# ACCDATA\_EL1, Accelerator Data

The ACCDATA\_EL1 characteristics are:

## Purpose

Holds the lower 32 bits of the data that is stored by an ST64BV0, Single-copy atomic 64-byte EL0 store instruction.

## Configuration

This register is present only when FEAT\_LS64\_ACCDATA is implemented. Otherwise, direct accesses to ACCDATA\_EL1 are UNDEFINED.

## Attributes

ACCDATA\_EL1 is a 64-bit register.

## Field descriptions

The ACCDATA\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
ACCDATA																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### ACCDATA, bits [31:0]

Accelerator Data field. Holds bits[31:0] of the data that is stored by an ST64BV0 instruction.

## Accessing the ACCDATA\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ACCDATA\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1101	0b0000	0b101

```

# ACTLR\_EL1, Auxiliary Control Register (EL1)

The ACTLR\_EL1 characteristics are:

## Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

Note

Arm recommends the contents of this register have no effect on the PE when [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, and instead the configuration and control fields are provided by the [ACTLR\\_EL2](#) register. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

## Configuration

AArch64 System register ACTLR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ACTLR\[31:0\]](#).

AArch64 System register ACTLR\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [ACTLR2\[31:0\]](#).

## Attributes

ACTLR\_EL1 is a 64-bit register.

## Field descriptions

The ACTLR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																															
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ACTLR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ACTLR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TACR == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '1x1' then
        return NVMem[0x118];
    else
        return ACTLR_EL1;
elsif PSTATE.EL == EL2 then
    return ACTLR_EL1;
elsif PSTATE.EL == EL3 then
    return ACTLR_EL1;

```

MSR ACTLR\_EL1, &lt;Xt&gt;

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TACR == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '1x1' then
        NVMem[0x118] = X[t];
    else
        ACTLR_EL1 = X[t];
    endif
elsif PSTATE.EL == EL2 then

## htmldiff from-

**(new)**

The ACTLR\_EL2 characteristics are:

## Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for EL2.

### Note

Arm recommends the contents of this register are updated to apply to EL0 when `HCR_EL2.{E2H, TGE}` is `{1, 1}`, gaining configuration and control fields from the `ACTLR_EL1`. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

## Configuration

AArch64 System register ACTLR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HACTLR\[31:0\]](#).

AArch64 System register ACTLR\_EL2 bits [63:32] are architecturally mapped to AArch32 System register [HACTLR2\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ACTLR\_EL2 is a 64-bit register.

## Field descriptions

The ACTLR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# AMCG1IDR\_EL0, Activity Monitors Counter Group 1 Identification Register

The AMCG1IDR\_EL0 characteristics are:

## Purpose

Defines which auxiliary counters are implemented, and which of them have a corresponding virtual offset register, [AMEVCNTVOFF1<n>\\_EL2](#) implemented.

## Configuration

This register is present only when FEAT\_AMUv1p1 is implemented. Otherwise, direct accesses to AMCG1IDR\_EL0 are UNDEFINED.

## Attributes

AMCG1IDR\_EL0 is a 64-bit register.

## Field descriptions

The AMCG1IDR\_EL0 bit assignments are:

63	62	61
AMEVCNTVOFF115_EL2	AMEVCNTVOFF114_EL2	AMEVCNTVOFF113_EL2
bit [n+16], for n = 0 to 15	bit [n], for n = 0 to 15	
31	30	29

### Bits [63:32]

Reserved, RES0.

### AMEVCNTVOFF1<n>\_EL2, bit [n+16], for n = 150 to 015

Indicates which implemented auxiliary counters have a corresponding virtual offset register, [AMEVCNTVOFF1<n>\\_EL2](#) implemented.

AMEVCNTVOFF1<n>_EL2	Meaning
0b0	When read, mean that <a href="#">AMEