a href="#">MPAMVPM0_EL2</a> to <a href="#">MPAMVPM7_EL2</a> registers to map the virtual PARTID into a physical PARTID to label memory system requests.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**Accessing the MPAMHCR\_EL2**

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, MPAMHCR\_EL2

op0	op1	CRn	CRm	op2

# MPAMVPM0\_EL2, MPAM Virtual PARTID Mapping Register 0

The MPAMVPM0\_EL2 characteristics are:

## Purpose

MPAMVPM0\_EL2 provides mappings from virtual PARTIDs 0 - 3 to physical PARTIDs.

[MPAMIDR\\_EL1.VPMR\\_MAX](#) field gives the index of the highest implemented MPAMVPM<n>\_EL2 register. VPMR\_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If [MPAMIDR\\_EL1.VPMR\\_MAX](#) == 0, there is only a single MPAMVPM<n>\_EL2 register, [MPAMVPM0\\_EL2](#).

Virtual PARTID mapping is enabled by [MPAMHCR\\_EL2.EL1\\_VPMEN](#) for PARTIDs in [MPAM1\\_EL1](#) and by [MPAMHCR\\_EL2.EL0\\_VPMEN](#) for PARTIDs in [MPAM0\\_EL1](#).

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the [MPAMVPMV\\_EL2.VPM\\_V](#) bit in bit position n is set to 1.

## Configuration

This register is present only when FEAT\_MPAM is implemented and MPAMIDR\_EL1.HAS\_HCR == 1. Otherwise, direct accesses to MPAMVPM0\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MPAMVPM0\_EL2 is a 64-bit register.

## Field descriptions

The MPAMVPM0\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">PhyPARTID3</a>																<a href="#">PhyPARTID2</a>															
<a href="#">PhyPARTID1</a>																<a href="#">PhyPARTID0</a>

### PhyPARTID3, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 3. PhyPARTID3 gives the mapping of virtual PARTID 3 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PhyPARTID2, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 2. PhyPARTID2 gives the mapping of virtual PARTID 2 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID1, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 1. PhyPARTID1 gives the mapping of virtual PARTID 1 to a physical PARTID.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

PhyPARTID0, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 0. PhyPARTID0 gives the mapping of virtual PARTID 0 to a physical PARTID.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

Accessing the MPAMVPM0\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, MPAMVPM0\_EL2

# MPAMVPM1\_EL2, MPAM Virtual PARTID Mapping Register 1

The MPAMVPM1\_EL2 characteristics are:

## Purpose

MPAMVPM1\_EL2 provides mappings from virtual PARTIDs 4 - 7 to physical PARTIDs.

[MPAMIDR\\_EL1.VPMR\\_MAX](#) field gives the index of the highest implemented [MPAMVPM0\\_EL2](#) to [MPAMVPM7\\_EL2](#) registers. VPMR\_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If [MPAMIDR\\_EL1.VPMR\\_MAX](#) == 0, there is only a single MPAMVPM<n>\_EL2 register, [MPAMVPM0\\_EL2](#).

Virtual PARTID mapping is enabled by [MPAMHCR\\_EL2.EL1\\_VPMEN](#) for PARTIDs in [MPAM1\\_EL1](#) and by [MPAMHCR\\_EL2.EL0\\_VPMEN](#) for PARTIDs in [MPAM0\\_EL1](#).

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the [MPAMVPMV\\_EL2.VPM\\_V](#) bit in bit position n is set to 1.

## Configuration

This register is present only when FEAT\_MPAM is implemented, [MPAMIDR\\_EL1.HAS\\_HCR](#) == 1 and [MPAMIDR\\_EL1.VPMR\\_MAX](#) > 0. Otherwise, direct accesses to MPAMVPM1\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MPAMVPM1\_EL2 is a 64-bit register.

## Field descriptions

The MPAMVPM1\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">PhyPARTID7</a>																<a href="#">PhyPARTID6</a>															
<a href="#">PhyPARTID5</a>																<a href="#">PhyPARTID4</a>															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### PhyPARTID7, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 7. PhyPARTID7 gives the mapping of virtual PARTID 7 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PhyPARTID6, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 6. PhyPARTID6 gives the mapping of virtual PARTID 6 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PhyPARTID5, bits [31:16]**

Virtual PARTID Mapping Entry for virtual PARTID 5. PhyPARTID5 gives the mapping of virtual PARTID 5 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PhyPARTID4, bits [15:0]**

Virtual PARTID Mapping Entry for virtual PARTID 4. PhyPARTID4 gives the mapping of virtual PARTID 4 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the MPAMVPM1\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, MPAMVPM1\_EL2

# MPAMVPM2\_EL2, MPAM Virtual PARTID Mapping Register 2

The MPAMVPM2\_EL2 characteristics are:

## Purpose

MPAMVPM2\_EL2 provides mappings from virtual PARTIDs 8 - 11 to physical PARTIDs.

[MPAMIDR\\_EL1.VPMR\\_MAX](#) field gives the index of the highest implemented [MPAMVPM0\\_EL2](#) to [MPAMVPM7\\_EL2](#) registers. [VPMR\\_MAX](#) can be as large as 7 (8 registers) or 32 virtual PARTIDs. If [MPAMIDR\\_EL1.VPMR\\_MAX](#) == 0, there is only a single MPAMVPM<n>\_EL2 register, [MPAMVPM0\\_EL2](#).

Virtual PARTID mapping is enabled by [MPAMHCR\\_EL2.EL1\\_VPMEN](#) for PARTIDs in [MPAM1\\_EL1](#) and by [MPAMHCR\\_EL2.EL0\\_VPMEN](#) for PARTIDs in [MPAM0\\_EL1](#).

A virtual-to-physical PARTID mapping entry, [PhyPARTID<n>](#), is only valid when the [MPAMVPMV\\_EL2.VPM\\_V](#) bit in bit position n is set to 1.

## Configuration

This register is present only when [FEAT\\_MPAM](#) is implemented, [MPAMIDR\\_EL1.HAS\\_HCR](#) == 1 and [MPAMIDR\\_EL1.VPMR\\_MAX](#) > 1. Otherwise, direct accesses to MPAMVPM2\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MPAMVPM2\_EL2 is a 64-bit register.

## Field descriptions

The MPAMVPM2\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
PhyPARTID11																PhyPARTID10															
PhyPARTID9																PhyPARTID8															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### PhyPARTID11, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 11. [PhyPARTID11](#) gives the mapping of virtual PARTID 11 to a physical PARTID.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### PhyPARTID10, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 10. [PhyPARTID10](#) gives the mapping of virtual PARTID 10 to a physical PARTID.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**PhyPARTID9, bits [31:16]**

Virtual PARTID Mapping Entry for virtual PARTID 9. PhyPARTID9 gives the mapping of virtual PARTID 9 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PhyPARTID8, bits [15:0]**

Virtual PARTID Mapping Entry for virtual PARTID 8. PhyPARTID8 gives the mapping of virtual PARTID 8 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the MPAMVPM2\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, MPAMVPM2\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0110	0b010

```

if PSTATE.EL == EL0 then

# MPAMVPM3\_EL2, MPAM Virtual PARTID Mapping Register 3

The MPAMVPM3\_EL2 characteristics are:

## Purpose

MPAMVPM3\_EL2 provides mappings from virtual PARTIDs 12 - 15 to physical PARTIDs.

[MPAMIDR\\_EL1.VPMR\\_MAX](#) field gives the index of the highest implemented MPAMVPM<n>\_EL2 registers. VPMR\_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If [MPAMIDR\\_EL1.VPMR\\_MAX](#) == 0, there is only a single MPAMVPM<n>\_EL2 register, [MPAMVPM0\\_EL2](#).

Virtual PARTID mapping is enabled by [MPAMHCR\\_EL2.EL1\\_VPMEN](#) for PARTIDs in [MPAM1\\_EL1](#) and by [MPAMHCR\\_EL2.EL0\\_VPMEN](#) for PARTIDs in [MPAM0\\_EL1](#).

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the [MPAMVPMV\\_EL2.VPM\\_V](#) bit in bit position n is set to 1.

## Configuration

This register is present only when FEAT\_MPAM is implemented, [MPAMIDR\\_EL1.HAS\\_HCR](#) == 1 and [MPAMIDR\\_EL1.VPMR\\_MAX](#) > 2. Otherwise, direct accesses to MPAMVPM3\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MPAMVPM3\_EL2 is a 64-bit register.

## Field descriptions

The MPAMVPM3\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">PhyPARTID15</a>																<a href="#">PhyPARTID14</a>															
<a href="#">PhyPARTID13</a>																<a href="#">PhyPARTID12</a>															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### PhyPARTID15, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 15. PhyPARTID15 gives the mapping of virtual PARTID 15 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PhyPARTID14, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 14. PhyPARTID14 gives the mapping of virtual PARTID 14 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PhyPARTID13, bits [31:16]**

Virtual PARTID Mapping Entry for virtual PARTID 13. PhyPARTID13 gives the mapping of virtual PARTID 13 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PhyPARTID12, bits [15:0]**

Virtual PARTID Mapping Entry for virtual PARTID 12. PhyPARTID12 gives the mapping of virtual PARTID 12 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the MPAMVPM3\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, MPAMVPM3\_EL2

op0	op1	CRn	CRm	op2

# MPAMVPM4\_EL2, MPAM Virtual PARTID Mapping Register 4

The MPAMVPM4\_EL2 characteristics are:

## Purpose

MPAMVPM4\_EL2 provides mappings from virtual PARTIDs 16 - 19 to physical PARTIDs.

[MPAMIDR\\_EL1.VPMR\\_MAX](#) field gives the index of the highest implemented MPAMVPM<n>\_EL2 registers. VPMR\_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If [MPAMIDR\\_EL1.VPMR\\_MAX](#) == 0, there is only a single MPAMVPM<n>\_EL2 register, [MPAMVPM0\\_EL2](#).

Virtual PARTID mapping is enabled by [MPAMHCR\\_EL2.EL1\\_VPMEN](#) for PARTIDs in [MPAM1\\_EL1](#) and by [MPAMHCR\\_EL2.EL0\\_VPMEN](#) for PARTIDs in [MPAM0\\_EL1](#).

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the [MPAMVPMV\\_EL2.VPM\\_V](#) bit in bit position n is set to 1.

## Configuration

This register is present only when FEAT\_MPAM is implemented, MPAMIDR\_EL1.HAS\_HCR == 1 and MPAMIDR\_EL1.VPMR\_MAX > 3. Otherwise, direct accesses to MPAMVPM4\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MPAMVPM4\_EL2 is a 64-bit register.

## Field descriptions

The MPAMVPM4\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
PhyPARTID19																PhyPARTID18															
PhyPARTID17																PhyPARTID16															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### PhyPARTID19, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 19. PhyPARTID19 gives the mapping of virtual PARTID 19 to a physical PARTID.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### PhyPARTID18, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 18. PhyPARTID18 gives the mapping of virtual PARTID 18 to a physical PARTID.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**PhyPARTID17, bits [31:16]**

Virtual PARTID Mapping Entry for virtual PARTID 17. PhyPARTID17 gives the mapping of virtual PARTID 17 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PhyPARTID16, bits [15:0]**

Virtual PARTID Mapping Entry for virtual PARTID 16. PhyPARTID16 gives the mapping of virtual PARTID 16 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the MPAMVPM4\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, MPAMVPM4\_EL2

op0	op1	CRn	CRm	op2

# MPAMVPM5\_EL2, MPAM Virtual PARTID Mapping Register 5

The MPAMVPM5\_EL2 characteristics are:

## Purpose

MPAMVPM5\_EL2 provides mappings from virtual PARTIDs 20 - 23 to physical PARTIDs.

[MPAMIDR\\_EL1.VPMR\\_MAX](#) field gives the index of the highest implemented MPAMVPM<n>\_EL2 registers. VPMR\_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If [MPAMIDR\\_EL1.VPMR\\_MAX](#) == 0, there is only a single MPAMVPM<n>\_EL2 register, [MPAMVPM0\\_EL2](#).

Virtual PARTID mapping is enabled by [MPAMHCR\\_EL2.EL1\\_VPMEN](#) for PARTIDs in [MPAM1\\_EL1](#) and by [MPAMHCR\\_EL2.EL0\\_VPMEN](#) for PARTIDs in [MPAM0\\_EL1](#).

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the [MPAMVPMV\\_EL2.VPM\\_V](#) bit in bit position n is set to 1.

## Configuration

This register is present only when FEAT\_MPAM is implemented, MPAMIDR\_EL1.HAS\_HCR == 1 and MPAMIDR\_EL1.VPMR\_MAX > 4. Otherwise, direct accesses to MPAMVPM5\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MPAMVPM5\_EL2 is a 64-bit register.

## Field descriptions

The MPAMVPM5\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">PhyPARTID23</a>																<a href="#">PhyPARTID22</a>															
<a href="#">PhyPARTID21</a>																<a href="#">PhyPARTID20</a>															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### PhyPARTID23, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 23. PhyPARTID23 gives the mapping of virtual PARTID 23 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PhyPARTID22, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 22. PhyPARTID22 gives the mapping of virtual PARTID 22 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PhyPARTID21, bits [31:16]**

Virtual PARTID Mapping Entry for virtual PARTID 21. PhyPARTID21 gives the mapping of virtual PARTID 21 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PhyPARTID20, bits [15:0]**

Virtual PARTID Mapping Entry for virtual PARTID 20. PhyPARTID20 gives the mapping of virtual PARTID 20 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the MPAMVPM5\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, MPAMVPM5\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0110	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;

# MPAMVPM6\_EL2, MPAM Virtual PARTID Mapping Register 6

The MPAMVPM6\_EL2 characteristics are:

## Purpose

MPAMVPM6\_EL2 provides mappings from virtual PARTIDs 24 - 27 to physical PARTIDs.

[MPAMIDR\\_EL1.VPMR\\_MAX](#) field gives the index of the highest implemented MPAMVPM<n>\_EL2 registers. VPMR\_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If [MPAMIDR\\_EL1.VPMR\\_MAX](#) == 0, there is only a single MPAMVPM<n>\_EL2 register, [MPAMVPM0\\_EL2](#).

Virtual PARTID mapping is enabled by [MPAMHCR\\_EL2.EL1\\_VPMEN](#) for PARTIDs in [MPAM1\\_EL1](#) and by [MPAMHCR\\_EL2.EL0\\_VPMEN](#) for PARTIDs in [MPAM0\\_EL1](#).

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the [MPAMVPMV\\_EL2.VPM\\_V](#) bit in bit position n is set to 1.

## Configuration

This register is present only when FEAT\_MPAM is implemented, MPAMIDR\_EL1.HAS\_HCR == 1 and MPAMIDR\_EL1.VPMR\_MAX > 5. Otherwise, direct accesses to MPAMVPM6\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MPAMVPM6\_EL2 is a 64-bit register.

## Field descriptions

The MPAMVPM6\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
PhyPARTID27																PhyPARTID26															
PhyPARTID25																PhyPARTID24															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### PhyPARTID27, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 27. PhyPARTID27 gives the mapping of virtual PARTID 27 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PhyPARTID26, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 26. PhyPARTID26 gives the mapping of virtual PARTID 26 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PhyPARTID25, bits [31:16]**

Virtual PARTID Mapping Entry for virtual PARTID 25. PhyPARTID25 gives the mapping of virtual PARTID 25 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PhyPARTID24, bits [15:0]**

Virtual PARTID Mapping Entry for virtual PARTID 24. PhyPARTID24 gives the mapping of virtual PARTID 24 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the MPAMVPM6\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, MPAMVPM6\_EL2

op0	op1	CRn	CRm	op2

# MPAMVPM7\_EL2, MPAM Virtual PARTID Mapping Register 7

The MPAMVPM7\_EL2 characteristics are:

## Purpose

MPAMVPM7\_EL2 provides mappings from virtual PARTIDs 28 - 31 to physical PARTIDs.

[MPAMIDR\\_EL1.VPMR\\_MAX](#) field gives the index of the highest implemented MPAMVPM<n>\_EL2 registers. VPMR\_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If [MPAMIDR\\_EL1.VPMR\\_MAX](#) == 0, there is only a single MPAMVPM<n>\_EL2 register, [MPAMVPM0\\_EL2](#).

Virtual PARTID mapping is enabled by [MPAMHCR\\_EL2.EL1\\_VPMEN](#) for PARTIDs in [MPAM1\\_EL1](#) and by [MPAMHCR\\_EL2.EL0\\_VPMEN](#) for [MPAM0\\_EL1](#).

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is only valid when the [MPAMVPMV\\_EL2.VPM\\_V](#) bit in bit position n is set to 1.

## Configuration

This register is present only when FEAT\_MPAM is implemented, [MPAMIDR\\_EL1.HAS\\_HCR](#) == 1 and [MPAMIDR\\_EL1.VPMR\\_MAX](#) == 7. Otherwise, direct accesses to MPAMVPM7\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MPAMVPM7\_EL2 is a 64-bit register.

## Field descriptions

The MPAMVPM7\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">PhyPARTID31</a>																<a href="#">PhyPARTID30</a>															
<a href="#">PhyPARTID29</a>																<a href="#">PhyPARTID28</a>															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### PhyPARTID31, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 31. PhyPARTID31 gives the mapping of virtual PARTID 31 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PhyPARTID30, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 30. PhyPARTID30 gives the mapping of virtual PARTID 30 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PhyPARTID29, bits [31:16]**

Virtual PARTID Mapping Entry for virtual PARTID 29. PhyPARTID29 gives the mapping of virtual PARTID 29 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PhyPARTID28, bits [15:0]**

Virtual PARTID Mapping Entry for virtual PARTID 28. PhyPARTID28 gives the mapping of virtual PARTID 28 to a physical PARTID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the MPAMVPM7\_EL2**

Accesses to this register use the following encodings:

# MPAMVPMV\_EL2, MPAM Virtual Partition Mapping Valid Register

The MPAMVPMV\_EL2 characteristics are:

## Purpose

Valid bits for virtual PARTID mapping entries. Each bit *m* corresponds to virtual PARTID mapping entry *m* in the MPAMVPM<*n*>\_EL2 registers where *n* = *m* >> 2.

## Configuration

This register is present only when FEAT\_MPAM is implemented and MPAMIDR\_EL1.HAS\_HCR == 1. Otherwise, direct accesses to MPAMVPMV\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MPAMVPMV\_EL2 is a 64-bit register.

## Field descriptions

The MPAMVPMV\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53
VPM_V31VPM_V<m>, bit [m], for m = 0 to 31										
31	30	29	28	27	26	25	24	23	22	21

### Bits [63:32]

Reserved, RES0.

### VPM\_V<m>, bit [m], for m = 310 to 031

Contains valid bit for virtual PARTID mapping entry corresponding to virtual PARTID<m>.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the MPAMVPMV\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, MPAMVPMV\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0100	0b001

```

# MPIDR\_EL1, Multiprocessor Affinity Register

The MPIDR\_EL1 characteristics are:

## Purpose

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

## Configuration

AArch64 System register MPIDR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MPIDR\[31:0\]](#).

In a uniprocessor system Arm recommends that each Aff<n> field of this register returns a value of 0.

## Attributes

MPIDR\_EL1 is a 64-bit register.

## Field descriptions

The MPIDR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																								Aff3								
RES1	U	RES0						MT	Aff2								Aff1								Aff0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### Bits [63:40]

Reserved, RES0.

### Aff3, bits [39:32]

Affinity level 3. See the description of Aff0 for more information.

Aff3 is not supported in AArch32 state.

### Bit [31]

Reserved, RES1.

### U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

### Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

MT	Meaning
0b0	Performance of PEs at the lowest affinity level, or PEs with MPIDR_EL1.MT set to 1, different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs at the lowest affinity level, or PEs with MPIDR_EL1.MT set to 1, different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or [MPIDR\\_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

Accessing the MPIDR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, MPIDR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b101

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented("FEAT_IDST") then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.MPIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() then
        return VMPIDR_EL2;
    else
        return MPIDR_EL1;
elseif PSTATE.EL == EL2 then
    return MPIDR_EL1;
elseif PSTATE.EL == EL3 then
    return MPIDR_EL1;
```

Accessing the MPIDR\_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, MPIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b101

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;

# MVFR0\_EL1, AArch32 Media and VFP Feature Register 0

The MVFR0\_EL1 characteristics are:

## Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR1\\_EL1](#) and [MVFR2\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register MVFR0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MVFR0\[31:0\]](#).

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

## Attributes

MVFR0\_EL1 is a 64-bit register.

## Field descriptions

The MVFR0\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
FPRound				FPShVec				FPSqrt				FPDivide				FPTrap				FPDP				FPSP				SIMDReg			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

FPRound	Meaning
0b0000	Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the <a href="#">FPSCR</a> setting.
0b0001	All rounding modes supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

### **FPSHVec, bits [27:24]**

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

<b>FPSHVec</b>	<b>Meaning</b>
0b0000	Short vectors not supported.
0b0001	Short vector operation supported.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

### **FPSqrt, bits [23:20]**

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

<b>FPSqrt</b>	<b>Meaning</b>
0b0000	Not supported in hardware.
0b0001	Supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

### **FPDivide, bits [19:16]**

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

<b>FPDivide</b>	<b>Meaning</b>
0b0000	Not supported in hardware.
0b0001	Supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

### **FPTrap, bits [15:12]**

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

<b>FPTrap</b>	<b>Meaning</b>
0b0000	Not supported.
0b0001	Supported.

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

### **FPDP, bits [11:8]**

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:

FPDP	Meaning
0b0000	Not supported in hardware.
0b0001	Supported, VFPv2.
0b0010	Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.
- VDIV.F64 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

### FPSP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

FPSP	Meaning
0b0000	Not supported in hardware.
0b0001	Supported, VFPv2.
0b0010	Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

### SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

SIMDReg	Meaning
0b0000	The implementation has no Advanced SIMD and floating-point support.
0b0001	The implementation includes floating-point support with 16 x 64-bit registers.
0b0010	The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

### Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:0]**

Reserved, UNKNOWN.

**Accessing the MVFR0\_EL1**

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, MVFR0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b000

# MVFR1\_EL1, AArch32 Media and VFP Feature Register 1

The MVFR1\_EL1 characteristics are:

## Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0\\_EL1](#) and [MVFR2\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register MVFR1\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MVFR1\[31:0\]](#).

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

## Attributes

MVFR1\_EL1 is a 64-bit register.

## Field descriptions

The MVFR1\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
SIMDFMAC				FPHP				SIMDHP				SIMDSP				SIMDInt				SIMDLS				FPDNaN				FPFtZ			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

SIMDFMAC	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

**FPHP, bits [27:24]**

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

<b>FPHP</b>	<b>Meaning</b>
0b0000	Not supported.
0b0001	Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds instructions for conversion between double-precision and half-precision.
0b0011	As for 0b0010, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the FEAT\_FP16 extension.
- 0b0011 in an implementation with floating-point support that includes the FEAT\_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

<b>Half Precision instructions supported</b>	<b>FPHP</b>	<b>SIMDHP</b>
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

**SIMDHP, bits [23:20]**

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

<b>SIMDHP</b>	<b>Meaning</b>
0b0000	Not supported.
0b0001	SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0010 in an implementation with SIMD floating-point support that does not include the FEAT\_FP16 extension.
- 0b0011 in an implementation with SIMD floating-point support that includes the FEAT\_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

<b>Half Precision instructions supported</b>	<b>FPHP</b>	<b>SIMDHP</b>
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

**SIMDSP, bits [19:16]**

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

<b>SIMDSP</b>	<b>Meaning</b>
0b0000	Not implemented.
0b0001	Implemented. This value is permitted only if the SIMDInt field is 0b0001.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

### SIMDInt, bits [15:12]

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

SIMDInt	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

### SIMDLS, bits [11:8]

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

SIMDLS	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

### FPDNaN, bits [7:4]

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

FPDNaN	Meaning
0b0000	Not implemented, or hardware supports only the Default NaN mode.
0b0001	Hardware supports propagation of NaN values.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

### FPFtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

FPFtZ	Meaning
0b0000	Not implemented, or hardware supports only the Flush-to-Zero mode of operation.
0b0001	Hardware supports full denormalized number arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

### Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:0]**

Reserved, UNKNOWN.

**Accessing the MVFR1\_EL1**

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, MVFR1\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented("FEAT_IDST") then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else

### Bits [63:8]

Reserved, RES0.

### FPMisc, bits [7:4]

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

FPMisc	Meaning
0b0000	Not implemented, or no support for miscellaneous features.
0b0001	Support for Floating-point selection.
0b0010	As 0b0001, and Floating-point Conversion to Integer with Directed Rounding modes.
0b0011	As 0b0010, and Floating-point Round to Integer Floating-point.
0b0100	As 0b0011, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0100.

### SIMDMisc, bits [3:0]

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

SIMDMisc	Meaning
0b0000	Not implemented, or no support for miscellaneous features.
0b0001	Floating-point Conversion to Integer with Directed Rounding modes.
0b0010	As 0b0001, and Floating-point Round to Integer Floating-point.
0b0011	As 0b0010, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0011.

### Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
UNKNOWN																															

### Bits [63:0]

Reserved, UNKNOWN.

## Accessing the MVFR2\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, MVFR2\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b010

```

if PSTATE.EL == EL0 then

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

**Bits [63:4]**

Reserved, RES0.

~~This field is bit[1] of OSLM[1:0].~~

## OSLM, [1], bitsbit [3, 0]

OS lock model implemented. Identifies the form of OS save and restore mechanism implemented.

OSLM	Meaning
0b00	OS Lock not implemented.
0b10	OS Lock implemented.

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is OLSR\_EL1[3].
- OSLM[0] is OLSR\_EL1[0].

**nTT, bit [2]**

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

**OSLK, bit [1]**

OS Lock Status.

OSLK	Meaning
0b0	OS Lock unlocked.
0b1	OS Lock locked.

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

On a Cold reset, this field resets to 1.

On a Warm reset, the value of this field is unchanged.

### OSLM[0], bit [0]

This field is bit[0] of OSLM[1:0].

See OSLM[1] for the field description.

## Accessing the OSLSR\_EL1

Accesses to this register use the following encodings:

# PAR\_EL1, Physical Address Register

The PAR\_EL1 characteristics are:

## Purpose

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

## Configuration

AArch64 System register PAR\_EL1 bits [63:0] are architecturally mapped to AArch32 System register [PAR\[63:0\]](#).

## Attributes

PAR\_EL1 is a 64-bit register.

## Field descriptions

The PAR\_EL1 bit assignments are:

### When PAR\_EL1.F == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ATTR								RES0				PA[51:48]				PA[47:12]															
PA[47:12]												RES1		IMPLEMENTATION DEFINED				NS	SH		RES0						F				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR\_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- The PAR\_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors.
- See the PAR\_EL1.NS bit description for constraints on the value it returns.

### ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in [MAIR\\_EL1](#), [MAIR\\_EL2](#), and [MAIR\\_EL3](#).

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [55:52]

Reserved, RES0.

### PA[51:48], bits [51:48]

**When FEAT\_LPA is implemented:**

Extension to PA[47:12]. See PA[47:12] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PA[47:12], bits [47:12]**

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When FEAT\_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, the PA[51:48] bits form the upper part of the address value. Otherwise the PA[51:48] bits are RES0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [11]**

Reserved, RES1.

**IMPLEMENTATION DEFINED, bit [10]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NS, bit [9]**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when [SCR\\_EL3.EEL2](#) is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#), [AT S1E0R](#), and [AT S1E0W](#).
- In AArch32 state: [ATS1CPR](#), [ATS1CPW](#), [ATS1CPRP](#), [ATS1CPWP](#), [ATS1CUR](#), and [ATS1CUW](#).

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH, bits [8:7]**

Shareability attribute, for the returned output address. Permitted values are:

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

The value 0b01 is reserved.

**Note**

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [6:1]

Reserved, RES0.

#### F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### When PAR\_EL1.F == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32								
IMPLEMENTATION DEFINED								IMPLEMENTATION DEFINED								IMPLEMENTATION DEFINED								RES0															
RES0																RES1		RES0		S	PTW		RES0		FST						F								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0								

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

#### IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [47:12]

Reserved, RES0.

#### Bit [11]

Reserved, RES1.

**Bit [10]**

Reserved, RES0.

**S, bit [9]**

Indicates the translation stage at which the translation aborted:

S	Meaning
0b0	Translation aborted because of a fault in the stage 1 translation.
0b1	Translation aborted because of a fault in the stage 2 translation.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**PTW, bit [8]**

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bit [7]**

Reserved, RES0.

**FST, bits [6:1]**

Fault status code, as shown in the Data Abort ESR encoding.

FST	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b111101	Section Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When EL1 is capable of using AArch32

0b111110	Page Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When EL1 is capable of using AArch32
----------	--	--------------------------------------

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Accessing the PAR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, PAR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0111	0b0100	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;

# PMBLIMITR\_EL1, Profiling Buffer Limit Address Register

The PMBLIMITR\_EL1 characteristics are:

## Purpose

Defines the upper limit for the profiling buffer, and enables the profiling buffer

## Configuration

This register is present only when FEAT\_SPE is implemented. Otherwise, direct accesses to PMBLIMITR\_EL1 are UNDEFINED.

## Attributes

PMBLIMITR\_EL1 is a 64-bit register.

## Field descriptions

The PMBLIMITR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
																LIMIT																			
LIMIT																RES0										PMFZ		FM		RES0E		FM		E	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

### LIMIT, bits [63:12]

Limit address. PMBLIMITR\_EL1.LIMIT:Zeros(12) is the address of the first byte in memory after the last byte in the profiling buffer. If the smallest implemented translation granule is not 4KB, then bits[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value, Log<sub>2</sub>(smallest implemented translation granule).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [11:63]

Reserved, RES0.

### PMFZ, bit [5]

When FEAT\_SPEv1p2 is implemented:

Freeze PMU on SPE event. Stop PMU event counters when PMBSR\_EL1.S == 0b1.

PMFZ	Meaning
0b0	Do not freeze PMU event counters on Statistical Profiling Buffer Management event.
0b1	Freeze PMU event counters on Statistical Profiling Buffer Management event.

The PMU event counters affected by this control is controlled by PMCR\_EL0.FZS and, if EL2 is implemented, MDCR\_EL2.HPMFZS. See the descriptions of these control bits for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [4:3]**

Reserved, RES0.

**FM, bits [2:1]**

Fill mode.

FM	Meaning	Applies when
0b00	Fill mode. Stop collection and raise maintenance interrupt on buffer fill.	
0b10	Discard mode. All output is discarded.	When FEAT_SPEv1p2 is implemented

All other values are reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [0]**

Profiling Buffer enable

E	Meaning
0b0	All output is discarded.
0b1	Profiling buffer enabled.

On a Warm reset, this field resets to 0.

**Accessing the PMBLIMITR\_EL1**

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, PMBLIMITR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1010	0b000

```

# PMBSR\_EL1, Profiling Buffer Status/syndrome Register

The PMBSR\_EL1 characteristics are:

## Purpose

Provides syndrome information to software when the buffer is disabled because the management interrupt has been raised.

## Configuration

This register is present only when FEAT\_SPE is implemented. Otherwise, direct accesses to PMBSR\_EL1 are UNDEFINED.

## Attributes

PMBSR\_EL1 is a 64-bit register.

## Field descriptions

The PMBSR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
EC								RES0								DL	EA	S	COLL	MSS											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### EC, bits [31:26]

Exception class

Top-level description of the cause of the buffer management event

EC	Meaning	MSS
0b000000	Other buffer management event. All buffer management events other than those described by other defined Exception class codes.	<a href="#">MSS encoding for other buffer management events</a>
0b011111	Buffer management event for an IMPLEMENTATION DEFINED reason.	<a href="#">MSS encoding for a buffer management event for an IMPLEMENTATION DEFINED reason</a>
0b100100	Stage 1 Data Abort on write to Profiling Buffer.	<a href="#">MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer</a>
0b100101	Stage 2 Data Abort on write to Profiling Buffer.	<a href="#">MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer</a>

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [25:20]

Reserved, RES0.

#### DL, bit [19]

Partial record lost.

Following a buffer management event other than an asynchronous External abort, indicates whether the last record written to the Profiling Buffer is complete.

DL	Meaning
0b0	PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer.
0b1	Part of a record was lost because of a buffer management event or synchronous External abort. PMBPTR_EL1 might not point to the first byte after the last complete record written to the buffer, and so restarting collection might result in a data record stream that software cannot parse. All records prior to the last record have been written to the buffer.

When the buffer management event was because of an asynchronous external abort, this bit is set to 1 and software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if the PE never sets this bit as a result of a buffer management event caused by an asynchronous External abort.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### EA, bit [18]

External abort.

EA	Meaning
0b0	An external abort has not been asserted.
0b1	An external abort has been asserted and detected by the Statistical Profiling Extension.

This bit is RES0 if the PE never sets this bit as the result of an External abort.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### S, bit [17]

Service

S	Meaning
0b0	PMBIRQ is not asserted.
0b1	PMBIRQ is asserted. All profiling data has either been written to the buffer or discarded.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### COLL, bit [16]

Collision detected.

<b>COLL</b>	<b>Meaning</b>
0b0	No collision events detected.
0b1	At least one collision event was recorded.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **MSS, bits [15:0]**

Management Event Specific Syndrome.

Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer**

#### **Bits [15:6]**

Reserved, RES0.

#### **FSC, bits [5:0]**

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

It is IMPLEMENTATION DEFINED whether each of the Access Flag fault, asynchronous External abort and synchronous External abort, Alignment fault, and TLB Conflict abort values can be generated by the PE. For more information see 'Faults and Watchpoints'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## MSS encoding for other buffer management events

**Bits [15:6]**

Reserved, RES0.

**BSC, bits [5:0]**

Buffer status code

BSC	Meaning
0b000000	Buffer not filled
0b000001	Buffer filled

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**MSS encoding for a buffer management event for an IMPLEMENTATION DEFINED reason****IMPLEMENTATION DEFINED, bits [15:0]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMBSR\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, PMBSR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1010	0b011

```

# PMCCFILTR\_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR\_EL0 characteristics are:

## Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR\\_EL0](#), increments.

## Configuration

AArch64 System register PMCCFILTR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCCFILTR\[31:0\]](#).

AArch64 System register PMCCFILTR\_EL0 bits [31:0] are architecturally mapped to External register [PMCCFILTR\\_EL0\[31:0\]](#).

This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR\_EL0 are UNDEFINED.

## Attributes

PMCCFILTR\_EL0 is a 64-bit register.

## Field descriptions

The PMCCFILTR\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
P	U	NSK	NSU	NSH	M	RES0	SH	RES0																							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR\_EL0.NSK bit.

P	Meaning
0b0	Count cycles in EL1.
0b1	Do not count cycles in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR\_EL0.NSU bit.

U	Meaning
0b0	Count cycles in EL0.
0b1	Do not count cycles in EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### NSK, bit [29]

#### When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR\_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### NSU, bit [28]

#### When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR\_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### NSH, bit [27]

#### When EL2 is implemented:

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR\_EL0.SH bit.

NSH	Meaning
0b0	Do not count cycles in EL2.
0b1	Count cycles in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### M, bit [26]

#### When EL3 is implemented:

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR\_EL0.P bit, cycles in Secure EL3 are counted.  
Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

**Note**

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [25]**

Reserved, RES0.

**SH, bit [24]**

**When FEAT\_SEL2 is implemented and EL3 is implemented:**

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR\_EL0.NSH bit, cycles in Secure EL2 are counted.  
Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is ~~not implemented or is~~ disabled, this field is RES0.

**Note**

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [23:0]**

Reserved, RES0.

**Accessing the PMCCFILTR\_EL0**

PMCCFILTR\_EL0 can also be accessed by using [PMXEVTYPER\\_EL0](#) with [PMSELR\\_EL0](#).SEL set to 0b11111.  
Accesses to this register use the following encodings:

MRS <Xt>, PMCCFILTR\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b1111	0b111

```

# PMCEID0\_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0\_EL0 characteristics are:

## Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

### Note

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEID<n>\_EL0 registers see 'The PMU event number space and common events'.

## Configuration

AArch64 System register PMCEID0\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID0\[31:0\]](#).

AArch64 System register PMCEID0\_EL0 bits [63:32] are architecturally mapped to AArch32 System register [PMCEID2\[31:0\]](#).

AArch64 System register PMCEID0\_EL0 bits [31:0] are architecturally mapped to External register [PMCEID0\[31:0\]](#).

AArch64 System register PMCEID0\_EL0 bits [63:32] are architecturally mapped to External register [PMCEID2\[31:0\]](#).

This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0\_EL0 are UNDEFINED.

## Attributes

PMCEID0\_EL0 is a 64-bit register.

## Field descriptions

The PMCEID0\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48

ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**IDhi<n>, bit [n+32], for n = 0 to 31**

**When FEAT\_PMUv3p1 is implemented:**

**IDhi<n>, bit [n+32], for n = 31 to 0**

**When FEAT\_PMUv3p1 is implemented:**

IDhi[n] corresponds to common event ( $0x4000 + n$ ).

For each bit:

IDhi<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>\_EL0 registers of that earlier version of the PMU architecture.

**Otherwise:**

Reserved, RES0.

**ID<n>, bit [n], for n = 310 to 031**

ID[n] corresponds to common event n.

For each bit:

ID<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>\_EL0 registers of that earlier version of the PMU architecture.

**Accessing the PMCEID0\_EL0**

Accesses to this register use the following encodings:

MRS <Xt>, PMCEID0\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b110

```

# PMCEID1\_EL0, Performance Monitors Common Event Identification register 1

The PMCEID1\_EL0 characteristics are:

## Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0020 to 0x003F and 0x4020 to 0x403F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

### Note

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEID<n>\_EL0 registers see 'The PMU event number space and common events'.

## Configuration

AArch64 System register PMCEID1\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID1\[31:0\]](#).

AArch64 System register PMCEID1\_EL0 bits [63:32] are architecturally mapped to AArch32 System register [PMCEID3\[31:0\]](#).

AArch64 System register PMCEID1\_EL0 bits [31:0] are architecturally mapped to External register [PMCEID1\[31:0\]](#).

AArch64 System register PMCEID1\_EL0 bits [63:32] are architecturally mapped to External register [PMCEID3\[31:0\]](#).

This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMCEID1\_EL0 are UNDEFINED.

## Attributes

PMCEID1\_EL0 is a 64-bit register.

## Field descriptions

The PMCEID1\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48
IDhi31	IDhi<n>, bit [n+32], for n = 0 to 31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**IDhi<n>, bit [n+32], for n = 0 to 31**

**When FEAT\_PMUv3p1 is implemented:**

**IDhi<n>, bit [n+32], for n = 31 to 0**

**When FEAT\_PMUv3p1 is implemented:**

IDhi[n] corresponds to common event ( $0x4020 + n$ ).

For each bit:

IDhi<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>\_EL0 registers of that earlier version of the PMU architecture.

**Otherwise:**

Reserved, RES0.

**ID<n>, bit [n], for n = 310 to 031**

ID[n] corresponds to common event ( $0x0020 + n$ ).

For each bit:

ID<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>\_EL0 registers of that earlier version of the PMU architecture.

**Accessing the PMCEID1\_EL0**

Accesses to this register use the following encodings:

MRS <Xt>, PMCEID1\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b111

```

if PSTATE.EL == EL0 then

# PMCNTENCLR\_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR\_EL0 characteristics are:

## Purpose

Disables the Cycle Count Register, [PMCCNTR\\_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

## Configuration

AArch64 System register PMCNTENCLR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENCLR\[31:0\]](#).

AArch64 System register PMCNTENCLR\_EL0 bits [31:0] are architecturally mapped to External register [PMCNTENCLR\\_EL0\[31:0\]](#).

This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR\_EL0 are UNDEFINED.

## Attributes

PMCNTENCLR\_EL0 is a 64-bit register.

## Field descriptions

The PMCNTENCLR\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
C	P30P<n>, bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### C, bit [31]

[PMCCNTR\\_EL0](#) disable bit. Disables the cycle counter register. Possible values are:

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, disables the cycle counter.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### P<n>, bit [n], for n = 300 to 030

Event counter disable bit for [PMEVCNTR<n>\\_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR\\_EL2.HPMN](#). Otherwise, N is the value in [PMCR\\_EL0.N](#).

<b>P&lt;n&gt;</b>	<b>Meaning</b>
0b0	When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> is disabled. When written, has no effect.
0b1	When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> is enabled. When written, disables <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> .

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMCNTENCLR\_EL0

Accesses to this register use the following encodings:

MRS <Xt>, PMCNTENCLR\_EL0

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b11	0b011	0b1001	0b1100	0b010

The PMCNTENSET\_EL0 characteristics are:

## Purpose

Enables the Cycle Count Register, [PMCCNTR\\_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

## Configuration

AArch64 System register PMCNTENSET\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENSET\[31:0\]](#).

AArch64 System register PMCNTENSET\_EL0 bits [31:0] are architecturally mapped to External register [PMCNTENSET\\_EL0\[31:0\]](#).

This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENSET\_EL0 are UNDEFINED.

## Attributes

PMCNTENSET\_EL0 is a 64-bit register.

## Field descriptions

The PMCNTENSET\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
C	P30P<n>, bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### C, bit [31]

[PMCCNTR\\_EL0](#) enable bit. Enables the cycle counter register. Possible values are:

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, enables the cycle counter.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### P<n>, bit [n], for n = 300 to 030

Event counter enable bit for [PMEVCNTR<n>\\_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR\\_EL2.HPMN](#). Otherwise, N is the value in [PMCR\\_EL0.N](#).

<b>P&lt;n&gt;</b>	<b>Meaning</b>
0b0	When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> is disabled. When written, has no effect.
0b1	When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> event counter is enabled. When written, enables <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> .

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMCNTENSET\_EL0

Accesses to this register use the following encodings:

MRS <Xt>, PMCNTENSET\_EL0

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b11	0b011	0b1001	0b1100	0b001

# PMCR\_EL0, Performance Monitors Control Register

The PMCR\_EL0 characteristics are:

## Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

## Configuration

AArch64 System register PMCR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCR\[31:0\]](#).

AArch64 System register PMCR\_EL0 bits [7:0] are architecturally mapped to External register [PMCR\\_EL0\[7:0\]](#).

This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMCR\_EL0 are UNDEFINED.

## Attributes

PMCR\_EL0 is a 64-bit register.

## Field descriptions

The PMCR\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															FZS
IMP								IDCODE								N				RES0	FZOLP	RES0	LC	LPDP	LCX	DPD	XC	DPCE	P	E	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

### Bits [63:33]

Reserved, RES0.

### FZSIMP, bitbits [3231:24]

### When FEAT\_SPEv1p2 is implemented:

Freeze-on-SPE event. Stop counters when [PMBLIMITR\\_EL1](#).{PMFZ,E} == {1,1} and [PMBSR\\_EL1](#).S == 0b1.

FZS	Meaning
0b0	Do not freeze on Statistical Profiling Buffer Management event.
0b1	Event counters do not count following a Statistical Profiling Buffer Management event.

If EL2 is implemented, then:

- This bit affects the operation of event counters in the range [0 .. ([MDCR\\_EL2](#).HPMN-1)].
- If [MDCR\\_EL2](#).HPMN is less than PMCR\_EL0.N:
  - This bit does not affect the operation of event counters in the range [[MDCR\\_EL2](#).HPMN .. (PMCR\_EL0.N-1)].
- This applies even when EL2 is disabled in the current Security state.

This bit does not affect the operation of [PMCCNTR\\_EL0](#).

On a Warm reset, when AArch32 is supported at any Exception level, this field resets to 0.

On a Warm reset, when the implementation only supports execution in AArch64 state, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**IMP, bits [31:24]**

**When FEAT\_PMUv3p7 is not implemented:**

Implementer code.

If this field is zero, then PMCR\_EL0.IDCODE is RES0 and software must use [MIDR\\_EL1](#) to identify the PE.

Otherwise, this field and PMCR\_EL0.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as [MIDR\\_EL1](#).Implementer.

Use of this field is deprecated.

This field reads as an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

**IDCODE, bits [23:16]**

**When PMCR\_EL0.IMP != 0x00:**

**Otherwise:**

Reserved, RAZ.

**IDCODE, bits [23:16]**

**When PMCR\_EL0.IMP != 0x00:**

Identification code. Use of this field is deprecated. This field has an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

Access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

**N, bits [15:11]**

Indicates the number of event counters implemented. This value is in the range of 0b000000-0b11111. If the value is 0b00000 then only [PMCCNTR\\_EL0](#) is implemented. If the value is 0b11111 [PMCCNTR\\_EL0](#) and 31 event counters are implemented.

When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the value of [MDCR\\_EL2](#).HPMN.

Access to this field is **RO**.

**BitBits [10:8]**

Reserved, RES0.

**FZOLP, bit [97]**

When **FEAT\_PMUv3p7** **FEAT\_PMUv3p5** is implemented:

Freeze-on-overflow. Stop event counters on overflow.

FZO	Meaning
0b0	Do not freeze on overflow.
0b1	Event counters do not count when <a href="#">PMOVSCLR_EL0</a> [(N-1):0] is nonzero, where N is the value of <a href="#">MDCR_EL2</a> .HPMN if EL2 is implemented, and PMCR_EL0.N otherwise.

If EL2 is implemented, then:

- This bit affects the operation of event counters in the range [0 .. ([MDCR\\_EL2](#).HPMN-1)].
- If [MDCR\\_EL2](#).HPMN is less than PMCR\_EL0.N:
  - This bit does not affect the operation of event counters in the range [[MDCR\\_EL2](#).HPMN .. (PMCR\_EL0.N-1)].
  - The operation of this bit ignores the values of [PMOVSCLR\\_EL0](#)[(PMCR\_EL0.N-1):[MDCR\\_EL2](#).HPMN].
- This applies even when EL2 is disabled in the current Security state.

This bit does not affect the operation of [PMCCNTR\\_EL0](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bit [8]**

Reserved, RES0.

**LP, bit [7]**

When **FEAT\_PMUv3p5** is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> [31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> [63:0].

If EL2 is implemented and [MDCR\\_EL2](#).HPMN or [HDCR](#).HPMN is less than PMCR\_EL0.N, this bit does not affect the operation of event counters in the range [[HDCR](#).HPMN..(PMCR\_EL0.N-1)] or [[MDCR\\_EL2](#).HPMN..(PMCR\_EL0.N-1)].

**Note**

The effect of [MDCR\\_EL2](#).HPMN or [HDCR](#).HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of [MDCR\\_EL2](#).HPMN or [HDCR](#).HPMN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**LC, bit [6]**

**When AArch32 is supported at any Exception level:**

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of <a href="#">PMCCNTR_EL0</a> [31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of <a href="#">PMCCNTR_EL0</a> [63:0].

Arm deprecates use of [PMCR\\_EL0](#).LC = 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**DP, bit [5]**

**When EL3 is implemented or (FEAT\_PMUv3p1 is implemented and EL2 is implemented):**

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by <a href="#">PMCCNTR_EL0</a> is not affected by this bit.
0b1	When event counting for counters in the range [0.. <a href="#">MDCR_EL2</a> .HPMN-1] is prohibited, cycle counting by <a href="#">PMCCNTR_EL0</a> is disabled.

For more information see 'Prohibiting event counting'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**X, bit [4]**

**When the implementation includes a PMU event export bus:**

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAZ/WI.

**D, bit [3]**

When AArch32 is supported at any Exception level:

Clock divider.

D	Meaning
0b0	When enabled, <a href="#">PMCCNTR_EL0</a> counts every clock cycle.
0b1	When enabled, <a href="#">PMCCNTR_EL0</a> counts once every 64 clock cycles.

If PMCR\_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR\_EL0.D = 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**C, bit [2]**

Cycle counter reset. The effects of writing to this bit are:

C	Meaning
0b0	No action.
0b1	Reset <a href="#">PMCCNTR_EL0</a> to zero.

This bit is always RAZ.

**Note**

Resetting [PMCCNTR\\_EL0](#) does not change the cycle counter overflow bit.

The value of PMCR\_EL0.LC is ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

**P, bit [1]**

Event counter reset. The effects of writing to this bit are:

P	Meaning
0b0	No action.
0b1	Reset all event counters accessible in the current Exception level, not including <a href="#">PMCCNTR_EL0</a> , to zero.

This bit is always RAZ.

In EL0 and EL1:

- If EL2 is implemented and enabled in the current Security state, and [MDCR\\_EL2](#).HPMN is less than PMCR\_EL0.N, a write of 1 to this bit does not reset event counters in the range [[MDCR\\_EL2](#).HPMN..(PMCR\_EL0.N-1)].
- If EL2 is not implemented, EL2 is disabled in the current Security state, or [MDCR\\_EL2](#).HPMN equals PMCR\_EL0.N, a write of 1 to this bit resets all the event counters.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

**Note**

Resetting the event counters does not change the event counter overflow bits.

If FEAT\_PMUv3p5 is implemented, the values of [MDCR\\_EL2.HLP](#) and [PMCR\\_EL0.LP](#) are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

## E, bit [0]

Enable.

E	Meaning
0b0	All event counters in the range [0..(PMN-1)] and <a href="#">PMCCNTR_EL0</a> , are disabled.
0b1	All event counters in the range [0..(PMN-1)] and <a href="#">PMCCNTR_EL0</a> , are enabled by <a href="#">PMCNTENSET_EL0</a> .

If EL2 is implemented, then:

- If EL2 is using AArch32, PMN is [HDCR.HPMN](#).
- If EL2 is using AArch64, PMN is [MDCR\\_EL2.HPMN](#).
- If PMN is less than [PMCR\\_EL0.N](#), this bit does not affect the operation of event counters in the range [PMN..(PMCR\_EL0.N-1)].

If EL2 is not implemented, PMN is [PMCR\\_EL0.N](#).

### Note

The effect of [MDCR\\_EL2.HPMN](#) or [HDCR.HPMN](#) on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of [MDCR\\_EL2.HPMN](#) or [HDCR.HPMN](#).

On a Warm reset, this field resets to 0.

## Accessing the PMCR\_EL0

Accesses to this register use the following encodings:

MRS <Xt>, PMCR\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b000

# PMEVTYPER<n>\_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>\_EL0 characteristics are:

## Purpose

Configures event counter n, where n is 0 to 30.

## Configuration

AArch64 System register PMEVTYPER<n>\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVTYPER<n>\[31:0\]](#).

AArch64 System register PMEVTYPER<n>\_EL0 bits [31:0] are architecturally mapped to External register [PMEVTYPER<n>\\_EL0\[31:0\]](#).

This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n>\_EL0 are UNDEFINED.

## Attributes

PMEVTYPER<n>\_EL0 is a 64-bit register.

## Field descriptions

The PMEVTYPER<n>\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
P	U	NSK	NSU	NSH	M	MT	SH	RES0								evtCount[15:10]								evtCount[9:0]							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>\_EL0.NSK bit.

P	Meaning
0b0	Count events in EL1.
0b1	Do not count events in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>\_EL0.NSU bit.

U	Meaning
0b0	Count events in EL0.
0b1	Do not count events in EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### NSK, bit [29]

#### When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>\_EL0.P bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### NSU, bit [28]

#### When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>\_EL0.U bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### NSH, bit [27]

#### When EL2 is implemented:

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>\_EL0.SH bit.

NSH	Meaning
0b0	Do not count events in EL2.
0b1	Count events in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### M, bit [26]

#### When EL3 is implemented:

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMEVTYPER<n>\_EL0.P bit, events in Secure EL3 are counted.

Otherwise, events in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0b0.

---

#### Note

This field is not visible in the AArch32 [PMEVTYPER<n>](#) System register.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### MT, bit [25]

When **FEAT\_MTPMU is implemented and enabled** or an IMPLEMENTATION DEFINED multi-threaded PMU **extensionExtension** is implemented:

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

#### Note

- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT\_MTPMU is not implemented, this bit is RES0. See [ID\\_AA64DFR0\\_EL1.MTPMU](#).

This bit is ignored by the PE and treated as zero when FEAT\_MTPMU is implemented and Disabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### SH, bit [24]

When FEAT\_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>\_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

---

#### Note

This field is not visible in the AArch32 [PMEVTYPER<n>](#) System register.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [23:16]**

Reserved, RES0.

**evtCount[15:10], bits [15:10]****When FEAT\_PMUv3p1 is implemented:**

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**evtCount[9:0], bits [9:0]**

Event to count. The event number of the event that is counted by event counter [PMEVCNTR<n>\\_EL0](#).

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

**Note**

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMEVTYPER<n>\_EL0

PMEVTYPER<n>\_EL0 can also be accessed by using [PMXEVTYPER\\_EL0](#) with [PMSELR\\_EL0](#).SEL set to n.

If FEAT\_FGT is implemented and <n> is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of [PMEVTYPER<n>\\_EL0](#) is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT\_FGT is not implemented and <n> is greater than or equal to the number of accessible counters, then reads and writes of [PMEVTYPER<n>\\_EL0](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.

- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

---

**Note**

In EL0, an access is permitted if it is enabled by [PMUSERENR\\_EL0](#).EN.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, [MDCR\\_EL2](#).HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. See [MDCR\\_EL2](#).HPMN for more details.

---

Accesses to this register use the following encodings:

MRS <Xt>, PMEVTYPER<n>\_EL0

op0	op1	CRn	CRm	op2

# PMINTENCLR\_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR\_EL1 characteristics are:

## Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR\\_EL0](#), and the event counters [PMEVCNTR<n>\\_EL0](#). Reading the register shows which overflow interrupt requests are enabled.

## Configuration

AArch64 System register PMINTENCLR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENCLR\[31:0\]](#).

AArch64 System register PMINTENCLR\_EL1 bits [31:0] are architecturally mapped to External register [PMINTENCLR\\_EL1\[31:0\]](#).

This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR\_EL1 are UNDEFINED.

## Attributes

PMINTENCLR\_EL1 is a 64-bit register.

## Field descriptions

The PMINTENCLR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
C	P30P<n> bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### C, bit [31]

[PMCCNTR\\_EL0](#) overflow interrupt request disable bit. Possible values are:

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

P<n>, bit [n], for n = 300 to 030

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>\\_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in [MDCR\\_EL2.HPMN](#). Otherwise, N is the value in [PMCR\\_EL0.N](#).

P<n>	Meaning
0b0	When read, means that the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> event counter interrupt request is enabled. When written, disables the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# PMINTENSET\_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET\_EL1 characteristics are:

## Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR\\_EL0](#), and the event counters [PMEVCNTR<n>\\_EL0](#). Reading the register shows which overflow interrupt requests are enabled.

## Configuration

AArch64 System register PMINTENSET\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENSET\[31:0\]](#).

AArch64 System register PMINTENSET\_EL1 bits [31:0] are architecturally mapped to External register [PMINTENSET\\_EL1\[31:0\]](#).

This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMINTENSET\_EL1 are UNDEFINED.

## Attributes

PMINTENSET\_EL1 is a 64-bit register.

## Field descriptions

The PMINTENSET\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
C	P30P<n> bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### C, bit [31]

[PMCCNTR\\_EL0](#) overflow interrupt request enable bit. Possible values are:

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### P<n>, bit [n], for n = 300 to 030

Event counter overflow interrupt request enable bit for [PMEVCNTR<n>\\_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in [MDCR\\_EL2.HPMN](#). Otherwise, N is the value in [PMCR\\_EL0.N](#).

P<n>	Meaning
0b0	When read, means that the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> event counter interrupt request is enabled. When written, enables the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# PMMIR\_EL1, Performance Monitors Machine Identification Register

The PMMIR\_EL1 characteristics are:

## Purpose

Describes Performance Monitors parameters specific to the implementation to software.

## Configuration

This register is present only when FEAT\_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR\_EL1 are UNDEFINED.

## Attributes

PMMIR\_EL1 is a 64-bit register.

## Field descriptions

The PMMIR\_EL1 bit assignments are:

Bits [63:8]

Bits [63:20]

Reserved, RES0.

BUS\_WIDTH, bits [19:16]

From Armv8.7:

Bus width. Indicates the number of bytes each BUS\_ACCESS event relates to. Encoded as  $\text{Log}_2(\text{number of bytes})$ , plus one. Defined values are:

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS\_ACCESS is at most BUS\_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS\_ACCESS counter by more than one.

**Otherwise:**

Reserved, RAZ.

**BUS\_SLOTS, bits [15:8]**

**From Armv8.7:**

Bus count. The largest value by which the BUS\_ACCESS event might increment by in a single BUS\_CYCLES cycle.

If the information is not available, this field will read as zero.

**Otherwise:**

Reserved, RAZ.

**SLOTS, bits [7:0]**

Operation width. The largest value by which the STALL\_SLOT event might increment by in a single cycle. If the STALL\_SLOT event is not implemented, this field might read as zero.

## Accessing the PMMIR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, PMMIR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1110	0b110

# PMOVSLR\_EL0, Performance Monitors Overflow Flag Status Clear Register

The PMOVSLR\_EL0 characteristics are:

## Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR\\_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

## Configuration

AArch64 System register PMOVSLR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSRR\[31:0\]](#).

AArch64 System register PMOVSLR\_EL0 bits [31:0] are architecturally mapped to External register [PMOVSLR\\_EL0\[31:0\]](#).

This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMOVSLR\_EL0 are UNDEFINED.

## Attributes

PMOVSLR\_EL0 is a 64-bit register.

## Field descriptions

The PMOVSLR\_EL0 bit assignments are:

### Bits [63:32]

Reserved, RES0.

### C, bit [31]

Cycle counter overflow clear bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

[PMCR\\_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR\\_EL0](#)[31:0] or unsigned overflow of [PMCCNTR\\_EL0](#)[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 300 to 030**

Event counter overflow clear bit for [PMEVCNTR<n>\\_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN. Otherwise, N is the value in [PMCR\\_EL0](#).N.

P<n>	Meaning
0b0	When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> has overflowed since this bit was last cleared. When written, clears the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> overflow bit to 0.

If FEAT\_PMUv3p5 is implemented, [MDCR\\_EL2](#).HLP and [PMCR\\_EL0](#).LP control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>\\_EL0](#)[31:0] or unsigned overflow of [PMEVCNTR<n>\\_EL0](#)[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMOVSLR\_EL0

# PMOVSSET\_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET\_EL0 characteristics are:

## Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR\\_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#).

## Configuration

AArch64 System register PMOVSSET\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSSET\[31:0\]](#).

AArch64 System register PMOVSSET\_EL0 bits [31:0] are architecturally mapped to External register [PMOVSSET\\_EL0\[31:0\]](#).

This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET\_EL0 are UNDEFINED.

## Attributes

PMOVSSET\_EL0 is a 64-bit register.

## Field descriptions

The PMOVSSET\_EL0 bit assignments are:

### Bits [63:32]

Reserved, RES0.

### C, bit [31]

Cycle counter overflow set bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

[PMCR\\_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR\\_EL0](#)[31:0] or unsigned overflow of [PMCCNTR\\_EL0](#)[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 300 to 030**

Event counter overflow set bit for [PMEVCNTR<n>\\_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN. Otherwise, N is the value in [PMCR\\_EL0](#).N.

P<n>	Meaning
0b0	When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> has overflowed since this bit was last cleared. When written, sets the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> overflow bit to 1.

If FEAT\_PMUv3p5 is implemented, [MDCR\\_EL2](#).HLP and [PMCR\\_EL0](#).LP control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>\\_EL0](#)[31:0] or unsigned overflow of [PMEVCNTR<n>\\_EL0](#)[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMOVSSET\_EL0

Accesses to this register use the following encodings:

# PMSCR\_EL1, Statistical Profiling Control Register (EL1)

The PMSCR\_EL1 characteristics are:

## Purpose

Provides EL1 controls for Statistical Profiling.

## Configuration

This register is present only when FEAT\_SPE is implemented. Otherwise, direct accesses to PMSCR\_EL1 are UNDEFINED.

## Attributes

PMSCR\_EL1 is a 64-bit register.

## Field descriptions

The PMSCR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
RES0																PCT		TS	PACX		RES0	E1SPE	E0SPE								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:8]

Reserved, RES0.

### PCT, bits [7:6]

When EL2 is implemented:

Physical Timestamp. If timestamp sampling is enabled and the Profiling Buffer is owned by EL1, requests which timestamp counter value is collected.

If FEAT\_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.

PCT	Meaning	Applies when
0b00	Virtual timestamp. The collected timestamp is the physical counter minus the value of CNTVOFF_EL2, is collected.	When FEAT_ECV is implemented
0b01	Physical timestamp. The collected timestamp is the physical counter, is collected.	
0b11	Guest Physical physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPCT_EL0, minus CNTPOFF_EL2, is collected. <ul style="list-style-type: none"><li>SCR_EL3.ECVEn == 0b0.</li><li>CNTHCTL_EL2.ECV == 0b0.</li></ul>	

When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true:

- [CNTHCTL\\_EL2.ECV](#) is 0.
- [SCR\\_EL3.ECVEn](#) is 0.
- [HCR\\_EL2.{E2H, TGE}](#) is {1, 1}.

If EL2 is implemented and enabled in the current Security state, then this field value is ignored. [PMSCR\\_EL2.PCT](#) might override or modify the meaning of this field.

This field is ignored by the PE when the Profiling Buffer owning Exception level is EL2.

If the Profiling Buffer owning Exception level is EL1, this field is combined with [PMSCR\\_EL2.PCT](#) to determine which timestamp counter value is collected. For more information, see 'Controlling the data that is collected'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Physical Timestamp. Reserved. This field reads as 0b01 and ignores writes. Software should treat this field as UNK/SBZP.

When EL2 is not implemented, the Effective values of [CNTVOFF\\_EL2](#) and [CNTPOFF\\_EL2](#) are zero, meaning the virtual counter and physical counter have the same value.

#### TS, bit [5]

Timestamp enable.

TS	Meaning
0b0	Timestamp sampling disabled.
0b1	Timestamp sampling enabled.

This bit is ignored by the PE if EL2 is implemented and the Profiling Buffer is owned by EL2. For more information, see 'Controlling the data that is collected'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### PA, bit [4]

Physical Address sample enable.

PA	Meaning
0b0	Physical addresses are not collected.
0b1	Physical addresses are collected.

If EL2 is implemented:

- If the Profiling Buffer is owned by EL1, this bit is combined with [PMSCR\\_EL2.PA](#) to determine which address is collected. For more information, see 'Controlling the data that is collected'.
- If the Profiling Buffer is owned by EL2, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### CX, bit [3]

[CONTEXTIDR\\_EL1](#) sample enable.

CX	Meaning
0b0	<a href="#">CONTEXTIDR_EL1</a> is not collected.
0b1	<a href="#">CONTEXTIDR_EL1</a> is collected.

If EL2 is implemented and enabled in the current Security state when an operation is sampled:

- If the PE is at EL2, this bit is ignored by the PE.
- If [HCR\\_EL2.TGE](#) == 1, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bit [2]

Reserved, RES0.

## E1SPE, bit [1]

EL1 Statistical Profiling Enable.

E1SPE	Meaning
0b0	Sampling disabled at EL1.
0b1	Sampling enabled at EL1.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when [HCR\\_EL2.TGE](#) == 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## E0SPE, bit [0]

EL0 Statistical Profiling Enable. Controls sampling at EL0 when [HCR\\_EL2.TGE](#) == 0 or if EL2 is disabled or not implemented.

E0SPE	Meaning
0b0	Sampling disabled at EL0.
0b1	Sampling enabled at EL0.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when [HCR\\_EL2.TGE](#) == 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# PMSCR\_EL2, Statistical Profiling Control Register (EL2)

The PMSCR\_EL2 characteristics are:

## Purpose

Provides EL2 controls for Statistical Profiling.

## Configuration

This register is present only when FEAT\_SPE is implemented. Otherwise, direct accesses to PMSCR\_EL2 are UNDEFINED.

## Attributes

PMSCR\_EL2 is a 64-bit register.

## Field descriptions

The PMSCR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
																RES0																					
RES0																PCT						TS		PA		CX		RES0		E2SPE		E0HSPE					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

### Bits [63:8]

Reserved, RES0.

### PCT, bits [7:6]

Physical Timestamp. If timestamp sampling is enabled, determines which counter is collected. The behavior depends on the Profiling Buffer owning Exception level.

If FEAT\_ECV is implemented, this is a 

two-bit

two-bit

 field as shown. Otherwise, bit[7] is RES0.

PCT	Meaning	Applies when
0b00	<p>Virtual timestamp. The collected timestamp is the physical counter minus a virtual offset. If any of the following are true, the virtual offset is zero, otherwise the virtual offset is the value of <code>CNTVOFF_EL2</code>: is collected.</p> <ul style="list-style-type: none"> <li>The sampled operation executed at EL2 and <code>HCR_EL2.E2H == 0b1</code>.</li> <li>The sampled operation executed at EL0 and <code>HCR_EL2.{E2H,TGE} == {1,1}</code>.</li> </ul> <p><b>Note</b> If the Profiling Buffer owning Exception level is EL1, the virtual offset is always <code>CNTVOFF_EL2</code>.</p>	
0b01	<p>If the Profiling Buffer owning Exception level is EL1, <code>EL2</code>: then Physical the timestamp value is selected by counter, <code>PMSCR_EL1.CNTPCT_EL0.PCT</code>, is collected. Otherwise, If physical the timestamp. Profiling The Buffer collected owning timestamp Exception level is the EL1: physical Timestamp counter value is selected by <code>PMSCR_EL1.PCT</code>.</p>	
0b11	<p>If the Profiling Buffer owning Exception level is EL1 and <code>PMSCR_EL1.PCT == 0b00</code>, then guest virtual timestamp. The collected timestamp is the physical counter minus the value of <code>CNTVOFF_EL2</code>.</p> <p>If the Profiling Buffer owning Exception level is EL2: Physical counter, <code>CNTPCT_EL0</code>, minus <code>CNTPOFF_EL2</code> is collected.</p> <p>Otherwise, guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of <code>CNTPOFF_EL2</code>:</p> <p>If the Profiling Buffer owning Exception level is EL1: If <code>PMSCR_EL1.PCT == 0b00</code>, the virtual counter, <code>CNTVCT_EL0</code> is collected. Otherwise, the physical counter, <code>CNTPCT_EL0</code>, minus <code>CNTPOFF_EL2</code> is collected.</p> <ul style="list-style-type: none"> <li><code>SCR_EL3.ECVEn == 0b0</code>.</li> <li><code>CNTHCTL_EL2.ECV == 0b0</code>.</li> </ul>	When FEAT_ECV is implemented

AllWhen other EL2 values is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are reserved, true:

- `CNTHCTL_EL2.ECV` is 0.
- `SCR_EL3.ECVEn` is 0.
- `HCR_EL2.{E2H, TGE}` is {1, 1}.

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE behaves as if this field is set to 0b01, other than for a direct read of the register.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 0b01, other than for a direct read of the register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## TS, bit [5]

Timestamp Enable.

TS	Meaning
0b0	Timestamp sampling disabled.
0b1	Timestamp sampling enabled.

This bit is ignored by the PE when any of the following are true:

- The Profiling Buffer owning Exception level is EL1.
- In Secure state, and either FEAT\_SEL2 is not implemented or Secure EL2 is disabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### PA, bit [4]

Physical Address Sample Enable.

PA	Meaning
0b0	Physical addresses are not collected.
0b1	Physical addresses are collected.

If the Profiling Buffer owning Exception level is EL1, and EL2 is enabled in the current Security state, this bit is combined with [PMSCR\\_EL1.PA](#) to determine which address is collected.

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit and behaves as if this bit is set to 1, other than for a direct read of the register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### CX, bit [3]

[CONTEXTIDR\\_EL2](#) Sample Enable.

CX	Meaning
0b0	<a href="#">CONTEXTIDR_EL2</a> is not collected.
0b1	<a href="#">CONTEXTIDR_EL2</a> is collected.

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bit [2]

Reserved, RES0.

#### E2SPE, bit [1]

EL2 Statistical Profiling Enable.

E2SPE	Meaning
0b0	Sampling disabled at EL2.
0b1	Sampling enabled at EL2.

This bit is RES0 if [MDCR\\_EL2.E2PB](#) != 0b00.

If EL2 is disabled in the current Security state, this bit is ignored by the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### EOHSPE, bit [0]

EL0 Statistical Profiling Enable.

EOHSPE	Meaning
0b0	Sampling disabled at EL0.
0b1	Sampling enabled at EL0.

If [MDCR\\_EL2.E2PB](#) != 0b00, this bit is RES0.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when [HCR\\_EL2.TGE](#) == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMSCR\_EL2

Accesses to this register use the following encodings:

# PMSEVFR\_EL1, Sampling Event Filter Register

The PMSEVFR\_EL1 characteristics are:

## Purpose

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if E[3] and E[5] are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 set (TLB walk) are recorded.

## Configuration

This register is present only when FEAT\_SPE is implemented. Otherwise, direct accesses to PMSEVFR\_EL1 are UNDEFINED.

## Attributes

PMSEVFR\_EL1 is a 64-bit register.

## Field descriptions

The PMSEVFR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	
E[63]	E[62]	E[61]	E[60]	E[59]	E[58]	E[57]	E[56]	E[55]	E[54]	E[53]	E[52]	E[51]	E[50]	E[49]	E[48]						
E[31]	E[30]	E[29]	E[28]	E[27]	E[26]	E[25]	E[24]	RAZ/WI						E[18]	E[17]	RAZ/ WI	E[15]	E[14]	E[13]	E[12]	E[11]
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	

### E[63], bit [63]

E[63] is the event filter for event 63. If event 63 is not implemented, or filtering on event 63 is not supported, the corresponding bit is RAZ/WI.

### E[<x>], bit [x], for x = 63 to 48, 31 to 24, 15 to 12

E[<x>] is the event filter for event <x>. If event <x> is not implemented, or filtering on event <x> is not supported, the corresponding bit is RAZ/WI.

E[<x>][63]	Meaning
0b0	Event <x>63 is ignored.
0b1	Do not record samples that have event <x>63 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSEVFR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### E[62], bit [62]

E[62] is the event filter for event 62. If event 62 is not implemented, or filtering on event 62 is not supported, the corresponding bit is RAZ/WI.

<b>E[62]</b>	<b>Meaning</b>
0b0	Event 62 is ignored.
0b1	Do not record samples that have event 62 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[61], bit [61]**

E[61] is the event filter for event 61. If event 61 is not implemented, or filtering on event 61 is not supported, the corresponding bit is RAZ/WI.

<b>E[61]</b>	<b>Meaning</b>
0b0	Event 61 is ignored.
0b1	Do not record samples that have event 61 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[60], bit [60]**

E[60] is the event filter for event 60. If event 60 is not implemented, or filtering on event 60 is not supported, the corresponding bit is RAZ/WI.

<b>E[60]</b>	<b>Meaning</b>
0b0	Event 60 is ignored.
0b1	Do not record samples that have event 60 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[59], bit [59]**

E[59] is the event filter for event 59. If event 59 is not implemented, or filtering on event 59 is not supported, the corresponding bit is RAZ/WI.

<b>E[59]</b>	<b>Meaning</b>
0b0	Event 59 is ignored.
0b1	Do not record samples that have event 59 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[58], bit [58]**

E[58] is the event filter for event 58. If event 58 is not implemented, or filtering on event 58 is not supported, the corresponding bit is RAZ/WI.

<b>E[58]</b>	<b>Meaning</b>
0b0	Event 58 is ignored.
0b1	Do not record samples that have event 58 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[57], bit [57]**

E[57] is the event filter for event 57. If event 57 is not implemented, or filtering on event 57 is not supported, the corresponding bit is RAZ/WI.

<b>E[57]</b>	<b>Meaning</b>
0b0	Event 57 is ignored.
0b1	Do not record samples that have event 57 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[56], bit [56]**

E[56] is the event filter for event 56. If event 56 is not implemented, or filtering on event 56 is not supported, the corresponding bit is RAZ/WI.

<b>E[56]</b>	<b>Meaning</b>
0b0	Event 56 is ignored.
0b1	Do not record samples that have event 56 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[55], bit [55]**

E[55] is the event filter for event 55. If event 55 is not implemented, or filtering on event 55 is not supported, the corresponding bit is RAZ/WI.

<b>E[55]</b>	<b>Meaning</b>
0b0	Event 55 is ignored.
0b1	Do not record samples that have event 55 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[54], bit [54]**

E[54] is the event filter for event 54. If event 54 is not implemented, or filtering on event 54 is not supported, the corresponding bit is RAZ/WI.

<b>E[54]</b>	<b>Meaning</b>
0b0	Event 54 is ignored.
0b1	Do not record samples that have event 54 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[53], bit [53]**

E[53] is the event filter for event 53. If event 53 is not implemented, or filtering on event 53 is not supported, the corresponding bit is RAZ/WI.

<b>E[53]</b>	<b>Meaning</b>
0b0	Event 53 is ignored.
0b1	Do not record samples that have event 53 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[52], bit [52]**

E[52] is the event filter for event 52. If event 52 is not implemented, or filtering on event 52 is not supported, the corresponding bit is RAZ/WI.

<b>E[52]</b>	<b>Meaning</b>
0b0	Event 52 is ignored.
0b1	Do not record samples that have event 52 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[51], bit [51]**

E[51] is the event filter for event 51. If event 51 is not implemented, or filtering on event 51 is not supported, the corresponding bit is RAZ/WI.

<b>E[51]</b>	<b>Meaning</b>
0b0	Event 51 is ignored.
0b1	Do not record samples that have event 51 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[50], bit [50]**

E[50] is the event filter for event 50. If event 50 is not implemented, or filtering on event 50 is not supported, the corresponding bit is RAZ/WI.

<b>E[50]</b>	<b>Meaning</b>
0b0	Event 50 is ignored.
0b1	Do not record samples that have event 50 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[49], bit [49]**

E[49] is the event filter for event 49. If event 49 is not implemented, or filtering on event 49 is not supported, the corresponding bit is RAZ/WI.

<b>E[49]</b>	<b>Meaning</b>
0b0	Event 49 is ignored.
0b1	Do not record samples that have event 49 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[48], bit [48]**

E[48] is the event filter for event 48. If event 48 is not implemented, or filtering on event 48 is not supported, the corresponding bit is RAZ/WI.

<b>E[48]</b>	<b>Meaning</b>
0b0	Event 48 is ignored.
0b1	Do not record samples that have event 48 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **Bits [47:32]**

#### **E[31], bit [31]**

E[31] is the event filter for event 31. If event 31 is not implemented, or filtering on event 31 is not supported, the corresponding bit is RAZ/WI.

<b>E[31]</b>	<b>Meaning</b>
0b0	Event 31 is ignored.
0b1	Do not record samples that have event 31 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[30], bit [30]**

E[30] is the event filter for event 30. If event 30 is not implemented, or filtering on event 30 is not supported, the corresponding bit is RAZ/WI.

<b>E[30]</b>	<b>Meaning</b>
0b0	Event 30 is ignored.
0b1	Do not record samples that have event 30 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[29], bit [29]**

E[29] is the event filter for event 29. If event 29 is not implemented, or filtering on event 29 is not supported, the corresponding bit is RAZ/WI.

<b>E[29]</b>	<b>Meaning</b>
0b0	Event 29 is ignored.
0b1	Do not record samples that have event 29 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[28], bit [28]**

E[28] is the event filter for event 28. If event 28 is not implemented, or filtering on event 28 is not supported, the corresponding bit is RAZ/WI.

<b>E[28]</b>	<b>Meaning</b>
0b0	Event 28 is ignored.
0b1	Do not record samples that have event 28 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[27], bit [27]**

E[27] is the event filter for event 27. If event 27 is not implemented, or filtering on event 27 is not supported, the corresponding bit is RAZ/WI.

<b>E[27]</b>	<b>Meaning</b>
0b0	Event 27 is ignored.
0b1	Do not record samples that have event 27 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[26], bit [26]**

E[26] is the event filter for event 26. If event 26 is not implemented, or filtering on event 26 is not supported, the corresponding bit is RAZ/WI.

<b>E[26]</b>	<b>Meaning</b>
0b0	Event 26 is ignored.
0b1	Do not record samples that have event 26 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[25], bit [25]**

E[25] is the event filter for event 25. If event 25 is not implemented, or filtering on event 25 is not supported, the corresponding bit is RAZ/WI.

<b>E[25]</b>	<b>Meaning</b>
0b0	Event 25 is ignored.
0b1	Do not record samples that have event 25 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[24], bit [24]**

E[24] is the event filter for event 24. If event 24 is not implemented, or filtering on event 24 is not supported, the corresponding bit is RAZ/WI.

<b>E[24]</b>	<b>Meaning</b>
0b0	Event 24 is ignored.
0b1	Do not record samples that have event 24 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Reserved, RAZ/WI.

#### **Bits [23:19]**

Reserved, RAZ/WI.

#### **E[18], bit [18]**

When [FEAT\\_SPEv1p1](#) is implemented and [FEAT\\_SVE](#) is implemented:

Empty predicate.

<b>E[18]</b>	<b>Meaning</b>
0b0	Empty predicate event is ignored.
0b1	Do not record samples that have the Empty predicate event == 0.

This bit is ignored by the PE when [PMSFCR\\_EL1.FE](#) == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAZ/WI.

**E[17], bit [17]**

When **FEAT\_SPEv1p1** is implemented and **FEAT\_SVE** is implemented:

Partial predicate.

E[17]	Meaning
0b0	Partial predicate event is ignored.
0b1	Do not record samples that have the Partial predicate event == 0.

This bit is ignored by the PE when [PMSFCR\\_EL1.FE](#) == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAZ/WI.

**Bit [16]**

E[15] is the event filter for event 15. If event 15 is not implemented, or filtering on event 15 is not supported, the corresponding bit is RAZ/WI.

E[15]	Meaning
0b0	Event 15 is ignored.
0b1	Do not record samples that have event 15 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSFCR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E[14], bit [14]**

E[14] is the event filter for event 14. If event 14 is not implemented, or filtering on event 14 is not supported, the corresponding bit is RAZ/WI.

E[14]	Meaning
0b0	Event 14 is ignored.
0b1	Do not record samples that have event 14 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSFCR\\_EL1.FE](#) == 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E[13], bit [13]**

E[13] is the event filter for event 13. If event 13 is not implemented, or filtering on event 13 is not supported, the corresponding bit is RAZ/WI.

E[13]	Meaning
0b0	Event 13 is ignored.
0b1	Do not record samples that have event 13 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSFCR\\_EL1.FE == 0](#)

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[12], bit [12]**

E[12] is the event filter for event 12. If event 12 is not implemented, or filtering on event 12 is not supported, the corresponding bit is RAZ/WI.

<b>E[12]</b>	<b>Meaning</b>
0b0	Event 12 is ignored.
0b1	Do not record samples that have event 12 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSFCR\\_EL1.FE == 0](#)

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[11], bit [11]**

**When FEAT\_SPEv1p1 is implemented:**

Reserved, RAZ/WI.

#### **E[1115], bit [1115]**

**When FEAT\_SPEv1p1 is implemented:**

Alignment.

<b>E[11]</b>	<b>Meaning</b>
0b0	Alignment event is ignored.
0b1	Do not record samples that have the Alignment event == 0.

This bit is ignored by the PE when [PMSFCR\\_EL1.FE == 0](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAZ/WI.

#### **Bits [10:8]**

Reserved, RAZ/WI.

#### **E[7], bit [7]**

Mispredicted.

<b>E[7]</b>	<b>Meaning</b>
0b0	Mispredicted event is ignored.
0b1	Do not record samples that have the Mispredicted event == 0.

This bit is ignored by the PE when [PMSFCR\\_EL1.FE == 0](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **E[6], bit [6]**

**When FEAT\_SPEv1p2 is implemented:**

Not taken.

Reserved, RAZ/WI.

E[6]	Meaning
0b0	Not taken event is ignored.
0b1	Do not record samples that have the Not taken event == 0.

This bit is ignored by the PE when [PMSFCR\\_EL1.FE](#) == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAZ/WI.

**E[5], bit [5]**

TLB walk.

E[5]	Meaning
0b0	TLB walk event is ignored.
0b1	Do not record samples that have the TLB walk event == 0.

This bit is ignored by the PE when [PMSFCR\\_EL1.FE](#) == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [4]**

Reserved, RAZ/WI.

**E[3], bit [3]**

Level 1 data or unified cache refill.

E[3]	Meaning
0b0	Level 1 data or unified cache refill event is ignored.
0b1	Do not record samples that have the Level 1 data or unified cache refill event == 0.

This bit is ignored by the PE when [PMSFCR\\_EL1.FE](#) == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [2]**

Reserved, RAZ/WI.

**E[1], bit [1]****When the PE supports sampling of speculative instructions:**

Architecturally retired.

When the PE supports sampling of speculative instructions:

E[1]	Meaning
0b0	Architecturally retired event is ignored.
0b1	Do not record samples that have the Architecturally retired event == 0.

This bit is ignored by the PE when [PMSFCR\\_EL1.FE](#) == 0.

If the PE does not support the sampling of speculative instructions, or always discards the sample record for speculative instructions, this bit reads as an UNKNOWN value and the PE ignores its value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, UNKNOWN.

#### Bit [0]

Reserved, RAZ/WI.

## Accessing the PMSEVFR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, PMSEVFR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1001	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;

# PMSFCR\_EL1, Sampling Filter Control Register

The PMSFCR\_EL1 characteristics are:

## Purpose

Controls sample filtering. The filter is the logical AND of the FL, FT and FE bits. For example, if FE == 1 and FT == 1 only samples including the selected operation types and the selected events will be recorded

## Configuration

This register is present only when FEAT\_SPE is implemented. Otherwise, direct accesses to PMSFCR\_EL1 are UNDEFINED.

## Attributes

PMSFCR\_EL1 is a 64-bit register.

## Field descriptions

The PMSFCR\_EL1 bit assignments are:

### Bits [63:19]

Reserved, RES0.

### ST, bit [18]

Store filter enable

ST	Meaning
0b0	Do not record store operations
0b1	Record all store operations, including vector stores and all atomic operations

This bit is ignored by the PE when PMSFCR\_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### LD, bit [17]

Load filter enable

LD	Meaning
0b0	Do not record load operations
0b1	Record all load operations, including vector loads and atomic operations that return data

This bit is ignored by the PE when PMSFCR\_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**B, bit [16]**

Branch filter enable

B	Meaning
0b0	Do not record branch and exception return operations
0b1	Record all branch and exception return operations

This bit is ignored by the PE when PMSFCR\_EL1.FT == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:43]**

Reserved, RES0.

**FnE, bit [3]**

**When FEAT\_SPEv1p2 is implemented:**

Filter by event, inverted.

FnE	Meaning
0b0	Inverted event filtering disabled.
0b1	Inverted event filtering enabled. Samples including the events selected by PMSNEVER_EL1 will not be recorded.

If any of the following are true, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR\_EL1.FnE == 0b0:

- PMSFCR\_EL1.FnE == 0b1 and PMSNEVER\_EL1 is zero.
- PMSFCR\_EL1.FnE == 0b1, PMSFCR\_EL1.FE == 0b1, and there exists a value x such that PMSEVER\_EL1.E[x] == 0b1 and PMSNEVER\_EL1.E[x] == 0b1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FL, bit [2]**

Filter by latency

FL	Meaning
0b0	Latency filtering disabled
0b1	Latency filtering enabled. Samples with a total latency less than PMSLATFR_EL1.MINLAT will not be recorded

If this field is set to 1 and PMSLATFR\_EL1.MINLAT is set to zero, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR\_EL1.FL is set to 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FT, bit [1]**

Filter by operation type. The filter is the logical OR of the ST, LD and B bits. For example, if LD and ST are both set, both load and store operations are recorded

FT	Meaning
0b0	Type filtering disabled
0b1	Type filtering enabled. Samples not one of the selected operation types will not be recorded

If this field is set to 1 and the PMSFCR\_EL1.{ST, LD, B} bits are all set to zero, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR\_EL1.FT is set to 0

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## FE, bit [0]

Filter by event.

FE	Meaning
0b0	Event filtering disabled.
0b1	Event filtering enabled. Samples not including the events selected by <a href="#">PMSEVFR_EL1</a> will not be recorded.

If any of the following are true, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR\_EL1.FE == 0b0:

If PMSFCR\_EL1.FE == 0b1 and PMSEVFR\_EL1 is zero, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR\_EL1.FE == 0b0.

- PMSFCR\_EL1.FE == 0b1 and [PMSEVFR\\_EL1](#) is zero.
- FEAT\_SPEv1p2 is implemented, PMSFCR\_EL1.FnE == 0b1, PMSFCR\_EL1.FE == 0b1, and there exists a value x such that [PMSEVFR\\_EL1.E\[x\]](#) == 0b1 and [PMSNEVER\\_EL1.E\[x\]](#) == 0b1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMSFCR\_EL1

Accesses to this register use the following encodings:

# PMSICR\_EL1, Sampling Interval Counter Register

The PMSICR\_EL1 characteristics are:

## Purpose

Software must write zero to PMSICR\_EL1 before enabling sample profiling for a sampling session. Software must then treat PMSICR\_EL1 as an opaque, 64-bit, read/write register used for context switches only.

## Configuration

This register is present only when FEAT\_SPE is implemented. Otherwise, direct accesses to PMSICR\_EL1 are UNDEFINED.

## Attributes

The value of PMSICR\_EL1 does not change whilst profiling is disabled.

## Attributes

PMSICR\_EL1 is a 64-bit register.

## Field descriptions

The PMSICR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ECOUNT								RES0																							
COUNT																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ECOUNT, bits [63:56]

When PMSIDR\_EL1.ERnd == 1:

ECOUNT, bits [63:56]

When PMSIDR\_EL1.ERnd == 1:

Secondary sample interval counter.

This field provides the secondary counter used after the primary counter reaches zero. Whilst the secondary counter is nonzero and profiling is enabled, the secondary counter decrements by 1 for each member of the sample population. The primary counter also continues to decrement since it is also nonzero. When the secondary counter reaches zero, a member of the sampling population is selected for sampling.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [55:32]**

Reserved, RES0.

**COUNT, bits [31:0]**

Primary sample interval counter

Provides the primary counter used for sampling.

The primary counter is reloaded when the value of this register is zero and the PE moves from a state or Exception level where profiling is disabled to a state or Exception level where profiling is enabled

Whilst the primary counter is nonzero and sampling is enabled, the primary counter decrements by 1 for each member of the sample population

When the counter reaches zero, the behavior depends on the values of PMSIDR\_EL1.ERnd and PMSIRR\_EL1.RND

- If [PMSIRR\\_EL1](#).RND == 0 or PMSIDR\_EL1.ERnd == 0:
  - A member of the sampling population is selected for sampling
  - The primary counter is reloaded
- If [PMSIRR\\_EL1](#).RND == 1 and [PMSIDR\\_EL1](#).ERnd == 1:
  - The secondary counter is set to a random or pseudorandom value in the range 0x00 to 0xFF
  - The primary counter is reloaded

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMSICR\_EL1**

Accesses to this register use the following encodings:

# PMSIDR\_EL1, Sampling Profiling ID Register

The PMSIDR\_EL1 characteristics are:

## Purpose

Describes the Statistical Profiling implementation to software

## Configuration

This register is present only when FEAT\_SPE is implemented. Otherwise, direct accesses to PMSIDR\_EL1 are UNDEFINED.

## Attributes

PMSIDR\_EL1 is a 64-bit register.

## Field descriptions

The PMSIDR\_EL1 bit assignments are:

### Bits [63:20]

### Bits [63:24]

Reserved, RES0.

### Format, bits [23:20]

#### From Armv8.7:

Defines the format of the sample records. Defined values are:

Format	Meaning
0b0000	Format 0.

All other values are reserved.

#### Otherwise:

Reserved, RAZ.

### CountSize, bits [19:16]

Defines the size of the counters. Defined values are: counters

CountSize	Meaning
0b0010	12-bit saturating counters.

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Reserved values might be defined in a future version of the architecture.

### MaxSize, bits [15:12]

Defines the largest size for a single record, rounded up to a power-of-two. If this is the same as the minimum alignment (PMBIDR\_EL1.Align), then each record is exactly this size. Defined values are:

MaxSize	Meaning
0b0100	16 bytes
0b0101	32 bytes
0b0110	64 bytes
0b0111	128 bytes
0b1000	256 bytes
0b1001	512 bytes
0b1010	1024 bytes
0b1011	2KB

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Reserved values might be defined in a future version of the architecture.

### Interval, bits [11:8]

Recommended minimum sampling interval. This provides guidance from the implementer to the smallest minimum sampling interval, N. Defined values are:

Interval	Meaning
0b0000	256
0b0010	512
0b0011	768
0b0100	1,024
0b0101	1,536
0b0110	2,048
0b0111	3,072
0b1000	4,096

All other values are reserved. Reserved values might be defined in a future version of the architecture.

### Bits [7:6]

Reserved values might be defined in a future version of the architecture.

### Bit [7]

Reserved, RES0.

### FnE, bit [6]

Filtering by events, inverted. Defined values are:

FnE	Meaning
0b0	PMSNEVFR_EL1 is not implemented and PMSFCR_EL1.FnE is RES0.
0b1	PMSNEVFR_EL1 and PMSFCR_EL1.FnE are implemented.

The value 0b1 indicates support for the FEAT\_SPEv1p2 feature.

### ERnd, bit [5]

Defines how the random number generator is used in determining the interval between samples, when enabled by PMSIRR\_EL1.RND. Defined values are:

ERnd	Meaning
0b0	The random number is added at the start of the interval, and the sample is taken and a new interval started when the combined interval expires.
0b1	The random number is added and the new interval started after the interval programmed in PMSIRR_EL1.INTERVAL expires, and the sample is taken when the random interval expires.

**LDS, bit [4]**

Data source indicator for sampled load instructions. Defined values are: instructions

LDS	Meaning
0b0	Loaded data source not implemented.
0b1	Loaded data source implemented.

**ArchInst, bit [3]**

Architectural instruction profiling. Defined values are: profiling

ArchInst	Meaning
0b0	Micro-op sampling implemented.
0b1	Architecture instruction sampling implemented.

**FL, bit [2]**

Filtering by latency. This bit is RAO.

**FT, bit [1]**

Filtering by operation type. This bit is RAO.

**FE, bit [0]**

Filtering by events. This bit is RAO.

**Accessing the PMSIDR\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, PMSIDR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1001	0b111

# PMSNEVFR\_EL1, Sampling Inverted Event Filter Register

The PMSNEVFR\_EL1 characteristics are:

## Purpose

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if E[3] and E[5] are both set to 0b1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 (TLB walk) clear are recorded.

## Configuration

This register is present only when FEAT\_SPEv1p2 is implemented. Otherwise, direct accesses to PMSNEVFR\_EL1 are UNDEFINED.

## Attributes

PMSNEVFR\_EL1 is a 64-bit register.

## Field descriptions

The PMSNEVFR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	
E[63]	E[62]	E[61]	E[60]	E[59]	E[58]	E[57]	E[56]	E[55]	E[54]	E[53]	E[52]	E[51]	E[50]	E[49]	E[48]						
E[31]	E[30]	E[29]	E[28]	E[27]	E[26]	E[25]	E[24]	RAZ/WI						E[18]	E[17]	RAZ/ WI	E[15]	E[14]	E[13]	E[12]	E[11]
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	

**E[<x>], bit [x], for x = 63 to 48, 31 to 24, 15 to 12**

E[<x>] is the event filter for IMPLEMENTATION DEFINED event <x>.

E[<x>]	Meaning
0b0	Event <x> is ignored.
0b1	Do not record samples that have event <x> == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR\_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This bit is ignored by the PE when [PMSFCR\\_EL1](#).FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When event <x> is not implemented, or filtering on event <x> is not supported, access to this field is **RAZ/WI**.

### Bits [47:32]

Reserved, RAZ/WI.

### Bits [23:19]

Reserved, RAZ/WI.

**E[18], bit [18]**

When **FEAT\_SVE** is implemented and **FEAT\_SPEv1p1** is implemented:

Not empty predicate.

<b>E[18]</b>	<b>Meaning</b>
0b0	Empty predicate event is ignored.
0b1	Do not record samples that have the Empty predicate event == 1.

This bit is ignored by the PE when [PMSFCR\\_EL1](#).FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAZ/WI.

**E[17], bit [17]**

When **FEAT\_SVE** is implemented and **FEAT\_SPEv1p1** is implemented:

Not partial predicate.

<b>E[17]</b>	<b>Meaning</b>
0b0	Partial predicate event is ignored.
0b1	Do not record samples that have the Partial predicate event == 1.

This bit is ignored by the PE when [PMSFCR\\_EL1](#).FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAZ/WI.

**Bit [16]**

Reserved, RAZ/WI.

**E[11], bit [11]**

When **FEAT\_SPEv1p1** is implemented:

Aligned.

<b>E[11]</b>	<b>Meaning</b>
0b0	Misalignment event is ignored.
0b1	Do not record samples that have the Misalignment event == 1.

This bit is ignored by the PE when [PMSFCR\\_EL1](#).FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAZ/WI.

**Bits [10:8]**

Reserved, RAZ/WI.

**E[7], bit [7]**

Correctly predicted.

<b>E[7]</b>	<b>Meaning</b>
0b0	Mispredicted event is ignored.
0b1	Do not record samples that have the Mispredicted event == 1.

This bit is ignored by the PE when [PMSFCR\\_EL1](#).FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E[6], bit [6]**

Taken.

<b>E[6]</b>	<b>Meaning</b>
0b0	Not taken event is ignored.
0b1	Do not record samples that have the Not taken event == 1.

This bit is ignored by the PE when [PMSFCR\\_EL1](#).FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E[5], bit [5]**

TLB hit.

<b>E[5]</b>	<b>Meaning</b>
0b0	TLB walk event is ignored.
0b1	Do not record samples that have the TLB walk event == 1.

This bit is ignored by the PE when [PMSFCR\\_EL1](#).FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [4]**

Reserved, RAZ/WI.

**E[3], bit [3]**

Level 1 data or unified cache hit.

<b>E[3]</b>	<b>Meaning</b>
0b0	Level 1 data or unified cache refill event is ignored.
0b1	Do not record samples that have the Level 1 data or unified cache refill event == 1.

This bit is ignored by the PE when [PMSFCR\\_EL1](#).FnE == 0b0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [2]**

Reserved, RAZ/WI.

**E[1], bit [1]**

Speculative.

<b>E[1]</b>	<b>Meaning</b>
0b0	Architecturally retired event is ignored.
0b1	Do not record samples that have the Architecturally retired event == 1.

This bit is ignored by the PE when [PMSFCR\\_EL1](#).FnE == 0b0. This bit is RES0 if the PE does not support sampling of speculative instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [0]**

Reserved, RAZ/WI.

**Accessing the PMSNEVFR\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, PMSNEVFR\_EL1

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b11	0b000	0b1001	0b1001	0b001

# PMSWINC\_EL0, Performance Monitors Software Increment register

The PMSWINC\_EL0 characteristics are:

## Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see 'SW\_INCR'.

## Configuration

AArch64 System register PMSWINC\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMSWINC\[31:0\]](#).

AArch64 System register PMSWINC\_EL0 bits [31:0] are architecturally mapped to External register [PMSWINC\\_EL0\[31:0\]](#).

This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC\_EL0 are UNDEFINED.

## Attributes

PMSWINC\_EL0 is a 64-bit register.

## Field descriptions

The PMSWINC\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34
RES0																													
RES0	P30P<n> bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2

### Bits [63:31]

Reserved, RES0.

P<n>, bit [n], for n = 300 to 030

Event counter software increment bit for [PMEVCNTR<n>\\_EL0](#).

If N is less than 31, then bits [30:N] are WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR\\_EL2.HPMN](#). Otherwise, N is the value in [PMCR\\_EL0.N](#).

P<n>	Meaning
0b0	No action. The write to this bit is ignored.
0b1	If <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> is enabled and configured to count the software increment event, increments <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> by 1. If <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> is disabled, or not configured to count the software increment event, the write to this bit is ignored.

## Accessing the PMSWINC\_EL0

Accesses to this register use the following encodings:

# PMUSERENR\_EL0, Performance Monitors User Enable Register

The PMUSERENR\_EL0 characteristics are:

## Purpose

Enables or disables EL0 access to the Performance Monitors.

## Configuration

AArch64 System register PMUSERENR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMUSERENR\[31:0\]](#).  
This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR\_EL0 are UNDEFINED.

## Attributes

PMUSERENR\_EL0 is a 64-bit register.

## Field descriptions

The PMUSERENR\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
																RES0																					
RES0																																					
																														ER		CR		SW		EN	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CR, bit [2]

Cycle counter Read. Traps EL0 access to cycle counter reads to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2.TGE](#) is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped MRC accesses are reported using EC syndrome value 0x03, trapped MRRC accesses are reported using EC syndrome value 0x04.

CR	Meaning
0b0	EL0 using AArch64: EL0 read accesses to the <a href="#">PMCCNTR_EL0</a> are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 read accesses to the <a href="#">PMCCNTR</a> are trapped if PMUSERENR_EL0.EN is also 0.
0b1	Overrides PMUSERENR_EL0.EN and enables access to: <ul style="list-style-type: none"> <li>• <a href="#">PMCCNTR_EL0</a> at EL0.</li> <li>• <a href="#">PMCCNTR</a> at EL0.</li> </ul>

### SW, bit [1]

Traps Software Increment writes to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2.TGE](#) is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped accesses are reported using EC syndrome value 0x03.

SW	Meaning
0b0	EL0 using AArch64: EL0 writes to the <a href="#">PMSWINC_EL0</a> are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 writes to the <a href="#">PMSWINC</a> are trapped if PMUSERENR_EL0.EN is also 0.
0b1	Overrides PMUSERENR_EL0.EN and enables access to: <ul style="list-style-type: none"> <li>• <a href="#">PMSWINC_EL0</a> at EL0.</li> <li>• <a href="#">PMSWINC</a> at EL0.</li> </ul>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EN, bit [0]

Traps EL0 accesses to the Performance Monitor registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2.TGE](#) is 1, from both Execution states as follows:

- In AArch64 state, MRS or MSR accesses to the following registers are reported using EC syndrome value 0x18:
  - [PMCR\\_EL0](#), [PMOVSLR\\_EL0](#), [PMSELR\\_EL0](#), [PMCEID0\\_EL0](#), [PMCEID1\\_EL0](#), [PMCCNTR\\_EL0](#), [PMXEVTYPER\\_EL0](#), [PMXVCNTR\\_EL0](#), [PMCNTENSET\\_EL0](#), [PMCNTENCLR\\_EL0](#), [PMCNTENSET\\_EL0](#), [PMOVSSET\\_EL0](#), [PMEVCNTR<n>\\_EL0](#), [PMEVTYPER<n>\\_EL0](#), [PMCCFILTR\\_EL0](#), [PMSWINC\\_EL0](#).
  - If FEAT\_PMuV3p4 is implemented, [PMMIR\\_EL1](#).
  - [PMSWINC\\_EL0](#), MSR accesses only.
  - If FEAT\_PMuV3p4 is implemented, [PMMIR\\_EL1](#).
- In AArch32 state, MRC or MCR accesses to the following registers are reported using EC syndrome value 0x03:
  - [PMCR](#), [PMOVS](#), [PMSELR](#), [PMCEID0](#), [PMCEID1](#), [PMCCNTR](#), [PMXEVTYPER](#), [PMXVCNTR](#), [PMCNTENSET](#), [PMCNTENCLR](#), [PMOVSSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMCCFILTR](#), [PMSWINC](#).
  - If FEAT\_PMuV3p4 is implemented, [PMMIR](#).

- PMSWINC**, MCR accesses only.
- If **FEAT\_PMUv3p1**~~FEAT\_PMUv3p4~~ is implemented, in AArch32 state, **PMCEID2**~~PMMIR~~, and **PMCEID3**.
  - ~~If FEAT\_PMUv3p1 is implemented, in AArch32 state, **PMCEID2**, and **PMCEID3**.~~
- In AArch32 state, MRRC or MCRR accesses to **PMCCNTR** are reported using EC syndrome value 0x04.

EN	Meaning
0b0	While at EL0, accesses to the specified registers at EL0 are trapped, unless overridden by one of PMUSERENR_EL0.{ER, CR, SW}.
0b1	While at EL0, software can access all of the specified registers.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMUSERENR\_EL0

Accesses to this register use the following encodings:

MRS <Xt>, PMUSERENR\_EL0

# PMXEVTYPER\_EL0, Performance Monitors Selected Event Type Register

The PMXEVTYPER\_EL0 characteristics are:

## Purpose

When [PMSELR\\_EL0](#).SEL selects an event counter, this accesses a [PMEVTYPER<n>\\_EL0](#) register. When [PMSELR\\_EL0](#).SEL selects the cycle counter, this accesses [PMCCFILTR\\_EL0](#).

## Configuration

AArch64 System register PMXEVTYPER\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMXEVTYPER\[31:0\]](#).

This register is present only when FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER\_EL0 are UNDEFINED.

## Attributes

PMXEVTYPER\_EL0 is a 64-bit register.

## Field descriptions

The PMXEVTYPER\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Event type register or PMCCFILTR_EL0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### Bits [31:0]

When [PMSELR\\_EL0](#).SEL == 31, this register accesses [PMCCFILTR\\_EL0](#).

Otherwise, this register accesses [PMEVTYPER<n>\\_EL0](#) where n is the value in [PMSELR\\_EL0](#).SEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMXEVTYPER\_EL0

If FEAT\_FGT is implemented, and [PMSELR\\_EL0](#).SEL is not 31 and is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of [PMXEVTYPER\\_EL0](#) is as follows:

- If [PMSELR\\_EL0](#).SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT\_FGT is not implemented, and [PMSELR\\_EL0](#).SEL is not 31 and is greater than or equal to the number of accessible counters, then reads and writes of [PMXEVTYPER\\_EL0](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if [PMSELR\\_EL0.SEL](#) has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if [PMSELR\\_EL0.SEL](#) is 31.
- If EL2 is implemented and enabled in the current Security state, [PMSELR\\_EL0](#) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

---

**Note**

In EL0, an access is permitted if it is enabled by [PMUSERENR\\_EL0.EN](#).

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, [MDCR\\_EL2.HPMN](#) identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. See [MDCR\\_EL2.HPMN](#) for more details.

---

Accesses to this register use the following encodings:

MRS <Xt>, [PMXEVTYPER\\_EL0](#)

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1101	0b001

```

if PSTATE.EL == EL0 then

## Accessing the PMXEVTYPER\_EL0

If FEAT\_FGT is implemented, and [PMSELR\\_EL0.SEL](#) is not 31 and is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of [PMXEVTYPER\\_EL0](#) is as follows:

- If [PMSELR\\_EL0.SEL](#) selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT\_FGT is not implemented, and [PMSELR\\_EL0.SEL](#) is not 31 and is greater than or equal to the number of accessible counters, then reads and writes of [PMXEVTYPER\\_EL0](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if [PMSELR\\_EL0.SEL](#) has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.

- Accesses to the register behave as if [PMSELR\\_EL0.SEL](#) is 31.
- If EL2 is implemented and enabled in the current Security state, [PMSELR\\_EL0](#) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

---

**Note**

In EL0, an access is permitted if it is enabled by [PMUSERENR\\_EL0.EN](#).

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, [MDCR\\_EL2.HPMN](#) identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. See [MDCR\\_EL2.HPMN](#) for more details.

---

Accesses to this register use the following encodings:

# REVIDR\_EL1, Revision ID Register

The REVIDR\_EL1 characteristics are:

## Purpose

Provides implementation-specific minor revision information.

## Configuration

AArch64 System register REVIDR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [REVIDR\[31:0\]](#).

If REVIDR\_EL1 has the same value as [MIDR\\_EL1](#), then its contents have no significance.

## Attributes

REVIDR\_EL1 is a 64-bit register.

## Field descriptions

The REVIDR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																															
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

## Accessing the REVIDR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, REVIDR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b110

# RGSR\_EL1, Random Allocation Tag Seed Register.

The RGSR\_EL1 characteristics are:

## Purpose

Random Allocation Tag Seed Register.

## Configuration

This register is present only when FEAT\_MTE2FEAT\_MTE is implementedimplemented and ID\_AA64PFR1\_EL1.MTE != 0b0001. Otherwise, direct accesses to RGSR\_EL1 are UNDEFINED.

When GCR\_EL1.RRND==0b1, updates to RGSR\_EL1 are implementation-specific.

## Attributes

RGSR\_EL1 is a 64-bit register.

## Field descriptions

The RGSR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																RES0																
RES0								SEED																RES0				TAG				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### Bits [63:24]

Reserved, RES0.

### SEED, bits [23:8]

Seed register used for generating values returned by RandomAllocationTag().

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Bits [7:4]

Reserved, RES0.

### TAG, bits [3:0]

Tag generated by the most recent IRG instruction.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the RGSR\_EL1

Accesses to this register use the following encodings:

# RMR\_EL1, Reset Management Register (EL1)

The RMR\_EL1 characteristics are:

## Purpose

When this register is implemented:

- A write to the register at EL1 can request a Warm reset.
- If EL1 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

## Configuration

AArch64 System register RMR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [RMR\[31:0\]](#) when the highest implemented Exception level is EL1.

This register is present only when the highest implemented Exception level is EL1. Otherwise, direct accesses to RMR\_EL1 are UNDEFINED.

When EL1 is the highest implemented Exception level:

- If EL1 can use all Execution states then this register must be implemented.
- If EL1 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

## Attributes

RMR\_EL1 is a 64-bit register.

## Field descriptions

The RMR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32					
																RES0																				
																RES0																	RR		AA64	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					

### Bits [63:2]

Reserved, RES0.

### RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

On a Warm reset, this field resets to 0.

### AA64, bit [0]

When EL1 is capable of using AArch32:

When EL1 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
0b0	AArch32.
0b1	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL1 can only use AArch64 state, this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

**Otherwise:**

Reserved, RAO/WI.

## Accessing the RMR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, RMR\_EL1

# RNDR, Random Number

The RNDR characteristics are:

## Purpose

Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is 0.

RNDR is a read-only register.

## Configuration

This register is present only when FEAT\_RNG is implemented. Otherwise, direct accesses to RNDR are UNDEFINED.

## Attributes

RNDR is a 64-bit register.

## Field descriptions

The RNDR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RNDR															
																RNDR															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### RNDR, bits [63:0]

Random Number. Returns a 64-bit Random Number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the RNDR

Accesses to this register use the following encodings:

MRS <Xt>, RNDR

op0	op1	CRn	CRm	op2
0b11	0b011	0b0010	0b0100	0b000

```
if PSTATE.EL == EL0 then
    return RNDR;
elsif PSTATE.EL == EL1 then
    return RNDR;
elsif PSTATE.EL == EL2 then
    return RNDR;
elsif PSTATE.EL == EL3 then
    return RNDR;
```

# RNDRRS, Reseeded Random Number

The RNDRRS characteristics are:

## Purpose

Reseeded Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source immediately before the read of the random number.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is 0.

RNDRRS is a read-only register.

## Configuration

This register is present only when FEAT\_RNG is implemented. Otherwise, direct accesses to RNDRRS are UNDEFINED.

## Attributes

RNDRRS is a 64-bit register.

## Field descriptions

The RNDRRS bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RNDRRS

# SCR\_EL3, Secure Configuration Register

The SCR\_EL3 characteristics are:

## Purpose

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0, EL1, and EL2. The Security state is either Secure or Non-secure.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ,SError interrupts, and External abort exceptions are taken to EL3.
- Whether various operations are trapped to EL3.

## Configuration

AArch64 System register SCR\_EL3 bits [31:0] can be mapped to AArch32 System register [SCR\[31:0\]](#), but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCR\_EL3 are UNDEFINED.

## Attributes

SCR\_EL3 is a 64-bit register.

## Field descriptions

The SCR\_EL3 bit assignments are:

**HXEnAMVOFFEN**, bit [3835]

When **FEAT\_HCXFEAT\_AMUv1p1** is implemented:

Enables access to the [HCRX\\_EL2](#) register at EL2 from EL3.

HXEn	Meaning
0b0	EL2 accesses to <a href="#">HCRX_EL2</a> are trapped to EL3. Indirect reads of <a href="#">HCRX_EL2</a> return 0.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**ADEn, bit [37]****When FEAT\_LS64 is implemented:**

Enables access to the [ACCDATA\\_EL1](#) register at EL1 and EL2.

ADEn	Meaning
0b0	Accesses to <a href="#">ACCDATA_EL1</a> at EL1 and EL2 are trapped to EL3, unless the accesses are trapped to EL2 by the EL2 fine-grained trap.
0b1	This control does not cause accesses to <a href="#">ACCDATA_EL1</a> to be trapped.

If the [HFGWTR\\_EL2.nACCDATA\\_EL1](#) or [HFGTR\\_EL2.nACCDATA\\_EL1](#) traps are enabled, they take priority over this trap.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EnAS0, bit [36]****When FEAT\_LS64 is implemented:**

Traps execution of an ST64BV0 instruction at EL0, EL1, or EL2 to EL3.

EnAS0	Meaning
0b0	EL0 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL1 by <a href="#">SCTLR_EL1.EnAS0</a> , or to EL2 by either <a href="#">HCRX_EL2.EnAS0</a> or <a href="#">SCTLR_EL2.EnAS0</a> . EL1 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL2 by <a href="#">HCRX_EL2.EnAS0</a> . EL2 execution of an ST64BV0 instruction is trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an [ESR\\_ELx.EC](#) value of 0x0A, with an ISS code of 0x0000001.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**AMVOFFEN, bit [35]****When FEAT\_AMUv1p1 is implemented:**

Activity Monitors Virtual Offsets Enable.

AMVOFFEN	Meaning
0b0	Accesses to <a href="#">AMEVCNTVOFF0&lt;n&gt;_EL2</a> and <a href="#">AMEVCNTVOFF1&lt;n&gt;_EL2</a> at EL2 are trapped to EL3. Indirect reads of the virtual offset registers are zero.
0b1	Accesses to <a href="#">AMEVCNTVOFF0&lt;n&gt;_EL2</a> and <a href="#">AMEVCNTVOFF1&lt;n&gt;_EL2</a> are not affected by this field.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [34]**

Reserved, RES0.

**TWEDEL, bits [33:30]**

**When FEAT\_TWED is implemented:**

TWE Delay. A 4-bit unsigned number that, when SCR\_EL3.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE\* caused by SCR\_EL3.TWE as  $2^{(TWEDEL + 8)}$  cycles.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TWEDEn, bit [29]**

**When FEAT\_TWED is implemented:**

TWE Delay Enable. Enables a configurable delayed trap of the WFE\* instruction caused by SCR\_EL3.TWE.

TWEDEn	Meaning
0b0	The delay for taking thea WFE trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking thea WFE trap is at least the number of cycles defined in SCR_EL3.TWEDEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**ECVEn, bit [28]**

**When FEAT\_ECV is implemented:**

ECV Enable. Enables access to the [CNTPOFF\\_EL2](#) register.

ECVEn	Meaning
0b0	EL2 accesses to <a href="#">CNTPOFF_EL2</a> are trapped to EL3, and the value of <a href="#">CNTPOFF_EL2</a> is treated as 0 for all purposes other than direct reads or writes to the register from EL3.
0b1	EL2 accesses to <a href="#">CNTPOFF_EL2</a> are not trapped to EL3 by this mechanism.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FGTEEn, bit [27]**

**When FEAT\_FGT is implemented:**

Fine-Grained Enables Trapsaccess Enable.to When the EL2Fine-Grained isTraps implemented, enables access to registers: [HAFGRTR\\_EL2](#), [HDFGRTR\\_EL2](#), [HDFGWTR\\_EL2](#), [HFGTRTR\\_EL2](#), [HFGITR\\_EL2](#) and [HFGWTR\\_EL2](#).

**Note**

If EL2 is not implemented but EL3 is implemented, FEAT\_FGT implements the [MDCR\\_EL3.TDCC](#) traps.

FGTE <sub>n</sub>	Meaning
0b0	EL2 <a href="#">accesses</a> <del>Accesses</del> to <a href="#">HAFGRTR_EL2</a> , <a href="#">HDFGRTR_EL2</a> , <a href="#">HDFGWTR_EL2</a> , <a href="#">HFGTRTR_EL2</a> , <a href="#">HFGITR_EL2</a> and <a href="#">HFGWTR_EL2</a> registers are trapped to EL3, and those registers behave as if all bits are set to 0.
0b1	EL2 <a href="#">accesses</a> <del>Accesses</del> to <a href="#">HAFGRTR_EL2</a> , <a href="#">HDFGRTR_EL2</a> , <a href="#">HDFGWTR_EL2</a> , <a href="#">HFGTRTR_EL2</a> , <a href="#">HFGITR_EL2</a> and <a href="#">HFGWTR_EL2</a> registers are not trapped to EL3 by this mechanism.

Traps caused by accesses to the fine-grained trap registers are reported using an ESR\_EL<sub>x</sub>.EC value of 0x18 and its associated ISS.

**Otherwise:**

Reserved, RES0.

**ATA, bit [26]**

When [FEAT\\_MTE2](#) ~~FEAT\_MTE~~ is implemented:

Allocation Tag Access. Controls access at EL2, EL1 and EL0 to Allocation Tags.

When access is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
- MRS and MSR instructions at EL1 and EL2 using [GCR\\_EL1](#), [RGSRR\\_EL1](#), [TFSR\\_EL1](#), [TFSR\\_EL2](#) or [TFSRE0\\_EL1](#) that are not UNDEFINED or trapped to a lower Exception level are trapped to EL3.
- MRS and MSR instructions at EL2 using [TFSR\\_EL12](#) that are not UNDEFINED are trapped to EL3.

ATA	Meaning
0b0	Access is prevented.
0b1	Access is not prevented.

This field is permitted to be cached in a TLB.

[On a Warm reset](#), this ~~This~~ field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EnSCXT, bit [25]**

When [FEAT\\_CSV2](#) is implemented:

Enable access to the [SCXTNUM\\_EL2](#), [SCXTNUM\\_EL1](#), and [SCXTNUM\\_EL0](#) registers. The defined values are:

EnSCXT	Meaning
0b0	EL2, EL1 and EL0 access to <a href="#">SCXTNUM_EL0</a> , EL2 and EL1 access to <a href="#">SCXTNUM_EL1</a> , EL2 access to <a href="#">SCXTNUM_EL2</a> registers are disabled by this mechanism, causing an exception to EL3, and the values of these registers to be treated as 0.
0b1	This control does not cause accesses to <a href="#">SCXTNUM_EL0</a> , <a href="#">SCXTNUM_EL1</a> , <a href="#">SCXTNUM_EL2</a> to be trapped.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bits [24:22]

Reserved, RES0.

#### FIEN, bit [21]

##### When FEAT\_RASv1p1 is implemented:

Fault Injection enable. Trap accesses to the registers [ERXPFPCDN\\_EL1](#), [ERXPFPCCTL\\_EL1](#), and [ERXPFPCGF\\_EL1](#) from EL1 and EL2 to EL3, reported using an ESR\_ELx.EC value of 0x18.

FIEN	Meaning
0b0	Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.
0b1	This control does not cause any instructions to be trapped.

If EL3 is not implemented, the Effective value of SCR\_EL3.FIEN is 0b1.

If [ERRIDR\\_EL1](#).NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### NMEA, bit [20]

##### When FEAT\_DoubleFault is implemented:

Non-maskable External Aborts. When [SCR\\_EL3](#).EA == 1, controls whether PSTATE.A masks SError interrupts at EL3.

NMEA	Meaning
0b0	If <a href="#">SCR_EL3</a> .EA == 1, asserted SError interrupts are not taken at EL3 if PSTATE.A == 1.
0b1	If <a href="#">SCR_EL3</a> .EA == 1, asserted SError interrupts are taken at EL3 regardless of the value of PSTATE.A.

When SCR\_EL3.EA == 0:

- Asserted SError interrupts are not taken at EL3 regardless of the value of PSTATE.A and this field.
- This field is ignored and its Effective value is 0.

On a Warm reset, this **This** field resets to 0.

**Otherwise:**

Reserved, RES0.

**EASE, bit [19]****When FEAT\_DoubleFault is implemented:**

External aborts to SError interrupt vector.

EASE	Meaning
0b0	Synchronous External abort exceptions taken to EL3 are taken to the appropriate synchronous exception vector offset from <a href="#">VBAR_EL3</a> .
0b1	Synchronous External abort exceptions taken to EL3 are taken to the appropriate SError interrupt vector offset from <a href="#">VBAR_EL3</a> .

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**EEL2, bit [18]****When FEAT\_SEL2 is implemented:**

Secure EL2 Enable.

EEL2	Meaning
0b0	All behaviors associated with Secure EL2 are disabled. All registers, including timer registers, defined by FEAT_SEL2 are UNDEFINED, and those timers are disabled.
0b1	All behaviors associated with Secure EL2 are enabled.

When the value of this bit is 1, then:

- When SCR\_EL3.NS == 0, the SCR\_EL3.RW bit is treated as 1 for all purposes other than reading or writing the register.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2, using the EC value of [ESR\\_EL2](#).EC == 0x3 :
  - A read or write of the [SCR](#).
  - A read or write of the [NSACR](#).
  - A read or write of the [MVBAR](#).
  - A read or write of the [SDCR](#).
  - Execution of an ATS12NSO\*\* instruction.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using the EC value of [ESR\\_EL2](#).EC == 0x0 :
  - Execution of an SRS instruction that uses R13\_mon.
  - Execution of an MRS (Banked register) or MSR (Banked register) instruction that would access [SPSR\\_mon](#), R13\_mon, or R14\_mon.

**Note**

If the Effective value of SCR\_EL3.EEL2 is 0, then these operations executed in Secure EL1 using AArch32 are trapped to EL3.

In a Secure only implementation that does not implement EL3 but implements EL2, behaves as if SCR\_EL3.EEL2 == 1.

This bit is permitted to be cached in a TLB.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### API, bit [17]

##### When FEAT\_SEL2 is implemented and FEAT\_PAuth is implemented:

Controls the use of the following instructions related to Pointer Authentication. Traps are reported using an ESR\_ELx.EC value of 0x09:

- PACGA, which is always enabled.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAB when:
  - In EL0, when [HCR\\_EL2.TGE](#) == 0 or [HCR\\_EL2.E2H](#) == 0, and the associated [SCTLR\\_EL1.En<N><M>](#) == 1.
  - In EL0, when [HCR\\_EL2.TGE](#) == 1 and [HCR\\_EL2.E2H](#) == 1, and the associated [SCTLR\\_EL2.En<N><M>](#) == 1.
  - In EL1, when the associated [SCTLR\\_EL1.En<N><M>](#) == 1.
  - In EL2, when the associated [SCTLR\\_EL2.En<N><M>](#) == 1.

API	Meaning
0b0	The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the <a href="#">HCR_EL2.API</a> bit.
0b1	This control does not cause any instructions to be trapped.

An instruction is trapped only if Pointer Authentication is enabled for that instruction, for more information, see 'System register control of pointer authentication'.

#### Note

If FEAT\_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

##### When FEAT\_SEL2 is not implemented and FEAT\_PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- PACGA.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZ, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAB when:
  - In Non-secure EL0, when [HCR\\_EL2.TGE](#) == 0 or [HCR\\_EL2.E2H](#) == 0, and the associated [SCTLR\\_EL1.En<N><M>](#) == 1.
  - In Non-secure EL0, when [HCR\\_EL2.TGE](#) == 1 and [HCR\\_EL2.E2H](#) == 1, and the associated [SCTLR\\_EL2.En<N><M>](#) == 1.
  - In Secure EL0, when the associated [SCTLR\\_EL2.En<N><M>](#) == 1.
  - In Secure or Non-secure EL1, when the associated [SCTLR\\_EL1.En<N><M>](#) == 1.
  - In EL2, when the associated [SCTLR\\_EL2.En<N><M>](#) == 1.

API	Meaning
0b0	The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the <a href="#">HCR_EL2.API</a> bit.
0b1	This control does not cause any instructions to be trapped.

**Note**

If FEAT\_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**APK, bit [16]****When FEAT\_PAuth is implemented:**

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers, using an ESR\_ELx.EC value of 0x18, from EL1 or EL2 to EL3 unless they are trapped to EL2 as a result of the HCR\_EL2.APK bit or other traps:

- [APIAKeyLo\\_EL1](#), [APIAKeyHi\\_EL1](#), [APIBKeyLo\\_EL1](#), [APIBKeyHi\\_EL1](#).
- [APDAKeyLo\\_EL1](#), [APDAKeyHi\\_EL1](#), [APDBKeyLo\\_EL1](#), [APDBKeyHi\\_EL1](#).
- [APGAKeyLo\\_EL1](#), and [APGAKeyHi\\_EL1](#).

APK	Meaning
0b0	Access to the registers holding "key" values for pointer authentication from EL1 or EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the <a href="#">HCR_EL2.APK</a> bit or other traps.
0b1	This control does not cause any instructions to be trapped.

For more information, see 'System register control of pointer authentication'.

**Note**

If FEAT\_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TERR, bit [15]****When FEAT\_RAS is implemented:**

Trap Error record accesses. Accesses to the RAS ERR\* and RAS ERX\* registers from EL1 and EL2 to EL3 are trapped as follows:

- Accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using an ESR\_ELx.EC value of 0x18:
  - [ERRIDR\\_EL1](#), [ERRSELR\\_EL1](#), [ERXADDR\\_EL1](#), [ERXCTLR\\_EL1](#), [ERXFR\\_EL1](#), [ERXMISC0\\_EL1](#), [ERXMISC1\\_EL1](#), and [ERXSTATUS\\_EL1](#).

- If FEAT\_RASv1p1 is implemented, accesses from EL1 and EL2 using AArch64 to [ERXMISC2\\_EL1](#), and [ERXMISC3\\_EL1](#), are trapped and reported using an ESR\_ELx.EC value of 0x18.
- Accesses from EL1 and EL2 using AArch32, to the following registers are trapped and reported using an ESR\_ELx.EC value of 0x03:
  - [ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#).
- If FEAT\_RASv1p1 is implemented, accesses from EL1 and EL2 using AArch32 to the following registers are trapped and reported using an ESR\_ELx.EC value of 0x03:
  - [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), and [ERXMISC7](#).

TERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### TLOR, bit [14]

When FEAT\_LOR is implemented:

Trap LOR registers. Traps accesses to the [LORSA\\_EL1](#), [LOREA\\_EL1](#), [LORN\\_EL1](#), [LORC\\_EL1](#), and [LORID\\_EL1](#) registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

TLOR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped <a href="#">HCR_EL2.TLOR</a> .

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### TWE, bit [13]

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from both Security states and both Execution states, reported using an ESR\_ELx.EC value of 0x01.

When FEAT\_WFxT is implemented, this trap also applies to the WFET instruction.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by <a href="#">SCTLR.nTWE</a> , <a href="#">HCR.TWE</a> , <a href="#">SCTLR_EL1.nTWE</a> , <a href="#">SCTLR_EL2.nTWE</a> , or <a href="#">HCR_EL2.TWE</a> .

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

### Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## TWI, bit [12]

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from both Security states and both Execution states, reported using an ESR\_ELx.EC value of 0x01.

When FEAT\_WFxT is implemented, this trap also applies to the WFIT instruction.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by <a href="#">SCTLR.nTWI</a> , <a href="#">HCR.TWI</a> , <a href="#">SCTLR_EL1.nTWI</a> , <a href="#">SCTLR_EL2.nTWI</a> , or <a href="#">HCR_EL2.TWI</a> .

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

### Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## ST, bit [11]

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only, reported using an ESR\_ELx.EC value of 0x18.

ST	Meaning
0b0	Secure EL1 using AArch64 accesses to the <a href="#">CNTPS_TVAL_EL1</a> , <a href="#">CNTPS_CTL_EL1</a> , and <a href="#">CNTPS_CVAL_EL1</a> are trapped to EL3 when Secure EL2 is disabled. If Secure EL2 is enabled, the behavior is as if the value of this field was 0b1.
0b1	This control does not cause any instructions to be trapped.

### Note

Accesses to the Counter-timer Physical Secure timer registers are always enabled at EL3. These registers are not accessible at EL0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**RW, bit [10]****When AArch32 is supported at any Exception level:**

Execution state control for lower Exception levels.

RW	Meaning
0b0	Lower levels are all AArch32.
0b1	The next lower level is AArch64. If EL2 is present: <ul style="list-style-type: none"> <li>EL2 is AArch64.</li> <li>EL2 controls EL1 and EL0 behaviors.</li> </ul> If EL2 is not present: <ul style="list-style-type: none"> <li>EL1 is AArch64.</li> <li>EL0 is determined by the Execution state described in the current process state when executing at EL0.</li> </ul>

If AArch32 state is not supported by the implementation at EL2 and AArch32 state is not supported by the implementation at EL1, then this bit is RAO/WI.

If AArch32 state is supported by the implementation at EL1, SCR\_EL3.NS == 1 and AArch32 state is not supported by the implementation at EL2, the Effective value of this bit is 1.

If AArch32 state is supported by the implementation at EL1, FEAT\_SEL2 is implemented and SCR\_EL3.{EEL2, NS} == {1, 0}, the Effective value of this bit is 1.

This bit is permitted to be cached in a TLB.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAO/WI.

**SIF, bit [9]****When FEAT\_SEL2 is implemented:**

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from memory marked in the first stage of translation as being Non-secure. The possible values for this bit are:

SIF	Meaning
0b0	Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are permitted.
0b1	Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are not permitted.

When FEAT\_PAN3 is implemented, it is IMPLEMENTATION DEFINED whether SCR\_EL3.SIF is also used to determine instruction access permission for the purpose of PAN.

This bit is permitted to be cached in a TLB.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory.

SIF	Meaning
0b0	Secure state instruction fetches from Non-secure memory are permitted.
0b1	Secure state instruction fetches from Non-secure memory are not permitted.

This bit is permitted to be cached in a TLB.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## HCE, bit [8]

Hypervisor Call instruction enable. Enables HVC instructions at EL3 and, if EL2 is enabled in the current Security state, at EL2 and EL1, in both Execution states, reported using an ESR\_ELx.EC value of 0x00.

HCE	Meaning
0b0	HVC instructions are UNDEFINED.
0b1	HVC instructions are enabled at EL3, EL2, and EL1.

### Note

HVC instructions are always UNDEFINED at EL0 and, if Secure EL2 is disabled, at Secure EL1. Any resulting exception is taken from the current Exception level to the current Exception level.

If EL2 is not implemented, this bit is RES0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## SMD, bit [7]

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from both Security states and both Execution states, reported using an ESR\_ELx.EC value of 0x00.

SMD	Meaning
0b0	SMC instructions are enabled at EL3, EL2 and EL1.
0b1	SMC instructions are UNDEFINED.

### Note

SMC instructions are always UNDEFINED at EL0. Any resulting exception is taken from the current Exception level to the current Exception level.

If [HCR\\_EL2.TSC](#) or [HCR.TSC](#) traps attempted EL1 execution of SMC instructions to EL2, that trap has priority over this disable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bit [6]

Reserved, RES0.

## Bits [5:4]

Reserved, RES1.

## EA, bit [3]

External Abort and SError interrupt routing.

EA	Meaning
0b0	When executing at Exception levels below EL3, External aborts and SError interrupts are not taken to EL3. In addition, when executing at EL3: <ul style="list-style-type: none"> <li>SErrors interrupts are not taken.</li> <li>External aborts are taken to EL3.</li> </ul>
0b1	When executing at any Exception level, External aborts and SError interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**FIQ, bit [2]**

Physical FIQ Routing.

FIQ	Meaning
0b0	When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3.
0b1	When executing at EL3, physical FIQ interrupts are not taken. When executing at any Exception level, physical FIQ interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**IRQ, bit [1]**

Physical IRQ Routing.

IRQ	Meaning
0b0	When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3.
0b1	When executing at EL3, physical IRQ interrupts are not taken. When executing at any Exception level, physical IRQ interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**NS, bit [0]**

Non-secure bit.

NS	Meaning
0b0	Indicates that EL0 and EL1 are in Secure state.
0b1	Indicates that Exception levels lower than EL3 are in Non-secure state, <b>and</b> so memory accesses from those Exception levels cannot access Secure memory.

When SCR\_EL3.{EEL2, NS} == {1, 0}, then EL2 is using AArch64 and in Secure state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Accessing the SCR\_EL3**

Accesses to this register use the following encodings:

MRS <Xt>, SCR\_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return SCR_EL3;

```

MSR SCR\_EL3, &lt;Xt&gt;

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SCR_EL3 = X[t];
```

# SCTLR\_EL1, System Control Register (EL1)

The SCTLR\_EL1 characteristics are:

## Purpose

Provides top level control of the system, including its memory system, at EL1 and EL0.

## Configuration

AArch64 System register SCTLR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [SCTLR\[31:0\]](#).

## Attributes

SCTLR\_EL1 is a 64-bit register.

## Field descriptions

The SCTLR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49
RES0						EPANTWEDEL	EnALSTWEDEn	EnAS0DSSBS	EnASRATA		RES0ATA0			TV
EnIA	EnIB	LSMAOE	nTL	SMD	EnDAUCI	EE	E0E	SPAN	EIS	IESBT	TSCXT	WXN	nTWE	RES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17

Bits [63:50]

Bits [63:58]

Reserved, RES0.

EPANTWEDEL, bitbits [5749:46]

When FEAT\_PAN3FEAT\_TWED is implemented:

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL1 data access to a page with stage 1 EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

TWE Delay. A 4-bit unsigned number that, when SCTLR\_EL1.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR\_EL1.nTWE as  $2^{(TWEDEL + 8)}$  cycles.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

EPAN	Meaning
0b0	No additional Permission faults are generated by this mechanism.
0b1	An EL1 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault. Any speculative data accesses that would generate a Permission fault if the accesses were not speculative will not cause an allocation into a cache.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

#### EnALSTWEDEn, bit [5645]

When FEAT\_LS64FEAT\_TWED is implemented:

When TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR\_EL1.nTWE. HCR\_EL2.{E2H, TGE} != {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 to EL1.

EnALSTWEDEn	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL1. The delay for taking a WFE trap is IMPLEMENTATION DEFINED.
0b1	This control delay does for not taking cause a anyWFE instruction trap to is beat trapped.least the number of cycles defined in SCTLR_EL1.TWEDEL.

AIn traps ofsystem anwhere LD64Bthe orPE ST64Bresets instructioninto isEL1, reportedthis usingfield anresets ESR\_ELx.ECto valuean ofarchitecturally 0x0AUNKNOWN, with an ISS code of 0x0000002.value.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

#### EnAS0DSSBS, bit [5544]

When FEAT\_LS64FEAT\_SSBS is implemented:

When HCR\_EL2.{E2H, TGE} != {1, 1}, traps execution of an ST64BV0 instruction at EL0 to EL1.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR\_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

#### EnASR, bit [54]

When FEAT\_LS64 is implemented:

When HCR\_EL2.{E2H, TGE} != {1, 1}, traps execution of an ST64BV instruction at EL0 to EL1.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR\_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [53:50]**

Reserved, RES0.

**TWEDEL, bits [49:46]****When FEAT\_TWED is implemented:**

TWE Delay. A 4-bit unsigned number that, when SCTLR\_EL1.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE\* caused by SCTLR\_EL1.nTWE as  $2^{(TWEDEL + 8)}$  cycles.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TWEDEn, bit [45]****When FEAT\_TWED is implemented:**

TWE Delay Enable. Enables a configurable delayed trap of the WFE\* instruction caused by SCTLR\_EL1.nTWE.

TWEDEn	Meaning
0b0	The delay for taking the trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking the trap is at least the number of cycles defined in SCTLR_EL1.TWEDEL.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DSSBS, bit [44]****When FEAT\_SSBS is implemented:**

Default PSTATE.SSBS value on Exception Entry. The defined values are:

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL1.
0b1	PSTATE.SSBS is set to 1 on an exception to EL1.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an IMPLEMENTATION DEFINED value.

**Otherwise:**

Reserved, RES0.

**ATA, bit [43]****When FEAT\_MTE2 is implemented:**

Allocation Tag Access in EL1. When [SCR\\_EL3.ATA=1](#) and [HCR\\_EL2.ATA=1](#), controls EL1 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

ATA	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	Access to Allocation Tags is not prevented.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### ATA0, bit [42]

When FEAT\_MTE2FEAT\_MTE is implemented:

Allocation Tag Access in EL0. When SCR\_EL3.ATA=1, HCR\_EL2.ATA=1, and HCR\_EL2.{E2H, TGE} != {1, 1}, controls EL0 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

ATA0	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	Access to Allocation Tags is not prevented.

This field is permitted to be cached in a TLB.

#### Note

Software may change this control bit on a context switch.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### TCF, bits [41:40]

When FEAT\_MTE2FEAT\_MTE is implemented:

Tag Check Fault in EL1. Controls the effect of Tag Check Faults due to Loads and Stores in EL1.

If FEAT\_MTE3 is not implemented, the value 0b11 is reserved.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value. 0b11 is reserved.

Otherwise:

Reserved, RES0.

### TCF0, bits [39:38]

When FEAT\_MTE2FEAT\_MTE is implemented:

Tag Check Fault in EL0. When HCR\_EL2.{E2H,TGE} != {1,1}, controls the effect of Tag Check Faults due to Loads and Stores in EL0.

TCF0	Meaning
0b00	Tag Check Faults have no effect on the PE.
0b01	Tag Check Faults cause a synchronous exception.
0b10	Tag Check Faults are asynchronously accumulated.

The value 0b11 is reserved.

If FEAT\_MTE3 is not implemented, the value 0b11 is reserved.

### Note

Software may change this control bit on a context switch.

In a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

TCF0	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### ITFSB, bit [37]

When **FEAT\_MTE2FEAT\_MTE** is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, **this which field are controls generated whether for on Loads exception and entry Stores into EL0 or EL1, all controls the auto-synchronization of Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into TFSRE0\_EL1 and TFSR\_EL1 registers.**

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL1.
0b1	Tag Check Faults are synchronized on entry to EL1.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### BT1, bit [36]

When **FEAT\_BT1** is implemented:

PAC Branch Type compatibility at EL1.

BT1	Meaning
0b0	When the PE is executing at EL1, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL1, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### BT0, bit [35]

When **FEAT\_BT1** is implemented:

PAC Branch Type compatibility at EL0.

BT0	Meaning
0b0	When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

When **HCR\_EL2.E2H == 1 && HCR\_EL2.TGE == 1**, the value of the SCTLR\_EL1.BT0 has no effect on execution at EL0

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### Bits [34:32]

Reserved, RES0.

### EnIA, bit [31]

**When FEAT\_PAuth is implemented:**

Controls enabling of pointer authentication (using the APIAKey\_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnIA	Meaning
0b0	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

**Note**

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EnIB, bit [30]****When FEAT\_PAuth is implemented:**

Controls enabling of pointer authentication (using the APIBKey\_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnIB	Meaning
0b0	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

**Note**

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**LSMAOE, bit [29]****When FEAT\_LSMAOC is implemented:**

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES1.

### nTLSMD, bit [28]

#### When FEAT\_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES1.

### EnDA, bit [27]

#### When FEAT\_PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey\_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnDA	Meaning
0b0	Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

#### Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a

pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### UCI, bit [26]

Traps EL0 execution of cache maintenance instructions, to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2.TGE](#) is 1, from AArch64 state only, reported using an [ESR\\_ELx.EC](#) value of 0x18.

This applies to [DC CVAU](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#), and [IC IVAU](#).

If FEAT\_DPB2 is implemented, this trap also applies to [DC CVADP](#).

If [FEAT\\_MTE2](#) is implemented, this trap also applies to [DC CIGVAC](#), [DC CIGDVAC](#), [DC CGVAC](#), [DC CGDVAC](#), [DC CGVAP](#), and [DC CGDVAP](#).

If FEAT\_DPB2 and [FEAT\\_MTE2](#) are implemented, this trap also applies to [DC CGVADP](#) and [DC CGDVADP](#).

UCI	Meaning
0b0	Execution of the specified instructions at EL0 using AArch64 is trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

#### EE, bit [25]

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

The possible values of this bit are:

EE	Meaning
0b0	Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.
0b1	Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an IMPLEMENTATION DEFINED value.

## E0E, bit [24]

Endianness of data accesses at EL0.

The possible values of this bit are:

E0E	Meaning
0b0	Explicit data accesses at EL0 are little-endian.
0b1	Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR\_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR\_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

When FEAT\_VHE is implemented, and the value of HCR\_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

## SPAN, bit [23]

When FEAT\_PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 on taking an exception to EL1.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

When FEAT\_VHE is implemented, and the value of HCR\_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

## EIS, bit [22]

When FEAT\_ExS is implemented:

Exception Entry is Context Synchronizing. The defined values are:

EIS	Meaning
0b0	The taking of an exception to EL1 is not a context synchronizing event.
0b1	The taking of an exception to EL1 is a context synchronizing event.

When FEAT\_VHE is implemented, and the value of HCR\_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

If SCTLR\_EL1.EIS is set to 0b0:

- Indirect writes to ESR\_EL1, FAR\_EL1, SPSR\_EL1, ELR\_EL1 are synchronized on exception entry to EL1, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.

- DCPS\* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR\_EL1.EIS:

- Changes to the PSTATE information on entry to EL1.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

## IESB, bit [21]

When FEAT\_IESB is implemented:

Implicit Error Synchronization event enable. Possible values are:

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: <ul style="list-style-type: none"> <li>• At each exception taken to EL1.</li> <li>• Before the operational pseudocode of each ERET instruction executed at EL1.</li> </ul>

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL1 and before each DRPS instruction executed at EL1, in addition to the other cases where it is added.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

## TSCXT, bit [20]

When FEAT\_CSV2 is implemented:

Trap EL0 Access to the [SCXTNUM\\_EL0](#) register, when EL0 is using AArch64. The defined values are:

TSCXT	Meaning
0b0	EL0 access to <a href="#">SCXTNUM_EL0</a> is not disabled by this mechanism.
0b1	EL0 access to <a href="#">SCXTNUM_EL0</a> is disabled, causing an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and <a href="#">HCR_EL2</a> .TGE is 1. The value of <a href="#">SCXTNUM_EL0</a> is treated as 0.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL1&0 translation regime is forced to XN for accesses from software executing at EL1 or EL0.

This bit applies only when SCTLR\_EL1.M bit is set.

The WXN bit is permitted to be cached in a TLB.

When FEAT\_VHE is implemented, and the value of HCR\_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**nTWE, bit [18]**

Traps EL0 execution of WFE instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR\_EL2.TGE is 1, from both Execution states, reported using an ESR\_ELx.EC value of 0x01.

When FEAT\_WFxT is implemented, this trap also applies to the WFET instruction.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT\_VHE is implemented, and the value of HCR\_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Bit [17]**

Reserved, RES0.

**nTWI, bit [16]**

Traps EL0 execution of WFI instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR\_EL2.TGE is 1, from both Execution states, reported using an ESR\_ELx.EC value of 0x01.

When FEAT\_WFxT is implemented, this trap also applies to the WFIT instruction.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

### Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in [In](#) a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

### UCT, bit [15]

Traps EL0 accesses to the [CTR\\_EL0](#) to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2](#).TGE is 1, from AArch64 state only, reported using an ESR\_ELx.EC value of 0x18.

UCT	Meaning
0b0	Accesses to the <a href="#">CTR_EL0</a> from EL0 using AArch64 are trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in [In](#) a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

### DZE, bit [14]

Traps EL0 execution of [DC ZVA](#) instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2](#).TGE is 1, from AArch64 state only, reported using an ESR\_ELx.EC value of 0x18.

If [FEAT\\_MTE2](#)~~FEAT\_MTE~~ is implemented, this trap also applies to [DC GVA](#) and [DC GZVA](#).

DZE	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped. Reading <a href="#">DCZID_EL0</a> .DZP from EL0 returns 1, indicating that the instructions this trap applies to are not supported.
0b1	This control does not cause any instructions to be trapped.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in [In](#) a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

### EnDB, bit [13]

When FEAT\_PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey\_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnDB	Meaning
0b0	Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

### Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### I, bit [12]

Stage 1 instruction access Cacheability control, for accesses at EL0 and EL1:

I	Meaning
0b0	All instruction access to Stage 1 Normal memory from EL0 and EL1 are Stage 1 Non-cacheable. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Stage 1 Cacheability of instruction access to Stage 1 Normal memory from EL0 and EL1. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

When the value of the HCR\_EL2.DC bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the SCTLR\_EL1.I bit.

When FEAT\_VHE is implemented, and the value of HCR\_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

#### EOS, bit [11]

##### When FEAT\_ExS is implemented:

Exception Exit is Context Synchronizing. The defined values are:

EOS	Meaning
0b0	An exception return from EL1 is not a context synchronizing event
0b1	An exception return from EL1 is a context synchronizing event

When FEAT\_VHE is implemented, and the value of HCR\_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

If SCTLR\_EL1.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS\* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR\_EL1.EOS:

- The indirect write of the PSTATE and PC values from SPSR\_EL1 and ELR\_EL1 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**EnRCTX, bit [10]****When FEAT\_SPECRES is implemented:**

Enable EL0 Access to the following instructions:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

The defined values are:

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL1, or to EL2 when it is implemented and enabled for the current Security state and <a href="#">HCR_EL2.TGE</a> is 1.
0b1	EL0 access to these instructions is enabled.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**UMA, bit [9]**

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.{D, A, I, F} masks to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2.TGE](#) is 1, from AArch64 state only, reported using an ESR\_ELx.EC value of 0x18.

UMA	Meaning
0b0	Any attempt at EL0 using AArch64 to execute an MRS, MSR(REGISTER), or MSR(IMMEDIATE) instruction that accesses the DAIF is trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

**SED, bit [8]****When EL0 is capable of using AArch32:**

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

SED	Meaning
0b0	SETEND instruction execution is enabled at EL0 using AArch32.
0b1	SETEND instructions are UNDEFINED at EL0 using AArch32 and any attempt at EL0 to access a SETEND instruction generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and <a href="#">HCR_EL2.TGE</a> is 1, reported using an ESR_ELx.EC value of 0x00.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

## ITD, bit [7]

When EL0 is capable of using AArch32:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL0 using AArch32.
0b1	Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED and generates an exception, reported using an ESR_ELx.EC value of 0x00, to EL1 or to EL2 when it is implemented and enabled for the current Security state and <a href="#">HCR_EL2</a> .TGE is 1: <ul style="list-style-type: none"> <li>All encodings of the IT instruction with hw1[3:0] != 1000.</li> <li>All encodings of the subsequent instruction with the following values for hw1: <ul style="list-style-type: none"> <li>0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.</li> <li>0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5.</li> <li>0b10100xxxxxxxxxxx: ADD Rd, PC, #imm</li> <li>0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm]</li> <li>0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.</li> <li>0b010001xx1xxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.</li> </ul> </li> </ul> <p>These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.</p> <p>It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:</p> <ul style="list-style-type: none"> <li>A 16-bit instruction, that can only be followed by another 16-bit instruction.</li> <li>The first half of a 32-bit instruction.</li> </ul> <p>This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.</p>

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the SCTLR\_EL1. If it is not implemented then this bit is RAZ/WI.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

**nAA, bit [6]**

When FEAT\_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions.

nAA	Meaning
0b0	LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1	This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**CP15BEN, bit [5]**

When EL0 is capable of using AArch32:

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

CP15BEN	Meaning
0b0	EL0 using AArch32: EL0 execution of the <a href="#">CP15DMB</a> , <a href="#">CP15DSB</a> , and <a href="#">CP15ISB</a> instructions is UNDEFINED and generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and <a href="#">HCR_EL2</a> .TGE is 1. The exception is reported using an ESR_ELx.EC value of 0x00.
0b1	EL0 using AArch32: EL0 execution of the <a href="#">CP15DMB</a> , <a href="#">CP15DSB</a> , and <a href="#">CP15ISB</a> instructions is enabled.

CP15BEN is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the SCTLR\_EL1. If it is not implemented then this bit is RAO/WI.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**SA0, bit [4]**

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

### SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

When FEAT\_VHE is implemented, and the value of HCR\_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

### C, bit [2]

Stage 1 Cacheability control, for data accesses.

C	Meaning
0b0	All data access to Stage 1 Normal memory from EL0 and EL1, and all Normal memory accesses from unified cache to the EL1&0 Stage 1 translation tables, are treated as Stage 1 Non-cacheable.
0b1	This control has no effect on the Stage 1 Cacheability of: <ul style="list-style-type: none"> <li>Data access to Normal memory from EL0 and EL1.</li> <li>Normal memory accesses to the EL1&amp;0 Stage 1 translation tables.</li> </ul>

When the value of the HCR\_EL2.DC bit is 1, the PE ignores SCTLR.C. This means that Non-secure EL0 and Non-secure EL1 data accesses to Normal memory are Cacheable.

When FEAT\_VHE is implemented, and the value of HCR\_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

### A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0 .

A	Meaning
0b0	Alignment fault checking disabled when executing at EL1 or EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at EL1 or EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When FEAT\_VHE is implemented, and the value of HCR\_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

### M, bit [0]

MMU enable for EL1&0 stage 1 address translation.

M	Meaning
0b0	EL1&0 stage 1 address translation disabled. See the SCTLR_EL1.I field for the behavior of instruction accesses to Normal memory.
0b1	EL1&0 stage 1 address translation enabled.

If the value of [HCR\\_EL2](#).{DC, TGE} is not {0, 0} then in Non-secure state the PE behaves as if the value of the SCTLR\_EL1.M field is 0 for all purposes other than returning the value of a direct read of the field.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

## Accessing the SCTLR\_EL1

When [HCR\\_EL2](#).E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SCTLR\_EL1 or SCTLR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, SCTLR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

# SCTLR\_EL2, System Control Register (EL2)

The SCTLR\_EL2 characteristics are:

## Purpose

Provides top level control of the system, including its memory system, at EL2.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, these controls apply also to execution at EL0.

## Configuration

AArch64 System register SCTLR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HSCTLR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

SCTLR\_EL2 is a 64-bit register.

## Field descriptions

The SCTLR\_EL2 bit assignments are:

### When HCR\_EL2.E2H != 1 or HCR\_EL2.TGE != 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37
RES0																			DSSBS	ATA	RES0	TCF	RES0	ITF		
EnIA	EnIB	RES1	EnDA	RES0	EE	RES0	RES1	EIS	IESB	RES0	WXN	RES1	RES0	RES1	RES0	EnDB	I	EOS	RES0	nAA	RI					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5

This format applies in all Armv8.0 implementations, and from Armv8.1 when the Effective value of [HCR\\_EL2](#).{E2H, TGE} != {1, 1}.

### Bits [63:45]

Reserved, RES0.

### DSSBS, bit [44]

When FEAT\_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL2.
0b1	PSTATE.SSBS is set to 1 on an exception to EL2.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

**Otherwise:**

Reserved, RES0.

**ATA, bit [43]**

When **FEAT\_MTE2** is implemented:

Allocation Tag Access in EL2. When **SCR\_EL3.ATA** is 1, controls EL2 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

ATA	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	Access to Allocation Tags is not prevented.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [42]**

Reserved, RES0.

**TCF, bits [41:40]**

When **FEAT\_MTE2** is implemented:

Tag Check Fault. Controls the effect of Tag Check Faults due to Loads and Stores in EL2.

If **FEAT\_MTE3** is not implemented, the value 0b11 is reserved.

TCF	Meaning
0b00	Tag Check Faults have no effect on the PE.
0b01	Tag Check Faults cause a synchronous exception.
0b10	Tag Check Faults are asynchronously accumulated.
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value. 0b11 value is reserved.

**Otherwise:**

Reserved, RES0.

**Bits [39:38]**

Reserved, RES0.

**ITFSB, bit [37]**

When **FEAT\_MTE** is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether for on Loads exception and entry Stores into EL2, all EL1 Tag Check Faults are controls due to auto-synchronization instructions executed before Check exception entry, that are reported asynchronously, are synchronized into TFSRE0\_EL1, TFSR\_EL1, and TFSR\_EL2 registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL2.
0b1	Tag Check Faults are synchronized on entry to EL2.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**BT, bit [36]**

When **FEAT\_BT** is implemented:

PAC Branch Type compatibility at EL2.

BT	Meaning
0b0	When the PE is executing at EL2, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL2, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [35:32]**

Reserved, RES0.

**EnIA, bit [31]**

When **FEAT\_PAuth** is implemented:

Controls enabling of pointer authentication (using the APIAKey\_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnIA	Meaning
0b0	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

**Note**

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### EnIB, bit [30]

##### When FEAT\_PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey\_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnIB	Meaning
0b0	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

#### Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bits [29:28]

Reserved, RES1.

#### EnDA, bit [27]

##### When FEAT\_PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey\_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnDA	Meaning
0b0	Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

#### Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bit [26]

Reserved, RES0.

#### EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are little-endian.
0b1	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

#### Bit [24]

Reserved, RES0.

#### Bit [23]

Reserved, RES1.

#### EIS, bit [22]

##### When FEAT\_ExS is implemented:

Exception entry is a context synchronization event. The defined values are:

EIS	Meaning
0b0	The taking of an exception to EL2 is not a context synchronization event.
0b1	The taking of an exception to EL2 is a context synchronization event.

If SCTLR\_EL2.EIS is set to 0b0:

- Indirect writes to [ESR\\_EL2](#), [FAR\\_EL2](#), [SPSR\\_EL2](#), [ELR\\_EL2](#), and [HPFAR\\_EL2](#) are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS\* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR\_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES1.

### IESB, bit [21]

#### When FEAT\_IESB is implemented:

Implicit Error Synchronization event enable.

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: <ul style="list-style-type: none"> <li>• At each exception taken to EL2.</li> <li>• Before the operational pseudocode of each ERET instruction executed at EL2.</li> </ul>

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### Bit [20]

Reserved, RES0.

### WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as ~~XN.XN~~.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2.

This bit applies only when SCTLR\_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Bit [18]**

Reserved, RES1.

**Bit [17]**

Reserved, RES0.

**Bit [16]**

Reserved, RES1.

**Bits [15:14]**

Reserved, RES0.

**EnDB, bit [13]**

**When FEAT\_PAuth is implemented:**

Controls enabling of pointer authentication (using the APDBKey\_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnDB	Meaning
0b0	Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

**Note**

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**I, bit [12]**

Instruction access Cacheability control, for accesses at EL2:

I	Meaning
0b0	All instruction accesses to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL2. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0 or EL3 translation regimes.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

## EOS, bit [11]

When FEAT\_ExS is implemented:

Exception exit is a context synchronization ~~event~~.Event.

EOS	Meaning
0b0	An exception return from EL2 is not a context synchronization event.
0b1	An exception return from EL2 is a context synchronization event.

If SCTLR\_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS\* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR\_EL2.EOS:

- The indirect write of the PSTATE and PC values from [SPSR\\_EL2](#) and [ELR\\_EL2](#) on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

## Bits [10:7]

Reserved, RES0.

## nAA, bit [6]

When FEAT\_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL2 under certain conditions.

nAA	Meaning
0b0	LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1	This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [5:4]**

Reserved, RES1.

**SA, bit [3]**

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then **aan** SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**C, bit [2]**

Cacheability control, for data accesses.

C	Meaning
0b0	All data accesses to Normal memory from EL2, and all Normal memory accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	This control has no effect on the Cacheability of: <ul style="list-style-type: none"> <li>Data access to Normal memory from EL2.</li> <li>Normal memory accesses to the EL2 translation tables.</li> </ul>

This bit has no effect on the EL1&0 or EL3 translation regimes.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.

**A, bit [1]**

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

A	Meaning
0b0	Alignment fault checking disabled when executing at EL2. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at EL2. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**M, bit [0]**

MMU enable for EL2 stage 1 address translation.

M	Meaning
0b0	EL2 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.
0b1	EL2 stage 1 address translation enabled.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.

When HCR\_EL2.E2H == 1 and HCR\_EL2.TGE == 1:

This format applies only from Armv8.1 when EL2 is enabled in the current Security state and HCR\_EL2.{E2H, TGE} == {1, 1}.

Bits [63:5850]

Reserved, RES0.

EPANTWEDEL, bitbits [5749:46]

When FEAT\_PAN3FEAT\_TWED is implemented:

EnhancedTWE PrivilegedDelay, AccessA Never, 4-bit Whenunsigned PSTATE.PANnumber that, when SCTLR\_EL2.TWEDEn is 1, determinesencodes whetherthe anminimum EL2delay datain accesstaking to a pagetrap withof EL0WFE instructioncaused accessby permissionSCTLR\_EL2.nTWE generates a Permission fault as a2^(TWEDEn result+ of8) the Privileged Access Never mechanism.cycles.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

EPAN	Meaning
0b0	No additional Permission faults are generated by this mechanism.
0b1	An EL1 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault. Any speculative data accesses that would generate a Permission fault if the accesses were not speculative will not cause an allocation into a cache.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALSTWEDEn, bit [5645]

When FEAT\_LS64FEAT\_TWED is implemented:

Traps execution of an LD64B or ST64B instruction at EL0 to EL2.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR\_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**EnAS0, bit [55]****When FEAT\_LS64 is implemented:**

Traps execution of an ST64BV0 instruction at EL0 to EL2.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR\_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EnASR, bit [54]****When FEAT\_LS64 is implemented:**

Traps execution of an ST64BV instruction at EL0 to EL2.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR\_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [53:50]**

Reserved, RES0.

**TWEDEL, bits [49:46]****When FEAT\_TWED is implemented:**

TWE Delay. A 4-bit unsigned number that, when SCTLR\_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR\_EL2.nTWE as  $2^{(TWEDEL + 8)}$  cycles.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TWEDEn, bit [45]****When FEAT\_TWED is implemented:**

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR\_EL2.nTWE.

TWEDEn	Meaning
0b0	The delay for taking a WFE trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking a WFE trap is at least the number of cycles defined in SCTLR_EL2.TWEDEL.

On a Warm reset, inIn a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### DSSBS, bit [44]

When FEAT\_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL2.
0b1	PSTATE.SSBS is set to 1 on an exception to EL2.

On a Warm reset, inIn a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

#### Otherwise:

Reserved, RES0.

#### ATA, bit [43]

When FEAT\_MTE2FEAT\_MTE is implemented:

Allocation Tag Access in EL2. When SCR\_EL3.ATA=1, controls EL2 access to Allocation Tags. SCR\_EL3.ATA is 1, controls EL2 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

ATA	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	Access to Allocation Tags is not prevented.

This bit is permitted to be cached in a TLB.

On a Warm reset, inIn a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### ATA0, bit [42]

When FEAT\_MTE2FEAT\_MTE is implemented:

Allocation Tag Access in EL0. When SCR\_EL3.ATA is =1, controls EL0 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

ATA0	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	Access to Allocation Tags is not prevented.

This field is permitted to be cached in a TLB.

#### Note

Software may change this control bit on a context switch.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### TCF, bits [41:40]

When FEAT\_MTE2FEAT\_MTE is implemented:

Tag Check Fault in EL2. Controls the effect of Tag Check Faults due to Loads and Stores in EL2.

If FEAT\_MTE3 is not implemented, the value 0b11 is reserved.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value. 0b11 value is reserved.

#### Otherwise:

Reserved, RES0.

#### TCF0, bits [39:38]

When FEAT\_MTE2FEAT\_MTE is implemented:

Tag Check Fault in EL0. Controls the effect of Tag Check Faults due to Loads and Stores in EL0.

TCF0	Meaning
0b00	Tag Check Faults have no effect on the PE.
0b01	Tag Check Faults cause a synchronous exception.
0b10	Tag Check Faults are asynchronously accumulated.

The value 0b11 is reserved.

If FEAT\_MTE3 is not implemented, the value 0b11 is reserved.

#### Note

Software may change this control bit on a context switch.

In a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

TCF0	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### ITFSB, bit [37]

When FEAT\_MTE2FEAT\_MTE is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether for on Loads exception and entry Stores into EL2, all EL1 Tag Check Faults are reported asynchronously, are synchronized into TFSRE0\_EL1, TFSR\_EL1 and TFSR\_EL2 registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL2.
0b1	Tag Check Faults are synchronized on entry to EL2.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### BT1, bit [36]

When FEAT\_BT1 is implemented:

PAC Branch Type compatibility at EL2.

BT1	Meaning
0b0	When the PE is executing at EL2, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL2, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**BT0, bit [35]**

**When FEAT\_BT1 is implemented:**

PAC Branch Type compatibility at EL0.

BT0	Meaning
0b0	When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [34:32]**

Reserved, RES0.

**EnIA, bit [31]**

**When FEAT\_PAuth is implemented:**

Controls enabling of pointer authentication (using the APIAKey\_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnIA	Meaning
0b0	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

**Note**

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EnIB, bit [30]****When FEAT\_PAAuth is implemented:**

Controls enabling of pointer authentication (using the APIBKey\_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnIB	Meaning
0b0	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

**Note**

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**LSMAOE, bit [29]****When FEAT\_LSMAOC is implemented:**

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**nTLSMD, bit [28]****When FEAT\_LSMAOC is implemented:**

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES1.

#### EnDA, bit [27]

##### When FEAT\_PAAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey\_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnDA	Meaning
0b0	Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

#### Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### UCI, bit [26]

Traps execution of cache maintenance instructions at EL0 to EL2, from AArch64 state only. This applies to [DC CVAU](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#), and [IC IVAU](#).

If FEAT\_DPB2 is implemented, this trap also applies to [DC CVADP](#).

If FEAT\_MTE2FEAT\_MTE is implemented, this trap also applies to [DC CIGVAC](#), [DC CIGDVAC](#), [DC CGVAC](#), [DC CGDVAC](#), [DC CGVAP](#), and [DC CGDVAP](#).

If FEAT\_DPB2 and FEAT\_MTE2FEAT\_MTE are implemented, this trap also applies to [DC CGVADP](#) and [DC CGDVADP](#).

UCI	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

On a Warm reset, inIn a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

### EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime.

The possible values of this bit are:

EE	Meaning
0b0	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime are little-endian.
0b1	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL2&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

On a Warm reset, inIn a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

### E0E, bit [24]

Endianness of data accesses at EL0.

E0E	Meaning
0b0	Explicit data accesses at EL0 are little-endian.
0b1	Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0 then this bit is RES0. This option is not permitted when SCTLR\_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0 then this bit is RES1. This option is not permitted when SCTLR\_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

On a Warm reset, inIn a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

### SPAN, bit [23]

Set Privileged Access Never, on taking an exception to EL2.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 on taking an exception to EL2.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL2.

On a Warm reset, inIn a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

### EIS, bit [22]

**When FEAT\_ExS is implemented:**

Exception **entry** is a context synchronization event.

EIS	Meaning
0b0	The taking of an exception to EL2 is not a context synchronization event.
0b1	The taking of an exception to EL2 is a context synchronization event.

If SCTLR\_EL2.EIS is set to 0b0:

- Indirect writes to [ESR\\_EL2](#), [FAR\\_EL2](#), [SPSR\\_EL2](#), [ELR\\_EL2](#), and [HFPAR\\_EL2](#) are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS\* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR\_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**IESB, bit [21]****When FEAT\_IESB is implemented:**

Implicit Error Synchronization event **enable**.

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: <ul style="list-style-type: none"> <li>• <b>At</b> each exception taken to EL2.</li> <li>• Before the operational pseudocode of each ERET instruction executed at EL2.</li> </ul>

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TSCXT, bit [20]****When FEAT\_CSV2 is implemented:**

Trap EL0 Access to the SCXTNUM\_EL0 register, when EL0 is using AArch64.

TSCXT	Meaning
0b0	EL0 access to <a href="#">SCXTNUM_EL0</a> is not disabled by this mechanism.
0b1	EL0 access to <a href="#">SCXTNUM_EL0</a> is disabled, causing an exception to EL2, and the <a href="#">SCXTNUM_EL0</a> value is treated at 0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES1.

#### WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. ~~The possible values of this bit are:~~

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2.

This bit applies only when SCTLR\_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### nTWE, bit [18]

Traps execution of WFE instructions at EL0 to EL2, from both Execution states.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

#### Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Bit [17]

Reserved, RES0.

#### nTWI, bit [16]

Traps execution of WFI instructions at EL0 to EL2, from both Execution states.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

#### Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### UCT, bit [15]

Traps EL0 accesses to the [CTR\\_EL0](#) to EL2, from AArch64 state only.

UCT	Meaning
0b0	Accesses to the <a href="#">CTR_EL0</a> from EL0 using AArch64 are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### DZE, bit [14]

Traps execution of [DC ZVA](#) instructions at EL0 to EL2, from AArch64 state only.

If **FEAT\_MTE2** **FEAT\_MTE** is implemented, this trap also applies to [DC GVA](#) and [DC GZVA](#).

DZE	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. Reading <a href="#">DCZID_EL0.DZP</a> from EL0 returns 1, indicating that the instructions that this trap applies to are not supported.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### EnDB, bit [13]

When **FEAT\_PAuth** is implemented:

Controls enabling of pointer authentication (using the APDBKey\_EL1 key) of instruction addresses in the EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnDB	Meaning
0b0	Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

#### Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB

returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### I, bit [12]

Instruction access Cacheability control, for accesses at EL2 and EL0:

I	Meaning
0b0	All instruction access to Normal memory from EL2 and EL0 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and EL0. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL3 translation regimes.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### EOS, bit [11]

##### When FEAT\_ExS is implemented:

Exception exit is a context synchronization event.

EOS	Meaning
0b0	An exception return from EL2 is not a context synchronization event.
0b1	An exception return from EL2 is a context synchronization event.

If SCTLR\_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS\* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR\_EL2.EOS:

- The indirect write of the PSTATE and PC values from [SPSR\\_EL2](#) and [ELR\\_EL2](#) on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES1.

#### EnRCTX, bit [10]

**When FEAT\_SPECRES is implemented:**

Enable EL0 Access to the following instructions:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

The defined values are:

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL1.
0b1	EL0 access to these instructions is enabled.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [9]**

Reserved, RES0.

**SED, bit [8]****When EL0 is capable of using AArch32:**

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

SED	Meaning
0b0	SETEND instruction execution is enabled at EL0 using AArch32.
0b1	SETEND instructions are UNDEFINED at EL0 using AArch32.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**ITD, bit [7]****When EL0 is capable of using AArch32:**

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL0 using AArch32.
0b1	Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED: <ul style="list-style-type: none"> <li>All encodings of the IT instruction with hw1[3:0]≠1000.</li> <li>All encodings of the subsequent instruction with the following values for hw1: <ul style="list-style-type: none"> <li>0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.</li> <li>0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5.</li> <li>0b10100xxxxxxxxxxx: ADD Rd, PC, #imm</li> <li>0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm]</li> <li>0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.</li> <li>0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.</li> </ul> </li> </ul> <p>These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.</p> <p>It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:</p> <ul style="list-style-type: none"> <li>A 16-bit instruction, that can only be followed by another 16-bit instruction.</li> <li>The first half of a 32-bit instruction.</li> </ul> <p>This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.</p>

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the SCTLR\_EL1. If it is not implemented then this bit is RAZ/WI.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES1.

#### nAA, bit [6]

##### When FEAT\_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL2 and EL0 under certain conditions.

nAA	Meaning
0b0	LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1	This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**CP15BEN, bit [5]****When EL0 is capable of using AArch32:**

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

CP15BEN	Meaning
0b0	EL0 using AArch32: EL0 execution of the <a href="#">CP15DMB</a> , <a href="#">CP15DSB</a> , and <a href="#">CP15ISB</a> instructions is UNDEFINED.
0b1	EL0 using AArch32: EL0 execution of the <a href="#">CP15DMB</a> , <a href="#">CP15DSB</a> , and <a href="#">CP15ISB</a> instructions is enabled.

CP15BEN is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the SCTLR\_EL1. If it is not implemented then this bit is RAO/WI.

On a Warm reset, inIn a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SA0, bit [4]**

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

On a Warm reset, inIn a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**SA, bit [3]**

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

On a Warm reset, inIn a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**C, bit [2]**

Cacheability control, for data accesses.

C	Meaning
0b0	All data access to Normal memory from EL2 and EL0, and all Normal memory accesses to the EL2&0 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	This control has no effect on the Cacheability of: <ul style="list-style-type: none"> <li>Data access to Normal memory from EL2 and EL0.</li> <li>Normal memory accesses to the EL2&amp;0 translation tables.</li> </ul>

This bit has no effect on the EL3 translation regimes.

On a Warm reset, inIn a system where the PE resets into EL2, this field resets to 0.

**A, bit [1]**

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and EL0.

A	Meaning
0b0	Alignment fault checking disabled when executing at EL2 and EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at EL2 and EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

## M, bit [0]

MMU enable for EL2&0 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL2&0 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.
0b1	EL2&0 stage 1 address translation enabled.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

## Accessing the SCTLR\_EL2

When HCR\_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCTLR\_EL2 or SCTLR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, SCTLR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return SCTLR_EL2;
elsif PSTATE.EL == EL3 then
    return SCTLR_EL2;

```

MSR SCTLR\_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    SCTLR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    SCTLR_EL2 = X[t];

```

MRS <Xt>, SCTLR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.SCTLR_EL1 == '1'
then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        return NVMem[0x110];
    else
        return SCTLR_EL1;
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        return SCTLR_EL2;
    else
        return SCTLR_EL1;
elsif PSTATE.EL == EL3 then
    return SCTLR_EL1;

```

# SCTLR\_EL3, System Control Register (EL3)

The SCTLR\_EL3 characteristics are:

## Purpose

Provides top level control of the system, including its memory system, at EL3.

## Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCTLR\_EL3 are UNDEFINED.

## Attributes

SCTLR\_EL3 is a 64-bit register.

## Field descriptions

The SCTLR\_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37

### Bits [63:45]

Reserved, RES0.

### DSSBS, bit [44]

When FEAT\_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL3.
0b1	PSTATE.SSBS is set to 1 on an exception to EL3.

On a Warm reset, inIn a system where the PE resets into EL3, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

### ATA, bit [43]

When FEAT\_MTE2FEAT\_MTE is implemented:

Allocation Tag Access in EL3. Controls EL3 access to Allocation Tags.

When access to Allocation Tags is prevented:

- Instructions which Load or Store data are Unchecked.

- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.

ATA	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	Access to Allocation Tags is not prevented.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bit [42]

Reserved, RES0.

#### TCF, bits [41:40]

When FEAT\_MTE2FEAT\_MTE is implemented:

Tag Check Fault in EL3. Controls the effect of Tag Check Faults due to Loads and Stores in EL3.

If FEAT\_MTE3 is not implemented, the value 0b11 is reserved.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

OnThe a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally value UNKNOWN0b11 value.is reserved.

#### Otherwise:

Reserved, RES0.

#### Bits [39:38]

Reserved, RES0.

#### ITFSB, bit [37]

When FEAT\_MTE2FEAT\_MTE is implemented:

When synchronousasynchronous exceptions are not being generated by Tag Check Faults, thiswhich fieldare controlsgenerated whetherfor onLoads exceptionand entryStores intoat EL3,any all Tag Check Faults due to

instructions executed before exception entry level, that controls are the reported auto-synchronisation asynchronously, of are Tag synchronized Check Faults into TFSRE0\_EL1 and TFSR\_ELx registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL3.
0b1	Tag Check Faults are synchronized on entry to EL3.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### BT, bit [36]

When FEAT\_BT is implemented:

PAC Branch Type compatibility at EL3.

BT	Meaning
0b0	When the PE is executing at EL3, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL3, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### Bits [35:32]

Reserved, RES0.

### EnIA, bit [31]

When FEAT\_PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey\_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

EnIA	Meaning
0b0	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

For more information, see 'System register control of pointer authentication'.

### Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EnIB, bit [30]****When FEAT\_PAuth is implemented:**

Controls enabling of pointer authentication (using the APIBKey\_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

EnIB	Meaning
0b0	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

For more information, see 'System register control of pointer authentication'.

**Note**

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [29:28]**

Reserved, RES1.

**EnDA, bit [27]****When FEAT\_PAuth is implemented:**

Controls enabling of pointer authentication (using the APDAKey\_EL1 key) of instruction addresses in the EL3 translation regime.

EnDA	Meaning
0b0	Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

For more information, see 'System register control of pointer authentication'.

**Note**

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bit [26]

Reserved, RES0.

#### EE, bit [25]

Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian.
0b1	Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an IMPLEMENTATION DEFINED value.

#### Bit [24]

Reserved, RES0.

#### Bit [23]

Reserved, RES1.

#### EIS, bit [22]

##### When FEAT\_ExS is implemented:

Exception Entry is Context Synchronizing.

EIS	Meaning
0b0	The taking of an exception to EL3 is not a context synchronizing event.
0b1	The taking of an exception to EL3 is a context synchronizing event.

If SCTLR\_EL3.EIS is set to 0b0:

- Indirect writes to [ESR\\_EL3](#), [FAR\\_EL3](#), [SPSR\\_EL3](#), [ELR\\_EL3](#) are synchronized on exception entry to EL3, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS\* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR\_EL3.EIS:

- Changes to the PSTATE information on entry to EL3.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Debug state exit.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**IESB, bit [21]**

**When FEAT\_IESB is implemented:**

Implicit Error Synchronization event enable.

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: <ul style="list-style-type: none"> <li>At each exception taken to EL3.</li> <li>Before the operational pseudocode of each ERET instruction executed at EL3.</li> </ul>

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL3 and before each DRPS instruction executed at EL3, in addition to the other cases where it is added.

When FEAT\_DoubleFault is implemented, and the Effective value of SCR\_EL3.NMEA is 1, this field is ignored and its Effective value is 1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [20]**

Reserved, RES0.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3.

This bit applies only when SCTLR\_EL3.M bit is set.

The WXN bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Bit [18]**

Reserved, RES1.

**Bit [17]**

Reserved, RES0.

**Bit [16]**

Reserved, RES1.

**Bits [15:14]**

Reserved, RES0.

**EnDB, bit [13]**

**When FEAT\_PAAuth is implemented:**

Controls enabling of pointer authentication (using the APDBKey\_EL1 key) of instruction addresses in the EL3 translation regime.

EnDB	Meaning
0b0	Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

For more information, see 'System register control of pointer authentication'.

**Note**

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**I, bit [12]**

Instruction access Cacheability control, for accesses at EL3:

I	Meaning
0b0	All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL3. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**EOS, bit [11]**

**When FEAT\_ExS is implemented:**

Exception Exit is Context Synchronizing.

<b>EOS</b>	<b>Meaning</b>
0b0	An exception return from EL3 is not a context synchronizing event
0b1	An exception return from EL3 is a context synchronizing event

If SCTLR\_EL3.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS\* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR\_EL3.EOS:

- The indirect write of the PSTATE and PC values from [SPSR\\_EL3](#) and [ELR\\_EL3](#) on exception return is synchronized.
- If the PE enters Debug state before the first instruction after an Exception return from EL3 to Non-secure state, any pending Halting debug event completes execution.
- The GIC behavior that allocates interrupts to FIQ or IRQ changes simultaneously with leaving the EL3 Exception level.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

#### Bits [10:7]

Reserved, RES0.

#### nAA, bit [6]

**When FEAT\_LSE2 is implemented:**

Non-aligned access. This bit controls generation of Alignment faults at EL3 under certain conditions.

<b>nAA</b>	<b>Meaning</b>
0b0	LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1	This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

#### Bits [5:4]

Reserved, RES1.

**SA, bit [3]**

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**C, bit [2]**

Cacheability control, for data accesses.

C	Meaning
0b0	All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	This control has no effect on the Cacheability of: <ul style="list-style-type: none"> <li>Data access to Normal memory from EL3.</li> <li>Normal memory accesses to the EL3 translation tables.</li> </ul>

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**A, bit [1]**

Alignment check enable. This is the enable bit for Alignment fault checking at EL3.

A	Meaning
0b0	Alignment fault checking disabled when executing at EL3. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at EL3. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**M, bit [0]**

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL3 stage 1 address translation disabled. See the SCTLR_EL3.I field for the behavior of instruction accesses to Normal memory.
0b1	EL3 stage 1 address translation enabled.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Accessing the SCTLR\_EL3**

Accesses to this register use the following encodings:

MRS <Xt>, SCTLR\_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0000	0b000

# SCXTNUM\_EL0, EL0 Read/Write Software Context Number

The SCXTNUM\_EL0 characteristics are:

## Purpose

Provides a number that can be used to separate out different context numbers with the EL0 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

## Configuration

This register is present only when FEAT\_CSV2 is implemented. Otherwise, direct accesses to SCXTNUM\_EL0 are UNDEFINED.

## Attributes

SCXTNUM\_EL0 is a 64-bit register.

## Field descriptions

The SCXTNUM\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Software Context Number

# SCXTNUM\_EL1, EL1 Read/Write Software Context Number

The SCXTNUM\_EL1 characteristics are:

## Purpose

Provides a number that can be used to separate out different context numbers with the EL1 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

## Configuration

This register is present only when FEAT\_CSV2 is implemented. Otherwise, direct accesses to SCXTNUM\_EL1 are UNDEFINED.

## Attributes

SCXTNUM\_EL1 is a 64-bit register.

## Field descriptions

The SCXTNUM\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Software Context Number

# SCXTNUM\_EL2, EL2 Read/Write Software Context Number

The SCXTNUM\_EL2 characteristics are:

## Purpose

Provides a number that can be used to separate out different context numbers with the EL2 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

## Configuration

This register is present only when FEAT\_CSV2 is implemented. Otherwise, direct accesses to SCXTNUM\_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

SCXTNUM\_EL2 is a 64-bit register.

## Field descriptions

The SCXTNUM\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Software Context Number

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Software Context Number. A number to identify the context within the EL2 exception level.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the SCXTNUM\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic SCXTNUM\_EL2 or SCXTNUM\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, SCXTNUM\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1101	0b0000	0b111

# SP\_EL0, Stack Pointer (EL0)

The SP\_EL0 characteristics are:

## Purpose

Holds the stack pointer associated with EL0. At higher Exception levels, this is used as the current stack pointer when the value of [SPSel.SP](#) is 0.

## Configuration

There are no configuration notes.

## Attributes

SP\_EL0 is a 64-bit register.

## Field descriptions

The SP\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Stack pointer																															
Stack pointer																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Stack pointer.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the SP\_EL0

When the value of PSTATE.SP is 0, this register is accessible at all Exception levels as the current stack pointer.

Accesses to this register use the following encodings:

MRS <Xt>, SP\_EL0

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        return SP_EL0;
elsif PSTATE.EL == EL2 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        return SP_EL0;
elsif PSTATE.EL == EL3 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        return SP_EL0;

```

MSR SP\_EL0, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        SP_EL0 = X[t];
elsif PSTATE.EL == EL2 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        SP_EL0 = X[t];
elsif PSTATE.EL == EL3 then
    if PSTATE.SP == '0' then
        UNDEFINED;
    else
        SP_EL0 = X[t];

```

# SP\_EL1, Stack Pointer (EL1)

The SP\_EL1 characteristics are:

## Purpose

Holds the stack pointer associated with EL1. When executing at EL1, the value of [SPSel.SP](#) determines the current stack pointer:

SPSel.SP	Current stack pointer
0b0	<a href="#">SP_ELO</a>
0b1	<a href="#">SP_EL1</a>

## Configuration

There are no configuration notes.

## Attributes

SP\_EL1 is a 64-bit register.

## Field descriptions

The SP\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																Stack pointer															
																Stack pointer															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Stack pointer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the SP\_EL1

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of [SPSel.SP](#) is 1, this register is also accessible at EL1 as the current stack pointer.

### Note

When the value of [SPSel.SP](#) is 0, [SP\\_ELO](#) is used as the current stack pointer at all Exception levels.

Accesses to this register use the following encodings:

MRS <Xt>, SP\_EL1

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x240];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return SP_EL1;
elsif PSTATE.EL == EL3 then
    return SP_EL1;

```

MSR SP\_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x240] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    SP_EL1 = X[t];
elsif PSTATE.EL == EL3 then
    SP_EL1 = X[t];

```

# SP\_EL2, Stack Pointer (EL2)

The SP\_EL2 characteristics are:

## Purpose

Holds the stack pointer associated with EL2. When executing at EL2, the value of [SPSel.SP](#). SP determines the current stack pointer:

SPSel.SP	Current stack pointer
0b0	<a href="#">SP_EL0</a>
0b1	<a href="#">SP_EL2</a>

## Configuration

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

SP\_EL2 is a 64-bit register.

## Field descriptions

The SP\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
														Stack pointer																							
														Stack pointer																							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

### Bits [63:0]

Stack pointer.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the SP\_EL2

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of [SPSel.SP](#) is 1, this register is also accessible at EL2 as the current stack pointer.

Note

When the value of [SPSel.SP](#) is 0, [SP\\_EL0](#) is used as the current stack pointer at all Exception levels.

Accesses to this register use the following encodings:

MRS <Xt>, SP\_EL2

op0	op1	CRn	CRm	op2
0b11	0b110	0b0100	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return SP_EL2;

```

MSR SP\_EL2, <Xt>

# SP\_EL3, Stack Pointer (EL3)

The SP\_EL3 characteristics are:

## Purpose

Holds the stack pointer associated with EL3. When executing at EL3, the value of [SPSel.SP](#) determines the current stack pointer:

SPSel.SP	Current stack pointer
0b0	<a href="#">SP_EL0</a>
0b1	<a href="#">SP_EL3</a>

## Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to SP\_EL3 are UNDEFINED.

## Attributes

SP\_EL3 is a 64-bit register.

## Field descriptions

The SP\_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																Stack pointer															
																Stack pointer															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Stack pointer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the SP\_EL3

This register is not accessible using MRS and MSR instructions.

When the value of [SPSel.SP](#) is 1, this register is accessible at EL3 as the current stack pointer.

### Note

When the value of [SPSel.SP](#) is 0, [SP\\_EL0](#) is used as the current stack pointer at all Exception levels.

# SPSel, Stack Pointer Select

The SPSel characteristics are:

## Purpose

Allows the Stack Pointer to be selected between SP\_EL0 and SP\_ELx.

## Configuration

There are no configuration notes.

## Attributes

SPSel is a 64-bit register.

## Field descriptions

The SPSel bit assignments are:

### Bits [63:1]

Reserved, RES0.

### SP, bit [0]

Stack pointer to use. Possible values of this bit are:

SP	Meaning
0b0	Use SP_EL0 at all Exception levels.
0b1	Use SP_ELx for Exception level ELx.

On a Warm reset, thisThis field resets to 1.

## Accessing the SPSel

Accesses to this register use the following encodings:

MRS <Xt>, SPSel

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0010	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    return Zeros(63):PSTATE.SP;
elsif PSTATE.EL == EL2 then
    return Zeros(63):PSTATE.SP;
elsif PSTATE.EL == EL3 then
    return Zeros(63):PSTATE.SP;

```

MSR SPSe1, &lt;Xt&gt;

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0010	0b000

```

if PSTATE.EL == EL0 then

# SPSR\_abt, Saved Program Status Register (Abort mode)

The SPSR\_abt characteristics are:

## Purpose

Holds the saved process state when an exception is taken to Abort mode.

## Configuration

AArch64 System register SPSR\_abt bits [31:0] are architecturally mapped to AArch32 System register [SPSR\\_abt\[31:0\]](#).

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

## Attributes

SPSR\_abt is a 64-bit register.

## Field descriptions

The SPSR\_abt bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]		J	SSBS	PAN	DIT	IL	GE				IT[7:2]						E	A	I	F	T	M[4:0]				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Abort mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Abort mode.

On executing an exception return operation in Abort mode SPSR\_abt.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [21]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Abort mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Abort mode.

SPSR\_abt.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR\_abt.E is RES0. If the implementation does not support little-endian operation, SPSR\_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR\_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR\_abt.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR\_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the SPSR\_abt**

Accesses to this register use the following encodings:

MRS <Xt>, SPSR\_abt

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b001

# SPSR\_EL1, Saved Program Status Register (EL1)

The SPSR\_EL1 characteristics are:

## Purpose

Holds the saved process state when an exception is taken to EL1.

## Configuration

AArch64 System register SPSR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [SPSR\\_svc\[31:0\]](#).

## Attributes

SPSR\_EL1 is a 64-bit register.

## Field descriptions

The SPSR\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level and exception taken from AArch32 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]	DIT	SSBS	PAN	SS	IL	GE	IT[7:2]	E	A	I	F	T	M[4]	M[3:0]												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL1 using AArch64 makes SPSR\_EL1 become UNKNOWN.

### Bits [63:32]

Reserved, RES0.

### N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL1, and copied to PSTATE.Q on executing an exception return operation in EL1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL1, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL1.

On executing an exception return operation in EL1 SPSR\_EL1.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### DIT, bit [24]

#### When FEAT\_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### SSBS, bit [23]

#### When FEAT\_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### PAN, bit [22]

#### When FEAT\_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL1, and copied to PSTATE.GE on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL1, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL1.

SPSR\_EL1.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to EL1, and copied to PSTATE.E on executing an exception return operation in EL1.

If the implementation does not support big-endian operation, SPSR\_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR\_EL1.E is RES1. On executing an exception return operation in EL1, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR\_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR\_EL1.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL1, and copied to PSTATE.T on executing an exception return operation in EL1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**M[4], bit [4]**

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL1 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

<b>M[4]</b>	<b>Meaning</b>
0b1	AArch32 execution state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**M[3:0], bits [3:0]**

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL1, and copied to PSTATE.M[3:0] on executing an exception return operation in EL1.

<b>M[3:0]</b>	<b>Meaning</b>
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0111	Abort.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If SPSR\_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**When exception taken from AArch64 state:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	RES0	TCO	DIT	UAO	PAN	SS	IL	RES0								SSBS	BTYPE	D	A	I	F	RES0	M[4]	M[3:0]				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL1 using AArch64 makes SPSR\_EL1 become UNKNOWN.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [27:26]**

Reserved, RES0.

**TCO, bit [25]****When FEAT\_MTE is implemented:**

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL1, and copied to PSTATE.TCO on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [24]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**UAO, bit [23]****When FEAT\_UAO is implemented:**

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL1, and copied to PSTATE.UAO on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**BTYPE, bits [11:10]****When FEAT\_BTI is implemented:**

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL1, and copied to PSTATE.BTYPE on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**D, bit [9]**

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL1, and copied to PSTATE.D on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [5]**

Reserved, RES0.

**M[4], bit [4]**

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL1 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

M[4]	Meaning
0b0	AArch64 execution state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[3:0], bits [3:0]**

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.

Other values are reserved. If SPSR\_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL1 and copied to PSTATE.EL on executing an exception return operation in EL1.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL1 and copied to PSTATE.SP on executing an exception return operation in EL1

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the SPSR\_EL1

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic SPSR\_EL1 or SPSR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, SPSR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV1> == '01' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        return NVMem[0x160];
    else
        return SPSR_EL1;
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then

# SPSR\_EL2, Saved Program Status Register (EL2)

The SPSR\_EL2 characteristics are:

## Purpose

Holds the saved process state when an exception is taken to EL2.

## Configuration

AArch64 System register SPSR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [SPSR\\_hyp\[31:0\]](#).

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

SPSR\_EL2 is a 64-bit register.

## Field descriptions

The SPSR\_EL2 bit assignments are:

### When AArch32 is supported at any Exception level and exception taken from AArch32 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]		DIT	SSBS	PAN	SS	IL	GE				IT[7:2]					E	A	I	F	T	M[4]		M[3:0]			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL2 using AArch64 makes SPSR\_EL2 become UNKNOWN.

### Bits [63:32]

Reserved, RES0.

### N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL2, and copied to PSTATE.Q on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL2, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL2.

On executing an exception return operation in EL2 SPSR\_EL2.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DIT, bit [24]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL2, and copied to PSTATE.GE on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL2, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL2.

SPSR\_EL2.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to EL2, and copied to PSTATE.E on executing an exception return operation in EL2.

If the implementation does not support big-endian operation, SPSR\_EL2.E is RES0. If the implementation does not support little-endian operation, SPSR\_EL2.E is RES1. On executing an exception return operation in EL2, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR\_EL2.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR\_EL2.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL2, and copied to PSTATE.T on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[4], bit [4]**

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL2 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

M[4]	Meaning
0b1	AArch32 execution state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[3:0], bits [3:0]**

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL2, and copied to PSTATE.M[3:0] on executing an exception return operation in EL2.

M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If SPSR\_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When exception taken from AArch64 state:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

An exception return from EL2 using AArch64 makes SPSR\_EL2 become UNKNOWN.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [27:26]**

Reserved, RES0.

**TCO, bit [25]****When FEAT\_MTE is implemented:**

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL2, and copied to PSTATE.TCO on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [24]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**UAO, bit [23]****When FEAT\_UAO is implemented:**

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL2, and copied to PSTATE.UAO on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**BTTYPE, bits [11:10]****When FEAT\_BT is implemented:**

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL2, and copied to PSTATE.BTYPE on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**D, bit [9]**

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL2, and copied to PSTATE.D on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [5]**

Reserved, RES0.

**M[4], bit [4]**

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL2 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

M[4]	Meaning
0b0	AArch64 execution state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[3:0], bits [3:0]**

AArch64 Exception level and selected Stack Pointer.

<b>M[3:0]</b>	<b>Meaning</b>
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.
0b1000	EL2t.
0b1001	EL2h.

Other values are reserved. If SPSR\_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL2 and copied to PSTATE.EL on executing an exception return operation in EL2.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL2 and copied to PSTATE.SP on executing an exception return operation in EL2

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the SPSR\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic SPSR\_EL2 or SPSR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, SPSR\_EL2

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b11	0b100	0b0100	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return SPSR_EL1;
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return SPSR_EL2;
elsif PSTATE.EL == EL3 then
    return SPSR_EL2;

```

MSR SPSR\_EL2, <Xt>

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b11	0b100	0b0100	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then

# SPSR\_EL3, Saved Program Status Register (EL3)

The SPSR\_EL3 characteristics are:

## Purpose

Holds the saved process state when an exception is taken to EL3.

## Configuration

AArch64 System register SPSR\_EL3 bits [31:0] can be mapped to AArch32 System register [SPSR\\_mon\[31:0\]](#), but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to SPSR\_EL3 are UNDEFINED.

## Attributes

SPSR\_EL3 is a 64-bit register.

## Field descriptions

The SPSR\_EL3 bit assignments are:

### When AArch32 is supported at any Exception level and exception taken from AArch32 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]		DIT	SSBS	PAN	SS	IL	GE				IT[7:2]					E	A	I	F	T	M[4]		M[3:0]			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL3 using AArch64 makes SPSR\_EL1 become UNKNOWN.

### Bits [63:32]

Reserved, RES0.

### N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL3, and copied to PSTATE.Q on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to EL3, and copied to PSTATE.IT[1:0] on executing an exception return operation in EL3.

On executing an exception return operation in EL3 SPSR\_EL1.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DIT, bit [24]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL3, and copied to PSTATE.GE on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to EL3, and copied to PSTATE.IT[7:2] on executing an exception return operation in EL3.

SPSR\_EL1.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to EL3, and copied to PSTATE.E on executing an exception return operation in EL3.

If the implementation does not support big-endian operation, SPSR\_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR\_EL1.E is RES1. On executing an exception return operation in EL3, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR\_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR\_EL1.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL3, and copied to PSTATE.T on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[4], bit [4]**

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL3 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

M[4]	Meaning
0b1	AArch32 execution state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[3:0], bits [3:0]**

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL3, and copied to PSTATE.M[3:0] on executing an exception return operation in EL3.

M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0110	Monitor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If SPSR\_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When exception taken from AArch64 state:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	RES0	TCO	DIT	UAO	PAN	SS	IL	RES0								SSBS	BTYPE	D	A	I	F	RES0	M[4]	M[3:0]				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL3 using AArch64 makes SPSR\_EL1 become UNKNOWN.

**Bits [63:32]**

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [27:26]**

Reserved, RES0.

**TCO, bit [25]****When FEAT\_MTE is implemented:**

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL3, and copied to PSTATE.TCO on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [24]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**UAO, bit [23]****When FEAT\_UAO is implemented:**

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL3, and copied to PSTATE.UAO on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**BTTYPE, bits [11:10]****When FEAT\_BT is implemented:**

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL3, and copied to PSTATE.BTYPE on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**D, bit [9]**

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL3, and copied to PSTATE.D on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [5]**

Reserved, RES0.

**M[4], bit [4]**

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL3 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

M[4]	Meaning
0b0	AArch64 execution state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[3:0], bits [3:0]**

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.
0b1000	EL2t.
0b1001	EL2h.
0b1100	EL3t.
0b1101	EL3h.

Other values are reserved. If SPSR\_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL3 and copied to PSTATE.EL on executing an exception return operation in EL3.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL3 and copied to PSTATE.SP on executing an exception return operation in EL3

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the SPSR\_EL3

Accesses to this register use the following encodings:

MRS <Xt>, SPSR\_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0100	0b0000	0b000

# SPSR\_fiq, Saved Program Status Register (FIQ mode)

The SPSR\_fiq characteristics are:

## Purpose

Holds the saved process state when an exception is taken to FIQ mode.

## Configuration

AArch64 System register SPSR\_fiq bits [31:0] are architecturally mapped to AArch32 System register [SPSR\\_fiq\[31:0\]](#).

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

## Attributes

SPSR\_fiq is a 64-bit register.

## Field descriptions

The SPSR\_fiq bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]		J	SSBS	PAN	DIT	IL	GE			IT[7:2]					E	A	I	F	T	M[4:0]						
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to FIQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in FIQ mode.

On executing an exception return operation in FIQ mode SPSR\_fiq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [21]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to FIQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in FIQ mode.

SPSR\_fiq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR\_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR\_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR\_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR\_fiq.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

<b>M[4:0]</b>	<b>Meaning</b>
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR\_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the SPSR\_fiq**

Accesses to this register use the following encodings:

MRS <Xt>, SPSR\_fiq

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b11	0b100	0b0100	0b0011	0b011

### Bits [63:32]

Reserved, RES0.

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to IRQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode SPSR\_irq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [21]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to IRQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in IRQ mode.

SPSR\_irq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR\_irq.E is RES0. If the implementation does not support little-endian operation, SPSR\_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR\_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR\_irq.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR\_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

Accessing the SPSR\_irq

Accesses to this register use the following encodings:

MRS <Xt>, SPSR\_irq

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return SPSR_irq;
elsif PSTATE.EL == EL3 then
    return SPSR_irq;
```

MSR SPSR\_irq, <Xt>

# SPSR\_und, Saved Program Status Register (Undefined mode)

The SPSR\_und characteristics are:

## Purpose

Holds the saved process state when an exception is taken to Undefined mode.

## Configuration

AArch64 System register SPSR\_und bits [31:0] are architecturally mapped to AArch32 System register [SPSR\\_und\[31:0\]](#).

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

## Attributes

SPSR\_und is a 64-bit register.

## Field descriptions

The SPSR\_und bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL	GE				IT[7:2]				E	A	I	F	T	M[4:0]							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Undefined mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode SPSR\_und.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [21]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Undefined mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Undefined mode.

SPSR\_und.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR\_und.E is RES0. If the implementation does not support little-endian operation, SPSR\_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR\_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR\_und.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR\_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the SPSR\_und**

Accesses to this register use the following encodings:

MRS <Xt>, SPSR\_und

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;

# SSBS, Speculative Store Bypass Safe

The SSBS characteristics are:

## Purpose

Allows access to the Speculative Store Bypass Safe bit.

## Configuration

This register is present only when FEAT\_SSBS is implemented. Otherwise, direct accesses to SSBS are UNDEFINED.

## Attributes

SSBS is a 64-bit register.

## Field descriptions

The SSBS bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																SSBS		RES0													
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:13]

Reserved, RES0.

### SSBS, bit [12]

Speculative Store Bypass Safe.

Prohibits speculative loads or stores which might practically allow a cache timing side channel.

A cache timing side channel might be exploited where a load or store uses an address that is derived from a register that is being loaded from memory using a load instruction speculatively read from a memory location. If PSTATE.SSBS is enabled, the address derived from the load instruction might be from earlier in the coherence order than the latest store to that memory location with the same virtual address.

SSBS	Meaning
0b0	Hardware is not permitted to load or store speculatively, in a manner that could practically give rise to a cache timing side channel, using an address derived from a register value that has been loaded from memory using a load instruction (L) that speculatively reads an entry from earlier in the coherence order from that location being loaded from than the entry generated by the latest store (S) to that location using the same virtual address as L.
0b1	Hardware is permitted to load or store speculatively, in a manner that could practically give rise to a cache timing side channel, using an address derived from a register value that has been loaded from memory using a load instruction (L) that speculatively reads an entry from earlier in the coherence order fro that location being loaded from than the entry generated by the latest store (S) to that location using the same virtual address as L.

The TCR EL1 characteristics are:

## Purpose

The control register for stage 1 of the EL1&0 translation regime.

## Configuration

AArch64 System register TCR EL1 bits [31:0] are architecturally mapped to AArch32 System register [TTBCR\[31:0\]](#).

AArch64 System register TCR EL1 bits [63:32] are architecturally mapped to AArch32 System register [TTBCR2\[31:0\]](#)

## Attributes

TCR EL1 is a 64-bit register.

## Field descriptions

The TCR\_EL1 bit assignments are:

63626160	59	58	57	56	55	54	53	52	51		
RES0	DSTCMA1	TCMA1	TCMA0	TCMA0E0PD1	E0PD1E0PD0	E0PD0NFD1	NFD1NFD0	NFD0TBID1	TBID1	TBID0	TBID0HW
TG1SH1	ORGN1			IRGN1			EPD1	A1			
31302928	27	26	25	24	23	22	21	20	19		

Any of the bits in TCR\_EL1, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

**Bits [63:6059]**

Reserved, RES0.

**DSTCMA1**, bit [5958]

When ~~FEAT\_LPA2~~~~FEAT\_MTE~~ is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL1&0 translation regime.

DS	Meaning
0b0	<p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p>
0b1	<p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of translation table descriptors hold output address[51:50].</p> <p>The shareability information of block and page descriptors for cacheable locations is determined by:</p> <ul style="list-style-type: none"> <li>TCR_EL1.SH0 if the VA is translated using tables pointed to by <a href="#">TTBR0_EL1</a>.</li> <li>TCR_EL1.SH1 if the VA is translated using tables pointed to by <a href="#">TTBR1_EL1</a>.</li> </ul> <p>The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of <a href="#">TTBR0_EL1</a> or <a href="#">TTBR1_EL1</a> are used to hold bits[51:48] of the output address in all cases.</p>
<p><b>Note</b></p> <p>As FEAT_LVA must be implemented if TCR_EL1.DS == 1, the minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12, as determined by that extension.</p> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p>	
<p><b>Note</b></p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p>	

This field is RES0 for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### TCMA1, bit [58]

##### When FEAT\_MTE is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if [HCR\\_EL2](#).{E2H,TGE}!= {1,1}, when address[59:55] = 0b11111.

TCMA1	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL1 or EL0.
0b1	All accesses at EL1 and EL0 are Unchecked.

#### Note

Software may change this control bit on a context switch.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TCMA0, bit [57]****When FEAT\_MTE is implemented:**

Controls the generation of Unchecked accesses at EL1, and at EL0 if [HCR\\_EL2](#).{E2H,TGE}!={1,1}, when address[59:55] = 0b00000.

TCMA0	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL1 or EL0.
0b1	All accesses at EL1 and EL0 are Unchecked.

**Note**

Software may change this control bit on a context switch.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EOPD1, bit [56]****When FEAT\_EOPD is implemented:**

Faulting control for Unprivileged access to any address translated by [TTBR1\\_EL1](#).

EOPD1	Meaning
0b0	Unprivileged access to any address translated by <a href="#">TTBR1_EL1</a> will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by <a href="#">TTBR1_EL1</a> will generate a level 0 translation fault.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EOPD0, bit [55]****When FEAT\_EOPD is implemented:**

Faulting control for Unprivileged access to any address translated by [TTBR0\\_EL1](#).

EOPD0	Meaning
0b0	Unprivileged access to any address translated by <a href="#">TTBR0_EL1</a> will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by <a href="#">TTBR0_EL1</a> will generate a level 0 translation fault.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NFD1, bit [54]****When FEAT\_SVE is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR1\\_EL1](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR1\\_EL1](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

NFD1	Meaning
0b0	Does not disable stage 1 translation table walks using <a href="#">TTBR1_EL1</a> .
0b1	A TLB miss on a virtual address that is translated using <a href="#">TTBR1_EL1</a> due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NFD0, bit [53]****When FEAT\_SVE is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR0\\_EL1](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR0\\_EL1](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

NFD0	Meaning
0b0	Does not disable stage 1 translation table walks using <a href="#">TTBR0_EL1</a> .
0b1	A TLB miss on a virtual address that is translated using <a href="#">TTBR0_EL1</a> due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TBID1, bit [52]**

**When FEAT\_PAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

TBID1	Meaning
0b0	TCR_EL1.TB11 applies to Instruction and Data accesses.
0b1	TCR_EL1.TB11 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR1\\_EL1](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TBID0, bit [51]****When FEAT\_PAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

TBID0	Meaning
0b0	TCR_EL1.TB10 applies to Instruction and Data accesses.
0b1	TCR_EL1.TB10 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0\\_EL1](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU162, bit [50]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1\\_EL1](#).

HWU162	Meaning
0b0	For translations using <a href="#">TTBR1_EL1</a> , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR1_EL1</a> , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR\_EL1.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU161, bit [49]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1\\_EL1](#).

HWU161	Meaning
0b0	For translations using <a href="#">TTBR1_EL1</a> , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR1_EL1</a> , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR\_EL1.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU160, bit [48]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1\\_EL1](#).

HWU160	Meaning
0b0	For translations using <a href="#">TTBR1_EL1</a> , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR1_EL1</a> , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR\_EL1.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU159, bit [47]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1\\_EL1](#).

HWU159	Meaning
0b0	For translations using <a href="#">TTBR1_EL1</a> , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR1_EL1</a> , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR\_EL1.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU062, bit [46]**

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0\\_EL1](#).

HWU062	Meaning
0b0	For translations using <a href="#">TTBR0_EL1</a> , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR0_EL1</a> , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR\_EL1.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU061, bit [45]**

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0\\_EL1](#).

HWU061	Meaning
0b0	For translations using <a href="#">TTBR0_EL1</a> , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR0_EL1</a> , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR\_EL1.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU060, bit [44]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0\\_EL1](#).

HWU060	Meaning
0b0	For translations using <a href="#">TTBR0_EL1</a> , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR0_EL1</a> , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR\_EL1.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU059, bit [43]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0\\_EL1](#).

HWU059	Meaning
0b0	For translations using <a href="#">TTBR0_EL1</a> , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR0_EL1</a> , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR\_EL1.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HPD1, bit [42]****When FEAT\_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR1\\_EL1](#).

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]

When FEAT\_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0\\_EL1](#).

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When FEAT\_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL0 and EL1.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When FEAT\_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL0 and EL1.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the [TTBR1\\_EL1](#) region, or ignored and used for tagged addresses.

<b>TBI1</b>	<b>Meaning</b>
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by [TTBR1\\_EL1](#). It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT\_PAAuth is implemented and TCR\_EL1.TBID1 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### TBIO, bit [37]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0\\_EL1](#) region, or ignored and used for tagged addresses.

<b>TBIO</b>	<b>Meaning</b>
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by [TTBR0\\_EL1](#). It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT\_PAAuth is implemented and TCR\_EL1.TBID0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBIO is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### AS, bit [36]

ASID Size.

<b>AS</b>	<b>Meaning</b>
0b0	8 bit - the upper 8 bits of <a href="#">TTBR0_EL1</a> and <a href="#">TTBR1_EL1</a> are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
0b1	16 bit - the upper 16 bits of <a href="#">TTBR0_EL1</a> and <a href="#">TTBR1_EL1</a> are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Bit [35]

Reserved, RES0.

### IPS, bits [34:32]

Intermediate Physical Address Size.

IPS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB, and the value FEAT\_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT\_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR\_EL1 are 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TG1, bits [31:30]

Granule size for the [TTBR1\\_EL1](#).

TG1	Meaning
0b01	16KB.
0b10	4KB.
0b11	64KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1\\_EL1](#).

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1\\_EL1](#).

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1\\_EL1](#).

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### EPD1, bit [23]

Translation table walk disable for translations using [TTBR1\\_EL1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1\\_EL1](#). The encoding of this bit is:

EPD1	Meaning
0b0	Perform translation table walks using <a href="#">TTBR1_EL1</a> .
0b1	A TLB miss on an address that is translated using <a href="#">TTBR1_EL1</a> generates a Translation fault. No translation table walk is performed.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### A1, bit [22]

Selects whether [TTBR0\\_EL1](#) or [TTBR1\\_EL1](#) defines the ASID. The encoding of this bit is:

A1	Meaning
0b0	<a href="#">TTBR0_EL1</a> .ASID defines the ASID.
0b1	<a href="#">TTBR1_EL1</a> .ASID defines the ASID.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### T1SZ, bits [21:16]

The size offset of the memory region addressed by [TTBR1\\_EL1](#). The region size is  $2^{(64-T1SZ)}$  bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

**This field resets to an architecturally UNKNOWN value.**

#### Note

For the 4KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TG0, bits [15:14]

Granule size for the [TTBR0\\_EL1](#).

TG0	Meaning
0b00	4KB
0b01	64KB
0b10	16KB

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0\\_EL1](#).

SH0	Meaning
0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ORGNO, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL1](#).

ORGNO	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IRGNO, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL1](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## EPD0, bit [7]

Translation table walk disable for translations using [TTBR0\\_EL1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0\\_EL1](#). The encoding of this bit is:

EPD0	Meaning
0b0	Perform translation table walks using <a href="#">TTBR0_EL1</a> .
0b1	A TLB miss on an address that is translated using <a href="#">TTBR0_EL1</a> generates a Translation fault. No translation table walk is performed.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bit [6]

Reserved, RES0.

## T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0\\_EL1](#). The region size is  $2^{(64-T0SZ)}$  bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

**This field resets to an architecturally UNKNOWN value.**

### Note

For the 4KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the TCR\_EL1

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TCR\_EL1 or TCR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, TCR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.TCR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        return NVMem[0x120];
    else
        return TCR_EL1;
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        return TCR_EL2;
    else
        return TCR_EL1;
elsif PSTATE.EL == EL3 then
    return TCR_EL1;

```

MSR TCR\_EL1, &lt;Xt&gt;

# TCR\_EL2, Translation Control Register (EL2)

The TCR\_EL2 characteristics are:

## Purpose

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the Effective value of [HCR\\_EL2.E2H](#) is 0, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using [TTBR0\\_EL2](#).
- When the value of [HCR\\_EL2.E2H](#) is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
  - A lower VA range, translated using [TTBR0\\_EL2](#).
  - A higher VA range, translated using [TTBR1\\_EL2](#).

## Configuration

AArch64 System register TCR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HTCR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

TCR\_EL2 is a 64-bit register.

## Field descriptions

The TCR\_EL2 bit assignments are:

### When HCR\_EL2.E2H == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	
RES0																															
RES1	TCMA	TBID	HWU62	HWU61	HWU60	HWU59	HPD	RES1	HD	HATB	RES0	PS	TG0	SH0	ORGN0	IRGN0	RES0	T0SZ													
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	

Any of the bits in TCR\_EL2, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

### Bits [63:33:32]

Reserved, RES0.

### DS, bit [32]

#### When FEAT\_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL2 translation regime.

DS	Meaning
0b0	<p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of TCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p>
0b1	<p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of translation table descriptors hold output address[51:50].</p> <p>The shareability information of block and page descriptors for cacheable locations is determined by TCR_EL2.SH0.</p> <p>The minimum value of TCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of <a href="#">TTBR0_EL2</a> are used to hold bits[51:48] of the output address in all cases.</p>
<p><b>Note</b></p> <p>As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.T0SZ field is 12, as determined by that extension.</p> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p>	
<p><b>Note</b></p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p>	

This field is RES0 for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bit [31]

Reserved, RES1.

#### TCMA, bit [30]

When FEAT\_MTE is implemented:

Controls the generation of Unchecked accesses at EL2 when address [59:56] = 0b0000.

TCMA	Meaning
0b0	This control has no effect on the generation of Unchecked accesses.
0b1	All accesses are Unchecked.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TBID, bit [29]****When FEAT\_PAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

TBID	Meaning
0b0	TCR_EL2.TBI applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0\\_EL2](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU62, bit [28]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR\_EL2.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU61, bit [27]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR\_EL2.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU60, bit [26]**

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR\_EL2.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU59, bit [25]**

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR\_EL2.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HPD, bit [24]**

**When FEAT\_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0\\_EL2](#).

HPD	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

---

**Note**  
In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

---

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**HD, bit [22]**

**When FEAT\_HAFDBS is implemented:**

Hardware management of dirty state in stage 1 translations from EL2.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HA, bit [21]**

**When FEAT\_HAFDBS is implemented:**

Hardware Access flag update in stage 1 translations from EL2.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TBI, bit [20]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0\\_EL2](#) region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state'.

TBI	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR0\\_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT\_PAuth is implemented and TCR\_EL2.TBID is 1, then this field only applies to Data accesses.

If the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bit [19]

Reserved, RES0.

## PS, bits [18:16]

Physical Address Size.

PS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB, and the value FEAT\_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT\_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR\_EL2 are 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## TG0, bits [15:14]

Granule size for the [TTBR0\\_EL2](#).

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0\\_EL2](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL2](#).

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL2](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Bits [7:6]

Reserved, RES0.

### T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0\\_EL2](#). The region size is  $2^{(64-T0SZ)}$  bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

**This field resets to an architecturally UNKNOWN value.**

---

#### Note

---

For the 4KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT\_VHE is implemented and HCR\_EL2.E2H == 1:

This view of the register is only valid from Armv8.1 when HCR\_EL2.E2H is 1.

Any of the bits in TCR\_EL2 are permitted to be cached in a TLB.

Bits [63:6059]

Reserved, RES0.

DSTCMA1, bit [5958]

When FEAT\_LPA2FEAT\_MTE is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL2&0 translation regime.

DS	Meaning
0b0	<p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p>
0b1	<p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of translation table descriptors hold output address[51:50].</p> <p>The shareability information of block and page descriptors for cacheable locations is determined by:</p> <ul style="list-style-type: none"> <li>TCR_EL2.SH0 if the VA is an address that is translated using tables pointed to by TTBR0_EL2.</li> <li>TCR_EL2.SH1 if the VA is an address that is translated using tables pointed to by TTBR1_EL2.</li> </ul> <p>The minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 16 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of TTBR0_EL2 or TTBR1_EL2 are used to hold bits[51:48] of the output address in all cases.</p>
<p><b>Note</b></p> <p>As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 12, as determined by that extension.</p> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p>	
<p><b>Note</b></p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p>	

This field is RES0 for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### TCMA1, bit [58]

##### When FEAT\_MTE is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR\_EL2.TGE=1, when address[59:55] = 0b11111.

TCMA1	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL2 or EL0.
0b1	All accesses are Unchecked.

#### Note

Software may change this control bit on a context switch.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TCMA0, bit [57]****When FEAT\_MTE is implemented:**

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR\_EL2.TGE=1, when address[59:55] = 0b00000.

TCMA0	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL2 or EL0.
0b1	All accesses are Unchecked.

**Note**

Software may change this control bit on a context switch.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EOPD1, bit [56]****When FEAT\_EOPD is implemented:**

Faulting control for Unprivileged access to any address translated by [TTBR1\\_EL2](#).

EOPD1	Meaning
0b0	Unprivileged access to any address translated by <a href="#">TTBR1_EL2</a> will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by <a href="#">TTBR1_EL2</a> will generate a level 0 translation fault.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EOPD0, bit [55]****When FEAT\_EOPD is implemented:**

Faulting control for Unprivileged access to any address translated by [TTBR0\\_EL2](#).

EOPD0	Meaning
0b0	Unprivileged access to any address translated by <a href="#">TTBR0_EL2</a> will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by <a href="#">TTBR0_EL2</a> will generate a level 0 translation fault.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NFD1, bit [54]****When FEAT\_SVE is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR1\\_EL2](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR1\\_EL2](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

NFD1	Meaning
0b0	Does not disable stage 1 translation table walks using <a href="#">TTBR1_EL2</a> .
0b1	A TLB miss on a virtual address that is translated using <a href="#">TTBR1_EL2</a> due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NFD0, bit [53]****When FEAT\_SVE is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR0\\_EL2](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR0\\_EL2](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

NFD0	Meaning
0b0	Does not disable stage 1 translation table walks using <a href="#">TTBR0_EL2</a> .
0b1	A TLB miss on a virtual address that is translated using <a href="#">TTBR0_EL2</a> due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TBID1, bit [52]**

**When FEAT\_PAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

TBID1	Meaning
0b0	TCR_EL2.TBI1 applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR1\\_EL2](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TBID0, bit [51]****When FEAT\_PAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

For more information, see 'Address tagging in AArch64 state'.

TBID0	Meaning
0b0	TCR_EL2.TBI0 applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0\\_EL2](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU162, bit [50]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1\\_EL2](#).

HWU162	Meaning
0b0	For translations using <a href="#">TTBR1_EL2</a> , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR1_EL2</a> , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR\_EL2.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU161, bit [49]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1\\_EL2](#).

HWU161	Meaning
0b0	For translations using <a href="#">TTBR1_EL2</a> , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR1_EL2</a> , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR\_EL2.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU160, bit [48]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1\\_EL2](#).

HWU160	Meaning
0b0	For translations using <a href="#">TTBR1_EL2</a> , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR1_EL2</a> , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR\_EL2.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU159, bit [47]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1\\_EL2](#).

HWU159	Meaning
0b0	For translations using <a href="#">TTBR1_EL2</a> , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR1_EL2</a> , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR\_EL2.HPD1 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU062, bit [46]**

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0\\_EL1](#).

HWU062	Meaning
0b0	For translations using <a href="#">TTBR0_EL1</a> , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR0_EL1</a> , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR\_EL2.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU061, bit [45]**

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0\\_EL1](#).

HWU061	Meaning
0b0	For translations using <a href="#">TTBR0_EL1</a> , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR0_EL1</a> , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR\_EL2.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU060, bit [44]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0\\_EL1](#).

HWU060	Meaning
0b0	For translations using <a href="#">TTBR0_EL1</a> , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR0_EL1</a> , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR\_EL2.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU059, bit [43]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0\\_EL1](#).

HWU059	Meaning
0b0	For translations using <a href="#">TTBR0_EL1</a> , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR0_EL1</a> , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR\_EL2.HPD0 is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HPD1, bit [42]****When FEAT\_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR1\\_EL2](#).

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HPD0, bit [41]****When FEAT\_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0\\_EL2](#).

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HD, bit [40]****When FEAT\_HAFDBS is implemented:**

Hardware management of dirty state in stage 1 translations from EL2.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HA, bit [39]****When FEAT\_HAFDBS is implemented:**

Hardware Access flag update in stage 1 translations from EL2.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TBI1, bit [38]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR1\\_EL2](#) region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state'.

<b>TBI1</b>	<b>Meaning</b>
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR1\\_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT\_PAuth is implemented and TCR\_EL2.TBID1 is 1, then this field only applies to Data accesses.

If the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TBIO, bit [37]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0\\_EL2](#) region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state'.

<b>TBIO</b>	<b>Meaning</b>
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR0\\_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT\_PAuth is implemented and TCR\_EL2.TBID0 is 1, then this field only applies to Data accesses.

If the value of TBIO is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### AS, bit [36]

ASID Size.

<b>AS</b>	<b>Meaning</b>
0b0	8 bit - the upper 8 bits of <a href="#">TTBR0_EL2</a> and <a href="#">TTBR1_EL2</a> are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
0b1	16 bit - the upper 16 bits of <a href="#">TTBR0_EL2</a> and <a href="#">TTBR1_EL2</a> are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [35]

Reserved, RES0.

**IPS, bits [34:32]**

Intermediate Physical Address Size.

IPS	Meaning	Applies when
0b000	32 bits, 4GB.	
0b001	36 bits, 64GB.	
0b010	40 bits, 1TB.	
0b011	42 bits, 4TB.	
0b100	44 bits, 16TB.	
0b101	48 bits, 256TB.	
0b110	52 bits, 4PB.	When FEAT_LPA is implemented

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT\_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR\_EL2 are 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TG1, bits [31:30]**

Granule size for the [TTBR1\\_EL2](#).

TG1	Meaning
0b01	16KB.
0b10	4KB.
0b11	64KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH1, bits [29:28]**

Shareability attribute for memory associated with translation table walks using [TTBR1\\_EL2](#).

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ORGN1, bits [27:26]**

Outer cacheability attribute for memory associated with translation table walks using [TTBR1\\_EL2](#).

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1\\_EL2](#).

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### EPD1, bit [23]

Translation table walk disable for translations using [TTBR1\\_EL2](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1\\_EL2](#). The encoding of this bit is:

EPD1	Meaning
0b0	Perform translation table walks using <a href="#">TTBR1_EL2</a> .
0b1	A TLB miss on an address that is translated using <a href="#">TTBR1_EL2</a> generates a Translation fault. No translation table walk is performed.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### A1, bit [22]

Selects whether [TTBR0\\_EL2](#) or [TTBR1\\_EL2](#) defines the ASID. The encoding of this bit is:

A1	Meaning
0b0	<a href="#">TTBR0_EL2</a> .ASID defines the ASID.
0b1	<a href="#">TTBR1_EL2</a> .ASID defines the ASID.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### T1SZ, bits [21:16]

The size offset of the memory region addressed by [TTBR1\\_EL2](#). The region size is  $2^{(64-T1SZ)}$  bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

**This field resets to an architecturally UNKNOWN value.**

#### Note

For the 4KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

---

For the 16KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TG0, bits [15:14]

Granule size for the [TTBR0\\_EL2](#).

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0\\_EL2](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ORGNO, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL2](#).

ORGNO	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IRGNO, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL2](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### EPD0, bit [7]

Translation table walk disable for translations using [TTBR0\\_EL2](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0\\_EL2](#). The encoding of this bit is:

EPD0	Meaning
0b0	Perform translation table walks using <a href="#">TTBR0_EL2</a> .
0b1	A TLB miss on an address that is translated using <a href="#">TTBR0_EL2</a> generates a Translation fault. No translation table walk is performed.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Bit [6]

Reserved, RES0.

### T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0\\_EL2](#). The region size is  $2^{(64-T0SZ)}$  bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

**This field resets to an architecturally UNKNOWN value.**

#### Note

For the 4KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the TCR\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TCR\_EL2 or TCR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, TCR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return TCR_EL2;
elsif PSTATE.EL == EL3 then
    return TCR_EL2;

```

MSR TCR\_EL2, &lt;Xt&gt;

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TCR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    TCR_EL2 = X[t];

```

MRS &lt;Xt&gt;, TCR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then

The TCR EL3 characteristics are:

## Purpose

The control register for stage 1 of the EL3 translation regime.

## Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to TCR\_EL3 are UNDEFINED.

## Attributes

TCR EL3 is a 64-bit register.

## Field descriptions

The TCR EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33		
										RES0																						
RES1	TCMA	TBID	HWU62	HWU61	HWU60	HWU59	HPD	RES1	HD	HA	TBI	RES0	PS	TG0	SH0	ORGN0	IRGN0	RES0											T0SZ			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1		

Any of the bits in TCR EL3 are permitted to be cached in a TLB.

**Bits [63:3332]**

Reserved, RES0.

**DS, bit [32]**

**When FEAT\_LPA2 is implemented:**

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL3 translation regime.

DS	Meaning
0b0	<p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of TCR_EL3.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p>
0b1	<p>Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] of table translation descriptors hold output address[51:50].</p> <p>The shareability information of block and page descriptors for cacheable locations is determined by TCR_EL3.SH0.</p> <p>The minimum value of TCR_EL3.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of <a href="#">TTBR0_EL3</a> are used to hold bits[51:48] of the output address in all cases.</p>
<p><b>Note</b></p> <p>As FEAT_LVA must be implemented if TCR_EL3.DS == 1, the minimum value of the TCR_EL3.T0SZ field is 12, as determined by that extension.</p> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p>	
<p><b>Note</b></p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p>	

This field is RES0 for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bit [31]

Reserved, RES1.

#### TCMA, bit [30]

When FEAT\_MTE is implemented:

Controls the generation of Unchecked accesses at EL3 when address [59:56] = 0b0000.

TCMA	Meaning
0b0	This control has no effect on the generation of Unchecked accesses.
0b1	All accesses are Unchecked.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TBID, bit [29]****When FEAT\_PAuth is implemented:**

Controls the use of the top byte of instruction addresses for address matching.

TBID	Meaning
0b0	TCR_EL3.TBI applies to Instruction and Data accesses.
0b1	TCR_EL3.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0\\_EL3](#).

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU62, bit [28]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR\_EL3.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU61, bit [27]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR\_EL3.HPD is 0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU60, bit [26]**

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR\_EL3.HPD is 0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU59, bit [25]**

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR\_EL3.HPD is 0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HPD, bit [24]**

**When FEAT\_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0\\_EL3](#).

HPD	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

---

**Note**  
In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

---

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**HD, bit [22]**

**When FEAT\_HAFDBS is implemented:**

Hardware management of dirty state in stage 1 translations from EL3.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HA, bit [21]**

**When FEAT\_HAFDBS is implemented:**

Hardware Access flag update in stage 1 translations from EL3.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TBI, bit [20]**

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0\\_EL3](#) region, or ignored and used for tagged addresses.

<b>TBI</b>	<b>Meaning</b>
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by [TTBR0\\_EL3](#). It has an effect whether the EL3 translation regime is enabled or not.

If FEAT\_PAAuth is implemented and TCR\_EL3.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- An exception return to EL3.

For more information, see 'Address tagging in AArch64 state'.

---

#### Note

This control detrmines the scope of address tagging. It never causes an exception to be generated.

---

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

#### Bit [19]

Reserved, RES0.

#### PS, bits [18:16]

Physical Address Size.

<b>PS</b>	<b>Meaning</b>
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB, ~~and the value~~ FEAT\_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT\_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR\_EL3 are 0b0000.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

#### TG0, bits [15:14]

Granule size for the [TTBR0\\_EL3](#).

<b>TG0</b>	<b>Meaning</b>
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0\\_EL3](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ORGNO, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL3](#).

ORGNO	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## IRGNO, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0\\_EL3](#).

IRGNO	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bits [7:6]

Reserved, RES0.

## T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0\\_EL3](#). The region size is  $2^{(64-T0SZ)}$  bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

~~This field resets to an architecturally UNKNOWN value.~~

### Note

For the 4KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the TCR\_EL3

Accesses to this register use the following encodings:

MRS <Xt>, TCR\_EL3

# TFSR\_EL2, Tag Fault Status Register (EL2)

The TFSR\_EL2 characteristics are:

## Purpose

Holds accumulated Tag Check Faults occurring in EL2 that are not taken precisely.

## Configuration

This register is present only when ~~FEAT\_MTE2~~FEAT MTE is implementedimplemented and ID\_AA64PFR1\_EL1.MTE != 0b0001. Otherwise, direct accesses to TFSR\_EL2 are UNDEFINED.

## Attributes

TFSR\_EL2 is a 64-bit register.

## Field descriptions

The TFSR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32			
																RES0																		
																RES0																TF1		TF0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			

### Bits [63:2]

Reserved, RES0.

### TF1, bit [1]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b1 occurs.  
When [HCR\\_EL2.E2H](#)==0b0, this field is RES0.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### TF0, bit [0]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.  
On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the TFSR\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TFSR\_EL2 or TFSR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.  
Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, TFSR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0110	0b000

# TLBI ALLE1, TLBI ALLE1NXS, TLB Invalidate All, EL1

The TLBI ALLE1, TLBI ALLE1NXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If [SCR\\_EL3.NS](#) is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
- If [SCR\\_EL3.NS](#) is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation only applies to the PE that executes this System instruction.

---

### Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

---

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI ALLE1, TLBI ALLE1NXS is a 64-bit System instruction.

## Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

## Executing the TLBI ALLE1, TLBI ALLE1NXS instruction

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is CONstrained UNpredictable whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to 0b11111.

Accesses to this instruction use the following encodings:

TLBI ALLE1{, &lt;Xt&gt;}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0111	0b100

# TLBI ALLE2OS, TLBI ALLE2OSNXS, TLB Invalidate All, EL2, Outer Shareable

The TLBI ALLE2OS, TLBI ALLE2OSNXS characteristics are:

## Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- If `SCR_EL3.NS` is `01` and the entry would be required to translate an address using the `SecureNon-secure` EL2 or `SecureNon-secure` EL2&0 translation regime.
- If `SCR_EL3.NS` is `10` and the entry would be required to translate an address using the `Non-secureSecure` EL2 or `Non-secureSecure` EL2&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI ALLE2OS, TLBI ALLE2OSNXS are UNDEFINED.

## Attributes

TLBI ALLE2OS, TLBI ALLE2OSNXS is a 64-bit System instruction.

## Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

## Executing the TLBI ALLE2OS, TLBI ALLE2OSNXS instruction

When executing this instruction Xt should be encoded as `0b11111`. If the Xt field is not set to `0b11111`, it is CONstrained UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to `0b11111`.

Accesses to this instruction use the following encodings:

TLBI ALLE2OS{, &lt;Xt&gt;}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0001	0b000

```

# TLBI ALLE3, TLBI ALLE3NXS, TLB Invalidate All, EL3

The TLBI ALLE3, TLBI ALLE3NXS characteristics are:

## Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be required to translate an address using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI ALLE3, TLBI ALLE3NXS is a 64-bit System instruction.

## Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

## Executing the TLBI ALLE3, TLBI ALLE3NXS instruction

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is CONstrained UNpredictable whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to 0b11111.

Accesses to this instruction use the following encodings:

# TLBI ASIDE1, TLBI ASIDE1NXS, TLB Invalidate by ASID, EL1

The TLBI ASIDE1, TLBI ASIDE1NXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate an address using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI ASIDE1, TLBI ASIDE1NXS is a 64-bit System instruction.

## Field descriptions

The TLBI ASIDE1, TLBI ASIDE1NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																RES0															
																RES0															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**ASID, bits [63:48]**

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this System instruction.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**Bits [47:0]**

Reserved, RES0.

**Executing the TLBI ASIDE1 instruction**

Accesses to this instruction use the following encodings:

TLBI ASIDE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0111	0b010

# TLBI ASIDE1OS, TLBI ASIDE1OSNXS, TLB Invalidate by ASID, EL1, Outer Shareable

The TLBI ASIDE1OS, TLBI ASIDE1OSNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate an address using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI ASIDE1OS, TLBI ASIDE1OSNXS are UNDEFINED.

## Attributes

TLBI ASIDE1OS, TLBI ASIDE1OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI ASIDE1OS, TLBI ASIDE1OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
ASID																RES0																
RES0																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

**ASID, bits [63:48]**

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this System instruction.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**Bits [47:0]**

Reserved, RES0.

**Executing the TLBI ASIDE1OS instruction**

Accesses to this instruction use the following encodings:

TLBI ASIDE1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0001	0b010

```

The TLBI IPAS2E1, TLBI IPAS2E1NXS characteristics are:

## Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - `SCR_EL3.NS==1` is 0 and the entry would be required to translate the specified IPA using the `SecureNon-secure` EL1&0 translation regime.
  - `SCR_EL3.NS==0` is 1 and the entry would be required to translate the specified IPA using the `Non-secureSecure` EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI IPAS2E1, TLBI IPAS2E1NXS is a 64-bit System instruction.

## Field descriptions

The TLBI IPAS2E1, TLBI IPAS2E1NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

## NS, bit [63]

### When FEAT\_SEL2 is implemented:

## NS, bit [63]

### When FEAT\_SEL2 is implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT\_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

### Otherwise:

Reserved, RES0.

## Bits [62:48]

Reserved, RES0.

## TTL, bits [47:44]

### When FEAT\_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

### Otherwise:

Reserved, RES0.

**Bits [43:40]**

Reserved, RES0.

**IPA[51:48], bits [39:36]**

When FEAT\_LPA is implemented:

Extension to IPA[47:12]. See IPA[47:12] for more details.

Otherwise:

Reserved, RES0.

**IPA[47:12], bits [35:0]**

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT\_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

**Executing the TLBI IPAS2E1 instruction**

Accesses to this instruction use the following encodings:

TLBI IPAS2E1{, <Xt>}

op0	op1	CRn	CRm	op2

# TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS characteristics are:

## Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR\_EL3.NS==1 is 0 and the entry would be required to translate the specified IPA using the SecureNon-secure EL1&0 translation regime.
  - SCR\_EL3.NS==0 is 1 and the entry would be required to translate the specified IPA using the Non-secureSecure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

# TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS characteristics are:

## Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - SCR\_EL3.NS==1 is 0 and the entry would be required to translate the specified IPA using the SecureNon-secure EL1&0 translation regime.
  - SCR\_EL3.NS==0 is 1 and the entry would be required to translate the specified IPA using the Non-secureSecure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS are UNDEFINED.

## Attributes

TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32							
NS	RES0															TTL					RES0					IPA[51:48]					IPA[47:12]							
IPA[47:12]																																						
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0							

**NS, bit [63]**

**When FEAT\_SEL2 is implemented:**

**NS, bit [63]**

**When FEAT\_SEL2 is implemented:**

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT\_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

**Otherwise:**

Reserved, RES0.

**Bits [62:48]**

Reserved, RES0.

**TTL, bits [47:44]**

**When FEAT\_TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

Extension to IPA[47:12]. See IPA[47:12] for more details.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT\_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2E1OS instruction

Accesses to this instruction use the following encodings:

```
TLBI IPAS2E1OS{, <Xt>}
```

**(new)**

The TLBI IPAS2LE1, TLBI IPAS2LE1NXS characteristics are:

## Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - `SCR_EL3.NS==1` is 0 and the entry would be required to translate the specified IPA using the `SecureNon-secure` EL1&0 translation regime.
  - `SCR_EL3.NS==0` is 1 and the entry would be required to translate the specified IPA using the `Non-secureSecure` EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

    TLBI_ExcludeXS, X[t]);
```

**TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable**

## Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - `SCR_EL3.NS==1` is 0 and the entry would be required to translate the specified IPA using the `SecureNon-secure` EL1&0 translation regime.
  - `SCR_EL3.NS==0` is 1 and the entry would be required to translate the specified IPA using the `Non-secureSecure` EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

# TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS characteristics are:

## Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - SCR\_EL3.NS==1 is 0 and the entry would be required to translate the specified IPA using the SecureNon-secure EL1&0 translation regime.
  - SCR\_EL3.NS==0 is 1 and the entry would be required to translate the specified IPA using the Non-secureSecure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS are UNDEFINED.

## Attributes

TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32							
NS	RES0															TTL					RES0					IPA[51:48]					IPA[47:12]							
IPA[47:12]																																						
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0							

**NS, bit [63]**

**When FEAT\_SEL2 is implemented:**

**NS, bit [63]**

**When FEAT\_SEL2 is implemented:**

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT\_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

**Otherwise:**

Reserved, RES0.

**Bits [62:48]**

Reserved, RES0.

**TTL, bits [47:44]**

**When FEAT\_TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

Extension to IPA[47:12]. See IPA[47:12] for more details.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT\_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2LE1OS instruction

Accesses to this instruction use the following encodings:

TLBI IPAS2LE1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    TLBI_IPAS2LE1OS(X[t]);
elseif PSTATE.EL == EL3 then
    if !EL2Enabled() then
        //no operation
    else
        TLBI_IPAS2LE1OS(X[t]);
```

Executing the TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS instruction

Accesses to this instruction use the following encodings:

TLBI IPAS2LE1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b100

op0	op1	CRn	CRm	op2
0b01	0b100	0b1001	0b0100	0b100

# TLBI RIPAS2E1, TLBI RIPAS2E1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI RIPAS2E1, TLBI RIPAS2E1NXS characteristics are:

## Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - `SCR_EL3.NS==1` is 0 and the entry would be required to translate the specified IPA using the `SecureNon-secure` EL1&0 translation regime.
  - `SCR_EL3.NS==0` is 1 and the entry would be required to translate the specified IPA using the `Non-secureSecure` EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If `TTL==01` and `BaseADDR[29:12]` is not equal to 000000000000000000.
  - If `TTL==10` and `BaseADDR[20:12]` is not equal to 000000000.
- For the 16K translation granule:
  - If `TTL==10` and `BaseADDR[24:14]` is not equal to 00000000000.
- For the 64K translation granule:
  - If `TTL==01` and `BaseADDR[41:16]` is not equal to 00000000000000000000000000000000.
  - If `TTL==10` and `BaseADDR[28:16]` is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2E1, TLBI RIPAS2E1NXS are UNDEFINED.

Attributes

TLBI RIPAS2E1, TLBI RIPAS2E1NXS is a 64-bit System instruction.

Field descriptions

The TLBI RIPAS2E1, TLBI RIPAS2E1NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NS	RES0														TG	SCALE	NUM				TTL	BaseADDR									
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NS, bit [63]

When FEAT\_SEL2 is implemented:

NS, bit [63]

When FEAT\_SEL2 is implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT\_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

## SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

## NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

## TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<del>All</del> When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. <del>If</del> When using a 16KB translation granule, this value is reserved. <del>Hardware should treat this field as</del> FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

## BaseADDR, bits [36:0]

When FEAT\_LPA2 is implemented and TCR\_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

## Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

## Executing the TLBI RIPAS2E1 instruction

Accesses to this instruction use the following encodings:

TLBI RIPAS2E1{, <Xt>}

# TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS characteristics are:

## Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - `SCR_EL3.NS==1` is 0 and the entry would be required to translate the specified IPA using the `SecureNon-secure` EL1&0 translation regime.
  - `SCR_EL3.NS==0` is 1 and the entry would be required to translate the specified IPA using the `Non-secureSecure` EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If `TTL==01` and `BaseADDR[29:12]` is not equal to 000000000000000000.
  - If `TTL==10` and `BaseADDR[20:12]` is not equal to 000000000.
- For the 16K translation granule:
  - If `TTL==10` and `BaseADDR[24:14]` is not equal to 000000000000.
- For the 64K translation granule:
  - If `TTL==01` and `BaseADDR[41:16]` is not equal to 00000000000000000000000000000000.
  - If `TTL==10` and `BaseADDR[28:16]` is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS are UNDEFINED.

## Attributes

TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS is a 64-bit System instruction.

## Field descriptions

The TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

### NS, bit [63]

When FEAT\_SEL2 is implemented:

### NS, bit [63]

When FEAT\_SEL2 is implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT\_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

### Otherwise:

Reserved, RES0.

### Bits [62:48]

Reserved, RES0.

### TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<del>All</del> When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. <del>If</del> When using a 16KB translation granule, this value is reserved. <del>Hardware should treat this field as</del> FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT\_LPA2 is implemented and TCR\_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

# TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS characteristics are:

## Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- One of the following applies:
  - `SCR_EL3.NS==1` is 0 and the entry would be required to translate the specified IPA using the `SecureNon-secure` EL1&0 translation regime.
  - `SCR_EL3.NS==0` is 1 and the entry would be required to translate the specified IPA using the `Non-secureSecure` EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If `TTL==01` and `BaseADDR[29:12]` is not equal to 000000000000000000.
  - If `TTL==10` and `BaseADDR[20:12]` is not equal to 000000000.
- For the 16K translation granule:
  - If `TTL==10` and `BaseADDR[24:14]` is not equal to 000000000000.
- For the 64K translation granule:
  - If `TTL==01` and `BaseADDR[41:16]` is not equal to 00000000000000000000000000000000.
  - If `TTL==10` and `BaseADDR[28:16]` is not equal to 00000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS are UNDEFINED.

## Attributes

TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
NS	RES0														TG	SCALE	NUM				TTL	BaseADDR										
BaseADDR																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

NS, bit [63]

NS, bit [63]

When FEAT\_SEL2 is implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT\_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<del>All</del> When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. <del>If</del> When using a 16KB translation granule, this value is reserved. Hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT\_LPA2 is implemented and TCR\_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RIPAS2E1OS instruction

Accesses to this instruction use the following encodings:

TLBI RIPAS2E1OS{, <Xt>}

op0	op1	CRn	CRm	op2

# TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS characteristics are:

## Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - `SCR_EL3.NS==1` is 0 and the entry would be required to translate the specified IPA using the `SecureNon-secure` EL1&0 translation regime.
  - `SCR_EL3.NS==0` is 1 and the entry would be required to translate the specified IPA using the `Non-secureSecure` EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If `TTL==01` and `BaseADDR[29:12]` is not equal to 000000000000000000.
  - If `TTL==10` and `BaseADDR[20:12]` is not equal to 000000000.
- For the 16K translation granule:
  - If `TTL==10` and `BaseADDR[24:14]` is not equal to 00000000000.
- For the 64K translation granule:
  - If `TTL==01` and `BaseADDR[41:16]` is not equal to 00000000000000000000000000000000.
  - If `TTL==10` and `BaseADDR[28:16]` is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS are UNDEFINED.

# TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS characteristics are:

## Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- One of the following applies:
  - `SCR_EL3.NS == 1` is 0 and the entry would be required to translate the specified IPA using the `SecureNon-secure` EL1&0 translation regime.
  - `SCR_EL3.NS == 0` is 1 and the entry would be required to translate the specified IPA using the `Non-secureSecure` EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If `TTL == 01` and `BaseADDR[29:12]` is not equal to 000000000000000000.
  - If `TTL == 10` and `BaseADDR[20:12]` is not equal to 000000000.
- For the 16K translation granule:
  - If `TTL == 10` and `BaseADDR[24:14]` is not equal to 000000000000.
- For the 64K translation granule:
  - If `TTL == 01` and `BaseADDR[41:16]` is not equal to 00000000000000000000000000000000.
  - If `TTL == 10` and `BaseADDR[28:16]` is not equal to 00000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS are UNDEFINED.

## Attributes

TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS is a 64-bit System instruction.

# TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS characteristics are:

## Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final any level of the translation table walk.
- One of the following applies:
  - SCR\_EL3.NS==1 is 0 and the entry would be required to translate the specified IPA using the SecureNon-secure EL1&0 translation regime.
  - SCR\_EL3.NS==0 is 1 and the entry would be required to translate the specified IPA using the Non-secureSecure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

## Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR\_EL3.EEL2==1, then:

- A PE with SCR\_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR\_EL3.EEL2==0.
- A PE with SCR\_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR\_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

- If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
- If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS are UNDEFINED.

## Attributes

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
NS	RES0														TG	SCALE	NUM					TTL	BaseADDR										
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### NS, bit [63]

When FEAT\_SEL2 is implemented:

### NS, bit [63]

When FEAT\_SEL2 is implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT\_SEL2 is not implemented or is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

### Bits [62:48]

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<del>All</del> When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. <del>If</del> When using a 16KB translation granule, this value is reserved. <del>Hardware should treat this field as</del> FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

**When FEAT\_LPA2 is implemented and TCR\_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RIPAS2LE1OS instruction**

~~Accesses to this instruction use the following encodings:~~

TLBI RIPAS2LE1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b111

```

# TLBI RVAAE1, TLBI RVAAE1NXS, TLB Range Invalidate by VA, All ASID, EL1

The TLBI RVAAE1, TLBI RVAAE1NXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to the PE that executes this System instruction.

### Note

- ~~Global entries.~~
- ~~Non-global entries with any ASID.~~

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both [global entries and non-global entries with any ASID.](#)

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

[If FEAT\\_XS is implemented, the nXS variant of this System instruction is defined.](#)

[Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.](#)

[The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.](#)

Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAAE1, TLBI RVAAE1NXS are UNDEFINED.

Attributes

TLBI RVAAE1, TLBI RVAAE1NXS is a 64-bit System instruction.

Field descriptions

The TLBI RVAAE1, TLBI RVAAE1NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32			
RES0																TG	SCALE	NUM					TTL			BaseADDR								
BaseADDR																																		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	AllWhen using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. IfWhen using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]****When FEAT\_LPA2 is implemented and TCR\_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVAAE1 instruction**

# TLBI RVAAE1IS, TLBI RVAAE1ISNXS, TLB Range Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI RVAAE1IS, TLBI RVAAE1ISNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

### Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If [TTL](#)==01 and [BaseADDR](#)[29:12] is not equal to 000000000000000000.
  - If [TTL](#)==10 and [BaseADDR](#)[20:12] is not equal to 000000000.

TLBI RVAAE1IS, TLBI RVAAE1ISNXS, TLB Range Invalidate by VA, All ASID, EL1, Inner Shareable

- For the 16K translation granule:
  - If  $TTL == 10$  and  $BaseADDR[24:14]$  is not equal to 00000000000.
- For the 64K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[41:16]$  is not equal to 00000000000000000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[28:16]$  is not equal to 0000000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAAE1IS, TLBI RVAAE1ISNXS are UNDEFINED.

## Attributes

TLBI RVAAE1IS, TLBI RVAAE1ISNXS is a 64-bit System instruction.

## Field descriptions

The TLBI RVAAE1IS, TLBI RVAAE1ISNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																TG	SCALE	NUM				TTL		BaseADDR									
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### Bits [63:48]

Reserved, RES0.

### TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

### SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

### NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<del>All</del> When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. <del>If</del> When using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

When FEAT\_LPA2 is implemented and TCR\_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVAAE1IS instruction**

Accesses to this instruction use the following encodings:

TLBI RVAAE1IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0010	0b011

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then

# TLBI RVAAE1OS, TLBI RVAAE1OSNXS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI RVAAE1OS, TLBI RVAAE1OSNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

### Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If [TTL](#)==01 and [BaseADDR](#)[29:12] is not equal to 000000000000000000.
  - If [TTL](#)==10 and [BaseADDR](#)[20:12] is not equal to 000000000.

TLBI RVAAE1OS, TLBI RVAAE1OSNXS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

- For the 16K translation granule:
  - If  $TTL == 10$  and  $BaseADDR[24:14]$  is not equal to 00000000000.
- For the 64K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[41:16]$  is not equal to 00000000000000000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[28:16]$  is not equal to 0000000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAAE1OS, TLBI RVAAE1OSNXS are UNDEFINED.

## Attributes

TLBI RVAAE1OS, TLBI RVAAE1OSNXS is a 64-bit System instruction.

# TLBI RVAALE1, TLBI RVAALE1NXS, TLB Range Invalidate by VA, All ASID, Last level, EL1

The TLBI RVAALE1, TLBI RVAALE1NXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to the PE that executes this System instruction.

### Note

- ~~Global entries.~~
- ~~Non-global entries with any ASID.~~

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both [global entries and non-global entries with any ASID.](#)

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

[If FEAT\\_XS is implemented, the nXS variant of this System instruction is defined.](#)

[Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.](#)

[The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.](#)

Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAALE1, TLBI RVAALE1NXS are UNDEFINED.

Attributes

TLBI RVAALE1, TLBI RVAALE1NXS is a 64-bit System instruction.

Field descriptions

The TLBI RVAALE1, TLBI RVAALE1NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32			
RES0																TG	SCALE	NUM					TTL			BaseADDR								
BaseADDR																																		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	AllWhen using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. IfWhen using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]****When FEAT\_LPA2 is implemented and TCR\_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVAALE1 instruction**

Accesses to this instruction use the following encodings:

TLBI RVAALE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0110	0b111

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TTLB == '1' then

# TLBI RVAALE1IS, TLBI RVAALE1ISNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI RVAALE1IS, TLBI RVAALE1ISNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of SCR\_EL3.NS:
  - If HCR\_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If HCR\_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR\_EL3.EEL2==1, then:

- A PE with SCR\_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR\_EL3.EEL2==0.
- A PE with SCR\_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR\_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

### Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.

- If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAALE1IS, TLBI RVAALE1ISNXS are UNDEFINED.

## Attributes

TLBI RVAALE1IS, TLBI RVAALE1ISNXS is a 64-bit System instruction.

## Field descriptions

The TLBI RVAALE1IS, TLBI RVAALE1ISNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																TG	SCALE	NUM					TTL		BaseADDR								
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### Bits [63:48]

Reserved, RES0.

### TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

### SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<div>When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries.</div> <div>If when using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</div>
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT\_LPA2 is implemented and TCR\_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAALE1IS instruction

Accesses to this instruction use the following encodings:

TLBI RVAALE1IS{, <Xt>}

# TLBI RVAALE1OS, TLBI RVAALE1OSNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBI RVAALE1OS, TLBI RVAALE1OSNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both:

- Global entries.
- Non-global entries with any ASID.

### Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If [TTL](#)==01 and [BaseADDR](#)[29:12] is not equal to 000000000000000000.

- If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAALE1OS, TLBI RVAALE1OSNXS are UNDEFINED.

## Attributes

TLBI RVAALE1OS, TLBI RVAALE1OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI RVAALE1OS, TLBI RVAALE1OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																TG	SCALE	NUM					TTL		BaseADDR								
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### Bits [63:48]

Reserved, RES0.

### TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

### SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<div>When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries.</div> <div>If when using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</div>
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT\_LPA2 is implemented and TCR\_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAALE1OS instruction

Accesses to this instruction use the following encodings:

TLBI RVAALE1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0101	0b111

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TTLB == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.TTLB0S == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);

# TLBI RVAE1, TLBI RVAE1NXS, TLB Range Invalidate by VA, EL1

The TLBI RVAE1, TLBI RVAE1NXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE1, TLBI RVAE1NXS are UNDEFINED.

## Attributes

TLBI RVAE1, TLBI RVAE1NXS is a 64-bit System instruction.

## Field descriptions

The TLBI RVAE1, TLBI RVAE1NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TG	SCALE	NUM					TTL			BaseADDR							
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

### TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

### SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

### NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

### TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<del>All</del> When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. IfWhen using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]****When FEAT\_LPA2 is implemented and TCR\_EL1.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVAE1 instruction**

Accesses to this instruction use the following encodings:

TLBI RVAE1{, <Xt>}

# TLBI RVAE1IS, TLBI RVAE1ISNXS, TLB Range Invalidate by VA, EL1, Inner Shareable

The TLBI RVAE1IS, TLBI RVAE1ISNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If [TTL](#)==01 and [BaseADDR](#)[29:12] is not equal to 000000000000000000.
  - If [TTL](#)==10 and [BaseADDR](#)[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If [TTL](#)==10 and [BaseADDR](#)[24:14] is not equal to 000000000000.

- For the 64K translation granule:
  - If  $TTL==01$  and  $BaseADDR[41:16]$  is not equal to 000000000000000000000000.
  - If  $TTL==10$  and  $BaseADDR[28:16]$  is not equal to 00000000000000.

Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE1IS, TLBI RVAE1ISNXS are UNDEFINED.

Attributes

TLBI RVAE1IS, TLBI RVAE1ISNXS is a 64-bit System instruction.

Field descriptions

The TLBI RVAE1IS, TLBI RVAE1ISNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
ASID																TG	SCALE	NUM					TTL		BaseADDR							
BaseADDR																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If <b>FEAT_LPA2</b> is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

When **FEAT\_LPA2** is implemented and **TCR\_EL1.DS == 1**:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVAE1IS instruction**

Accesses to this instruction use the following encodings:

TLBI RVAE1IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0010	0b001

```

# TLBI RVAE1OS, TLBI RVAE1OSNXS, TLB Range Invalidate by VA, EL1, Outer Shareable

The TLBI RVAE1OS, TLBI RVAE1OSNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If [TTL](#)==01 and [BaseADDR](#)[29:12] is not equal to 000000000000000000.
  - If [TTL](#)==10 and [BaseADDR](#)[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If [TTL](#)==10 and [BaseADDR](#)[24:14] is not equal to 000000000000.

- For the 64K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[41:16]$  is not equal to 000000000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[28:16]$  is not equal to 00000000000000.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE1OS, TLBI RVAE1OSNXS are UNDEFINED.

## Attributes

TLBI RVAE1OS, TLBI RVAE1OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI RVAE1OS, TLBI RVAE1OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

### TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

### SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

### NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

### TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If <b>FEAT_LPA2</b> is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

When **FEAT\_LPA2** is implemented and **TCR\_EL1.DS == 1**:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVAE1OS instruction**

Accesses to this instruction use the following encodings:

# TLBI RVAE2, TLBI RVAE2NXS, TLB Range Invalidate by VA, EL2

The TLBI RVAE2, TLBI RVAE2NXS characteristics are:

## Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula  $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1) * \text{Translation\_Granule\_Size}})]$ , using the EL2 or EL2&0 translation regime.
- If `HCR_EL2.E2H == 0`, the entry is from any level of the translation table walk.
- If `HCR_EL2.E2H == 1`, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If `TTL==01` and `BaseADDR[29:12]` is not equal to 000000000000000000.
  - If `TTL==10` and `BaseADDR[20:12]` is not equal to 0000000000.
- For the 16K translation granule:
  - If `TTL==10` and `BaseADDR[24:14]` is not equal to 000000000000.
- For the 64K translation granule:
  - If `TTL==01` and `BaseADDR[41:16]` is not equal to 00000000000000000000000000000000.
  - If `TTL==10` and `BaseADDR[28:16]` is not equal to 0000000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE2, TLBI RVAE2NXS are UNDEFINED.

Attributes

TLBI RVAE2, TLBI RVAE2NXS is a 64-bit System instruction.

Field descriptions

The TLBI RVAE2, TLBI RVAE2NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32			
ASID																TG	SCALE	NUM					TTL			BaseADDR								
BaseADDR																																		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			

ASID, bits [63:48]

When HCR\_EL2.E2H == 1:

ASID, bits [63:48]

When HCR\_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. When using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

When FEAT\_LPA2 is implemented and TCR\_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVAE2 instruction**

# TLBI RVAE2IS, TLBI RVAE2ISNXS, TLB Range Invalidate by VA, EL2, Inner Shareable

The TLBI RVAE2IS, TLBI RVAE2ISNXS characteristics are:

## Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ , using the EL2 or EL2&0 translation regime,  $(5 * SCALE + 1) * Translation\_Granule\_Size]$ , using the EL2 or EL2&0 translation regime.
- If `HCR_EL2.E2H == 0`, the entry is from any level of the translation table walk.
- If `HCR_EL2.E2H == 1`, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If `TTL==01` and `BaseADDR[29:12]` is not equal to `000000000000000000`.
  - If `TTL==10` and `BaseADDR[20:12]` is not equal to `0000000000`.
- For the 16K translation granule:
  - If `TTL==10` and `BaseADDR[24:14]` is not equal to `000000000000`.
- For the 64K translation granule:
  - If `TTL==01` and `BaseADDR[41:16]` is not equal to `00000000000000000000000000000000`.
  - If `TTL==10` and `BaseADDR[28:16]` is not equal to `00000000000000`.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE2IS, TLBI RVAE2ISNXS are UNDEFINED.

Attributes

TLBI RVAE2IS, TLBI RVAE2ISNXXS is a 64-bit System instruction.

Field descriptions

The TLBI RVAE2IS, TLBI RVAE2ISNXXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

ASID, bits [63:48]

When HCR\_EL2.E2H == 1:

ASID, bits [63:48]

When HCR\_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. When using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

When FEAT\_LPA2 is implemented and TCR\_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

# TLBI RVAE2OS, TLBI RVAE2OSNXS, TLB Range Invalidate by VA, EL2, Outer Shareable

The TLBI RVAE2OS, TLBI RVAE2OSNXS characteristics are:

## Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula  $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1) * \text{Translation\_Granule\_Size}})]$ , using the EL2 or EL2&0 translation regime,  $(5 * \text{SCALE} + 1) * \text{Translation\_Granule\_Size}$ , using the EL2 or EL2&0 translation regime.
- If `HCR_EL2.E2H == 0`, the entry is from any level of the translation table walk.
- If `HCR_EL2.E2H == 1`, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If `TTL==01` and `BaseADDR[29:12]` is not equal to `000000000000000000`.
  - If `TTL==10` and `BaseADDR[20:12]` is not equal to `0000000000`.
- For the 16K translation granule:
  - If `TTL==10` and `BaseADDR[24:14]` is not equal to `000000000000`.
- For the 64K translation granule:
  - If `TTL==01` and `BaseADDR[41:16]` is not equal to `00000000000000000000000000000000`.
  - If `TTL==10` and `BaseADDR[28:16]` is not equal to `00000000000000`.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE2OS, TLBI RVAE2OSNXS are UNDEFINED.

Attributes

TLBI RVAE2OS, TLBI RVAE2OSNXS is a 64-bit System instruction.

Field descriptions

The TLBI RVAE2OS, TLBI RVAE2OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TG	SCALE	NUM					TTL		BaseADDR								
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

ASID, bits [63:48]

When HCR\_EL2.E2H == 1:

ASID, bits [63:48]

When HCR\_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<p>All entries to invalidate are Level 1 translation table entries.</p> <p>If <b>FEAT_LPA2</b> is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</p>
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

**When FEAT\_LPA2 is implemented and TCR\_EL2.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVAE2OS instruction**

Accesses to this instruction use the following encodings:

# TLBI RVAE3, TLBI RVAE3NXS, TLB Range Invalidate by VA, EL3

The TLBI RVAE3, TLBI RVAE3NXS characteristics are:

## Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[29:12]$  is not equal to 000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[20:12]$  is not equal to 000000000.
- For the 16K translation granule:
  - If  $TTL == 10$  and  $BaseADDR[24:14]$  is not equal to 00000000000.
- For the 64K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[41:16]$  is not equal to 00000000000000000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[28:16]$  is not equal to 0000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE3, TLBI RVAE3NXS are UNDEFINED.

## Attributes

TLBI RVAE3, TLBI RVAE3NXS is a 64-bit System instruction.

## Field descriptions

The TLBI RVAE3, TLBI RVAE3NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:48]**

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<del>All</del> When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. <del>If</del> When using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

**When FEAT\_LPA2 is implemented and TCR\_EL3.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

# TLBI RVAE3IS, TLBI RVAE3ISNXXS, TLB Range Invalidate by VA, EL3, Inner Shareable

The TLBI RVAE3IS, TLBI RVAE3ISNXXS characteristics are:

## Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[29:12]$  is not equal to 00000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[20:12]$  is not equal to 0000000000.
- For the 16K translation granule:
  - If  $TTL == 10$  and  $BaseADDR[24:14]$  is not equal to 000000000000.
- For the 64K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[41:16]$  is not equal to 00000000000000000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[28:16]$  is not equal to 00000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE3IS, TLBI RVAE3ISNXXS are UNDEFINED.

## Attributes

TLBI RVAE3IS, TLBI RVAE3ISNXXS is a 64-bit System instruction.

## Field descriptions

The TLBI RVAE3IS, TLBI RVAE3ISNXXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:48]**

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<del>All</del> When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. <del>If</del> When using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

**When FEAT\_LPA2 is implemented and TCR\_EL3.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

## Executing the TLBI RVAE3IS instruction

Accesses to this instruction use the following encodings:

# TLBI RVAE3OS, TLBI RVAE3OSNXS, TLB Range Invalidate by VA, EL3, Outer Shareable

The TLBI RVAE3OS, TLBI RVAE3OSNXS characteristics are:

## Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[29:12]$  is not equal to 000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[20:12]$  is not equal to 000000000.
- For the 16K translation granule:
  - If  $TTL == 10$  and  $BaseADDR[24:14]$  is not equal to 00000000000.
- For the 64K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[41:16]$  is not equal to 00000000000000000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[28:16]$  is not equal to 0000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE3OS, TLBI RVAE3OSNXS are UNDEFINED.

## Attributes

TLBI RVAE3OS, TLBI RVAE3OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI RVAE3OS, TLBI RVAE3OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:48]**

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<del>All</del> When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. <del>If</del> When using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

**When FEAT\_LPA2 is implemented and TCR\_EL3.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

## Executing the TLBI RVAE3OS instruction

# TLBI RVALE1, TLBI RVALE1NXS, TLB Range Invalidate by VA, Last level, EL1

The TLBI RVALE1, TLBI RVALE1NXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[29:12]$  is not equal to 000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[20:12]$  is not equal to 000000000.
- For the 16K translation granule:
  - If  $TTL == 10$  and  $BaseADDR[24:14]$  is not equal to 00000000000.
- For the 64K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[41:16]$  is not equal to 00000000000000000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[28:16]$  is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE1, TLBI RVALE1NXS are UNDEFINED.

Attributes

TLBI RVALE1, TLBI RVALE1NXS is a 64-bit System instruction.

Field descriptions

The TLBI RVALE1, TLBI RVALE1NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TG	SCALE	NUM					TTL		BaseADDR								
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. When using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

When FEAT\_LPA2 is implemented and TCR\_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVALE1 instruction**

Accesses to this instruction use the following encodings:

TLBI RVALE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0110	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

# TLBI RVALE1IS, TLBI RVALE1ISNXS, TLB Range Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI RVALE1IS, TLBI RVALE1ISNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If [TTL](#)==01 and [BaseADDR](#)[29:12] is not equal to 000000000000000000.
  - If [TTL](#)==10 and [BaseADDR](#)[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If [TTL](#)==10 and [BaseADDR](#)[24:14] is not equal to 00000000000.
- For the 64K translation granule:

- If  $TTL == 01$  and  $BaseADDR[41:16]$  is not equal to 000000000000000000000000.
- If  $TTL == 10$  and  $BaseADDR[28:16]$  is not equal to 00000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE1IS, TLBI RVALE1ISNXS are UNDEFINED.

## Attributes

TLBI RVALE1IS, TLBI RVALE1ISNXS is a 64-bit System instruction.

## Field descriptions

The TLBI RVALE1IS, TLBI RVALE1ISNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TG	SCALE	NUM						TTL		BaseADDR							
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

### TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

### SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

### NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<del>All</del> When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. <del>If</del> When using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

When FEAT\_LPA2 is implemented and TCR\_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVALE1IS instruction**

Accesses to this instruction use the following encodings:

TLBI RVALE1IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0010	0b101

```

if PSTATE.EL == EL0 then

# TLBI RVALE1OS, TLBI RVALE1OSNXS, TLB Range Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI RVALE1OS, TLBI RVALE1OSNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If [TTL](#)==01 and [BaseADDR](#)[29:12] is not equal to 000000000000000000.
  - If [TTL](#)==10 and [BaseADDR](#)[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If [TTL](#)==10 and [BaseADDR](#)[24:14] is not equal to 00000000000.
- For the 64K translation granule:

TLBI RVALE1OS, TLBI RVALE1OSNXS, TLB Range Invalidate by VA, Last level, EL1, Outer Shareable

- If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
- If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE1OS, TLBI RVALE1OSNXS are UNDEFINED.

## Attributes

TLBI RVALE1OS, TLBI RVALE1OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI RVALE1OS, TLBI RVALE1OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TG	SCALE	NUM				TTL		BaseADDR									
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

### TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

### SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

### NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<del>All</del> When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. <del>If</del> When using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

When FEAT\_LPA2 is implemented and TCR\_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVALE1OS instruction**

Accesses to this instruction use the following encodings:

TLBI RVALE1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0101	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TTLB == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.TTLB0S == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);

# TLBI RVALE2, TLBI RVALE2NXS, TLB Range Invalidate by VA, Last level, EL2

The TLBI RVALE2, TLBI RVALE2NXS characteristics are:

## Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula  $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1) * \text{Translation\_Granule\_Size}})]$  using the EL2 or EL2&0 translation regime,  $(5 * \text{SCALE} + 1) * \text{Translation\_Granule\_Size}]$  using the EL2 or EL2&0 translation regime.
- If `HCR_EL2.E2H == 0`, the entry is from the final level of the translation table walk.
- If `HCR_EL2.E2H == 1`, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If `TTL==01` and `BaseADDR[29:12]` is not equal to 00000000000000000000.
  - If `TTL==10` and `BaseADDR[20:12]` is not equal to 0000000000.
- For the 16K translation granule:
  - If `TTL==10` and `BaseADDR[24:14]` is not equal to 000000000000.
- For the 64K translation granule:
  - If `TTL==01` and `BaseADDR[41:16]` is not equal to 00000000000000000000000000000000.
  - If `TTL==10` and `BaseADDR[28:16]` is not equal to 00000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE2, TLBI RVALE2NXS are UNDEFINED.

Attributes

TLBI RVALE2, TLBI RVALE2NXS is a 64-bit System instruction.

Field descriptions

The TLBI RVALE2, TLBI RVALE2NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TG	SCALE	NUM					TTL		BaseADDR								
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

ASID, bits [63:48]

When HCR\_EL2.E2H == 1:

ASID, bits [63:48]

When HCR\_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<p>All entries to invalidate are Level 1 translation table entries.</p> <p>If when using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.</p>
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

When FEAT\_LPA2 is implemented and TCR\_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVALE2 instruction**

# TLBI RVALE2IS, TLBI RVALE2ISNXS, TLB Range Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI RVALE2IS, TLBI RVALE2ISNXS characteristics are:

## Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula  $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1) * \text{Translation\_Granule\_Size}})]$  using the EL2 or EL2&0 translation regime,  $(5 * \text{SCALE} + 1) * \text{Translation\_Granule\_Size}]$  using the EL2 or EL2&0 translation regime.
- If `HCR_EL2.E2H == 0`, the entry is from the final level of the translation table walk.
- If `HCR_EL2.E2H == 1`, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If `TTL==01` and `BaseADDR[29:12]` is not equal to 000000000000000000.
  - If `TTL==10` and `BaseADDR[20:12]` is not equal to 0000000000.
- For the 16K translation granule:
  - If `TTL==10` and `BaseADDR[24:14]` is not equal to 000000000000.
- For the 64K translation granule:
  - If `TTL==01` and `BaseADDR[41:16]` is not equal to 00000000000000000000000000000000.
  - If `TTL==10` and `BaseADDR[28:16]` is not equal to 0000000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE2IS, TLBI RVALE2ISNXS are UNDEFINED.

## Attributes

TLBI RVALE2IS, TLBI RVALE2ISNXXS is a 64-bit System instruction.

## Field descriptions

The TLBI RVALE2IS, TLBI RVALE2ISNXXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ASID, bits [63:48]

When HCR\_EL2.E2H == 1:

### ASID, bits [63:48]

When HCR\_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

### Otherwise:

Reserved, RES0.

### TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

### SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

### NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

### TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If <b>FEAT_LPA2</b> is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

When **FEAT\_LPA2** is implemented and **TCR\_EL2.DS == 1**:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVALE2IS instruction**

Accesses to this instruction use the following encodings:

TLBI RVALE2IS{, <Xt>}

# TLBI RVALE2OS, TLBI RVALE2OSNXS, TLB Range Invalidate by VA, Last level, EL2, Outer Shareable

The TLBI RVALE2OS, TLBI RVALE2OSNXS characteristics are:

## Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula  $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1) * \text{Translation\_Granule\_Size}})]$  using the EL2 or EL2&0 translation regime,  $(5 * \text{SCALE} + 1) * \text{Translation\_Granule\_Size}]$  using the EL2 or EL2&0 translation regime.
- If `HCR_EL2.E2H == 0`, the entry is from the final level of the translation table walk.
- If `HCR_EL2.E2H == 1`, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If `TTL==01` and `BaseADDR[29:12]` is not equal to 000000000000000000.
  - If `TTL==10` and `BaseADDR[20:12]` is not equal to 0000000000.
- For the 16K translation granule:
  - If `TTL==10` and `BaseADDR[24:14]` is not equal to 000000000000.
- For the 64K translation granule:
  - If `TTL==01` and `BaseADDR[41:16]` is not equal to 00000000000000000000000000000000.
  - If `TTL==10` and `BaseADDR[28:16]` is not equal to 0000000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE2OS, TLBI RVALE2OSNXS are UNDEFINED.

Attributes

TLBI RVALE2OS, TLBI RVALE2OSNXS is a 64-bit System instruction.

Field descriptions

The TLBI RVALE2OS, TLBI RVALE2OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ASID, bits [63:48]

When HCR\_EL2.E2H == 1:

ASID, bits [63:48]

When HCR\_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If <b>FEAT_LPA2</b> is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

**When FEAT\_LPA2 is implemented and TCR\_EL2.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

**Executing the TLBI RVALE2OS instruction**

# TLBI RVALE3, TLBI RVALE3NXS, TLB Range Invalidate by VA, Last level, EL3

The TLBI RVALE3, TLBI RVALE3NXS characteristics are:

## Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[29:12]$  is not equal to 000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[20:12]$  is not equal to 000000000.
- For the 16K translation granule:
  - If  $TTL == 10$  and  $BaseADDR[24:14]$  is not equal to 00000000000.
- For the 64K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[41:16]$  is not equal to 00000000000000000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[28:16]$  is not equal to 0000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

# TLBI RVALE3IS, TLBI RVALE3ISNXS, TLB Range Invalidate by VA, Last level, EL3, Inner Shareable

The TLBI RVALE3IS, TLBI RVALE3ISNXS characteristics are:

## Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[29:12]$  is not equal to 000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[20:12]$  is not equal to 000000000.
- For the 16K translation granule:
  - If  $TTL == 10$  and  $BaseADDR[24:14]$  is not equal to 00000000000.
- For the 64K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[41:16]$  is not equal to 00000000000000000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[28:16]$  is not equal to 00000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE3IS, TLBI RVALE3ISNXS are UNDEFINED.

## Attributes

TLBI RVALE3IS, TLBI RVALE3ISNXS is a 64-bit System instruction.

## Field descriptions

The TLBI RVALE3IS, TLBI RVALE3ISNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## Bits [63:48]

Reserved, RES0.

## TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

## SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

## NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

## TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<del>All</del> When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. <del>If</del> When using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

## BaseADDR, bits [36:0]

**When FEAT\_LPA2 is implemented and TCR\_EL3.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

## Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

## Executing the TLBI RVALE3IS instruction

Accesses to this instruction use the following encodings:

TLBI RVALE3IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0010	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TLBI_RVALE3IS(X[t]);
```

## Executing the TLBI RVALE3IS, TLBI RVALE3ISNXS instruction

Accesses to this instruction use the following encodings:

TLBI RVALE3IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0010	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TLBI_RVA(SecurityStateAtEL(EL3), Regime_EL3, VMID[], Shareability_Inner, TLBIlevel_Last,
    TLBI_AllAttr, X[t]);
```

TLBI RVALE3ISNXS{, <Xt>}

op0	op1	CRn	CRm	op2

# TLBI RVALE3OS, TLBI RVALE3OSNXS, TLB Range Invalidate by VA, Last level, EL3, Outer Shareable

The TLBI RVALE3OS, TLBI RVALE3OSNXS characteristics are:

## Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula  $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1) * Translation\_Granule\_Size})]$ .

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[29:12]$  is not equal to 00000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[20:12]$  is not equal to 0000000000.
- For the 16K translation granule:
  - If  $TTL == 10$  and  $BaseADDR[24:14]$  is not equal to 000000000000.
- For the 64K translation granule:
  - If  $TTL == 01$  and  $BaseADDR[41:16]$  is not equal to 00000000000000000000000000000000.
  - If  $TTL == 10$  and  $BaseADDR[28:16]$  is not equal to 00000000000000.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE3OS, TLBI RVALE3OSNXS are UNDEFINED.

## Attributes

TLBI RVALE3OS, TLBI RVALE3OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI RVALE3OS, TLBI RVALE3OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:48]**

Reserved, RES0.

**TG, bits [47:46]**

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

**SCALE, bits [45:44]**

The exponent element of the calculation that is used to produce the upper range.

**NUM, bits [43:39]**

The base element of the calculation that is used to produce the upper range.

**TTL, bits [38:37]**

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	<del>All</del> When using a 4KB or 64KB translation granule, all entries to invalidate are Level 1 translation table entries. <del>If</del> When using a 16KB translation granule, this value is reserved and hardware should treat this field as FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

**BaseADDR, bits [36:0]**

**When FEAT\_LPA2 is implemented and TCR\_EL3.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

**Otherwise:**

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

## Executing the TLBI RVALE3OS instruction

Accesses to this instruction use the following encodings:

TLBI RVALE3OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0101	0b101

```
if PSTATE.EL == EL0 then

# TLBI VAAE1, TLBI VAAE1NXS, TLB Invalidate by VA, All ASID, EL1

The TLBI VAAE1, TLBI VAAE1NXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

### Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VAAE1, TLBI VAAE1NXS is a 64-bit System instruction.

## Field descriptions

The TLBI VAAE1, TLBI VAAE1NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TTL				VA[55:12]											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When FEAT\_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAAE1 instruction**

Accesses to this instruction use the following encodings:

TLBI VAAE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0111	0b011

```

# TLBI VAAE1IS, TLBI VAAE1ISNXS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI VAAE1IS, TLBI VAAE1ISNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

---

### Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

~~For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.~~

---

### Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VAAE1IS, TLBI VAAE1ISNXS is a 64-bit System instruction.

## Field descriptions

The TLBI VAAE1IS, TLBI VAAE1ISNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																TTL			VA[55:12]													
VA[55:12]																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### Bits [63:48]

Reserved, RES0.

### TTL, bits [47:44]

When FEAT\_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAAE1IS instruction**

Accesses to this instruction use the following encodings:

TLBI VAAE1IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0011	0b011

```

# TLBI VAAE1OS, TLBI VAAE1OSNXS, TLB Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI VAAE1OS, TLBI VAAE1OSNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

---

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

~~For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.~~

---

### Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAAE1OS, TLBI VAAE1OSNXS are UNDEFINED.

## Attributes

TLBI VAAE1OS, TLBI VAAE1OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI VAAE1OS, TLBI VAAE1OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																TTL				VA[55:12]													
VA[55:12]																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### Bits [63:48]

Reserved, RES0.

### TTL, bits [47:44]

When FEAT\_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

### Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAAE1OS instruction**

Accesses to this instruction use the following encodings:

TLBI VAAE1OS{, <Xt>}

# TLBI VAALE1, TLBI VAALE1NXS, TLB Invalidate by VA, All ASID, Last level, EL1

The TLBI VAALE1, TLBI VAALE1NXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

### Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VAALE1, TLBI VAALE1NXS is a 64-bit System instruction.

## Field descriptions

The TLBI VAALE1, TLBI VAALE1NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TTL				VA[55:12]											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:48]**

Reserved, RES0.

**TTL, bits [47:44]**

When FEAT\_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAALE1 instruction**

Accesses to this instruction use the following encodings:

TLBI VAALE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0111	0b111

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TTLB == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.TLBIVAALE1 == '1'
then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.FB == '1' then
        TLBI_VAALE1IS(X[t]);
    else
        TLBI_VAALE1(X[t]);
elsif PSTATE.EL == EL2 then
    TLBI_VAALE1(X[t]);
elsif PSTATE.EL == EL3 then
    TLBI_VAALE1(X[t]);

```

## Executing the TLBI VAALE1, TLBI VAALE1NXS instruction

Accesses to this instruction use the following encodings:

TLBI VAALE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0111	0b111

```

if PSTATE.EL == EL0 then
    UNDEFINED;

# TLBI VAALE1IS, TLBI VAALE1ISNXS, TLB Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI VAALE1IS, TLBI VAALE1ISNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

---

### Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

~~For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.~~

---

### Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VAALE1IS, TLBI VAALE1ISNXS is a 64-bit System instruction.

## Field descriptions

The TLBI VAALE1IS, TLBI VAALE1ISNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																TTL				VA[55:12]													
VA[55:12]																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### Bits [63:48]

Reserved, RES0.

### TTL, bits [47:44]

When FEAT\_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAALE1IS instruction**

Accesses to this instruction use the following encodings:

TLBI VAALE1IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0011	0b111

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

# TLBI VAALE1OS, TLBI VAALE1OSNXS, TLB Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBI VAALE1OS, TLBI VAALE1OSNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

---

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

~~For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.~~

---

### Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAALE1OS, TLBI VAALE1OSNXS are UNDEFINED.

## Attributes

TLBI VAALE1OS, TLBI VAALE1OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI VAALE1OS, TLBI VAALE1OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																TTL			VA[55:12]													
VA[55:12]																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### Bits [63:48]

Reserved, RES0.

### TTL, bits [47:44]

When FEAT\_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

### Otherwise:

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAALE1OS instruction**

Accesses to this instruction use the following encodings:

TLBI VAALE1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0001	0b111

```

# TLBI VAE1, TLBI VAE1NXS, TLB Invalidate by VA, EL1

The TLBI VAE1, TLBI VAE1NXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VAE1, TLBI VAE1NXS is a 64-bit System instruction.

## Field descriptions

The TLBI VAE1, TLBI VAE1NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL		VA[55:12]													
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TTL, bits [47:44]****When FEAT\_TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

## Executing the TLBI VAE1 instruction

Accesses to this instruction use the following encodings:

TLBI VAE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0111	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

# TLBI VAE1IS, TLBI VAE1ISNXS, TLB Invalidate by VA, EL1, Inner Shareable

The TLBI VAE1IS, TLBI VAE1ISNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

---

### Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
  - A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
  - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
- 

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VAE1IS, TLBI VAE1ISNXXS is a 64-bit System instruction.

## Field descriptions

The TLBI VAE1IS, TLBI VAE1ISNXXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL			VA[55:12]												
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

### TTL, bits [47:44]

**When FEAT\_TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE1IS instruction**

Accesses to this instruction use the following encodings:

TLBI VAE1IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0011	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

# TLBI VAE1OS, TLBI VAE1OSNXS, TLB Invalidate by VA, EL1, Outer Shareable

The TLBI VAE1OS, TLBI VAE1OSNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If [FEAT\\_XS](#) is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when [FEAT\\_TLBIOS](#) is implemented. Otherwise, direct accesses to TLBI VAE1OS, TLBI VAE1OSNXS are UNDEFINED.

## Attributes

TLBI VAE1OS, TLBI VAE1OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI VAE1OS, TLBI VAE1OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL			VA[55:12]												
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

### TTL, bits [47:44]

**When FEAT\_TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VAE1OS instruction**

Accesses to this instruction use the following encodings:

TLBI VAE1OS{, <Xt>}

op0	op1	CRn	CRm	op2

# TLBI VAE2, TLBI VAE2NXS, TLB Invalidate by VA, EL2

The TLBI VAE2, TLBI VAE2NXS characteristics are:

## Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or the EL2&0 translation regime.
- If [HCR\\_EL2.E2H == 0](#), the entry is from any level of the translation table walk.
- If [HCR\\_EL2.E2H == 1](#), one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VAE2, TLBI VAE2NXS is a 64-bit System instruction.

## Field descriptions

The TLBI VAE2, TLBI VAE2NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL				VA[55:12]											
																VA[55:12]															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

## TTL, bits [47:44]

### When FEAT\_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

### Otherwise:

Reserved, RES0.

## VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

## Executing the TLBI VAE2 instruction

Accesses to this instruction use the following encodings:

TLBI VAE2{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0111	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

# TLBI VAE2IS, TLBI VAE2ISNXS, TLB Invalidate by VA, EL2, Inner Shareable

The TLBI VAE2IS, TLBI VAE2ISNXS characteristics are:

## Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or the EL2&0 translation regime.
- If [HCR\\_EL2.E2H == 0](#), the entry is from any level of the translation table walk.
- If [HCR\\_EL2.E2H == 1](#), one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VAE2IS, TLBI VAE2ISNXS is a 64-bit System instruction.

## Field descriptions

The TLBI VAE2IS, TLBI VAE2ISNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL		VA[55:12]													
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

## TTL, bits [47:44]

### When FEAT\_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

### Otherwise:

Reserved, RES0.

## VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

## Executing the TLBI VAE2IS instruction

Accesses to this instruction use the following encodings:

TLBI VAE2IS{, <Xt>}

# TLBI VAE2OS, TLBI VAE2OSNXS, TLB Invalidate by VA, EL2, Outer Shareable

The TLBI VAE2OS, TLBI VAE2OSNXS characteristics are:

## Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or the EL2&0 translation regime.
- If [HCR\\_EL2.E2H](#) == 0, the entry is from any level of the translation table walk.
- If [HCR\\_EL2.E2H](#) == 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk and matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAE2OS, TLBI VAE2OSNXS are UNDEFINED.

## Attributes

TLBI VAE2OS, TLBI VAE2OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI VAE2OS, TLBI VAE2OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL				VA[55:12]											
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**ASID, bits [63:48]****When HCR\_EL2.E2H == 1:****ASID, bits [63:48]****When HCR\_EL2.E2H == 1:**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**Otherwise:**

Reserved, RES0.

**TTL, bits [47:44]****When FEAT\_TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : <del>If Reserved. Treat as if TTL&lt;3:2&gt; is</del> FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : <del>If Reserved. Treat as if TTL&lt;3:2&gt; is</del> FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

## Executing the TLBI VAE2OS instruction

Accesses to this instruction use the following encodings:

TLBI VAE2OS{, <Xt>}

# TLBI VAE3, TLBI VAE3NXS, TLB Invalidate by VA, EL3

The TLBI VAE3, TLBI VAE3NXS characteristics are:

## Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VAE3, TLBI VAE3NXS is a 64-bit System instruction.

## Field descriptions

The TLBI VAE3, TLBI VAE3NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																TTL			VA[55:12]													
VA[55:12]																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### Bits [63:48]

Reserved, RES0.

### TTL, bits [47:44]

When FEAT\_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

#### Otherwise:

Reserved, RES0.

#### VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

## Executing the TLBI VAE3 instruction

Accesses to this instruction use the following encodings:

TLBI VAE3{, <Xt>}

op0	op1	CRn	CRm	op2

# TLBI VAE3OS, TLBI VAE3OSNXS, TLB Invalidate by VA, EL3, Outer Shareable

The TLBI VAE3OS, TLBI VAE3OSNXS characteristics are:

## Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAE3OS, TLBI VAE3OSNXS are UNDEFINED.

## Attributes

TLBI VAE3OS, TLBI VAE3OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI VAE3OS, TLBI VAE3OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TTL				VA[55:12]											
																VA[55:12]															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:48]

Reserved, RES0.

### TTL, bits [47:44]

When FEAT\_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

#### Otherwise:

Reserved, RES0.

#### VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

# TLBI VALE1, TLBI VALE1NXS, TLB Invalidate by VA, Last level, EL1

The TLBI VALE1, TLBI VALE1NXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VALE1, TLBI VALE1NXS is a 64-bit System instruction.

## Field descriptions

The TLBI VALE1, TLBI VALE1NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL				VA[55:12]											
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**ASID, bits [63:48]**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**TTL, bits [47:44]****When FEAT\_TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : <del>If Reserved. Treat as if TTL&lt;3:2&gt; is</del> FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : <del>If Reserved. Treat as if TTL&lt;3:2&gt; is</del> FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

## Executing the TLBI VALE1 instruction

Accesses to this instruction use the following encodings:

TLBI VALE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0111	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TTLB == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.TLBIVALE1 == '1'
then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.FB == '1' then
        TLBI_VALE1IS(X[t]);
    else
        TLBI_VALE1(X[t]);
elsif PSTATE.EL == EL2 then
    TLBI_VALE1(X[t]);
elsif PSTATE.EL == EL3 then
    TLBI_VALE1(X[t]);

```

## Executing the TLBI VALE1, TLBI VALE1NXS instruction

Accesses to this instruction use the following encodings:

TLBI VALE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0111	0b101

```

# TLBI VALE1IS, TLBI VALE1ISNXS, TLB Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI VALE1IS, TLBI VALE1ISNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

### Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VALE1IS, **TLBI VALE1ISNXS** is a 64-bit System instruction.

## Field descriptions

The TLBI VALE1IS, **TLBI VALE1ISNXS** input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL		VA[55:12]													
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

### TTL, bits [47:44]

**When FEAT\_TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : <b>If Reserved. Treat as if TTL&lt;3:2&gt; is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00.</b> 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : <b>If Reserved. Treat as if TTL&lt;3:2&gt; is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL&lt;3:2&gt; is 0b00.</b> 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE1IS instruction**

Accesses to this instruction use the following encodings:

TLBI VALE1IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0011	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then

# TLBI VALE1OS, TLBI VALE1OSNXS, TLB Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI VALE1OS, TLBI VALE1OSNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or [is](#) disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If [FEAT\\_XS](#) is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when [FEAT\\_TLBIOS](#) is implemented. Otherwise, direct accesses to TLBI VALE1OS, TLBI VALE1OSNXS are UNDEFINED.

## Attributes

TLBI VALE1OS, TLBI VALE1OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI VALE1OS, TLBI VALE1OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL		VA[55:12]													
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

### TTL, bits [47:44]

**When FEAT\_TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

**Executing the TLBI VALE1OS instruction**

Accesses to this instruction use the following encodings:

TLBI VALE1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0001	0b101

```

if PSTATE.EL == EL0 then

# TLBI VALE2, TLBI VALE2NXS, TLB Invalidate by VA, Last level, EL2

The TLBI VALE2, TLBI VALE2NXS characteristics are:

## Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If [HCR\\_EL2.E2H](#) == 0, the entry is from the final level of the translation table walk.
- If [HCR\\_EL2.E2H](#) == 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to the PE that executes this System instruction.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VALE2, TLBI VALE2NXS is a 64-bit System instruction.

## Field descriptions

The TLBI VALE2, TLBI VALE2NXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL				VA[55:12]											
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**ASID, bits [63:48]****When HCR\_EL2.E2H == 1:****ASID, bits [63:48]****When HCR\_EL2.E2H == 1:**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**Otherwise:**

Reserved, RES0.

**TTL, bits [47:44]****When FEAT\_TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : <del>If Reserved. Treat as if TTL&lt;3:2&gt; is</del> FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : <del>If Reserved. Treat as if TTL&lt;3:2&gt; is</del> FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

## Executing the TLBI VALE2 instruction

Accesses to this instruction use the following encodings:

TLBI VALE2{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0111	0b101

```

if PSTATE.EL == EL0 then

# TLBI VALE2IS, TLBI VALE2ISNXS, TLB Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI VALE2IS, TLBI VALE2ISNXS characteristics are:

## Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If [HCR\\_EL2.E2H](#) == 0, the entry is from the final level of the translation table walk.
- If [HCR\\_EL2.E2H](#) == 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VALE2IS, TLBI VALE2ISNXS is a 64-bit System instruction.

## Field descriptions

The TLBI VALE2IS, TLBI VALE2ISNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL				VA[55:12]											
																VA[55:12]															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

## TTL, bits [47:44]

### When FEAT\_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

### Otherwise:

Reserved, RES0.

## VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

## Executing the TLBI VALE2IS instruction

Accesses to this instruction use the following encodings:

TLBI VALE2IS{, <Xt>}

# TLBI VALE2OS, TLBI VALE2OSNXS, TLB Invalidate by VA, Last level, EL2, Outer Shareable

The TLBI VALE2OS, TLBI VALE2OSNXS characteristics are:

## Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime.
- If [HCR\\_EL2.E2H](#) == 0, the entry is from the final level of the translation table walk.
- If [HCR\\_EL2.E2H](#) == 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI VALE2OS, TLBI VALE2OSNXS are UNDEFINED.

## Attributes

TLBI VALE2OS, TLBI VALE2OSNXS is a 64-bit System instruction.

## Field descriptions

The TLBI VALE2OS, TLBI VALE2OSNXS input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TTL				VA[55:12]											
																VA[55:12]															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**ASID, bits [63:48]**

**When HCR\_EL2.E2H == 1:**

**ASID, bits [63:48]**

**When HCR\_EL2.E2H == 1:**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

**Otherwise:**

Reserved, RES0.

**TTL, bits [47:44]****When FEAT\_TTL is implemented:**

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : <del>If Reserved. Treat as if TTL&lt;3:2&gt; is</del> FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : <del>If Reserved. Treat as if TTL&lt;3:2&gt; is</del> FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

**Otherwise:**

Reserved, RES0.

**VA[55:12], bits [43:0]**

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

## Executing the TLBI VALE2OS instruction

Accesses to this instruction use the following encodings:

TLBI VALE2OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0001	0b101

```

RES0																TTL				VA[55:12]											
																VA[55:12]															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:48]

Reserved, RES0.

### TTL, bits [47:44]

When FEAT\_TTL is implemented:

Translation Table Level. Indicates the level of the page table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If Reserved. Treat as if TTL<3:2> is FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

#### Otherwise:

Reserved, RES0.

#### VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

## Executing the TLBI VALE3OS instruction

Accesses to this instruction use the following encodings:

TLBI VALE3OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0001	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TLBI_VALE3OS(X[t]);

```

## Executing the TLBI VALE3OS, TLBI VALE3OSNXS instruction

Accesses to this instruction use the following encodings:

TLBI VALE3OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0001	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TLBI_VA(SecurityStateAtEL(EL3), Regime_EL3, VMID[], Shareability_Outer, TLBILevel_Last,
    TLBI_AllAttr, X[t]);

```

TLBI VALE3OSNXS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b110	0b1001	0b0001	0b101

```

# TLBI VMALLE1, TLBI VMALLE1NXS, TLB Invalidate by VMID, All at stage 1, EL1

The TLBI VMALLE1, TLBI VMALLE1NXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to the PE that executes this System instruction.

---

### Note

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

---

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VMALLE1, TLBI VMALLE1NXS is a 64-bit System instruction.

## Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

## Executing the TLBI VMALLE1, TLBI VMALLE1NXS instruction

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is CONstrained UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to 0b11111.

Accesses to this instruction use the following encodings:

TLBI VMALLE1{, <Xt>}

# TLBI VMALLE1IS, TLBI VMALLE1ISNXS, TLB Invalidate by VMID, All at stage 1, EL1, Inner Shareable

The TLBI VMALLE1IS, TLBI VMALLE1ISNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

---

### Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

~~For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.~~

---

### Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VMALLE1IS, TLBI VMALLE1ISNXS is a 64-bit System instruction.

# TLBI VMALLE1OS, TLBI VMALLE1OSNXS, TLB Invalidate by VMID, All at stage 1, EL1, Outer Shareable

The TLBI VMALLE1OS, TLBI VMALLE1OSNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID, and would be required to translate the specified VA using the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

---

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

---

### Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If [FEAT\\_XS](#) is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT\_TLBIOS is implemented. Otherwise, direct accesses to TLBI VMALLE1OS, TLBI VMALLE1OSNXS are UNDEFINED.

## Attributes

TLBI VMALLE1OS, TLBI VMALLE1OSNXS is a 64-bit System instruction.

## Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

## Executing the TLBI VMALLE1OS, TLBI VMALLE1OSNXS instruction

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to 0b11111.

Accesses to this instruction use the following encodings:

TLBI VMALLE1OS{, <Xt>}

# TLBI VMALLS12E1, TLBI VMALLS12E1NXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1

The TLBI VMALLS12E1, TLBI VMALLS12E1NXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If [SCR\\_EL3.NS](#) is 0, then:
  - The entry would be required to translate an address using the Secure EL1&0 translation regime.
  - If FEAT\_SEL2 is implemented and enabled, the entry would be used with the current VMID.
- If [SCR\\_EL3.NS](#) is 1, then:
  - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to the PE that executes this System instruction.

---

### Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

---

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

There are no configuration notes.

## Attributes

TLBI VMALLS12E1, TLBI VMALLS12E1NXS is a 64-bit System instruction.

## Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

## Executing the TLBI VMALLS12E1, TLBI VMALLS12E1NXS instruction

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is CONstrained UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to 0b11111.

Accesses to this instruction use the following encodings:

TLBI VMALLS12E1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0111	0b110

# TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Inner Shareable

The TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If [SCR\\_EL3.NS](#) is 0, then:
  - The entry would be required to translate an address using the Secure EL1&0 translation regime.
  - If FEAT\_SEL2 is implemented and enabled, the entry would be used with the current VMID.
- If [SCR\\_EL3.NS](#) is 1, then:
  - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

---

### Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

---

### Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS instruction

# TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Outer Shareable

The TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXXS characteristics are:

## Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If [SCR\\_EL3.NS](#) is 0, then:
  - The entry would be required to translate an address using the Secure EL1&0 translation regime.
  - If FEAT\_SEL2 is implemented and enabled, the entry would be used with the current VMID.
- If [SCR\\_EL3.NS](#) is 1, then:
  - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

---

### Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR\\_EL3.EEL2](#)==1, then:

- A PE with [SCR\\_EL3.EEL2](#)==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==0.
- A PE with [SCR\\_EL3.EEL2](#)==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR\\_EL3.EEL2](#)==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For the EL1&0 translation regimes, the invalidation applies to both global entries, and non-global entries with any ASID.

---

### Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT\_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

## Configuration

This instruction is present only when FEAT TLBIOS is implemented. Otherwise, direct accesses to TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS are UNDEFINED.

## Attributes

TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS is a 64-bit System instruction.

## Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

## Executing the TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS instruction

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

# TPIDR\_EL2, EL2 Software Thread ID Register

The TPIDR\_EL2 characteristics are:

## Purpose

Provides a location where software executing at EL2 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

## Configuration

AArch64 System register TPIDR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HTPIDR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

TPIDR\_EL2 is a 64-bit register.

## Field descriptions

The TPIDR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Thread ID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Thread ID																															

### Bits [63:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the TPIDR\_EL2

Accesses to this register use the following encodings:

### Bits [63:7]

Reserved, RES0.

### TS, bits [6:5]

Timestamp **Control. Controls which timebase is used for trace timestamps.**~~Control~~

TS	Meaning	Applies when
0b01	Virtual timestamp. The traced timestamp is the physical counter value, minus the value of <a href="#">CNTVOFF_EL2</a> .	
0b10	Guest <b>physical</b> <del>Physical</del> timestamp. The traced timestamp is the physical counter value, minus a <b>physical offset</b> . If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of <a href="#">CNTPOFF_EL2</a> : <ul style="list-style-type: none"><li><a href="#">SCR_EL3.ECVEn</a> == 0b0.</li><li><a href="#">CNTHCTL_EL2.ECV</a> == 0b0.</li></ul>	When FEAT_ECV is implemented
0b11	Physical timestamp. The traced timestamp is the physical counter value.	

All other values are reserved.

This field is ignored **by the PE when**~~if~~ any of the following are true:

- ~~SelfHostedTraceEnabled() == FALSE.~~

- EL2 is implemented and [TRFCR\\_EL2](#).TS != 0b00.
- `SelfHostedTraceEnabled() == FALSE`.

If FEAT\_ECV is implemented, and EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if any of the following are true:

- [CNTHCTL\\_EL2](#).ECV is 0.
- [SCR\\_EL3](#).ECVEn is 0.
- [HCR\\_EL2](#).{E2H, TGE} is {1, 1}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [4:2]**

Reserved, RES0.

**E1TRE, bit [1]**

EL1 Trace Enable.

E1TRE	Meaning
0b0	Trace is prohibited at EL1.
0b1	Trace is allowed at EL1.

This field is ignored if `SelfHostedTraceEnabled() == FALSE`.

On a Warm reset, this field resets to 0.

**E0TRE, bit [0]**

EL0 Trace Enable.

E0TRE	Meaning
0b0	Trace is prohibited at EL0.
0b1	Trace is allowed at EL0.

This field is ignored if any of the following are true:

- `SelfHostedTraceEnabled() == FALSE`.
- EL2 is implemented and enabled in the current Security state and [HCR\\_EL2](#).TGE == 1.

On a Warm reset, this field resets to 0.

**Accessing the TRFCR\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, TRFCR\_EL1

op0	op1	CRn	CRm	op2

### Bits [63:7]

Reserved, RES0.

### TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

TS	Meaning	Applies when
0b00	Timestamp controlled by <a href="#">TRFCR_EL1</a> .TS or <a href="#">TRFCR</a> .TS.	
0b01	Virtual timestamp. The traced timestamp is the physical counter value, minus the value of <a href="#">CNTPOFF_EL2</a> .	
0b10	Guest <b>physicalPhysical</b> timestamp. The traced timestamp is the physical counter value, minus <b>a physical offset</b> . If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of <a href="#">CNTPOFF_EL2</a> : <ul style="list-style-type: none"><li><a href="#">SCR_EL3.ECVEn</a> == 0b0.</li><li><a href="#">CNTHCTL_EL2.ECV</a> == 0b0.</li></ul>	When FEAT_ECV is implemented
0b11	Physical timestamp. The traced timestamp is the physical counter value.	

This field is ignored if SelfHostedTraceEnabled() == FALSE.

If FEAT\_ECV is implemented, and EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if any of the following are true:

- CNTHCTL\_EL2.ECV is 0.
- SCR\_EL3.ECVEn is 0.
- HCR\_EL2.{E2H, TGE} is {1, 1}.

ThisAll fieldother isvalues ignoredare by the PE when SelfHostedTraceEnabled() == FALSE.reserved.

On a Warm reset, this field resets to 0.

Bit [4]

Reserved, RES0.

CX, bit [3]

CONTEXTIDR\_EL2 and VMID trace enable.

CX	Meaning
0b0	CONTEXTIDR_EL2 and VMID trace prohibited.
0b1	CONTEXTIDR_EL2 and VMID trace allowed.

This field is ignored if SelfHostedTraceEnabled() == FALSE.

On a Warm reset, this field resets to 0.

Bit [2]

Reserved, RES0.

E2TRE, bit [1]

EL2 Trace Enable.

E2TRE	Meaning
0b0	Trace is prohibited at EL2.
0b1	Trace is allowed at EL2.

This field is ignored if SelfHostedTraceEnabled() == FALSE.

On a Warm reset, this field resets to 0.

EOHTRE, bit [0]

EL0 Trace Enable.

EOHTRE	Meaning
0b0	Trace is prohibited at EL0 when HCR_EL2.TGE == 1.
0b1	Trace is allowed at EL0 when HCR_EL2.TGE == 1.

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is disabled in the current security state.
- HCR\_EL2.TGE == 0.

On a Warm reset, this field resets to 0.

# TTBR0\_EL1, Translation Table Base Register 0 (EL1)

The TTBR0\_EL1 characteristics are:

## Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

## Configuration

AArch64 System register TTBR0\_EL1 bits [63:0] are architecturally mapped to AArch32 System register [TTBR0\[63:0\]](#).

## Attributes

TTBR0\_EL1 is a 64-bit register.

## Field descriptions

The TTBR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																BADDR[47:1]BADDR															
																BADDR[47:1]BADDR															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ASID, bits [63:48]

An ASID for the translation table base address. The [TCR\\_EL1](#).A1 field selects either TTBR0\_EL1.ASID or TTBR1\_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

#### Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes FEAT\_LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes FEAT\_LPA, if the value of [TCR\\_EL1](#).IPS is 0b110, then:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### BADDR[47:1], bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

- When  $z > x$  register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When  $x > 6$  register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes FEAT\_TTCNP bit[0] of the stage 1 translation table base address is zero.
- BitsRegister Abits[47:xz] hold bits[47:z] of the stage 1 translation table base address, bitswhere arez inis registerdetermined bits[47as follows:x].

- If  $x \geq 6$  then  $z = x$ .
  - Otherwise,  $z = 6$ .
- Bits Register A[(x-1):0] bits[5:2] hold bits[51:48] of the stage 1 translation table base address are zero.

**Note**

- In an implementation that includes FEAT\_LPA a TCR\_EL1.IPS value of 0b110, that selects an IPA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID\_AA64MMFR0\_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the Effective value of TCR\_EL1.IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR\_EL1.IPS is not 0b110 then:

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR\_EL1.T0SZ, the translation stage, and the translation granule size.

**Note**

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR\_EL1.IPS is not 0b110, then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address addresses used in this stage of translation are 0b0000.

**Note**

This definition applies:

- To an implementation that includes FEAT\_LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include FEAT\_LPA.

If any TTBR0\_EL1[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR0\_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

If FEAT\_LPA is implemented and the value of TCR\_EL1.IPS is 0b110, then:

- Bits A[51x-1:480] of the stage 1 translation table base address are treated as if all the bits are in zero. The value read back from the corresponding register bits[5:2] is either the value written to the register or zero.
- Register The bit[1] result is of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero. RES0.
- When  $x > 6$ , register bits[(x-1):6] are RES0.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR\_EL1.T0SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

**CnP, bit [0]**

When FEAT\_TTCNP is implemented:

**Note**

TCR\_EL1.IPS==0b110 is permitted when:

- FEAT\_LPA is implemented and the 64KB translation granule is used.

- FEAT\_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of ID\_AA64MMFR0\_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when TCR\_EL1.IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0\_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CnP, bit [0]

When FEAT\_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0\_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0\_EL1.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by: <ul style="list-style-type: none"> <li>• The value of TTBR0_EL1.CnP on those other PEs.</li> <li>• The value of the current ASID.</li> <li>• If EL2 is implemented and enabled in the current Security state, the value of the current VMID.</li> </ul>
0b1	The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply: <ul style="list-style-type: none"> <li>• The translation table entries are pointed to by TTBR0_EL1.</li> <li>• The translation tables relate to the same translation regime.</li> <li>• The ASID is the same as the current ASID.</li> <li>• If EL2 is implemented and enabled in the current Security state, the value of the current VMID.</li> </ul>

This field is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

### Note

If the value of the TTBR0\_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0\_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

## Accessing the TTBR0\_EL1

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR0\_EL1 or TTBR0\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

**Note**

- Translation table base addresses of 52 bits,  $A[51:x]$ , are supported only in an implementation that includes FEAT\_LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes FEAT\_LPA, if the value of [TCR\\_EL2.{I}PS](#) is 0b110, then:

**BADDR[47:1], bits [47:1]**

Translation table base address,  $A[47:x]$  or  $A[51:x]$ , bits[47:1].

- When  $z > x$  register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When  $x > 6$  register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes FEAT\_TTCNP bit[0] of the stage 1 translation table base address is zero.
- BitsRegister  $A[bits[47:z]]$  hold bits[47:z] of the stage 1 translation table base address, bitswhere arez inis registerdetermined bits[47as follows:x].
  - If  $x \geq 6$  then  $z = x$ .
  - Otherwise,  $z = 6$ .
- BitsRegister  $A[(x-1):0]$ bits[5:2] hold bits[51:48] of the stage 1 translation table base address are zero.address.

**Note**

In an implementation that includes FEAT\_LPA:

- A [TCR\\_EL2.{I}PS](#) value of 0b110, that selects an OA size of 52 bits, is permitted only when using the 64KB translation granule.
- The OA size is specified by:
  - The value of [TCR\\_EL2.PS](#) when the value of [HCR\\_EL2.E2H](#) is 0.
  - The value of [TCR\\_EL2.IPS](#) when the value of [HCR\\_EL2.E2H](#) is 1.

When the value of [ID\\_AA64MMFR0\\_EL1.PARange](#) indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the Effective value of [TCR\\_EL2.{I}PS](#) is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of [TCR\\_EL2.{I}PS](#) is not 0b110 then:

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR\\_EL2.T0SZ](#), the translation stage, and the translation granule size.

**Note**

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of [TCR\\_EL2.{I}PS](#) is not 0b110, then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits  $A[51:48]$  of the stage 1 translation table base addressaddresses used in this stage of translation are 0b0000.

**Note**

This definition applies:

- To an implementation that includes FEAT\_LPA and is using a translation granule smaller than 64KB.

- 
- To any implementation that does not include FEAT\_LPA.
- 

If any TTBR0\_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR0\_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

If FEAT\_LPA is implemented and the value of TCR\_EL2.{I}PS is 0b110, then:

- Bits A[51x-1:480] of the stage 1 translation table base address are treated as if all the bits are in zero. The value read back from the corresponding register bits[5:2] is either the value written to the register or zero.
- RegisterThe bit[1]result is of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero. RES0.
- When x>6, register bits[(x-1):6] are RES0.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR\_EL2.T0SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

### CnP, bit [0]

When FEAT\_TTCNP is implemented:

---

#### Note

The OA size specified by TCR\_EL2.{I}PS is determined as follows:

- The value of TCR\_EL2.PS when the value of HCR\_EL2.E2H is 0.
- The value of TCR\_EL2.IPS when the value of HCR\_EL2.E2H is 1.

TCR\_EL2.{I}PS==0b110 is permitted when:

- FEAT\_LPA is implemented and the 64KB translation granule is used.
- FEAT\_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of ID\_AA64MMFR0\_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when TCR\_EL2.{I}PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

---

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0\_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CnP, bit [0]

When FEAT\_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0\_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0\_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by: <ul style="list-style-type: none"> <li>The value of TTBR0_EL2.CnP on those other PEs.</li> <li>When the current translation regime is the EL2&amp;0 regime, the value of the current ASID.</li> </ul>
0b1	The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply: <ul style="list-style-type: none"> <li>The translation table entries are pointed to by TTBR0_EL2.</li> <li>The translation tables relate to the same translation regime.</li> <li>If that translation regime is the EL2&amp;0 regime, the ASID is the same as the current ASID.</li> </ul>

This field is permitted to be cached in a TLB.

### Note

If the value of the TTBR0\_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0\_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

## Accessing the TTBR0\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR0\_EL2 or TTBR0\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, TTBR0\_EL2

# TTBR0\_EL3, Translation Table Base Register 0 (EL3)

The TTBR0\_EL3 characteristics are:

## Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL3 translation regime, and other information for this translation regime.

## Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to TTBR0\_EL3 are UNDEFINED.

## Attributes

TTBR0\_EL3 is a 64-bit register.

## Field descriptions

The TTBR0\_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

																															CnP

### Bits [63:48]

Reserved, RES0.

Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes FEAT\_LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes FEAT\_LPA, if the value of TCR\_EL3.PS is 0b110 then:

### BADDR[47:1], bits [47:1]

Translation table base address, A[47:x] or A[51:x].

- When z>x register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When x>6 register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes FEAT\_TTCNP bit[0] of the stage 1 translation table base address is zero.
- BitsRegister Abits[47:zx] hold bits[47:z] of the stage 1 translation table base address, bitswhere arez inis registerdetermined bits[47as follows:x].
  - If x >= 6 then z=x.
  - Otherwise, z=6.
- BitsRegister A[(x-1):0bits[5:2] hold bits[51:48] of the stage 1 translation table base address are zero.address.

Note

- In an implementation that includes FEAT\_LPA a TCR\_EL3.PS value of 0b110, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID\_AA64MMFR0\_EL1.PARange indicates that the implementation does not support a 52-bit PA size, if a translation-table lookup uses this register with the 64KB translation granule when the Effective value of TCR\_EL3.PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR\_EL3.PS is not 0b110 then:

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR\_EL3.T0SZ, the translation stage, and the translation granule size.

#### Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR\_EL3.PS is not 0b110, then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are used in this stage of translation and are 0b0000.

#### Note

This definition applies:

- To an implementation that includes FEAT\_LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include FEAT\_LPA.

If any TTBR0\_EL3[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR0\_EL3, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

If FEAT\_LPA is implemented and the value of TCR\_EL3.PS is 0b110, then:

- Bits A[51:x-1:480] of the stage 1 translation table base address are treated as if all the bits are in zero. The value read back from the corresponding register bits[5:2] is either the value written to the register or zero.
- Register bit[1] result is of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero. RES0.
- When x>6, register bits[(x-1):6] are RES0.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR\_EL3.T0SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

### CnP, bit [0]

When FEAT\_TTCNP is implemented:

#### Note

TCR\_EL3.PS==0b110 is permitted when:

- FEAT\_LPA is implemented and the 64KB translation granule is used.
- FEAT\_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of ID\_AA64MMFR0\_EL1.PARange indicates that the implementation does not support a 52-bit PA size, if a translation table lookup

uses this register when TCR\_EL3.PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0\_EL3, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT\_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0\_EL3 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0\_EL3.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL3, for the current translation regime, are permitted to differ from corresponding entries for TTBR0_EL3 for other PEs in the Inner Shareable domain. This is not affected by the value of TTBR0_EL3.CnP on those other PEs.
0b1	The translation table entries pointed to by TTBR0_EL3 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1 and the translation table entries are pointed to by TTBR0_EL3.

This field is permitted to be cached in a TLB.

Note

If the value of the TTBR0\_EL3.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0\_EL3s do not point to the same translation table entries the results of translations using TTBR0\_EL3 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the TTBR0\_EL3

Accesses to this register use the following encodings:

MRS <Xt>, TTBR0\_EL3

op0	op1	CRn	CRm	op2

# TTBR1\_EL1, Translation Table Base Register 1 (EL1)

The TTBR1\_EL1 characteristics are:

## Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 stage 1 translation regime, and other information for this translation regime.

## Configuration

AArch64 System register TTBR1\_EL1 bits [63:0] are architecturally mapped to AArch32 System register [TTBR1\[63:0\]](#).

## Attributes

TTBR1\_EL1 is a 64-bit register.

## Field descriptions

The TTBR1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																BADDR[47:1]BADDR															
																BADDR[47:1]BADDR															CnP
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ASID, bits [63:48]

An ASID for the translation table base address. The [TCR\\_EL1.A1](#) field selects either TTBR0\_EL1.ASID or TTBR1\_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

#### Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes FEAT\_LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes FEAT\_LPA, if the value of [TCR\\_EL1.IPS](#) is 0b110, then:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### BADDR[47:1], bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

- When  $z > x$  register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When  $x > 6$  register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes FEAT\_TTCNP bit[0] of the stage 1 translation table base address is zero.
- BitsRegister Abits[47:xz] hold bits[47:z] of the stage 1 translation table base address, bitswhere arez inis registerdetermined bits[47as follows:x].

- If  $x \geq 6$  then  $z = x$ .
- Otherwise,  $z = 6$ .
- Bits Register A[(x-1):0] bits[5:2] hold bits[51:48] of the stage 1 translation table base address. address.

**Note**

- In an implementation that includes FEAT\_LPA a TCR\_EL1.IPS value of 0b110, that selects an IPA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID\_AA64MMFR0\_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the Effective value of TCR\_EL1.IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR\_EL1.IPS is not 0b110 then:

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR\_EL1.T1SZ, the translation stage, and the translation granule size.

**Note**

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR\_EL1.IPS is not 0b110, then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address addresses used in this stage of translation are 0b0000.

**Note**

This definition applies:

- To an implementation that includes FEAT\_LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include FEAT\_LPA.

If any TTBR1\_EL1[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR1\_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

If FEAT\_LPA is implemented and the value of TCR\_EL1.IPS is 0b110, then:

- Bits A[51x-1:480] of the stage 1 translation table base address are treated as if all the bits are in zero. The value read back from the corresponding register bits[5:2] is either the value written to the register or zero.
- Register The bit[1] result is of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero. RES0.
- When  $x > 6$ , register bits[(x-1):6] are RES0.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR\_EL1.T1SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

**CnP, bit [0]**

When FEAT\_TTCNP is implemented:

**Note**

TCR\_EL1.IPS==0b110 is permitted when:

- FEAT\_LPA is implemented and the 64KB translation granule is used.

- FEAT\_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of ID\_AA64MMFR0\_EL1.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when TCR\_EL1.IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1\_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CnP, bit [0]

When FEAT\_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1\_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1\_EL1.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by: <ul style="list-style-type: none"> <li>• The value of TTBR1_EL1.CnP on those other PEs.</li> <li>• The value of the current ASID.</li> <li>• If EL2 is implemented and enabled in the current Security state, the value of the current VMID.</li> </ul>
0b1	The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply: <ul style="list-style-type: none"> <li>• The translation table entries are pointed to by TTBR1_EL1.</li> <li>• The translation tables relate to the same translation regime.</li> <li>• The ASID is the same as the current ASID.</li> <li>• If EL2 is implemented and enabled in the current Security state, the value of the current VMID.</li> </ul>

This field is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

### Note

If the value of the TTBR1\_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1\_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

## Accessing the TTBR1\_EL1

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR1\_EL1 or TTBR1\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# TTBR1\_EL2, Translation Table Base Register 1 (EL2)

The TTBR1\_EL2 characteristics are:

## Purpose

When [HCR\\_EL2.E2H](#) is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL2&0 translation regime, and other information for this translation regime.

### Note

When [HCR\\_EL2.E2H](#) is 0, the contents of this register are ignored by the PE, except for a direct read or write of the register.

## Configuration

This register is present only when FEAT\_VHE is implemented. Otherwise, direct accesses to TTBR1\_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

TTBR1\_EL2 is a 64-bit register.

## Field descriptions

The TTBR1\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																BADDR[47:1]BADDR															
																BADDR[47:1]BADDR															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ASID, bits [63:48]

An ASID for the translation table base address. The [TCR\\_EL2.A1](#) field selects either TTBR0\_EL2.ASID or TTBR1\_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

### Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes FEAT\_LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes FEAT\_LPA, if the value of [TCR\\_EL2.{I}PS](#) is 0b110, then:

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**BADDR[47:1], bits [47:1]**

Translation table base address, A[47:x] or A[51:x], bits[47:1].

- When  $z > x$  register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When  $x > 6$  register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes FEAT\_TTCNP bit[0] of the stage 1 translation table base address is zero.
- BitsRegister Abits[47:xz] hold bits[47:z] of the stage 1 translation table base address, bitswhere arez inis registerdetermined bits[47as follows:x].
  - If  $x \geq 6$  then  $z = x$ .
  - Otherwise,  $z = 6$ .
- BitsRegister A[(x-1):0]bits[5:2] hold bits[51:48] of the stage 1 translation table base address are zero.address.

**Note**

- In an implementation that includes FEAT\_LPA a TCR\_EL2.{I}PS value of 0b110, that selects an OA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of ID\_AA64MMFR0\_EL1.PARange indicates that the implementation does not support a 52-bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the Effective value of TCR\_EL2.{I}PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of TCR\_EL2.{I}PS is not 0b110 then:

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR\_EL2.T1SZ, the translation stage, and the translation granule size.

**Note**

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR\_EL2.{I}PS is not 0b110, then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base addressaddresses used in this stage of translation are 0b0000.

**Note**

This definition applies:

- To an implementation that includes FEAT\_LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include FEAT\_LPA.

If any TTBR1\_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using TTBR1\_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

If FEAT\_LPA is implemented and the value of TCR\_EL2.{I}PS is 0b110, then:

- Bits A[51x-1:480] of the stage 1 translation table base address are treated as if all the bits are inzero. The value read back from the corresponding register bits[5:2], is either the value written to the register or zero.
- RegisterThe bit[1]result isof the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero. RES0.
- When  $x > 6$ , register bits[(x-1):6] are RES0.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR\_EL2.T1SZ, the stage of translation, and the translation granule size.

This field resets to an architecturally UNKNOWN value.

**CnP, bit [0]****When FEAT\_TTCNP is implemented:****Note**

The OA size specified by [TCR\\_EL2.{I}PS](#) is determined as follows:

- The value of [TCR\\_EL2.PS](#) when the value of [HCR\\_EL2.E2H](#) is 0.
- The value of [TCR\\_EL2.IPS](#) when the value of [HCR\\_EL2.E2H](#) is 1.

[TCR\\_EL2.{I}PS](#)==0b110 is permitted when:

- FEAT\_LPA is implemented and the 64KB translation granule is used.
- FEAT\_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of [ID\\_AA64MMFR0\\_EL1.PARange](#) indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when [TCR\\_EL2.{I}PS](#) is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1\_EL2, then the translation table base address might be misaligned, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CnP, bit [0]****When FEAT\_TTCNP is implemented:**

Common not Private. This bit indicates whether each entry that is pointed to by TBR1\_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1\_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR1_EL2 for the current ASID are permitted to differ from corresponding entries for TTBR1_EL2 for other PEs in the Inner Shareable domain. This is not affected by: <ul style="list-style-type: none"> <li>• The value of TTBR1_EL2.CnP on those other PEs.</li> <li>• The value of the current ASID.</li> </ul>
0b1	The translation table entries pointed to by TTBR1_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1 and all of the following apply: <ul style="list-style-type: none"> <li>• The translation table entries are pointed to by TTBR1_EL2.</li> <li>• The ASID is the same as the current ASID.</li> </ul>

This field is permitted to be cached in a TLB.

**Note**

- TTBR1\_EL2 is accessible only when the value of [HCR\\_EL2.E2H](#) is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1\_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1\_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNPREDICTABLE, see 'CONstrained UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

## Accessing the TTBR1\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR1\_EL2 or TTBR1\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# VBAR\_EL1, Vector Base Address Register (EL1)

The VBAR\_EL1 characteristics are:

## Purpose

Holds the vector base address for any exception that is taken to EL1.

## Configuration

AArch64 System register VBAR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [VBAR\[31:0\]](#).

## Attributes

VBAR\_EL1 is a 64-bit register.

## Field descriptions

The VBAR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Vector Base Address																															
Vector Base Address											RES0																				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL1.

Note

If the implementation does not support FEAT\_LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR\_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR\_EL1 must be the same or else the use of the vector address will result in a recursive exception.

If the implementation supports FEAT\_LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR\_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR\_EL1 must be the same or else the use of the vector address will result in a recursive exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [10:0]

Reserved, RES0.

## Accessing the VBAR\_EL1

### Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL2.

#### Note

If FEAT\_LVA is implemented:

- If [HCR\\_EL2.E2H](#) == 0b1:
  - If tagged addresses are being used, bits [55:52] of VBAR\_EL2 must be the same or else the use of the vector address will result in a recursive exception.
  - If tagged addresses are not being used, bits [63:52] of VBAR\_EL2 must be the same or else the use of the vector address will result in a recursive exception.
- If [HCR\\_EL2.E2H](#) == 0b0:
  - If tagged addresses are being used, bits [55:52] of VBAR\_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
  - If tagged addresses are not being used, bits [63:52] of VBAR\_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

If FEAT\_LVA is not implemented:

- If [HCR\\_EL2.E2H](#) == 0b1:
  - If tagged addresses are being used, bits [55:48] of VBAR\_EL2 must be the same or else the use of the vector address will result in a recursive exception.

- 
- If tagged addresses are not being used, bits [63:48] of VBAR\_EL2 must be the same or else the use of the vector address will result in a recursive exception.
  - If [HCR\\_EL2.E2H](#) == 0b0:
    - If tagged addresses are being used, bits [55:48] of VBAR\_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
    - If tagged addresses are not being used, bits [63:48] of VBAR\_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
- 

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bits [10:0]

Reserved, RES0.

## Accessing the VBAR\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic VBAR\_EL2 or VBAR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, VBAR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b0000	0b000

```

# VBAR\_EL3, Vector Base Address Register (EL3)

The VBAR\_EL3 characteristics are:

## Purpose

Holds the vector base address for any exception that is taken to EL3.

## Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to VBAR\_EL3 are UNDEFINED.

## Attributes

VBAR\_EL3 is a 64-bit register.

## Field descriptions

The VBAR\_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Vector Base Address																															
Vector Base Address																RES0															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL3.

Note

If the implementation does not support FEAT\_LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR\_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR\_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

If the implementation supports FEAT\_LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR\_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR\_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Bits [10:0]

Reserved, RES0.

## Accessing the VBAR\_EL3

# VDISR\_EL2, Virtual Deferred Interrupt Status Register

The VDISR\_EL2 characteristics are:

## Purpose

Records that a virtual SError interrupt has been consumed by an ESB instruction executed at EL1.

An indirect write to VDISR\_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value written to be observed by a direct read of [DISR\\_EL1](#) or [DISR](#) occurring in program order after the ESB instruction.

## Configuration

AArch64 System register VDISR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VDISR\[31:0\]](#).

This register is present only when FEAT\_RAS is implemented. Otherwise, direct accesses to VDISR\_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

VDISR\_EL2 is a 64-bit register.

## Field descriptions

The VDISR\_EL2 bit assignments are:

### When EL1 is using AArch64:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
A	RES0										DS	ISS																			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [30:25]

Reserved, RES0.

## IDS, bit [24]

The value copied from [VSESR\\_EL2.IDS](#).

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## ISS, bits [23:0]

The value copied from [VSESR\\_EL2.ISS](#).

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## When EL1 is using AArch32 and VDISR\_EL2.LPAE == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																																
A	RES0														AET	RES0	ExT	RES0	FS[4]	LPAE	RES0						FS[3:0]					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

## Bits [63:32]

Reserved, RES0.

## A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bits [30:16]

Reserved, RES0.

## AET, bits [15:14]

The value copied from [VSESR\\_EL2.AET](#).

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bit [13]

Reserved, RES0.

## ExT, bit [12]

The value copied from [VSESR\\_EL2.ExT](#).

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bit [11]

Reserved, RES0.

**This field is bit[4] of FS[4:0].**

## FS, [4], bitsbit [10, 3:0]

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError interrupt.

FS	Meaning
0b10110	Asynchronous SError interrupt.

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR\_EL2[10].
- FS[3:0] is VDISR\_EL2[3:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## LPAE, bit [9]

Format.

Set to TTBCR.EAE when an ESB instruction defers a virtual SError interrupt.

LPAE	Meaning
0b0	Using the Short-descriptor translation table format.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bits [8:4]

Reserved, RES0.

## FS[3:0], bits [3:0]

This field is bits[3:0] of FS[4:0].

See FS[4] for the field description.

## When EL1 is using AArch32 and VDISR\_EL2.LPAE == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
A	RES0															AET	RES0	EXT	RES0	LPAE	RES0		STATUS								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## Bits [63:32]

Reserved, RES0.

## A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bits [30:16]

Reserved, RES0.

## AET, bits [15:14]

The value copied from VSESRL\_EL2.AET.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [13]**

Reserved, RES0.

**ExT, bit [12]**

The value copied from [VSESr\\_EL2](#).ExT.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [11:10]**

Reserved, RES0.

**LPAE, bit [9]**

Format.

Set to [TTBCR](#).EAE when an ESB instruction defers a virtual SError interrupt.

LPAE	Meaning
0b1	Using the Long-descriptor translation table format.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [8:6]**

Reserved, RES0.

**STATUS, bits [5:0]**

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.

STATUS	Meaning
0b010001	Asynchronous SError interrupt.

All other values are reserved.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Accessing the VDISR\_EL2**

An indirect write to VDISR\_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of [DISR\\_EL1](#) or [DISR](#) occurring in program order after the ESB instruction.

Accesses to this register use the following encodings:

# VMPIDR\_EL2, Virtualization Multiprocessor ID Register

The VMPIDR\_EL2 characteristics are:

## Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by EL1 reads of [MPIDR\\_EL1](#).

## Configuration

AArch64 System register VMPIDR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VMPIDR\[31:0\]](#).

If EL2 is not implemented, reads of this register return the value of the [MPIDR\\_EL1](#) and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

VMPIDR\_EL2 is a 64-bit register.

## Field descriptions

The VMPIDR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																								Aff3								
RES1	U	RES0						MT	Aff2								Aff1								Aff0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### Bits [63:40]

Reserved, RES0.

### Aff3, bits [39:32]

Affinity level 3. See the description of VMPIDR\_EL2.Aff0 for more information.

Aff3 is not supported in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [31]

Reserved, RES1.

### U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [29:25]**

Reserved, RES0.

**MT, bit [24]**

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of VMPIDR\_EL2.Aff0 for more information about affinity levels.

MT	Meaning
0b0	Performance of PEs at the lowest affinity level is largely independent.
0b1	Performance of PEs at the lowest affinity level is very interdependent.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Aff2, bits [23:16]**

Affinity level 2. See the description of VMPIDR\_EL2.Aff0 for more information.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Aff1, bits [15:8]**

Affinity level 1. See the description of VMPIDR\_EL2.Aff0 for more information.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Aff0, bits [7:0]**

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or [MPIDR\\_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

**Accessing the VMPIDR\_EL2**

Accesses to this register use the following encodings:

# VNCR\_EL2, Virtual Nested Control Register

The VNCR\_EL2 characteristics are:

## Purpose

When FEAT\_NV2 is implemented, holds the base address that is used to define the memory location that is accessed by transformed reads and writes of System registers.

## Configuration

This register is present only when FEAT\_NV2 is implemented. Otherwise, direct accesses to VNCR\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

VNCR\_EL2 is a 64-bit register.

## Field descriptions

The VNCR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RESS												BADDR																			
												BADDR												RES0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### RESS, bits [63:53]

Reserved, Sign extended. If the bits marked as RESS do not all have the same value, then there is a CONSTRAINED UNPREDICTABLE choice between:

- Generating an EL2 translation regime Translation abort on use of the VNCR\_EL2 register.
- Bits[63:49] of VNCR\_EL2 are treated as the same value as bit[48] for all purposes other than reading back the register.
- Bits[63:49] of VNCR\_EL2 are treated as the same value as bit[48] for all purposes.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR\_EL2 are treated as the same value as bit[52] for all purposes other than reading back the register.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR\_EL2 are treated as the same value as bit[52].

Where the EL2 translation regime has upper and lower address ranges, bit[52] is used to select between those address ranges to determine if the address space supports more than 48 bits.

### BADDR, bits [52:12]

Base Address. If the virtual address space for EL2 does not support more than 48 bits, then bits [52:49] are RESS.

When a register read/write is transformed to be a Load or Store, the address of the load/store is to SignOffset(VNCR\_EL2.BADDR:Offset<11:0>, 64).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# VPIDR\_EL2, Virtualization Processor ID Register

The VPIDR\_EL2 characteristics are:

## Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by EL1 reads of [MIDR\\_EL1](#).

## Configuration

AArch64 System register VPIDR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VPIDR\[31:0\]](#).

If EL2 is not implemented, reads of this register return the value of the [MIDR\\_EL1](#) and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

VPIDR\_EL2 is a 64-bit register.

## Field descriptions

The VPIDR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Implementer								Variant				Architecture				PartNum												Revision			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

Hex representation	ASCII representation	Implementer
0x41	A	Arm Limited
0x42	B	Broadcom Corporation
0x43	C	Cavium Inc.
0x44	D	Digital Equipment Corporation
0x49	I	Infineon Technologies AG
0x4D	M	Motorola or Freescale Semiconductor Inc.
0x4E	N	NVIDIA Corporation
0x50	P	Applied Micro Circuits Corporation
0x51	Q	Qualcomm Inc.
0x56	V	Marvell International Ltd.
0x69	i	Intel Corporation

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Architecture, bits [19:16]

Architecture version. Defined values are:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers, see 'ID registers'.

All other values are reserved.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

# VSESR\_EL2, Virtual SError Exception Syndrome Register

The VSESR\_EL2 characteristics are:

## Purpose

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When the virtual SError interrupt is taken to EL1 using AArch64, then the syndrome value is reported in [ESR\\_EL1](#).

When the virtual SError interrupt is taken to EL1 using AArch32, then the syndrome value is reported in [DFSR](#).{AET, ExT} and the remainder of [DFSR](#) is set as defined by VMSAv8-32. For more information, see The AArch32 Virtual Memory System Architecture.

When the virtual SError interrupt is deferred by an ESB instruction, then the syndrome value is written to [VDISR\\_EL2](#).

## Configuration

AArch64 System register VSESR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VDFSR\[31:0\]](#).

This register is present only when FEAT\_RAS is implemented. Otherwise, direct accesses to VSESR\_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

VSESR\_EL2 is a 64-bit register.

## Field descriptions

The VSESR\_EL2 bit assignments are:

### When EL1 is using AArch32:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																AET	RES0	Ext	RES0												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:16]

Reserved, RES0.

### AET, bits [15:14]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[15:4] is set to VSESR\_EL2.AET.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR\\_EL2](#)[15:4] is set to VSESR\_EL2.AET.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[12] is set to VSESR\_EL2.ExT.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR\\_EL2](#)[12] is set to VSESR\_EL2.ExT.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

When EL1 is using AArch64:

Bits [63:25]

Reserved, RES0.

IDS, bit [24]

When a virtual SError interrupt is taken to EL1 using AArch64, [ESR\\_EL1](#)[24] is set to VSESR\_EL2.IDS.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR\\_EL2](#)[24] is set to VSESR\_EL2.IDS.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

When a virtual SError interrupt is taken to EL1 using AArch64, [ESR\\_EL1](#)[23:0] is set to VSESR\_EL2.ISS.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR\\_EL2](#)[23:0] is set to VSESR\_EL2.ISS.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

Accessing the VSESR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, VSESR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0010	0b011

# VSTCR\_EL2, Virtualization Secure Translation Control Register

The VSTCR\_EL2 characteristics are:

## Purpose

The control register for stage 2 of the Secure EL1&0 translation regime.

## Configuration

This register is present only when FEAT\_SEL2 is implemented. Otherwise, direct accesses to VSTCR\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

VSTCR\_EL2 is a 64-bit register.

## Field descriptions

The VSTCR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32			
RES0																																	SL2	RES0
RES1	SA	SW	RES0													TG0	RES0						SLO	TOSZ										
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			

Any of the bits in VSTCR\_EL2 are permitted to be cached in a TLB.

### Bits [63:34:32]

Reserved, RES0.

### SL2, bit [33]

#### When FEAT\_LPA2 is implemented:

Starting level of the Secure stage 2 translation lookup controlled by VSTCR\_EL2.

If VTCR\_EL2.DS == 1, then VSTCR\_EL2.SL2, in combination with VSTCR\_EL2.SL0, gives encodings for the Secure stage 2 translation table walk initial lookup level.

If VTCR\_EL2.DS == 0, then VSTCR\_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

**Bit [32]**

Reserved, RES0.

**Bit [31]**

Reserved, RES1.

**SA, bit [30]**

Secure stage 2 translation output address space.

SA	Meaning
0b0	All stage 2 translations for the Secure IPA space access the Secure PA space.
0b1	All stage 2 translations for the Secure IPA space access the Non-secure PA space.

When the value of VSTCR\_EL2.SW is 1, this bit behaves as 1 for all purposes other than reading back the value of the bit.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**SW, bit [29]**

Secure stage 2 translation address space.

SW	Meaning
0b0	All stage 2 translation table walks for the Secure IPA space are to the Secure PA space.
0b1	All stage 2 translation table walks for the Secure IPA space are to the Non-secure PA space.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [28:16]**

Reserved, RES0.

**TG0, bits [15:14]**Secure stage 2 granule size for [VSTTBR\\_EL2](#).

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If FEAT\_GTG is implemented, [ID\\_AA64MMFR0\\_EL1](#).{TGran4\_2, TGran16\_2, TGran64\_2} indicate which granule sizes are supported for Level 2 translation.

If FEAT\_GTG is not implemented, [ID\\_AA64MMFR0\\_EL1](#).{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value, or a size that has not been implemented, then for all purposes other than read back from this register, the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [13:8]**

Reserved, RES0.

**SL0, bits [7:6]****When FEAT\_TTST is implemented:**

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR\_EL2. The meaning of this field depends on the value of VSTCR\_EL2.TG0.

SL0	Meaning
0b00	<p>If VSTCR_EL2.TG0 is 0b00 (4KB granule):</p> <p><del>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.</del></p> <ul style="list-style-type: none"> <li>If FEAT_LPA2 is not implemented, start at level 2.</li> <li>If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 2.</li> <li>If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b1, start at level -1.</li> </ul> <p>If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.</p>
0b01	<p>If VSTCR_EL2.TG0 is 0b00 (4KB granule):</p> <p><del>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.</del></p> <ul style="list-style-type: none"> <li>If FEAT_LPA2 is not implemented, start at level 1.</li> <li>If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 1.</li> <li>If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 01 and VSTCR_EL2.SL2 == 1 is reserved.</li> </ul> <p>If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.</p>
0b10	<p>If VSTCR_EL2.TG0 is 0b00 (4KB granule):</p> <p><del>If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.</del></p> <ul style="list-style-type: none"> <li>If FEAT_LPA2 is not implemented, start at level 0.</li> <li>If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 0.</li> <li>If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 10 and VSTCR_EL2.SL2 == 1 is reserved.</li> </ul> <p>If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.</p>
0b11	<p><del>If VSTCR_EL2.TG0 is 0b00 (4KB granule):, start at level 3.</del></p> <ul style="list-style-type: none"> <li>If FEAT_LPA2 is not implemented, start at level 3.</li> <li>If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 3.</li> <li>If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 11 and VSTCR_EL2.SL2 == 1 is reserved.</li> </ul> <p>If VSTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0.</p>

~~All other values are reserved.~~ If this field is programmed ~~to a reserved value, or~~ to a value that is not consistent with the programming of VSTCR\_EL2.TOSZ, then a stage 2 level 0 Translation fault is generated.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**Otherwise:**

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR\_EL2. The meaning of this field depends on the value of VSTCR\_EL2.TG0.

SL0	Meaning
0b00	If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.
0b01	If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.
0b10	If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VSTCR\_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## T0SZ, bits [5:0]

The size offset of the memory region addressed by [VSTTBR\\_EL2](#). The region size is  $2^{(64-T0SZ)}$  bytes.

The maximum and minimum possible values for this field depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally UNKNOWN value.

### Note

For the 4KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the VSTCR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, VSTCR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0110	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if HaveEL(EL3) && SCR_EL3.NS == '1' then
        UNDEFINED;
    elsif EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x048];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;

(old)

htmldiff from-

(new)

- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When  $z > x$  register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When  $x > 6$  register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.

### Note

When the value of [ID\\_AA64MMFR0\\_EL1](#).PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the Effective value of [VTCR\\_EL2](#).PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of [VTCR\\_EL2](#).PS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

If any VSTTBR\_EL2[47:1] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VSTTBR\_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [VSTCR\\_EL2](#).TOSZ, the stage of translation, and the translation granule size.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CnP, bit [0]

Common not Private, for stage 2 of the Secure EL1&0 translation regime. In an implementation that includes FEAT\_TTCNP, indicates whether each entry that is pointed to by VSTTBR\_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VSTTBR\_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VSTTBR_EL2 are permitted to differ from the entries for VSTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VSTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

### Note

If the value of VSTTBR\_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VSTTBR\_EL2s do not point to the same translation table entries when using the current VMID, then the results of translations using VSTTBR\_EL2 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the VSTTBR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, VSTTBR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0110	0b000

# VTCR\_EL2, Virtualization Translation Control Register

The VTCR\_EL2 characteristics are:

## Purpose

The control register for stage 2 of the EL1&0 translation regime.

## Configuration

AArch64 System register VTCR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VTCR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

VTCR\_EL2 is a 64-bit register.

## Field descriptions

The VTCR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																																
RES1	NSA	NSW	HWU62	HWU61	HWU60	HWU59	RES0	HD	HA	RES0	VS	PS	TG0	SH0	ORGNO	IRGN0	SL0	T0SZ														SL2DS
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Any of the bits in VTCR\_EL2 are permitted to be cached in a TLB.

### Bits [63:34:32]

Reserved, RES0.

### SL2, bit [33]

#### When FEAT\_LPA2 is implemented:

Starting level of the stage 2 translation lookup controlled by VTCR\_EL2.

If VTCR\_EL2.DS == 1, then VTCR\_EL2.SL2, in combination with VTCR\_EL2.SL0, gives encodings for the stage 2 translation table walk initial lookup level.

If VTCR\_EL2.DS == 0, then VTCR\_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### DS, bit [32]

**When FEAT\_LPA2 is implemented:**

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 2 of the EL1&0 translation regime.

DS	Meaning
0b0	<p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of VTCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.</p> <p>The minimum value of <a href="#">VSTCR_EL2.T0SZ</a> is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.</p> <p>Output address[51:48] is 0000.</p>
0b1	<p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] in translation descriptors hold output address[51:50].</p> <p>The shareability information of block and page descriptors for cacheable locations is determined by VTCR_EL2.SH0.</p> <p>The minimum value of VTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.</p> <p>The minimum value of <a href="#">VSTCR_EL2.T0SZ</a> is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.</p>
<p><b>Note</b></p> <p>As FEAT_LPA must be implemented if VTCR_EL2.DS == 1, the minimum values of VTCR_EL2.T0SZ and <a href="#">VSTCR_EL2.T0SZ</a> are 12, as determined by that extension.</p> <p>For the TLBI range instructions affecting IPA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 00.</p>	
<p><b>Note</b></p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p>	

This field is RES0 for a 64KB translation granule.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [31]**

Reserved, RES1.

**NSA, bit [30]****When FEAT\_SEL2 is implemented:**

Non-secure stage 2 translation output address space.

NSA	Meaning
0b0	All stage 2 translations for the Non-secure IPA space of the Secure EL1&0 translation regime access the Secure PA space.
0b1	All stage 2 translations for the Non-secure IPA space of the Secure EL1&0 translation regime access the Non-secure PA space.

This bit behaves as 1 for all purposes other than reading back the value of the bit when one of the following is true:

- The PE is executing in Non-secure state.
- The value of VTCR\_EL2.NSW is 1.
- The value of [VSTCR\\_EL2.SA](#) is 1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### NSW, bit [29]

When FEAT\_SEL2 is implemented:

Non-secure stage 2 translation table address space.

NSW	Meaning
0b0	All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&0 translation regime are to the Secure PA space.
0b1	All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&0 translation regime are to the Non-secure PA space.

When the PE is executing in Non-secure state, this bit behaves as 1 for all purposes other than reading back the value of the bit.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### HWU62, bit [28]

When FEAT\_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

**HWU61, bit [27]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU60, bit [26]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU59, bit [25]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [24:23]**

Reserved, RES0.

**HD, bit [22]**

When FEAT\_HAFDBS is implemented:

Hardware management of dirty state in stage 2 translations when EL2 is enabled in the current Security state.

HD	Meaning
0b0	Stage 2 hardware management of dirty state disabled.
0b1	Stage 2 hardware management of dirty state enabled, only if the VTCR_EL2.HA bit is also set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**HA, bit [21]**

When FEAT\_HAFDBS is implemented:

Hardware Access flag update in Non-secure and Secure stage 2 translations when EL2 is enabled in the current Security state.

HA	Meaning
0b0	Stage 2 Access flag update disabled.
0b1	Stage 2 Access flag update enabled.

Otherwise:

Reserved, RES0.

**Bit [20]**

Reserved, RES0.

**VS, bit [19]**

When FEAT\_VMID16 is implemented:

VMID Size.

VS	Meaning
0b0	8 bit - the upper 8 bits of <a href="#">VTTBR_EL2</a> and <a href="#">VSTTBR_EL2</a> are ignored by the hardware, and treated as if they are all zeros, for every purpose except when reading back the register.
0b1	16 bit - the upper 8 bits of <a href="#">VTTBR_EL2</a> and <a href="#">VSTTBR_EL2</a> are used for allocation and matching in the TLB.

If the implementation only supports an 8-bit VMID, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**PS, bits [18:16]**

Physical address Size for the Second Stage of translation.

PS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB, and the value FEAT\_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT\_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by VTCR\_EL2 are 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TG0, bits [15:14]**

Granule size for the [VTTBR\\_EL2](#).

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If FEAT\_GTG is implemented, [ID\\_AA64MMFR0\\_EL1](#).{TGran4\_2, TGran16\_2, TGran64\_2} indicate which granule sizes are supported for Level 2 translation.

If FEAT\_GTG is not implemented, [ID\\_AA64MMFR0\\_EL1](#).{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using [VTTBR\\_EL2](#) or [VSTTBR\\_EL2](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using [VTTBR\\_EL2](#) or [VSTTBR\\_EL2](#).

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using [VTTBR\\_EL2](#) or [VSTTBR\\_EL2](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**SL0, bits [7:6]**

When FEAT\_TTST is implemented:

Starting level of the **Secure** stage 2 translation lookup, controlled by VTCR\_EL2. The meaning of this field depends on the value of VTCR\_EL2.TG0.

SL0	Meaning
0b00	<p>If VTCR_EL2.TG0 is 0b00 (4KB granule):</p> <p>If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.</p> <ul style="list-style-type: none"> <li>If FEAT_LPA2 is not implemented, start at level 2.</li> <li>If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 2.</li> <li>If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b1, start at level -1.</li> </ul> <p>If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.</p>
0b01	<p>If VTCR_EL2.TG0 is 0b00 (4KB granule):</p> <p>If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.</p> <ul style="list-style-type: none"> <li>If FEAT_LPA2 is not implemented, start at level 1.</li> <li>If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 1.</li> <li>If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 01 and VTCR_EL2.SL2 == 1 is reserved.</li> </ul> <p>If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.</p>
0b10	<p>If VTCR_EL2.TG0 is 0b00 (4KB granule):</p> <p>If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.</p> <ul style="list-style-type: none"> <li>If FEAT_LPA2 is not implemented, start at level 0.</li> <li>If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 0.</li> <li>If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 10 and VTCR_EL2.SL2 == 1 is reserved.</li> </ul> <p>If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.</p>
0b11	<p>If VTCR_EL2.TG0 is 0b00 (4KB granule):, start at level 3.</p> <ul style="list-style-type: none"> <li>If FEAT_LPA2 is not implemented, start at level 3.</li> <li>If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 3.</li> <li>If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 11 and VTCR_EL2.SL2 == 1 is reserved.</li> </ul> <p>If VTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0.</p>

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VTCR\_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Starting level of the Secure stage 2 translation lookup, controlled by VTCR\_EL2. The meaning of this field depends on the value of VTCR\_EL2.TG0.

SL0	Meaning
0b00	If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.
0b01	If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.
0b10	If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VTCR\_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### T0SZ, bits [5:0]

The size offset of the memory region addressed by [VTTBR\\_EL2](#). The region size is  $2^{(64-T0SZ)}$  bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

This field resets to an architecturally UNKNOWN value.

#### Note

For the 4KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT\_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the VTCR\_EL2

Any of the bits in VTCR\_EL2 are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

MRS <Xt>, VTCR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0001	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x040];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return VTCR_EL2;
elsif PSTATE.EL == EL3 then
    return VTCR_EL2;

```

MSR VTCR\_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0001	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x040] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    VTCR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    VTCR_EL2 = X[t];

```

# VTTBR\_EL2, Virtualization Translation Table Base Register

The VTTBR\_EL2 characteristics are:

## Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the EL1&0 translation regime, and other information for this translation regime.

## Configuration

AArch64 System register VTTBR\_EL2 bits [63:0] are architecturally mapped to AArch32 System register [VTTBR\[63:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

VTTBR\_EL2 is a 64-bit register.

## Field descriptions

The VTTBR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
VMID																BADDR																
BADDR																																CnP
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
VMID[15:8]								VMID[7:0]								BADDR																
BADDR																																CnP
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### VMID[15:8], bits [63:56]

When FEAT\_VMID16 is implemented and VTCR\_EL2.VS == 1:

Extension to VMID[7:0]. See VTTBR\_EL2.VMID[7:0] for more details.

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

This field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

### VMID[7:0], bits [55:48]

The VMID for the translation table.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- The [VTCR\\_EL2.VS](#) is 0.
- FEAT\_VMID16 is not implemented.

This field resets to an architecturally UNKNOWN value.

#### VMID, bits [63:48]

**VMID encoding when FEAT\_VMID16 is implemented or (VTCR\_EL2.VS == 1 or AArch32 is supported at any Exception level)**

#### VMID, bits [15:0]

The VMID for the translation table.

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VMID encoding when FEAT\_VMID16 is not implemented or (VTCR\_EL2.VS == 0 or the implementation only supports execution in AArch64 state)**

#### Bits [15:8]

Reserved, RES0.

#### VMID, bits [7:0]

The VMID for the translation table.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- The [VTCR\\_EL2.VS](#) is 0.
- FEAT\_VMID16 is not implemented.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

##### Note

- Translation table base addresses of 52 bits, A[51:x], are supported only in an implementation that includes FEAT\_LPA and is using the 64KB translation granule.
- A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes FEAT\_LPA, if the value of [VTCR\\_EL2.PS](#) is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
  - If  $x \geq 6$  then  $z=x$ .
  - Otherwise,  $z=6$ .
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When  $z > x$  register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When  $x > 6$  register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes FEAT\_TTCNP, bit[0] of the stage 1 translation table base address is zero.

**Note**

- In an implementation that includes FEAT\_LPA a [VTCR\\_EL2](#).PS value of 0b110, that selects a PA size of 52 bits, is permitted only when using the 64KB translation granule.
- When the value of [ID\\_AA64MMFR0\\_EL1](#).PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the Effective value of [VTCR\\_EL2](#).PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of [VTCR\\_EL2](#).PS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

**Note**

This definition applies:

- To an implementation that includes FEAT\_LPA and is using a translation granule smaller than 64KB.
- To any implementation that does not include FEAT\_LPA.

If any VTTBR\_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VTTBR\_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [VTCR\\_EL2](#).T0SZ, the stage of translation, and the translation granule size.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CnP, bit [0]****When FEAT\_TTCNP is implemented:**

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR\_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR\_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

This field is permitted to be cached in a TLB.

**Note**

If the value of VTTBR\_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR\_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR\_EL2 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Accessing the VTTBR\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, VTTBR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x020];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return VTTBR_EL2;
elsif PSTATE.EL == EL3 then
    return VTTBR_EL2;

```

MSR VTTBR\_EL2, <Xt>

op0	op1	CRn	CRm	op2

        NVMem[0x020] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    VTTBR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    VTTBR_EL2 = X[t];

```

**(old)****htmldiff from-****(new)**

The ZCR\_EL1 characteristics are:

## Purpose

The SVE Control Register for EL1 is used to control aspects of SVE visible at Exception levels EL1 and EL0.

## Configuration

This register is present only when FEAT\_SVE is implemented. Otherwise, direct accesses to ZCR\_EL1 are UNDEFINED.

When [HCR\\_EL2](#).{E2H, TGE} == {1, 1} and EL2 is enabled in the current Security state, the fields in this register have no effect on execution at EL0

## Attributes

ZCR\_EL1 is a 64-bit register.

## Field descriptions

The ZCR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
																RES0																					
RES0																RAZ/WI								LEN													
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

**Bits [63:9]**

Reserved, RES0.

**Bits [8:4]**

Reserved, RAZ/WI.

**LEN, bits [3:0]**

**EffectiveConstrains** **Scalablethe** **Vectorscalable** **Length**, vector register length for EL1 and EL0 to (LEN+1)x128 bits. For all purposes other than returning the result of a direct read of ZCR\_EL1 then this field behaves as if it is set to the minimum of the stored value and the constrained length inherited from more privileged Exception levels in the current Security state, rounded down to the nearest implemented vector length.

Constrains the scalable vector register length for EL1 and EL0 to  $(LEN+1) \times 128$  bits.

For all purposes other than returning the result of a direct read of ZCR\_EL1, this field behaves as if:

- It is set to the minimum of the stored value and the constrained length inherited from more privileged Exception levels in the current Security state.
- It is rounded down to the nearest implemented vector length.

An indirect read of ZCR\_EL1.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ZCR\_EL1

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic ZCR\_EL1 or ZCR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, ZCR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0010	0b000

```

# ZCR\_EL2, SVE Control Register for EL2

The ZCR\_EL2 characteristics are:

## Purpose

The SVE Control Register for EL2 is used to control aspects of SVE visible at Exception levels EL2, EL1, and EL0, when EL2 is enabled in the current Security state.

## Configuration

This register is present only when FEAT\_SVE is implemented. Otherwise, direct accesses to ZCR\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ZCR\_EL2 is a 64-bit register.

## Field descriptions

The ZCR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																RES0

### Bits [63:9]

Reserved, RES0.

### Bits [8:4]

Reserved, RAZ/WI.

### LEN, bits [3:0]

Effective Constrains Scalablethe Vectorscalable Lengthvector register length for EL2, EL1, and EL0 to (LEN+1)x128 bits, when EL2 is enabled in the current Security state. For all purposes other than returning the result of a direct read of ZCR\_EL2 then this field behaves as if it is set to the minimum of the stored value and the constrained length inherited from more privileged Exception levels in the current Security state, rounded down to the nearest implemented vector length.

Constrains the scalable vector register length for EL2, EL1, and EL0 to (LEN+1)x128 bits, when EL2 is enabled in the current Security state.

For all purposes other than returning the result of a direct read of ZCR\_EL2, this field behaves as if:

- It is set to the minimum of the stored value and the constrained length inherited from more privileged Exception levels in the current Security state.
- It is rounded down to the nearest implemented vector length.

An indirect read of ZCR\_EL2.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Accessing the ZCR\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic ZCR\_EL2 or ZCR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, ZCR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0010	0b000

```

# ACTLR, Auxiliary Control Register

The ACTLR characteristics are:

## Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

## Configuration

AArch32 System register ACTLR bits [31:0] are architecturally mapped to AArch64 System register [ACTLR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ACTLR are UNDEFINED.

Some bits might define global configuration settings, and be common to the Secure and Non-secure instances of the register.

## Attributes

ACTLR is a 32-bit register.

## Field descriptions

The ACTLR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ACTLR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;

# ACTLR2, Auxiliary Control Register 2

The ACTLR2 characteristics are:

## Purpose

Provides additional space to the ACTLR register to hold IMPLEMENTATION DEFINED trap functionality for execution at EL1 and EL0.

## Configuration

AArch32 System register ACTLR2 bits [31:0] are architecturally mapped to AArch64 System register [ACTLR\\_EL1\[63:32\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ACTLR2 are UNDEFINED.

In Armv8.0 and Armv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining [ID\\_MMFR4.AC2](#).

From Armv8.2 this register must be implemented.

## Attributes

ACTLR2 is a 32-bit register.

## Field descriptions

The ACTLR2 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ACTLR2

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

# AMAIRO, Auxiliary Memory Attribute Indirection Register 0

The AMAIRO characteristics are:

## Purpose

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by [MAIRO](#).

## Configuration

AArch32 System register AMAIRO bits [31:0] are architecturally mapped to AArch64 System register [AMAIR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to AMAIRO are UNDEFINED.

## Attributes

AMAIRO is a 32-bit register.

## Field descriptions

The AMAIRO bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIRO(S) gives the value for memory accesses from Secure state.
- AMAIRO(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by [MAIRO](#) and [MAIR1](#).

In a typical implementation, AMAIRO and [AMAIR1](#) split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

## Accessing the AMAIRO

Accesses to this register use the following encodings:

# AMAIR1, Auxiliary Memory Attribute Indirection Register 1

The AMAIR1 characteristics are:

## Purpose

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by [MAIR1](#).

## Configuration

AArch32 System register AMAIR1 bits [31:0] are architecturally mapped to AArch64 System register [AMAIR\\_EL1\[63:32\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to AMAIR1 are UNDEFINED.

When EL3 is using AArch32, write access to AMAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

## Attributes

AMAIR1 is a 32-bit register.

## Field descriptions

The AMAIR1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIR1(S) gives the value for memory accesses from Secure state.
- AMAIR1(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by [MAIR0](#) and [MAIR1](#).

In a typical implementation, [AMAIR0](#) and AMAIR1 split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the AMAIR1

# AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

## Purpose

Disable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

## Configuration

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR0\\_ELO\[31:0\]](#).

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to External register [AMCNTENCLR0\[31:0\]](#).

This register is present only when FEAT\_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are UNDEFINED.

## Attributes

AMCNTENCLR0 is a 32-bit register.

## Field descriptions

The AMCNTENCLR0 bit assignments are:

### Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 150 to 015

Activity monitor event counter disable bit for [AMEVCNTR0<n>](#).

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in [AMCGCR.CG0NC](#).

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that <a href="#">AMEVCNTR0&lt;n&gt;</a> is disabled. When written, has no effect.
0b1	When read, means that <a href="#">AMEVCNTR0&lt;n&gt;</a> is enabled. When written, disables <a href="#">AMEVCNTR0&lt;n&gt;</a> .

On a Cold reset, this field resets to 0.

## Accessing the AMCNTENCLR0

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0010	0b100

# AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

## Purpose

Disable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

## Configuration

AArch32 System register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR1\\_ELO\[31:0\]](#).

AArch32 System register AMCNTENCLR1 bits [31:0] are architecturally mapped to External register [AMCNTENCLR1\[31:0\]](#).

This register is present only when FEAT\_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are UNDEFINED.

## Attributes

AMCNTENCLR1 is a 32-bit register.

## Field descriptions

The AMCNTENCLR1 bit assignments are:

### Bits [31:16]

Reserved, RES0.

### P<n>, bit [n], for n = 150 to 015

Activity monitor event counter disable bit for [AMEVCNTR1<n>](#).

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in [AMCGCR\\_ELO.CG1NC](#).

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that <a href="#">AMEVCNTR1&lt;n&gt;</a> is disabled. When written, has no effect.
0b1	When read, means that <a href="#">AMEVCNTR1&lt;n&gt;</a> is enabled. When written, disables <a href="#">AMEVCNTR1&lt;n&gt;</a> .

On a Cold reset, this field resets to 0.

## Accessing the AMCNTENCLR1

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENCLR1 are UNDEFINED.

**Note**

The number of auxiliary activity monitor event counters implemented is zero exactly when [AMCFGR.NCG](#) == 0b0000.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0011	0b000

```

# CLIDR, Cache Level ID Register

The CLIDR characteristics are:

## Purpose

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

## Configuration

AArch32 System register CLIDR bits [31:0] are architecturally mapped to AArch64 System register [CLIDR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CLIDR are UNDEFINED.

## Attributes

CLIDR is a 32-bit register.

## Field descriptions

The CLIDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ICB	LoUU	LoC	LoUIS	Ctype7	Ctype6	Ctype5	Ctype4	Ctype3	Ctype2	Ctype1																					

### ICB, bits [31:30]

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

The possible values are:

ICB	Meaning
0b00	Not disclosed by this mechanism.
0b01	L1 cache is the highest Inner Cacheable level.
0b10	L2 cache is the highest Inner Cacheable level.
0b11	L3 cache is the highest Inner Cacheable level.

### LoUU, bits [29:27]

Level of Unification Uniprocessor for the cache hierarchy.

#### Note

When FEAT\_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

### LoC, bits [26:24]

Level of Coherence for the cache hierarchy.

### LoUIS, bits [23:21]

Level of Unification Inner Shareable for the cache hierarchy.

#### Note

When FEAT\_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

### Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 71 to 17

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

Ctype<n>	Meaning
0b000	No cache.
0b001	Instruction cache only.
0b010	Data cache only.
0b011	Separate instruction and data caches.
0b100	Unified cache.

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

## Accessing the CLIDR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b001	0b0000	0b0000	0b001

```

if PSTATE.EL == EL0 then

# CNTFRQ, Counter-timer Frequency register

The CNTFRQ characteristics are:

## Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

## Configuration

AArch32 System register CNTFRQ bits [31:0] are architecturally mapped to AArch64 System register [CNTFRQ\\_ELO\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTFRQ are UNDEFINED.

## Attributes

CNTFRQ is a 32-bit register.

## Field descriptions

The CNTFRQ bit assignments are:

### Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the CNTFRQ

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0000	0b000

```

# CNTHCTL, Counter-timer Hyp Control register

The CNTHCTL characteristics are:

## Purpose

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 modes to the physical counter and the Non-secure EL1 physical timer.

## Configuration

AArch32 System register CNTHCTL bits [31:0] are architecturally mapped to AArch64 System register [CNTHCTL\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHCTL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHCTL is a 32-bit register.

## Field descriptions

The CNTHCTL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
														RES0	EVNTIS										EVNTI	EVNTDIR	EVNTEN	PL1PCEN	PL1PCTEN		

### Bits [31:18]

Reserved, RES0.

### EVNTIS, bit [17]

When FEAT\_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTHCTL.EVNTI field applies to <a href="#">CNTPCT</a> [15:0].
0b1	The CNTHCTL.EVNTI field applies to <a href="#">CNTPCT</a> [23:8].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### Bits [16:8]

Reserved, RES0.

**EVNTI, bits [7:4]**

Selects which bit of the counter register [CNTPCT](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT\_ECV is implemented, and CNTHCTL.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register [CNTPCT](#) is the trigger.

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**EVNTDIR, bit [3]**

Controls which transition of the counter register [CNTPCT](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**EVNTEN, bit [2]**

Enables the generation of an event stream from the counter register [CNTPCT](#):

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**PL1PCEN, bit [1]**

Traps Non-secure EL0 and EL1 accesses to the physical timer registers to Hyp mode.

PL1PCEN	Meaning
0b0	Non-secure EL0 and EL1 accesses to the <a href="#">CNTP_CTL</a> , <a href="#">CNTP_CVAL</a> , and <a href="#">CNTP_TVAL</a> are trapped to Hyp mode, unless the it is trapped by <a href="#">CNTKCTL.PL0PTEN</a> .
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**PL1PCTEN, bit [0]**

Traps Non-secure EL0 and EL1 accesses to the physical counter register to Hyp mode.

PL1PCTEN	Meaning
0b0	Non-secure EL0 and EL1 accesses to the <a href="#">CNTPCT</a> are trapped to Hyp mode, unless it is trapped by <a href="#">CNTKCTL.PL0PCTEN</a> .
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

## Accessing the CNTHCTL

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1110	0b0001	0b000

```

# CNTHP\_CTL, Counter-timer Hyp Physical Timer Control register

The CNTHP\_CTL characteristics are:

## Purpose

Control register for the Hyp mode physical timer.

## Configuration

AArch32 System register CNTHP\_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTHP\\_CTL\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHP\_CTL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHP\_CTL is a 32-bit register.

## Field descriptions

The CNTHP\_CTL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																ISTATUS		IMASK	ENABLE												

### Bits [31:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

## ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHP\\_TVAL](#) continues to count down.

### Note

Disabling the output signal might be a power-saving option.

## Accessing the CNTHP\_CTL

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

# CNTHP\_CVAL, Counter-timer Hyp Physical CompareValue register

The CNTHP\_CVAL characteristics are:

## Purpose

Holds the compare value for the Hyp mode physical timer.

## Configuration

AArch32 System register CNTHP\_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTHP\\_CVAL\\_EL2\[63:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHP\_CVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHP\_CVAL is a 64-bit register.

## Field descriptions

The CNTHP\_CVAL bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																CompareValue															
																CompareValue															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When [CNTHP\\_CTL](#).ENABLE is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHP\\_CTL](#).ISTATUS is set to 1.
- If [CNTHP\\_CTL](#).IMASK is 0, an interrupt is generated.

When [CNTHP\\_CTL](#).ENABLE is 0, the timer condition is not met, but [CNTPCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

# CNTHP\_TVAL, Counter-timer Hyp Physical Timer TimerValue register

The CNTHP\_TVAL characteristics are:

## Purpose

Holds the timer value for the Hyp mode physical timer.

## Configuration

AArch32 System register CNTHP\_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTHP\\_TVAL\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHP\_TVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHP\_TVAL is a 32-bit register.

## Field descriptions

The CNTHP\_TVAL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																TimerValue															

### TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHP\\_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHP\\_CTL.ENABLE](#) is 1, the value returned is ([CNTHP\\_CVAL](#) - [CNTPCT](#)).

On a write of this register, [CNTHP\\_CVAL](#) is set to ([CNTPCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHP\\_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - [CNTHP\\_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHP\\_CTL.ISTATUS](#) is set to 1.
- If [CNTHP\\_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHP\\_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count, so the TimerValue view appears to continue to count down.

# CNTHPS\_CTL, Counter-timer Secure Physical Timer Control Register (EL2)

The CNTHPS\_CTL characteristics are:

## Purpose

Provides AArch32 access from EL0 to the Secure EL2 physical timer.

## Configuration

AArch32 System register CNTHPS\_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTHPS\\_CTL\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHPS\_CTL are UNDEFINED.

## Attributes

CNTHPS\_CTL is a 32-bit register.

## Field descriptions

The CNTHPS\_CTL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																ISTATUS			IMASK		ENABLE										

### Bits [31:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the CNTHPS\_CTL.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS\_CTL.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHPS\_TVAL\_EL2 continues to count down.

Note

Disabling the output signal might be a power-saving option.

Accessing the CNTHPS\_CTL

This register is accessed using the encoding for CNTP\_CTL.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0010	0b001

```

The CNTHPS\_CVAL characteristics are:

Provides AArch32 access from EL0 to the compare value for the Secure EL2 physical timer.

AArch32 System register CNTHPS\_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTHPS\\_CVAL\\_EL2\[63:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHPS\_CVAL are UNDEFINED.

CNTHPS\_CVAL is a 64-bit register.

The CNTHPS\_CVAL bit assignments are:

Diagram illustrating the 64-bit register structure. The register is divided into two 32-bit halves, both labeled `CompareValue` in blue text. The bit indices are shown above and below the register boundaries.

Holds the EL2 physical timer CompareValue.

When `CNTHPS_CTL_EL2.ENABLE` is 1, the timer condition is met when `(CNTPCT_EL0 - CompareValue)` is greater than or equal to zero. This means that `CompareValue` acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHPS\_CTL\_EL2.ISTATUS is set to 1.
- If CNTHPS\_CTL\_EL2.IMASK is 0, an interrupt is generated.

When [CNTHPS\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This register is accessed using the encoding for [CNTF\\_CVAL](#).

Accesses to this register use the following encodings:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b1110	0b0010

# CNTHPS\_TVAL, Counter-timer Secure Physical Timer TimerValue Register (EL2)

The CNTHPS\_TVAL characteristics are:

## Purpose

Provides AArch32 access from EL0 to the timer value for the Secure EL2 physical timer.

## Configuration

AArch32 System register CNTHPS\_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTHPS\\_TVAL\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHPS\_TVAL are UNDEFINED.

## Attributes

CNTHPS\_TVAL is a 32-bit register.

## Field descriptions

The CNTHPS\_TVAL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TimerValue																															

### TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHPS\\_CTL\\_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHPS\\_CTL\\_EL2.ENABLE](#) is 1, the value returned is ([CNTHPS\\_CVAL\\_EL2](#) - [CNTPCT\\_EL0](#)).

On a write of this register, [CNTHPS\\_CVAL\\_EL2](#) is set to ([CNTPCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHPS\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - [CNTHPS\\_CVAL\\_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHPS\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHPS\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHPS\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

## Accessing the CNTHPS\_TVAL

This register is accessed using the encoding for [CNTP\\_TVAL](#).

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0010	0b000

```

# CNTHV\_CTL, Counter-timer Virtual Timer Control register (EL2)

The CNTHV\_CTL characteristics are:

## Purpose

Provides AArch32 access to the control register for the EL2 virtual timer.

## Configuration

AArch32 System register CNTHV\_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTHV\\_CTL\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_VHE is implemented. Otherwise, direct accesses to CNTHV\_CTL are UNDEFINED.

## Attributes

CNTHV\_CTL is a 32-bit register.

## Field descriptions

The CNTHV\_CTL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																ISTATUS			IMASK		ENABLE										

### Bits [31:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHV\\_TVAL](#) continues to count down.

---

#### Note

Disabling the output signal might be a power-saving option.

---

# CNTHV\_CVAL, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV\_CVAL characteristics are:

## Purpose

Provides AArch32 access to the compare value for the EL2 virtual timer.

## Configuration

AArch32 System register CNTHV\_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTHV\\_CVAL\\_EL2\[63:0\]](#).

This register is present only when FEAT\_VHE is implemented. Otherwise, direct accesses to CNTHV\_CVAL are UNDEFINED.

## Attributes

CNTHV\_CVAL is a 64-bit register.

## Field descriptions

The CNTHV\_CVAL bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CompareValue																															

### CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When [CNTHV\\_CTL](#).ENABLE is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHV\\_CTL](#).ISTATUS is set to 1.
- If [CNTHV\\_CTL](#).IMASK is 0, an interrupt is generated.

When [CNTHV\\_CTL](#).ENABLE is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

## Accessing the CNTHV\_CVAL

Accesses to this register use the following encodings:

# CNTHV\_TVAL, Counter-timer Virtual Timer TimerValue register (EL2)

The CNTHV\_TVAL characteristics are:

## Purpose

Provides AArch32 access to the timer value for the EL2 virtual timer.

## Configuration

AArch32 System register CNTHV\_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTHV\\_TVAL\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_VHE is implemented. Otherwise, direct accesses to CNTHV\_TVAL are UNDEFINED.

## Attributes

CNTHV\_TVAL is a 32-bit register.

## Field descriptions

The CNTHV\_TVAL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TimerValue																															

### TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHV\\_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHV\\_CTL.ENABLE](#) is 1, the value returned is ([CNTHV\\_CVAL](#) - [CNTVCT](#)).

On a write of this register, [CNTHV\\_CVAL](#) is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHV\\_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - [CNTHV\\_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHV\\_CTL.ISTATUS](#) is set to 1.
- If [CNTHV\\_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHV\\_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

## Accessing the CNTHV\_TVAL

~~This register is accessed using the encoding for [CNTV\\_TVAL](#).~~

~~Accesses to this register use the following encodings:~~

# CNTHVS\_CTL, Counter-timer Secure Virtual Timer Control Register (EL2)

The CNTHVS\_CTL characteristics are:

## Purpose

Provides AArch32 access from EL0 to the Secure EL2 virtual timer.

## Configuration

AArch32 System register CNTHVS\_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTHVS\\_CTL\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHVS\_CTL are UNDEFINED.

## Attributes

CNTHVS\_CTL is a 32-bit register.

## Field descriptions

The CNTHVS\_CTL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																ISTATUS		IMASK	ENABLE												

### Bits [31:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHVS\\_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

Accessing the CNTHVS\_CTL

This register is accessed using the encoding for [CNTV\\_CTL](#).

Accesses to this register use the following encodings:

# CNTHVS\_CVAL, Counter-timer Secure Virtual Timer CompareValue Register (EL2)

The CNTHVS\_CVAL characteristics are:

## Purpose

Provides AArch32 access to the compare value for the Secure EL2 virtual timer.

## Configuration

AArch32 System register CNTHVS\_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTHVS\\_CVAL\\_EL2\[63:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHVS\_CVAL are UNDEFINED.

## Attributes

CNTHVS\_CVAL is a 64-bit register.

## Field descriptions

The CNTHVS\_CVAL bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CompareValue																															

### CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When [CNTHVS\\_CTL](#).ENABLE is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHVS\\_CTL](#).ISTATUS is set to 1.
- If [CNTHVS\\_CTL](#).IMASK is 0, an interrupt is generated.

When [CNTHVS\\_CTL](#).ENABLE is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

## Accessing the CNTHVS\_CVAL

This register is accessed using the encoding for [CNTV\\_CVAL](#).

Accesses to this register use the following encodings:

MRRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b1110	0b0011

```

# CNTHVS\_TVAL, Counter-timer Secure Virtual Timer TimerValue Register (EL2)

The CNTHVS\_TVAL characteristics are:

## Purpose

Provides AArch32 access to the timer value for the Secure EL2 virtual timer.

## Configuration

AArch32 System register CNTHVS\_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTHVS\\_TVAL\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHVS\_TVAL are UNDEFINED.

## Attributes

CNTHVS\_TVAL is a 32-bit register.

## Field descriptions

The CNTHVS\_TVAL bit assignments are:

### TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHVS\\_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHVS\\_CTL.ENABLE](#) is 1, the value returned is ([CNTHVS\\_CVAL](#) - [CNTVCT](#)).

On a write of this register, [CNTHVS\\_CVAL](#) is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHVS\\_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - [CNTHVS\\_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHVS\\_CTL.ISTATUS](#) is set to 1.
- If [CNTHVS\\_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHVS\\_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

## Accessing the CNTHVS\_TVAL

~~This register is accessed using the encoding for [CNTV\\_TVAL](#).~~

The CNTKCTL characteristics are:

## Purpose

Controls the generation of an event stream from the virtual counter, and access from EL0 modes to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

## Configuration

AArch32 System register CNTKCTL bits [31:0] are architecturally mapped to AArch64 System register [CNTKCTL\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTKCTL are UNDEFINED.

## Attributes

CNTKCTL is a 32-bit register.

## Field descriptions

The CNTKCTL bit assignments are:

3130292827262524232221201918	17	16151413121110	9	8	7	6	5	4	3	2	1	0
RES0	EVNTIS	RES0	PLOPTEN	PLOVTEN	EVNTI	EVNTDIR	EVNTEN	PLOVCTEN	PLOPCTEN			

**Bits [31:18]**

Reserved, RES0.

**EVNTIS, bit [17]**

**When FEAT\_ECV is implemented:**

Controls the scale of the generation of the event stream.

EVENTIS	Meaning
0b0	The CNTKCTL.EVENTI field applies to <a href="#">CNTVCT</a> [15:0].
0b1	The CNTKCTL.EVENTI field applies to <a href="#">CNTVCT</a> [23:8].

This control applies regardless of the value of the [CINTHCTL\\_EL2.ECV](#) bit.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [16:10]**

Reserved, RES0.

**PLOPTEN, bit [9]**

Traps PL0 accesses to the physical timer registers to Undefined mode.

PLOPTEN	Meaning
0b0	PL0 accesses to the <a href="#">CNTP_CTL</a> , <a href="#">CNTP_CVAL</a> , and <a href="#">CNTP_TVAL</a> registers are trapped to Undefined mode.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**PLOVTEN, bit [8]**

Traps PL0 accesses to the virtual timer registers to Undefined mode.

PLOVTEN	Meaning
0b0	PL0 accesses to the <a href="#">CNTV_CTL</a> , <a href="#">CNTV_CVAL</a> , and <a href="#">CNTV_TVAL</a> registers are trapped to Undefined mode.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**EVNTI, bits [7:4]**

Selects which bit of the counter register [CNTVCT](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT\_ECV is implemented, and CNTKCTL.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register [CNTVCT](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**EVNTDIR, bit [3]**

Controls which transition of the counter register [CNTVCT](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**EVNTEN, bit [2]**

Enables the generation of an event stream from the counter register [CNTVCT](#):

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**PLOVCTEN, bit [1]**

Traps PL0 accesses to the frequency register and virtual counter register to Undefined mode.

PLOVCTEN	Meaning
0b0	PL0 accesses to the <a href="#">CNTVCT</a> are trapped to Undefined mode. PL0 accesses to the <a href="#">CNTFRQ</a> register are trapped to Undefined mode, if <a href="#">CNTKCTL</a> .PLOTCTEN is also 0.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## PLOPCTEN, bit [0]

Traps PL0 accesses to the frequency register and physical counter register to Undefined mode.

PLOPCTEN	Meaning
0b0	PL0 accesses to the <a href="#">CNTPCT</a> are trapped to Undefined mode.
	PL0 accesses to the <a href="#">CNTFRQ</a> register are trapped to Undefined mode, if <a href="#">CNTKCTL.PL0VCTEN</a> is also 0.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTKCTL

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0001	0b000

# CNTP\_CTL, Counter-timer Physical Timer Control register

The CNTP\_CTL characteristics are:

## Purpose

Control register for the EL1 physical timer.

## Configuration

AArch32 System register CNTP\_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTP\\_CTL\\_EL0\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTP\_CTL are UNDEFINED.

## Attributes

CNTP\_CTL is a 32-bit register.

## Field descriptions

The CNTP\_CTL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																ISTATUS			IMASK		ENABLE										

### Bits [31:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP\\_TVAL](#) continues to count down.

---

### Note

Disabling the output signal might be a power-saving option.

---

## Accessing the CNTP\_CTL

Accesses to this register use the following encodings:

`MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}`

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0010	0b001

```

# CNTP\_CVAL, Counter-timer Physical Timer CompareValue register

The CNTP\_CVAL characteristics are:

## Purpose

Holds the compare value for the EL1 physical timer.

## Configuration

AArch32 System register CNTP\_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTP\\_CVAL\\_EL0\[63:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTP\_CVAL are UNDEFINED.

## Attributes

CNTP\_CVAL is a 64-bit register.

## Field descriptions

The CNTP\_CVAL bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CompareValue																															

### CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When [CNTP\\_CTL](#).ENABLE is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTP\\_CTL](#).ISTATUS is set to 1.
- If [CNTP\\_CTL](#).IMASK is 0, an interrupt is generated.

When [CNTP\\_CTL](#).ENABLE is 0, the timer condition is not met, but [CNTPCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

## Accessing the CNTP\_CVAL

# CNTP\_TVAL, Counter-timer Physical Timer TimerValue register

The CNTP\_TVAL characteristics are:

## Purpose

Holds the timer value for the EL1 physical timer.

## Configuration

AArch32 System register CNTP\_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTP\\_TVAL\\_EL0\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTP\_TVAL are UNDEFINED.

## Attributes

CNTP\_TVAL is a 32-bit register.

## Field descriptions

The CNTP\_TVAL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TimerValue																															

### TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If [CNTP\\_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTP\\_CTL.ENABLE](#) is 1, the value returned is ([CNTP\\_CVAL](#) - [CNTPCT](#)).

On a write of this register, [CNTP\\_CVAL](#) is set to ([CNTPCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP\\_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - [CNTP\\_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTP\\_CTL.ISTATUS](#) is set to 1.
- If [CNTP\\_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTP\\_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count, so the TimerValue view appears to continue to count down.

## Accessing the CNTP\_TVAL

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0010	0b000

```

# CNTV\_CTL, Counter-timer Virtual Timer Control register

The CNTV\_CTL characteristics are:

## Purpose

Control register for the virtual timer.

## Configuration

AArch32 System register CNTV\_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTV\\_CTL\\_EL0\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTV\_CTL are UNDEFINED.

## Attributes

CNTV\_CTL is a 32-bit register.

## Field descriptions

The CNTV\_CTL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																ISTATUS			IMASK		ENABLE										

### Bits [31:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTV\\_TVAL](#) continues to count down.

---

### Note

Disabling the output signal might be a power-saving option.

---

# CNTV\_CVAL, Counter-timer Virtual Timer CompareValue register

The CNTV\_CVAL characteristics are:

## Purpose

Holds the compare value for the virtual timer.

## Configuration

AArch32 System register CNTV\_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTV\\_CVAL\\_EL0\[63:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTV\_CVAL are UNDEFINED.

## Attributes

CNTV\_CVAL is a 64-bit register.

## Field descriptions

The CNTV\_CVAL bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CompareValue																															

### CompareValue, bits [63:0]

Holds the EL1 virtual timer CompareValue.

When [CNTV\\_CTL](#).ENABLE is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTV\\_CTL](#).ISTATUS is set to 1.
- If [CNTV\\_CTL](#).IMASK is 0, an interrupt is generated.

When [CNTV\\_CTL](#).ENABLE is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

## Accessing the CNTV\_CVAL

Accesses to this register use the following encodings:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

# CNTV\_TVAL, Counter-timer Virtual Timer TimerValue register

The CNTV\_TVAL characteristics are:

## Purpose

Holds the timer value for the virtual timer.

## Configuration

AArch32 System register CNTV\_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTV\\_TVAL\\_EL0\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTV\_TVAL are UNDEFINED.

## Attributes

CNTV\_TVAL is a 32-bit register.

## Field descriptions

The CNTV\_TVAL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TimerValue																															

### TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If [CNTV\\_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTV\\_CTL.ENABLE](#) is 1, the value returned is ([CNTV\\_CVAL](#) - [CNTVCT](#)).

On a write of this register, [CNTV\\_CVAL](#) is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP\\_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - [CNTP\\_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTV\\_CTL.ISTATUS](#) is set to 1.
- If [CNTV\\_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTV\\_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

## Accessing the CNTV\_TVAL

# CNTVOFF, Counter-timer Virtual Offset register

The CNTVOFF characteristics are:

## Purpose

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in [CNTPCT](#) and the virtual count value visible in [CNTVCT](#).

## Configuration

AArch32 System register CNTVOFF bits [63:0] are architecturally mapped to AArch64 System register [CNTVOFF\\_EL2\[63:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTVOFF are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

### Note

When EL2 is implemented and is using AArch64, if [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the virtual counter uses a fixed virtual offset of zero when [CNTVCT](#) is read from Non-secure EL0.

## Attributes

CNTVOFF is a 64-bit register.

## Field descriptions

The CNTVOFF bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual offset																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Virtual offset																															

### Bits [63:0]

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTVOFF

Accesses to this register use the following encodings:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

<b>coproc</b>	<b>CRm</b>	<b>opc1</b>
0b1111	0b1110	0b0100

```

if PSTATE.EL == EL0 then

# CONTEXTIDR, Context ID Register

The CONTEXTIDR characteristics are:

## Purpose

Identifies the current Process Identifier and, when using the Short-descriptor translation table format, the Address Space Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

## Configuration

AArch32 System register CONTEXTIDR bits [31:0] are architecturally mapped to AArch64 System register [CONTEXTIDR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CONTEXTIDR are UNDEFINED.

The register format depends on whether address translation is using the Long-descriptor or the Short-descriptor translation table format.

## Attributes

CONTEXTIDR is a 32-bit register.

## Field descriptions

The CONTEXTIDR bit assignments are:

### When TTBCR.EAE == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PROCID																								ASID							

### PROCID, bits [31:8]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### ASID, bits [7:0]

Address Space Identifier. This field is programmed with the value of the current ASID.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### When TTBCR.EAE == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PROCID																															

**PROCID, bits [31:0]**

Process Identifier. This field must be programmed with a unique value that identifies the current process.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CONTEXTIDR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b001

```

# CPACR, Architectural Feature Access Control Register

The CPACR characteristics are:

## Purpose

Controls access to trace, and to Advanced SIMD and floating-point functionality from EL0, EL1, and EL3.

In an implementation that includes EL2, the CPACR has no effect on instructions executed at EL2.

## Configuration

AArch32 System register CPACR bits [31:0] are architecturally mapped to AArch64 System register [CPACR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CPACR are UNDEFINED.

Bits in the [NSACR](#) control Non-secure access to the CPACR fields. See the field descriptions for more information.

### Note

In the register field descriptions, controls are described as applying at specified Privilege levels. This is because, in Secure state, a PL1 control:

- Applies to execution in a Secure EL3 mode when EL3 is using AArch32.
- Applies to execution in a Secure EL1 mode when EL3 is using AArch64.

See 'Security state, Exception levels, and AArch32 execution privilege'.

## Attributes

CPACR is a 32-bit register.

## Field descriptions

The CPACR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">ASEDIS</a>	<a href="#">RES0</a>	<a href="#">TRCDIS</a>			<a href="#">RES0</a>			<a href="#">cp11</a>	<a href="#">cp10</a>												<a href="#">RES0</a>										

### ASEDIS, bit [31]

Disables PL0 and PL1 execution of Advanced SIMD instructions.

ASEDIS	Meaning
0b0	This control permits execution of Advanced SIMD instructions at PL0 and PL1.
0b1	All instruction encodings that are Advanced SIMD instruction encodings, but are not also floating-point instruction encodings, are UNDEFINED at PL0 and PL1.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of [NSACR.NSASEDIS](#) is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

See the description of CPACR.cp10 for a list of other controls that can disable or trap execution of Advanced SIMD instructions in AArch32 state.

On a Warm reset, this **This** field resets to 0.

#### Bits [30:29]

Reserved, RES0.

#### TRCDIS, bit [28]

Traps PL0 and PL1 System register accesses to all implemented trace registers to Undefined mode.

TRCDIS	Meaning
0b0	This control has no effect on PL0 and PL1 System register accesses to trace registers.
0b1	PL0 and PL1 System register accesses to all implemented trace registers are trapped to Undefined mode.

If the implementation does not include a PE trace unit, or does not include a System register interface to the PE trace unit registers, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of [NSACR.NSTRCDIS](#) is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

#### Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT\_ETMv4, EL0 accesses to the trace registers are UNDEFINED.
- The architecture does not provide traps on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Bits [27:24]

Reserved, RES0.

#### cp11, bits [23:22]

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the CPACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of [NSACR.cp10](#) is 0, this field behaves as RAZ/WI, regardless of its actual value.

On a Warm reset, this **This** field resets to 0.

#### cp10, bits [21:20]

Defines the access rights for the floating-point and Advanced SIMD functionality. Possible values of the field are:

cp10	Meaning
0b00	PL0 and PL1 accesses to floating-point and Advanced SIMD registers or instructions are UNDEFINED.
0b01	PL0 accesses to floating-point and Advanced SIMD registers or instructions are UNDEFINED.
0b10	Reserved. The effect of programming this field to this value is CONSTRAINED UNPREDICTABLE. See 'Handling of System register control fields for Advanced SIMD and floating-point operation'.
0b11	This control permits full access to the floating-point and Advanced SIMD functionality from PL0 and PL1.

The floating-point and Advanced SIMD features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the [FPSCR](#), [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), or [FPEXC](#) System registers.

#### Note

The [CPACR](#) has no effect on floating-point and Advanced SIMD accesses from PL2. These can be disabled by the [HCPTR](#).TCP10 field.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of [NSACR](#).cp10 is 0, this field behaves as RAZ/WI, regardless of its actual value.

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, [CPACR\\_EL1](#).FPEN.
- [FPEXC](#).EN.
- If executing in Non-secure state:
  - [HCPTR](#).TCP10, or if EL2 is using AArch64, [CPTR\\_EL2](#).TFP.
  - [NSACR](#).cp10, or if EL3 is using AArch64, [CPTR\\_EL3](#).TFP.
- For Advanced SIMD instructions only:
  - CPACR.ASEDIS.
  - If executing in Non-secure state, [HCPTR](#).TASE and [NSACR](#).NSTRCDIS.

See the descriptions of the controls for more information.

On a Warm reset, this field resets to 0.

#### Bits [19:0]

Reserved, RES0.

## Accessing the CPACR

# CPSR, Current Program Status Register

The CPSR characteristics are:

## Purpose

Holds PE status and control information.

## Configuration

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CPSR are UNDEFINED.

## Attributes

CPSR is a 32-bit register.

## Field descriptions

The CPSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	RES0	SSBS	PAND	IT	RES0	GE	RES0	E	A	I	F	RES0	RES1	M													

### N, bit [31]

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

### Z, bit [30]

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

### C, bit [29]

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

### V, bit [28]

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

### Q, bit [27]

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

### Bits [26:24]

Reserved, RES0.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass Safe.

Prohibits speculative loads or stores which might practically allow a cache timing side channel.

A cache timing side channel might be exploited where a load or store uses an address that is derived from a register that is being loaded from memory using a load instruction speculatively read from a memory location. If PSTATE.SSBS is enabled, the address derived from the load instruction might be from earlier in the coherence order than the latest store to that memory location with the same virtual address.

SSBS	Meaning
0b0	Hardware is not permitted to load or store speculatively in the manner described.
0b1	Hardware is permitted to load or store speculatively in the manner described.

The value of this bit is usually set to the value described by the [SCTLR.DSSBS](#) bit on exceptions to any mode except Hyp mode, and the value described by [H SCTLR.DSSBS](#) on exceptions to Hyp mode.

On a Warm reset, this ~~This~~ field resets to an IMPLEMENTATION DEFINED value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never.

PAN	Meaning
0b0	The translation system is the same as Armv8.0.
0b1	Disables privileged read and write accesses to addresses accessible at EL0.

The value of this bit is usually preserved on taking an exception, except in the following situations:

- When the target of the exception is EL1, and the value of the [SCTLR.SPAN](#) bit for the current Security state is 0, this bit is set to 1.
- When the target of the exception is EL3, from Secure state, and the value of the Secure [SCTLR.SPAN](#) is 0, this bit is set to 1.
- When the target of the exception is EL3, from Non-secure state, this bit is set to 0 regardless of the value of the Secure [SCTLR.SPAN](#) bit.

**Otherwise:**

Reserved, RES0.

**DIT, bit [21]****When FEAT\_DIT is implemented:**

Data Independent Timing.

DIT	Meaning
0b0	The architecture makes no statement about the timing properties of any instructions.
0b1	The architecture requires that: <ul style="list-style-type: none"> <li>• The timing of every load and store instruction is insensitive to the value of the data being loaded or stored.</li> <li>• For certain data processing instructions, the instruction takes a time which is independent of: <ul style="list-style-type: none"> <li>◦ The values of the data supplied in any of its registers.</li> <li>◦ The values of the NZCV flags.</li> </ul> </li> <li>• For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on: <ul style="list-style-type: none"> <li>◦ The values of the data supplied in any of its registers.</li> <li>◦ The values of the NZCV flags.</li> </ul> </li> </ul>

The data processing instructions affected by this bit are:

- All cryptographic instructions. These instructions are:
  - AESD, AESE, AESMC, AESMC, SHA1C, SHA1H, SHA1M, SHA1P, SHA1SU0, SHA1SU1, SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.
- A subset of those instructions which use the general-purpose register file. For these instructions, the effects of CPSR.DIT apply only if they do not use R15 as either their source or destination and pass their condition execution check. The instructions are:
  - BFI, BFC, CLZ, CMN, CMP, MLA, MLAS, MLS, MOVT, MUL, MULS, NOP, PKHBT, PKHTB, RBIT, REV, REV16, REVSH, RRX, SADD16, SADD8, SASX, SBFX, SHADD16, SHADD8, SHASX, SHSAX, SHSUB16, SHSUB8, SMLAL\*\*, SMLAW\*, SMLSD\*, SMMMLA\*, SMMML\*, SMMUL\*, SMUAD\*, SMUL\*, SSAX, SSUB16, SSUB8, SXTAB\*, SXTAH, SXTB\*, SXTH, TEQ, TST, UADD\*, UASX, UBFX, UHADD\*, UHASX, UHSAX, UHSUB\*, UMAAL, UMLAL, UMLALS, UMULL, UMULLS, USADA8, USAX, USUB\*, UXTAB\*, UXTAH, UXTB\*, UXTH, ADC (register-shifted register), ADCS (register-shifted register), ADD (register-shifted register), ADDS (register-shifted register), AND (register-shifted register), ANDS (register-shifted register), ASR (register-shifted register), ASRS (register-shifted register), BIC (register-shifted register), BICS (register-shifted register), EOR (register-shifted register), EORS (register-shifted register), LSL (register-shifted register), LSLS (register-shifted register), LSR (register-shifted register), LSRS (register-shifted register), MOV (register-shifted register), MOVS (register-shifted register), MVN (register-shifted register), MVNS (register-shifted register), ORR (register-shifted register), ORRS (register-shifted register), ROR (register-shifted register), RORS (register-shifted register), RSB (register-shifted register), RSBS (register-shifted register), RSC (register-shifted register), RSCS (register-shifted register), SBC (register-shifted register), SBCS (register-shifted register), SUB (register-shifted register), and SUBS (register-shifted register).
- A subset of those instructions which use the general-purpose register file. For these instructions, the effects of CPSR.DIT apply only if they do not use R15 as either their source or destination. The effects of CPSR.DIT do not depend on these instructions passing their condition execution check. These instructions are:
  - ADC (immediate), ADC (register), ADCS (immediate), ADCS (register), ADD (immediate), ADD (register), ADDS (immediate), ADDS (register), AND (immediate), AND (register), ANDS (immediate), ANDS (register), ASR (immediate), ASR (register), ASRS (immediate), ASRS (register), BIC (immediate), BIC (register), BICS (immediate), BICS (register), EOR (immediate), EOR (register), EORS (immediate), EORS (register), LSL (immediate), LSL (register), LSLS (immediate), LSLS (register), LSR (immediate), LSR (register), LSRS (immediate), LSRS (register), MOV (immediate), MOV (register), MOVS (immediate), MOVS (register), MVN (immediate), MVN (register), MVNS (immediate), MVNS (register), ORR (immediate), ORR (register), ORRS (immediate), ORRS (register), ROR (immediate), ROR (register), RORS (immediate), RORS (register), RSB (immediate), RSB (register), RSBS (immediate), RSBS (register), RSC (immediate), RSC (register), RSCS (immediate), RSCS (register), SBC (immediate), SBC (register), SBCS (immediate), SBCS (register), SUB (immediate), SUB (register), SUBS (immediate), and SUBS (register).
- A subset of those instructions which use the SIMD&FP register file. For these instructions, the effects of CPSR.DIT apply only if they pass their condition execution check. These instructions are:
  - CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, CRC32CW, VABA\*, VABD\*, VABS, VACGE, VACGT, VACLE, VACLT, VADD (integer), VADDHN, VADDL, VADDW, VAND, VBIC, VBIF, VBIT, VBSL, VCGE, VCGT, VCLE, VCLS, VCLT, VCLZ, VCMPE, VCMPE, VCNT, VDUP, VEOR, VEXT, VHADD, VHSUB, VMAX (integer), VMIN (integer), VMLA (integer), VMLAL, VMLS (integer), VMLSL, VMOV, VMOVL, VMOVN, VMUL (integer and polynomial), VMULL (integer and polynomial), VMVN, VNEG, VORN, VORR, VPADAL, VPADD (integer), VPADDL, VPMAX (integer),

VPMIN (integer), VRADDHN, VREV\*, VRHADD, VRSHL, VRSHR, VRSHRN, VRSRA, VRSUBHN, VSELEQ, VSELGE, VSELGT, VSELVS, VSHL, VSHLL, VSHR, VSLI, VSRA, VSRI, VSUB (integer), VSUBHN, VSUBL, VSUBW, VSWP, VTBL, VTBX, VTRN, VTST, VUZP, and VZIP

On a Warm reset, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### Bit [20]

Reserved, RES0.

#### GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

#### Bits [15:10]

Reserved, RES0.

#### E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

E	Meaning
0b0	Little-endian operation
0b1	Big-endian operation.

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

#### A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

A	Meaning
0b0	Exception not masked.
0b1	Exception masked.

#### I, bit [7]

IRQ mask bit. The possible values of this bit are:

I	Meaning
0b0	Exception not masked.
0b1	Exception masked.

# CSSELR, Cache Size Selection Register

The CSSELR characteristics are:

## Purpose

Selects the current Cache Size ID Register, [CCSIDR](#), by specifying the required cache level and the cache type, which is either instruction cache or data cache.

If FEAT\_CCIDX is implemented, CSSELR also selects the current [CCSIDR2](#).

## Configuration

AArch32 System register CSSELR bits [31:0] are architecturally mapped to AArch64 System register [CSSELR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CSSELR are UNDEFINED.

## Attributes

CSSELR is a 32-bit register.

## Field descriptions

The CSSELR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																Level			InD												

### Bits [31:4]

Reserved, RES0.

### Level, bits [3:1]

Cache level of required cache. Permitted values are:

Level	Meaning
0b000	Level 1 cache.
0b001	Level 2 cache.
0b010	Level 3 cache.
0b011	Level 4 cache.
0b100	Level 5 cache.
0b101	Level 6 cache.
0b110	Level 7 cache.

All other values are reserved.

If CSSELR.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**InD, bit [0]**

Instruction not Data bit. Permitted values are:

InD	Meaning
0b0	Data or unified cache.
0b1	Instruction cache.

If CSSELR.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CSSELR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b010	0b0000	0b0000	0b000

```

# DACR, Domain Access Control Register

The DACR characteristics are:

## Purpose

Defines the access permission for each of the sixteen memory domains.

## Configuration

AArch32 System register DACR bits [31:0] are architecturally mapped to AArch64 System register [DACR32\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DACR are UNDEFINED.

This register has no function when [TTBCR](#).EAE is set to 1, to select the Long-descriptor translation table format.

## Attributes

DACR is a 32-bit register.

## Field descriptions

The DACR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0																

**D<n>, bits [2n+1:2n], for n = 0 to 15**

**D<n>, bits [2n+1:2n], for n = 15 to 0**

Domain n access permission, where n = 0 to 15. Permitted values are:

D<n>	Meaning
0b00	No access. Any access to the domain generates a Domain fault.
0b01	Client. Accesses are checked against the permission bits in the translation tables.
0b11	Manager. Accesses are not checked against the permission bits in the translation tables.

The value 0b10 is reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the DACR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0011	0b0000	0b000

```

if PSTATE.EL == EL0 then

# DBGBCR<n>, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n> characteristics are:

## Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>](#). If EL2 is implemented and this breakpoint supports Context matching, [DBGBVR<n>](#) can be associated with a Breakpoint Extended Value Register [DBGBXVR<n>](#) for VMID matching.

## Configuration

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGBCR<n>\\_EL1\[31:0\]](#).

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to External register [DBGBCR<n>\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGBCR<n> are UNDEFINED.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

## Attributes

DBGBCR<n> is a 32-bit register.

## Field descriptions

The DBGBCR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								BT				LBN				SSC		HMC	RES0				BAS			RES0	PMC	E			

When the E field is zero, all the other fields in the register are ignored.

### Bits [31:24]

Reserved, RES0.

### BT, bits [23:20]

Breakpoint Type. Possible values are:

BT	Meaning
0b0000	Unlinked instruction address match. <a href="#">DBGBVR&lt;n&gt;</a> is the address of an instruction.
0b0001	As 0b0000 with linking enabled.
0b0010	Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of <a href="#">HCR_EL2.E2H</a> is 1, if either the PE is executing at EL0 with <a href="#">HCR_EL2.TGE</a> set to 1 or the PE is executing at EL2, then <a href="#">DBGBVR&lt;n&gt;.ContextID</a> must match the <a href="#">CONTEXTIDR_EL2</a> value. Otherwise, <a href="#">DBGBVR&lt;n&gt;.ContextID</a> must match the <a href="#">CONTEXTIDR</a> value.
0b0011	As 0b0010 with linking enabled.
0b0100	Unlinked instruction address mismatch. <a href="#">DBGBVR&lt;n&gt;</a> is the address of an instruction to be stepped.
0b0101	As 0b0100 with linking enabled.
0b0110	Unlinked <a href="#">CONTEXTIDR_EL1</a> match. <a href="#">DBGBVR&lt;n&gt;.ContextID</a> is a Context ID compared against <a href="#">CONTEXTIDR</a> .
0b0111	As 0b0110 with linking enabled.
0b1000	Unlinked VMID match. <a href="#">DBGBXVR&lt;n&gt;.VMID</a> is a VMID compared against <a href="#">VTTBR.VMID</a> .
0b1001	As 0b1000 with linking enabled.
0b1010	Unlinked VMID and Context ID match. <a href="#">DBGBVR&lt;n&gt;.ContextID</a> is a Context ID compared against <a href="#">CONTEXTIDR</a> , and <a href="#">DBGBXVR&lt;n&gt;.VMID</a> is a VMID compared against <a href="#">VTTBR.VMID</a> .
0b1011	As 0b1010 with linking enabled.
0b1100	Unlinked <a href="#">CONTEXTIDR_EL2</a> match. <a href="#">DBGBXVR&lt;n&gt;.ContextID2</a> is a Context ID compared against <a href="#">CONTEXTIDR_EL2</a> .
0b1101	As 0b1100 with linking enabled.
0b1110	Unlinked Full Context ID match. <a href="#">DBGBVR&lt;n&gt;.ContextID</a> is compared against <a href="#">CONTEXTIDR</a> , and <a href="#">DBGBXVR&lt;n&gt;.ContextID2</a> is compared against <a href="#">CONTEXTIDR_EL2</a> .
0b1111	As 0b1110 with linking enabled.

For more information on Breakpoints and their constraints, see 'Breakpoint exceptions' and 'Reserved DBGBCR<n>.BT values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**On a Warm reset, the value of this field is unchanged.**

## LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>.E is 0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**On a Warm reset, the value of this field is unchanged.**

## SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields.

For more information, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved DBGBCR<n>.{SSC, HMC, PMC} values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**On a Warm reset, the value of this field is unchanged.**

## HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## Bits [12:9]

Reserved, RES0.

## BAS, bits [8:5]

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	<a href="#">DBGBVR&lt;n&gt;</a>	Use for T32 instructions
0b1100	<a href="#">DBGBVR&lt;n&gt;</a> +2	Use for T32 instructions
0b1111	<a href="#">DBGBVR&lt;n&gt;</a>	Use for A32 instructions

All other values are reserved. For more information, see 'Reserved DBGBCR<n>.BAS values'.

For more information on using the BAS field in Address Match breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Step instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint
0b0011	<a href="#">DBGBVR&lt;n&gt;</a>	Use for T32 instructions
0b1100	<a href="#">DBGBVR&lt;n&gt;</a> +2	Use for T32 instructions
0b1111	<a href="#">DBGBVR&lt;n&gt;</a>	Use for A32 instructions

All other values are reserved. For more information, see 'Reserved DBGBCR<n>.BAS values'.

For more information on using the BAS field in address mismatch breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## Bits [4:3]

Reserved, RES0.

## PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## E, bit [0]

Enable breakpoint [DBGBVR<n>](#). Possible values are:

E	Meaning
0b0	Breakpoint disabled.
0b1	Breakpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## Accessing the DBGBCR<n>

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

# DBGBVR<n>, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n> characteristics are:

## Purpose

Holds a value for use in breakpoint matching, either the virtual address of an instruction or a context ID. Forms breakpoint n together with control register [DBGBCR<n>](#). If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register [DBGBXVR<n>](#) for VMID matching.

## Configuration

AArch32 System register DBGBVR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGBVR<n>\\_EL1\[31:0\]](#).

AArch32 System register DBGBVR<n> bits [31:0] are architecturally mapped to External register [DBGBVR<n>\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGBVR<n> are UNDEFINED.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

## Attributes

How this register is interpreted depends on the value of [DBGBCR<n>](#).BT.

- When [DBGBCR<n>](#).BT is 0b0x0x, this register holds a virtual address.
- When [DBGBCR<n>](#).BT is 0bxx1x, this register holds a Context ID.

For other values of [DBGBCR<n>](#).BT, this register is RES0.

Some breakpoints might not support Context ID comparison. For more information, see the description of the [DBGDIDR](#).CTX\_CMPs field.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

## Attributes

DBGBVR<n> is a 32-bit register.

## Field descriptions

The DBGBVR<n> bit assignments are:

### When DBGBCR<n>.BT == 0b0x0x:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA[31:2]																															
RES0																															

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## Bits [1:0]

Reserved, RES0.

## When DBGBCR<n>.BT == 0b001x:

## ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR\\_EL2](#) when all of the following are true:

- FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented.
- [CONTEXTIDR\\_EL2](#) is implemented.
- [HCR\\_EL2](#).{E2H, TGE} is {1,1}.
- The PE is executing at EL0.
- EL2 is using AArch64 and is enabled in the current Security state.

Otherwise, the value is compared against [CONTEXTIDR](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## When DBGBCR<n>.BT == 0b101x and EL2 is implemented:

## ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## When DBGBCR<n>.BT == 0bx11x, EL2 is implemented and (FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented):

## ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## Accessing the DBGBVR<n>

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	n[3:0]	0b100

```

# DBGBXVR<n>, Debug Breakpoint Extended Value Registers, n = 0 - 15

The DBGBXVR<n> characteristics are:

## Purpose

Holds a value for use in breakpoint matching, to support VMID matching. Used in conjunction with a control register [DBGBCR<n>](#) and a value register [DBGBVR<n>](#), where EL2 is implemented and breakpoint n supports Context matching.

## Configuration

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGBVR<n>\\_EL1\[63:32\]](#).

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to External register [DBGBVR<n>\\_EL1\[63:32\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGBXVR<n> are UNDEFINED.

How this register is interpreted depends on the value of [DBGBCR<n>.BT](#).

- When [DBGBCR<n>.BT](#) is 0b10xx, this register holds a VMID.
- When [DBGBCR<n>.BT](#) is 0b11xx, this register holds a Context ID.

For other values of [DBGBCR<n>.BT](#), this register is RES0.

Accesses to this register are UNDEFINED in any of the following cases:

- Breakpoint n is not implemented.
- Breakpoint n does not support Context matching.
- EL2 is not implemented.

For more information, see the description of the [DBGDIDR.CTX\\_CMPs](#) field.

## Attributes

- When [DBGBCR<n>.BT](#) is 0b10xx, this register holds a VMID.
- When [DBGBCR<n>.BT](#) is 0b11xx, this register holds a Context ID.

For other values of [DBGBCR<n>.BT](#), this register is RES0.

DBGBXVR<n>How this register is interpreted 32-bitdepends register.on the value of[DBGBCR<n>.BT](#).

## Field descriptions

The DBGBXVR<n> bit assignments are:

When [DBGBCR<n>.BT == 0b10xx](#) and EL2 is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																VMID[15:8]								VMID[7:0]							

**Bits [31:16]**

Reserved, RES0.

**VMID[15:8], bits [15:8]**

**When FEAT\_VMID16 is implemented and VTCR\_EL2.VS == 1:**

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

**Otherwise:**

Reserved, RES0.

**VMID[7:0], bits [7:0]**

VMID value for comparison. The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCR\\_EL2.VS](#) is 0.
- FEAT\_VMID16 is not implemented.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

**When DBGBCR<n>.BT == 0b11xx and EL2 is implemented:**

**ContextID2, bits [31:0]**

**When FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented:**

**ContextID2, bits [31:0]**

**When FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented:**

Context ID value for comparison against [CONTEXTIDR\\_EL2](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

**Otherwise:**

Reserved, RES0.

**Accessing the DBGBXVR<n>**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

# DBGCLAIMCLR, Debug CLAIM Tag Clear register

The DBGCLAIMCLR characteristics are:

## Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

### Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET](#) register.

## Configuration

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to AArch64 System register [DBGCLAIMCLR\\_EL1\[31:0\]](#).

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to External register [DBGCLAIMCLR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGCLAIMCLR are UNDEFINED.

An implementation must include eight CLAIM tag bits.

## Attributes

DBGCLAIMCLR is a 32-bit register.

## Field descriptions

The DBGCLAIMCLR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RAZ/SBZ																								CLAIM							

### Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

### CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.

On a Warm reset, the value of this field is unchanged.

## Accessing the DBGCLAIMCLR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0111	0b1001	0b110

```

# DBGDRAR, Debug ROM Address Register

The DBGDRAR characteristics are:

## Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

## Configuration

AArch32 System register DBGDRAR bits [63:0] are architecturally mapped to AArch64 System register [MDRAR\\_EL1\[63:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDRAR are UNDEFINED.

DBGDRAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

## Attributes

DBGDRAR is a 64-bit register. register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

## Field descriptions

The DBGDRAR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																ROMADDR[47:12]																
ROMADDR[47:12]																RES0												Valid				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### Bits [63:48]

Reserved, RES0.

### ROMADDR[47:12], bits [47:12]

Bits[47:12] of the ROM table physical address.

If the physical address size in bits (PAsize) is less than 48 then the register bits corresponding to ROMADDR [47:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

If DBGDRAR.Valid == 0b00, then this field is UNKNOWN.

**Bits [11:2]**

Reserved, RES0.

**Valid, bits [1:0]**

This field indicates whether the ROM Table address is valid.

Valid	Meaning
0b00	ROM Table address is not valid. Software must ignore ROMADDR.
0b11	ROM Table address is valid.

Other values are reserved.

**Accessing the DBGDRAR**

Accesses to this register use the following encodings:

MRC{&lt;c&gt;}{&lt;q&gt;} &lt;coproc&gt;, {#}&lt;opc1&gt;, &lt;Rt&gt;, &lt;CRn&gt;, &lt;CRm&gt;{, {#}&lt;opc2&gt;}

# DBGDSAR, Debug Self Address Register

The DBGDSAR characteristics are:

## Purpose

In earlier versions of the Arm Architecture, this register defines the offset from the base address defined in [DBGDRAR](#) of the physical base address of the debug registers for the PE. Armv8 deprecates any use of this register.

## Configuration

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDSAR are UNDEFINED.

DBGDSAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

## Attributes

DBGDSAR is a 64-bit register. ~~register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.~~

## Field descriptions

The DBGDSAR bit assignments are:

### Bits [63:2]

Reserved, RES0.

### Bits [1:0]

Reserved, RAZ.

This field indicates whether the debug self address offset is valid. For ARMv8, this field is always 0b00, the offset is not valid.

## Accessing the DBGDSAR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

# DBGDSCRext, Debug Status and Control Register, External View

The DBGDSCRext characteristics are:

## Purpose

Main control register for the debug implementation.

## Configuration

AArch32 System register DBGDSCRext bits [31:0] are architecturally mapped to AArch64 System register [MDSCR\\_EL1\[31:0\]](#).

AArch32 System register DBGDSCRext bits [15:2] are architecturally mapped to AArch32 System register [DBGDSCRint\[15:2\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDSCRext are UNDEFINED.

This register is required in all implementations.

## Attributes

DBGDSCRext is a 32-bit register.

## Field descriptions

The DBGDSCRext bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TFO	RXfull	TXfull	RES0	RXO	TXU	RES0	INTdis	TDARE	RES0	SC2NS	SPNIDdis	SPIDdis	MDBGen	HDE	RES0	UDCCdis	RES0	ERRM	ERRM	ERRM	ERRM	ERRM	ERRM	ERRM	ERRM	ERRM	ERRM	ERRM	ERRM	ERRM	ERRM

### TFO, bit [31]

When FEAT\_TRF is implemented:

### TFO, bit [31]

When FEAT\_TRF is implemented:

Trace Filter override. Used for save/restore of [EDSCR.TFO](#).

When the OS Lock is unlocked, [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When the OS Lock is locked, [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.TFO](#). Reads and writes of this bit are indirect accesses to [EDSCR.TFO](#).

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

**RXfull, bit [30]**

DTRRX full. Used for save/restore of [EDSCR.RXfull](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.RXfull](#). Reads and writes of this bit are indirect accesses to [EDSCR.RXfull](#).

Arm deprecates use of this bit other than for save/restore. Use [DBGDSCRint](#) to access the DTRRX full status.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

**TXfull, bit [29]**

DTRTX full. Used for save/restore of [EDSCR.TXfull](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.TXfull](#). Reads and writes of this bit are indirect accesses to [EDSCR.TXfull](#).

Arm deprecates use of this bit other than for save/restore. Use [DBGDSCRint](#) to access the DTRTX full status.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

**Bit [28]**

Reserved, RES0.

**RXO, bit [27]**

Used for save/restore of [EDSCR.RXO](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.RXO](#). Reads and writes of this bit are indirect accesses to [EDSCR.RXO](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

**TXU, bit [26]**

Used for save/restore of [EDSCR.TXU](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.TXU](#). Reads and writes of this bit are indirect accesses to [EDSCR.TXU](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

#### Bits [25:24]

Reserved, RES0.

#### INTdis, bits [23:22]

Used for save/restore of [EDSCR](#).INTdis.

When [DBGOSLSR](#).OSLK == 0, this field is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR](#).OSLK == 1, this field is RW and holds the value of [EDSCR](#).INTdis. Reads and writes of this field are indirect accesses to [EDSCR](#).INTdis.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

#### TDA, bit [21]

Used for save/restore of [EDSCR](#).TDA.

When [DBGOSLSR](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR](#).OSLK == 1, this bit holds the value of [EDSCR](#).TDA. Reads and writes of this bit are indirect accesses to [EDSCR](#).TDA.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

#### Bit [20]

Reserved, RES0.

#### SC2, bit [19]

**When FEAT\_PCSRv8 is implemented, FEAT\_VHE is implemented and FEAT\_PCSRv8p2 is not implemented:**

Used for save/restore of [EDSCR](#).SC2.

When [DBGOSLSR](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR](#).OSLK == 1, this bit holds the value of [EDSCR](#).SC2. Reads and writes of this bit are indirect accesses to [EDSCR](#).SC2.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

#### Otherwise:

Reserved, RES0.

**NS, bit [18]**

Non-secure status. Returns the inverse of IsSecure().

Arm deprecates use of this field.

Access to this field is **RO**.

**SPNIDdis, bit [17]****When EL3 is implemented:**

Secure privileged profiling disabled status bit.

SPNIDdis	Meaning
0b0	Profiling allowed in Secure privileged modes.
0b1	Profiling prohibited in Secure privileged modes.

This field reads as 0 if any of the following applies, and reads as 1 otherwise:

- FEAT\_Debugv8p2 is not implemented and ExternalSecureNoninvasiveDebugEnabled() returns TRUE.
- EL3 is using AArch32 and the value of [SDCR.SPME](#) is 1.
- EL3 is using AArch64 and the value of [MDCR\\_EL3.SPME](#) is 1.

Arm deprecates use of this field.

Access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

**SPIDdis, bit [16]****When EL3 is implemented:**

Secure privileged AArch32 invasive self-hosted debug disabled status bit. The value of this bit depends on the value of [SDCR.SPD](#) and the pseudocode function AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled().

SPIDdis	Meaning
0b0	Self-hosted debug enabled in Secure privileged AArch32 modes.
0b1	Self-hosted debug disabled in Secure privileged AArch32 modes.

This bit reads as 1 if any of the following is true and reads as 0 otherwise:

- EL3 is using AArch32 and [SDCR.SPD](#) has the value 0b10.
- EL3 is using AArch64 and [MDCR\\_EL3.SPD32](#) has the value 0b10.
- EL3 is using AArch32, [SDCR.SPD](#) has the value 0b00, and AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled() returns FALSE.
- EL3 is using AArch64, [MDCR\\_EL3.SPD32](#) has the value 0b00, and AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled() returns FALSE.

Arm deprecates use of this field.

Access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

**MDBGen, bit [15]**

Monitor debug events enable. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

MDBGen	Meaning
0b0	Breakpoint, Watchpoint, and Vector Catch exceptions disabled.
0b1	Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

On a Warm reset, this field resets to 0.

**HDE, bit [14]**

Used for save/restore of [EDSCR.HDE](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.HDE](#). Reads and writes of this bit are indirect accesses to [EDSCR.HDE](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

**Bit [13]**

Reserved, RES0.

**UDCCdis, bit [12]**

Traps EL0 accesses to the DCC registers to Undefined mode.

UDCCdis	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 accesses to the <a href="#">DBGDSCRint</a> , <a href="#">DBGDTRRXint</a> , <a href="#">DBGDTRTXint</a> , <a href="#">DBGDIDR</a> , <a href="#">DBGDSAR</a> , and <a href="#">DBGDRAR</a> are trapped to Undefined mode.

**Note**

All accesses to these registers are trapped, including LDC and STC accesses to [DBGDTRTXint](#) and [DBGDTRRXint](#), and MRRC accesses to [DBGDSAR](#) and [DBGDRAR](#).

Traps of EL0 accesses to the [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

On a Warm reset, this field resets to 0.

**Bits [11:7]**

Reserved, RES0.

**ERR, bit [6]**

Used for save/restore of [EDSCR.ERR](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.ERR](#). Reads and writes of this bit are indirect accesses to [EDSCR.ERR](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is **RW**.
- When DBGOSLSR.OSLK == 0, access to this field is **RO**.

### MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

MOE	Meaning
0b0001	Breakpoint.
0b0011	Software breakpoint (BKPT) instruction.
0b0101	Vector catch.
0b1010	Watchpoint.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [1:0]

Reserved, RES0.

## Accessing the DBGDSCRext

Individual fields within this register might have restricted accessibility when the OS lock is unlocked, [DBGOSLSR](#).OSLK == 0. See the field descriptions for more detail.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0010	0b010

```

-------	----------------	-------

The DBGDTRRXext characteristics are:

## Purpose

Used for save/restore of [DBGDTRRXint](#). It is a component of the Debug Communications Channel.

## Configuration

AArch32 System register DBGDTRRX bits [31:0] are architecturally mapped to AArch64 System register [OSDTRRX\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDTRRText are UNDEFINED.

## Attributes

DBGDTRRXext is a 32-bit register.

## Field descriptions

The DBGDTRRXext bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Update DTRRX without side-effect																															

**Bits [31:0]**

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the DBGDTRRText

Arm deprecates reads and writes of DBGDTRRXtext through the System register interface when the OS Lock is unlocked, [DBGOSLSR](#).OSLK == 0.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<b>coproc</b>	<b>opc1</b>	<b>CRn</b>	<b>CRm</b>	<b>opc2</b>
0b1110	0b000	0b0000	0b0000	0b010

```

# DBGOSDLR, Debug OS Double Lock Register

The DBGOSDLR characteristics are:

## Purpose

Locks out the external debug interface.

## Configuration

AArch32 System register DBGOSDLR bits [31:0] are architecturally mapped to AArch64 System register [OSDLR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGOSDLR are UNDEFINED.

## Attributes

DBGOSDLR is a 32-bit register.

## Field descriptions

The DBGOSDLR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																DLK															

### Bits [31:1]

Reserved, RES0.

### DLK, bit [0]

When FEAT\_DoubleLock is implemented:

OS Double Lock control bit.

DLK	Meaning
0b0	OS Double Lock unlocked.
0b1	OS Double Lock locked, if <a href="#">DBGPRCR</a> .CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

On a Warm reset, this field resets to 0.

Otherwise:

## Accessing the DBGOSDLR

# DBGOSLSR, Debug OS Lock Status Register

The DBGOSLSR characteristics are:

## Purpose

Provides status information for the OS Lock.

## Configuration

AArch32 System register DBGOSLSR bits [31:0] are architecturally mapped to AArch64 System register [OSLSR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGOSLSR are UNDEFINED.

The OS Lock status is also visible in the external debug interface through EDPRSR.

## Attributes

DBGOSLSR is a 32-bit register.

## Field descriptions

The DBGOSLSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
													RES0						OSLM[1]		nTT	OSLK	OSLM[0]								

### Bits [31:4]

Reserved, RES0.

This field is bit[1] of OSLM[1:0].

### OSLM, bit [1], bits [3, 0]

OS lock model implemented. Identifies the form of OS save and restore mechanism implemented.

OSLM	Meaning
0b00	OS Lock not implemented.
0b10	OS Lock implemented.

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is DBGOSLSR[3].
- OSLM[0] is DBGOSLSR[0].

### nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

**OSLK, bit [1]**

OS Lock Status. The possible values are:

OSLK	Meaning
0b0	OS Lock unlocked.
0b1	OS Lock locked.

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

On a Cold reset, this field resets to 1.

On a Warm reset, the value of this field is unchanged.

**OSLM[0], bit [0]**

This field is bit[0] of OSLM[1:0].

See OSLM[1] for the field description.

**Accessing the DBGOSLSR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0001	0b100

```

# DBGPRCR, Debug Power Control Register

The DBGPRCR characteristics are:

## Purpose

Controls behavior of the PE on powerdown request.

## Configuration

AArch32 System register DBGPRCR bits [31:0] are architecturally mapped to AArch64 System register [DBGPRCR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGPRCR are UNDEFINED.

Bit [0] of this register is mapped to [EDPRCR](#).CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

## Attributes

DBGPRCR is a 32-bit register.

## Field descriptions

The DBGPRCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">RES0</a>																															<a href="#">CORENPDRQ</a>

### Bits [31:1]

Reserved, RES0.

### CORENPDRQ, bit [0]

When FEAT\_DoPD is implemented:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

**Note**

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

On a Warm reset, the value of this field is unchanged.

**Otherwise:**

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR.COREPURQ](#) on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

**Note**

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, this field resets to the value in [EDPRCR.COREPURQ](#).

On a Warm reset, the value of this field is unchanged.

**Accessing the DBGPRCR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0100	0b100

```

# DBGWCR<n>, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n> characteristics are:

## Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>](#).

## Configuration

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGWCR<n>\\_EL1\[31:0\]](#).

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to External register [DBGWCR<n>\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGWCR<n> are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

## Attributes

DBGWCR<n> is a 32-bit register.

## Field descriptions

The DBGWCR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															

When the E field is zero, all the other fields in the register are ignored.

### Bits [31:29]

Reserved, RES0.

### MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00001	Reserved.
0b00010	Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn\_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## Bits [23:21]

Reserved, RES0.

## WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions', and 'Reserved DBGBCR<n>.{SSC, HMC, PMC} values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>](#) is being watched.

BAS	Description
0bxxxxxxx1	Match byte at <a href="#">DBGWVR&lt;n&gt;</a>
0bxxxxxx1x	Match byte at <a href="#">DBGWVR&lt;n&gt;+1</a>
0bxxxxx1xx	Match byte at <a href="#">DBGWVR&lt;n&gt;+2</a>
0bxxxx1xxx	Match byte at <a href="#">DBGWVR&lt;n&gt;+3</a>

In cases where [DBGWVR<n>](#) addresses a double-word:

BAS	Description, if <a href="#">DBGWVR&lt;n&gt;</a> [2] == 0
0bxxx1xxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;+4</a>
0bxx1xxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;+5</a>
0bx1xxxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;+6</a>
0b1xxxxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;+7</a>

If [DBGWVR<n>](#)[2] == 1, only BAS[3:0] are used and BAS[7:4] are ignored. Arm deprecates setting [DBGWVR<n>](#)[2] == 1.

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>.BAS values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On a Warm reset, the value of this field is unchanged.~~

### LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On a Warm reset, the value of this field is unchanged.~~

### PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On a Warm reset, the value of this field is unchanged.~~

### E, bit [0]

Enable watchpoint n. Possible values are:

E	Meaning
0b0	Watchpoint disabled.
0b1	Watchpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On a Warm reset, the value of this field is unchanged.~~

## Accessing the DBGWCR<n>

# DBGWVR<n>, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n> characteristics are:

## Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>](#).

## Configuration

AArch32 System register DBGWVR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGWVR<n>\\_EL1\[31:0\]](#).

AArch32 System register DBGWVR<n> bits [31:0] are architecturally mapped to External register [DBGWVR<n>\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGWVR<n> are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

## Attributes

DBGWVR<n> is a 32-bit register.

## Field descriptions

The DBGWVR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA																RES0															

### VA, bits [31:2]

Bits[31:2] of the address value for comparison.

Arm deprecates setting [DBGWVR<n>\[2\] == 1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

### Bits [1:0]

Reserved, RES0.

## Accessing the DBGWVR<n>

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	n[3:0]	0b110

```

# DFAR, Data Fault Address Register

The DFAR characteristics are:

## Purpose

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception.

## Configuration

AArch32 System register DFAR bits [31:0] are architecturally mapped to AArch64 System register [FAR\\_EL1\[31:0\]](#).

AArch32 System register DFAR bits [31:0] (S) are architecturally mapped to AArch32 System register [HDFAR\[31:0\]](#) when EL2 is implemented, EL3 is implemented and the highest implemented Exception level is using AArch32 state.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DFAR are UNDEFINED.

## Attributes

DFAR is a 32-bit register.

## Field descriptions

The DFAR bit assignments are:

### Bits [31:0]

VA of faulting address of synchronous Data Abort exception.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the DFAR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

# DFSR, Data Fault Status Register

The DFSR characteristics are:

## Purpose

Holds status information about the last data fault.

## Configuration

AArch32 System register DFSR bits [31:0] are architecturally mapped to AArch64 System register [ESR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DFSR are UNDEFINED.

The current translation table format determines which format of the register is used.

## Attributes

DFSR is a 32-bit register.

## Field descriptions

The DFSR bit assignments are:

### When TTBCR.EAE == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																FnV	AET	CM	Ext	WnR	FS[4]	LPAE	RES0	Domain			FS[3:0]				

### Bits [31:17]

Reserved, RES0.

### FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	<a href="#">DFAR</a> is valid.
0b1	<a href="#">DFAR</a> is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### AET, bits [15:14]

#### When FEAT\_RAS is implemented:

Asynchronous Error Type. When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception. Possible values are:

AET	Meaning
0b00	Uncontainable (UC).
0b01	Unrecoverable state (UEU).
0b10	Restartable state (UEO).
0b11	Recoverable state (UER).

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other aborts.

In the event of multiple errors taken as a single SError interrupt exception, the overall PE error state is reported.

#### Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### CM, bit [13]

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault. The possible values of this bit are:

CM	Meaning
0b0	Abort not caused by execution of a cache maintenance instruction.
0b1	Abort caused by execution of a cache maintenance instruction, or on an address translation.

On a synchronous Data Abort on a translation table walk, this bit is UNKNOWN.

On an asynchronous fault, this bit is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### WnR, bit [11]

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction. The possible values of this bit are:

WnR	Meaning
0b0	Abort caused by a read instruction.
0b1	Abort caused by a write instruction.

For faults on the cache maintenance and address translation System instructions in the (coproc==0b1111) encoding space this bit always returns a value of 1.

This field is bit[4] of FS[4:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FS, [4], bits [10, 3:0]**

Fault status bits. Possible values of FS[4:0] are:

FS	Meaning	Applies when
0b00001	Alignment fault.	
0b00010	Debug exception.	
0b00011	Access flag fault, level 1.	
0b00100	Fault on instruction cache maintenance.	
0b00101	Translation fault, level 1.	
0b00110	Access flag fault, level 2.	
0b00111	Translation fault, level 2.	
0b01000	Synchronous External abort, not on translation table walk.	
0b01001	Domain fault, level 1.	
0b01011	Domain fault, level 2.	
0b01100	Synchronous External abort, on translation table walk, level 1.	
0b01101	Permission fault, level 1.	
0b01110	Synchronous External abort, on translation table walk, level 2.	
0b01111	Permission fault, level 2.	
0b10000	TLB conflict abort.	
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault).	
0b10101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive access fault).	
0b10110	SError interrupt.	
0b11000	SError interrupt, from a parity or ECC error on memory access.	When FEAT_RAS is not implemented
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b11100	Synchronous parity or ECC error on translation table walk, level 1.	When FEAT_RAS is not implemented
0b11110	Synchronous parity or ECC error on translation table walk, level 2.	When FEAT_RAS is not implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is DFSR[10].
- FS[3:0] is DFSR[3:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bit [8]

Reserved, RES0.

## Domain, bits [7:4]

The domain of the fault address.

Arm deprecates any use of this field, see 'The Domain field in the DFSR'.

This field is UNKNOWN for certain faults where the DFSR is updated and reported using the Short-descriptor FSR encodings, see 'Validity of Domain field on faults that update the DFSR when using the Short-descriptor encodings'.

## FS[3:0], bits [3:0]

This field is bits[3:0] of FS[4:0].

See FS[4] for the field description.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## When TTBCR.EAE == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0															FnV	AET	CM	Ext	WnR	RES0	LPAE	RES0		STATUS							

## Bits [31:17]

Reserved, RES0.

## FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	DFAR is valid.
0b1	DFAR is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## AET, bits [15:14]

### When FEAT\_RAS is implemented:

Asynchronous Error Type. When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception. Possible values are:

AET	Meaning
0b00	Uncontainable (UC).
0b01	Unrecoverable state (UEU).
0b10	Restartable state (UEO).
0b11	Recoverable state (UER).

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other aborts.

In the event of multiple errors taken as a single SError interrupt exception, the overall PE error state is reported.

## Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### CM, bit [13]

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault. The possible values of this bit are:

CM	Meaning
0b0	Abort not caused by execution of a cache maintenance instruction.
0b1	Abort caused by execution of a cache maintenance instruction.

On a synchronous Data Abort on a translation table walk, this bit is UNKNOWN.

On an asynchronous fault, this bit is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### WnR, bit [11]

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction. The possible values of this bit are:

WnR	Meaning
0b0	Abort caused by a read instruction.
0b1	Abort caused by a write instruction.

For faults on the cache maintenance and address translation System instructions in the (coproc==0b1111) encoding space this bit always returns a value of 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bit [10]

Reserved, RES0.

#### LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bits [8:6]

Reserved, RES0.

## STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

STATUS	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010001	Asynchronous SError interrupt.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011001	Asynchronous SError interrupt, from a parity or ECC error on memory access.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Debug exception.	
0b110000	TLB conflict abort.	
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Accessing the DFSR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0000	0b000

```

# DISR, Deferred Interrupt Status Register

The DISR characteristics are:

## Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

## Configuration

AArch32 System register DISR bits [31:0] are architecturally mapped to AArch64 System register [DISR\\_EL1\[31:0\]](#) when the highest implemented Exception level is using AArch64.

This register is present only when FEAT\_RAS is implemented. Otherwise, direct accesses to DISR are UNDEFINED.

## Attributes

DISR is a 32-bit register.

## Field descriptions

The DISR bit assignments are:

### When the ESB instruction is executed at EL2:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
A	RES0																			AET	EA	RES0			DFSC						

### A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### Bits [30:12]

Reserved, RES0.

### AET, bits [11:10]

Asynchronous Error Type. See the description of [HSR.AET](#) for an SError interrupt.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### EA, bit [9]

External abort Type. See the description of [HSR.EA](#) for an SError interrupt.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### Bits [8:6]

Reserved, RES0.

**DFSC, bits [5:0]**

Fault Status Code. See the description of [HSR.DFSC](#) for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 0:**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
A	RES0										AET		RES0	EXT	RES0	FS[4]	LPAE	RES0					FS[3:0]								

**A, bit [31]**

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [30:16]**

Reserved, RES0.

**AET, bits [15:14]**

Asynchronous Error Type. See the description of [DFSR.AET](#) for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [13]**

Reserved, RES0.

**ExT, bit [12]**

External abort Type. See the description of [DFSR.ExT](#) for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [11]**

Reserved, RES0.

This field is bit[4] of FS[4:0].

**FS, [4], bits [10, 3:0]**

Fault Status Code. See the description of [DFSR.FS](#) for an SError interrupt.

The FS field is split as follows:

- FS[4] is DISR[10].
- FS[3:0] is DISR[3:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**LPAE, bit [9]**

Format.

LPAE	Meaning
0b0	Using the Short-descriptor translation table format.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [8:4]**

Reserved, RES0.

**FS[3:0], bits [3:0]**

This field is bits[3:0] of FS[4:0].

See FS[4] for the field description.

**When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 1:**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
A	RES0															AET	RES0	ExT	RES0	LPAE	RES0		STATUS								

**A, bit [31]**

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [30:16]**

Reserved, RES0.

**AET, bits [15:14]**

Asynchronous Error Type. See the description of [DFSR.AET](#) for an SError interrupt.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bit [13]**

Reserved, RES0.

**ExT, bit [12]**

External abort Type. See the description of [DFSR.ExT](#) for an SError interrupt.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [11:10]**

Reserved, RES0.

**LPAE, bit [9]**

Format.

LPAE	Meaning
0b1	Using the Long-descriptor translation table format.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [8:6]**

Reserved, RES0.

**STATUS, bits [5:0]**

Fault Status Code. See the description of [DFSR.FS](#) for an SError interrupt.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Accessing the DISR**

An indirect write to DISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

DISR is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, and any of the following apply:

- EL3 is using AArch64, [SCR\\_EL3.EA](#) == 1, and any of the following apply:
  - The PE is executing at EL2.
  - The PE is executing at EL1 and (([SCR\\_EL3.NS](#) == 0 && [SCR\\_EL3.EEL2](#) == 0) || [HCR\\_EL2.AMO](#) == 0).
- EL3 is using AArch32, [SCR.EA](#) == 1, and any of the following apply:
  - The PE is executing at EL2.
  - The PE is executing at EL1 and ([SCR.NS](#) == 0 || [HCR.AMO](#) == 0).

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0001	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then

# DSPSR, Debug Saved Program Status Register

The DSPSR characteristics are:

## Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

## Configuration

AArch32 System register DSPSR bits [31:0] are architecturally mapped to AArch64 System register [DSPSR\\_EL0\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DSPSR are UNDEFINED.

## Attributes

DSPSR is a 32-bit register.

## Field descriptions

The DSPSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	DIT	SS	BS	PAN	SS	IL		GE					IT[7:2]				E	A	I	F	T			M[4:0]		

### N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on entering Debug state, and copied to PSTATE.Q on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on entering Debug state, and copied to PSTATE.IT[1:0] on exiting Debug state.

On exiting Debug state DSPSR.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DIT, bit [24]**

**When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SSBS, bit [23]**

**When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]**

**When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on entering Debug state, and copied to PSTATE.GE on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on entering Debug state, and copied to PSTATE.IT[7:2] on exiting Debug state.

DSPSR.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on entering Debug state, and copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR.E is RES0. If the implementation does not support little-endian operation, DSPSR.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on entering Debug state, and copied to PSTATE.T on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on entering Debug state, and copied to PSTATE.M[4:0] on exiting Debug state.

<b>M[4:0]</b>	<b>Meaning</b>
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10110	Monitor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If DSPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DSPSR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<b>coproc</b>	<b>opc1</b>	<b>CRn</b>	<b>CRm</b>	<b>opc2</b>
0b1111	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    return DSPSR;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<b>coproc</b>	<b>opc1</b>	<b>CRn</b>	<b>CRm</b>	<b>opc2</b>
0b1111	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    DSPSR = R[t];
```

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# ELR\_hyp, Exception Link Register (Hyp mode)

The ELR\_hyp characteristics are:

## Purpose

When taking an exception to Hyp mode, holds the address to return to.

## Configuration

AArch32 System register ELR\_hyp bits [31:0] are architecturally mapped to AArch64 System register [ELR\\_EL2\[31:0\]](#).

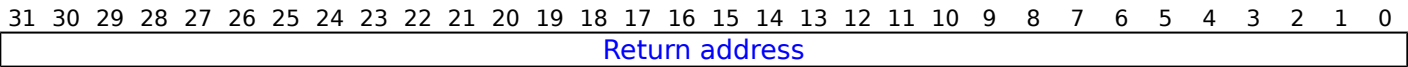

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ELR\_hyp are UNDEFINED.

## Attributes

ELR\_hyp is a 32-bit register.

## Field descriptions

The ELR\_hyp bit assignments are:

### Bits [31:0]

Return address.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the ELR\_hyp

ELR\_hyp is accessible only at Hyp mode and Monitor mode.

Accesses to this register use the following encodings:

MRS{<c>}{<q>} <Rd>, ELR\_hyp

R	M	M1
0b0	0b1	0b1110

MSR{<c>}{<q>} ELR\_hyp, <Rn>

R	M	M1

# ERRSELR, Error Record Select Register

The ERRSELR characteristics are:

## Purpose

Selects an error record to be accessed through the Error Record System registers.

## Configuration

AArch32 System register ERRSELR bits [31:0] are architecturally mapped to AArch64 System register [ERRSELR\\_EL1\[31:0\]](#).

This register is present only when FEAT\_RAS is implemented. Otherwise, direct accesses to ERRSELR are UNDEFINED.

If [ERRIDR](#) indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR is UNDEFINED or RES0.

## Attributes

ERRSELR is a 32-bit register.

## Field descriptions

The ERRSELR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																SEL															

### Bits [31:16]

Reserved, RES0.

### SEL, bits [15:0]

Selects the error record accessed through the ERX registers.

For example, if ERRSELR.SEL is set to 0x0004, then direct reads and writes of [ERXSTATUS](#) access ERR4STATUS.

If ERRSELR.SEL is set to a value greater than or equal to [ERRIDR.NUM](#), then all of the following apply:

- The value read back from ERRSELR.SEL is UNKNOWN.
- One of the following occurs:
  - An UNKNOWN error record is selected.
  - The ERX\* registers are RAZ/WI.
  - ERX\* register reads and writes are NOPs.
  - ERX\* register reads and writes are UNDEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ERRSELR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

# FPEXC, Floating-Point Exception Control register

The FPEXC characteristics are:

## Purpose

Provides a global enable for the implemented Advanced SIMD and floating-point functionality, and reports floating-point status information.

## Configuration

AArch32 System register FPEXC bits [31:0] are architecturally mapped to AArch64 System register [FPEXC32\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to FPEXC are UNDEFINED.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

## Attributes

FPEXC is a 32-bit register.

## Field descriptions

The FPEXC bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EX	EN	DEX	FP2V	VV	TFV	RES0										VECITR		IDF	RES0	IXF	UFF	OFF	DZF	IOF							

### EX, bit [31]

Exception bit. From Armv8, this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EN, bit [30]

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the [FPEXC](#) or [FPSID](#).
- VMRS accesses from the [FPEXC](#), [FPSID](#), [MVFR0](#), [MVFR1](#), or [MVFR2](#).

EN	Meaning
0b0	Accesses to the <a href="#">FPSCR</a> , and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.
0b1	This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- [CPACR](#).cp10, or, if executing at EL0, [CPACR\\_EL1](#).FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - [HCPTR](#).TCP10, or if EL2 is using AArch64, [CPTR\\_EL2](#).TFP.

- [NSACR](#).cp10, or if EL3 is using AArch64, [CPTR\\_EL3](#).TFP.
- For Advanced SIMD instructions only:
  - CPACR.ASEDIS.
  - If executing in Non-secure state, [HCPTR](#).TASE and [NSACR](#).NSTRCDIS.

See the descriptions of the controls for more information.

---

### Note

When executing at EL0 using AArch32:

- If EL1 is using AArch64 then behavior is as if the value of FPEXC.EN is 1.
  - If EL2 is using AArch64 and enabled in the current Security state, and the value of [HCR\\_EL2](#).{RW, TGE} is {1, 1}, then the behavior is as if the value of FPEXC.EN is 1.
  - If EL2 is using AArch64 and enabled in the current Security state, and the value of [HCR\\_EL2](#).{RW, TGE} is {0, 1}, then it is IMPLEMENTATION DEFINED whether the behavior is:
    - As if the value of FPEXC.EN is 1.
    - Determined by the value of FPEXC.EN, as described in this field description. However, Arm deprecates using the value of FPEXC.EN to determine behavior.
- 

On a Warm reset, this ~~This~~ field resets to 0.

### DEX, bit [29]

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC.TFV field is valid.

The meaning of this bit is:

DEX	Meaning
0b0	The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC.TFV is RW then it is invalid and UNKNOWN. If FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
0b1	The exception was generated during the execution of an unallocated encoding. FPEXC.TFV is valid and indicates the cause of the exception.

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the [FPSCR](#).{Stride, Len} fields as RAZ, this bit is RES0.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

### FP2V, bit [28]

FPINST2 instruction valid bit. From Armv8, this bit is RES0.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

### VV, bit [27]

VECITR valid bit. From Armv8, this bit is RES0.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**TFV, bit [26]**

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

TFV	Meaning
0b0	The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of <a href="#">FPSCR</a> .{Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.
0b1	FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements [FPSCR](#).{Stride, Len} as RAZ, this bit is RAO/WI.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**Bits [25:11]**

Reserved, RES0.

**VECITR, bits [10:8]**

Vector iteration count. From Armv8, this field is RES1.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**IDF, bit [7]**

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while [FPSCR](#).IDE was 1:

IDF	Meaning
0b0	Input Denormal exception has not occurred.
0b1	Input Denormal exception has occurred.

Input Denormal exceptions can occur only when [FPSCR](#).FZ is 1.

**Note**

A half-precision floating-point value that is flushed to zero because the value of [FPSCR](#).FZ16 is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**Bits [6:5]**

Reserved, RES0.

**IXF, bit [4]**

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while [FPSCR.IXE](#) was 1:

IXF	Meaning
0b0	Inexact exception has not occurred.
0b1	Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**UFF, bit [3]**

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while [FPSCR.UFE](#) was 1:

UFF	Meaning
0b0	Underflow exception has not occurred.
0b1	Underflow exception has occurred.

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when [FPSCR.FZ16](#) is 0.
- Otherwise only when [FPSCR.FZ](#) is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**OFF, bit [2]**

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while [FPSCR.OFE](#) was 1:

OFF	Meaning
0b0	Overflow exception has not occurred.
0b1	Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**DZF, bit [1]**

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while [FPSCR.DZE](#) was 1:

DZF	Meaning
0b0	Divide by Zero exception has not occurred.
0b1	Divide by Zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while [FPSCR.IOE](#) was 1:

IOF	Meaning
0b0	Invalid Operation exception has not occurred.
0b1	Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the FPEXC

Accesses to this register use the following encodings:

VMRS{<c>}{<q>} <Rt>, <spec\_reg>

reg
0b1000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if (ELUsingAArch32(EL3) && SCR.NS == '1' && NSACR.cp10 == '0') || CPACR.cp10 == '00' then

# FPSCR, Floating-Point Status and Control Register

The FPSCR characteristics are:

## Purpose

Provides floating-point system status information and control.

## Configuration

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to FPSCR are UNDEFINED.

The named fields in this register map to the equivalent fields in the AArch64 [FPCR](#) and [FPSR](#).

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

## Attributes

FPSCR is a 32-bit register.

## Field descriptions

The FPSCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	A	H	P	D	N	F	Z	R	Mode	Stride	FZ	16	Len	ID	RES0	IXE	UFE	OF	DZE	IOE	IDC	RES0	IXC	UFC	OF	DZC	IOC

### N, bit [31]

Negative condition flag. This is updated by floating-point comparison operations.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero condition flag. This is updated by floating-point comparison operations.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry condition flag. This is updated by floating-point comparison operations.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### V, bit [28]

Overflow condition flag. This is updated by floating-point comparison operations.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**QC, bit [27]**

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AHP, bit [26]**

Alternative half-precision control bit:

AHP	Meaning
0b0	IEEE half-precision format selected.
0b1	Alternative half-precision format selected.

This bit is only used only for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the FEAT\_FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DN, bit [25]**

Default NaN mode control bit:

DN	Meaning
0b0	NaN operands propagate through to the output of a floating-point operation.
0b1	Any operation involving one or more NaNs returns the Default NaN.

The value of this bit only controls only scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Default NaN setting, regardless of the value of the DN bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FZ, bit [24]**

Flush-to-zero mode control bit:

FZ	Meaning
0b0	Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
0b1	Flush-to-zero mode enabled.

The value of this bit only controls only scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Flush-to-zero setting, regardless of the value of the FZ bit.

This bit has no effect on half-precision calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**RMode, bits [23:22]**

Rounding Mode control field. The encoding of this field is:

RMode	Meaning
0b00	Round to Nearest (RN) mode.
0b01	Round towards Plus Infinity (RP) mode.
0b10	Round towards Minus Infinity (RM) mode.
0b11	Round towards Zero (RZ) mode.

The specified rounding mode is used by almost all scalar floating-point instructions. Advanced SIMD arithmetic always uses the Round to Nearest setting, regardless of the value of the RMode bits.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Stride, bits [21:20]

It is IMPLEMENTATION DEFINED whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ16, bit [19]

When FEAT\_FP16 is implemented:

Flush-to-zero mode control bit on half-precision data-processing instructions:

FZ16	Meaning
0b0	Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
0b1	Flush-to-zero mode enabled.

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Len, bits [18:16]

It is IMPLEMENTATION DEFINED whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDE, bit [15]

Input Denormal floating-point exception trap enable. Possible values are:

IDE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, then the IDC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IDC bit. The trap handling software can decide whether to set the IDC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [14:13]**

Reserved, RES0.

**IXE, bit [12]**

Inexact floating-point exception trap enable. Possible values are:

IXE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, then the IXC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IXC bit. The trap handling software can decide whether to set the IXC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

**UFE, bit [11]**

Underflow floating-point exception trap enable. Possible values are:

UFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, then the UFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, and the Flush-to-zero PE is does not enabled, update the PEUFC does bit, not The update trap handling software can decide whether to set the UFC bit. bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

**OFE, bit [10]**

Overflow floating-point exception trap enable. Possible values are:

OFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, then the OFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the OFC bit. The trap handling software can decide whether to set the OFC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

**DZE, bit [9]**

Divide by Zero floating-point exception trap enable. Possible values are:

DZE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, then the DZC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the DZC bit. The trap handling software can decide whether to set the DZC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

## IOE, bit [8]

Invalid Operation floating-point exception trap enable. Possible values are:

IOE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, then the IOC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IOC bit. The trap handling software can decide whether to set the IOC bit to 1.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

## IDC, bit [7]

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IDE bit.

Advanced SIMD instructions set this bit if the Input Denormal floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IDE bit.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

## Bits [6:5]

Reserved, RES0.

## IXC, bit [4]

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IXE bit.

Advanced SIMD instructions set this bit if the Inexact floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IXE bit.

The criteria for the Inexact floating-point exception to occur are different in Flush-to-zero mode. For details, see 'Flush-to-zero'.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

UFC, bit [3]

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the UFE bit.

Advanced SIMD instructions set this bit if the Underflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, **if regardless FPSCR.UFE of is the 0 value or of if the Flush-to-zero UFE is enabled bit.**

The criteria for the Underflow floating-point exception to occur are different in Flush-to-zero mode. For details, see 'Flush-to-zero'.

**On a Warm reset, this This** field resets to an architecturally UNKNOWN value.

OFC, bit [2]

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the OFE bit.

Advanced SIMD instructions set this bit if the Overflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the OFE bit.

**On a Warm reset, this This** field resets to an architecturally UNKNOWN value.

DZC, bit [1]

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the DZE bit.

Advanced SIMD instructions set this bit if the Divide by Zero floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the DZE bit.

**On a Warm reset, this This** field resets to an architecturally UNKNOWN value.

IOC, bit [0]

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IOE bit.

Advanced SIMD instructions set this bit if the Invalid Operation floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IOE bit.

**On a Warm reset, this This** field resets to an architecturally UNKNOWN value.

Accessing the FPSCR

Accesses to this register use the following encodings:

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

reg
0b0001

```

if PSTATE.EL == EL0 then

# FPSID, Floating-Point System ID register

The FPSID characteristics are:

## Purpose

Provides top-level information about the floating-point implementation.  
This register largely duplicates information held in the [MIDR](#). Arm deprecates use of it.

## Configuration

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to FPSID are UNDEFINED.  
Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

## Attributes

FPSID is a 32-bit register.

## Field descriptions

The FPSID bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Implementer								SW	Subarchitecture							PartNum						Variant			Revision						

### Implementer, bits [31:24]

Implementer codes are the same as those used for the [MIDR](#).  
For an implementation by Arm this field is 0x41, the ASCII code for A.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### SW, bit [23]

Software bit. Defined values are:

SW	Meaning
0b0	The implementation provides a hardware implementation of the floating-point instructions.
0b1	The implementation supports only software emulation of the floating-point instructions.

In Armv8-A, the only permitted value is 0b0.  
On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Subarchitecture, bits [22:16]

Subarchitecture version number. For an implementation by Arm, defined values are:

Subarchitecture	Meaning
0b00000000	VFPv1 architecture with an IMPLEMENTATION DEFINED subarchitecture.
0b00000001	VFPv2 architecture with Common VFP subarchitecture v1.
0b00000010	VFPv3 architecture, or later, with Common VFP subarchitecture v2. The VFP architecture version is indicated by the <a href="#">MVFR0</a> and <a href="#">MVFR1</a> registers.
0b00000011	VFPv3 architecture, or later, with Null subarchitecture. The entire floating-point implementation is in hardware, and no software support code is required. The VFP architecture version is indicated by the <a href="#">MVFR0</a> and <a href="#">MVFR1</a> registers. This value can be used only by an implementation that does not support the trap enable bits in the <a href="#">FPSCR</a> .
0b00000100	VFPv3 architecture, or later, with Common VFP subarchitecture v3, and support for trap enable bits in <a href="#">FPSCR</a> . The VFP architecture version is indicated by the <a href="#">MVFR0</a> and <a href="#">MVFR1</a> registers.

For a subarchitecture designed by Arm the most significant bit of this field, register bit[22], is 0. Values with a most significant bit of 0 that are not listed here are reserved.

When the subarchitecture designer is not Arm, the most significant bit of this field, register bit[22], must be 1. Each implementer must maintain its own list of subarchitectures it has designed, starting at subarchitecture version number 0x40.

In Armv8-A, the permitted values are 0b00000011 and 0b00000100.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

PartNum, bits [15:8]

An IMPLEMENTATION DEFINED part number for the floating-point implementation, assigned by the implementer.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

Variant, bits [7:4]

An IMPLEMENTATION DEFINED variant number. Typically, this field distinguishes between different production variants of a single product.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the floating-point implementation.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

# HACR, Hyp Auxiliary Configuration Register

The HACR characteristics are:

## Purpose

Controls trapping to Hyp mode of IMPLEMENTATION DEFINED aspects of Non-secure EL1 or EL0 operation.

## Configuration

AArch32 System register HACR bits [31:0] are architecturally mapped to AArch64 System register [HACR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HACR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HACR is a 32-bit register.

## Field descriptions

The HACR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the HACR

Accesses to this register use the following encodings:

# HACTLR2, Hyp Auxiliary Control Register 2

The HACTLR2 characteristics are:

## Purpose

Provides additional space to the HACTLR register to hold IMPLEMENTATION DEFINED trap functionality.

## Configuration

AArch32 System register HACTLR2 bits [31:0] are architecturally mapped to AArch64 System register [ACTLR\\_EL2\[63:32\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HACTLR2 are UNDEFINED.

In Armv8.0 and Armv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining [ID\\_MMFR4.AC2](#).

From Armv8.2 this register must be implemented.

## Attributes

HACTLR2 is a 32-bit register.

## Field descriptions

The HACTLR2 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

# HCPTR, Hyp Architectural Feature Trap Register

The HCPTR characteristics are:

## Purpose

Controls:

- Trapping to Hyp mode of Non-secure access, at EL1 or EL0, to trace, and to Advanced SIMD and floating-point functionality.
- Hyp mode access to trace, and to Advanced SIMD and floating-point functionality.

### Note

Accesses to this functionality:

- From Non-secure modes other than Hyp mode are also affected by settings in the [CPACR](#) and [NSACR](#).
- From Hyp mode are also affected by settings in the [NSACR](#).

Exceptions generated by the [CPACR](#) and [NSACR](#) controls are higher priority than those generated by the HCPTR controls.

## Configuration
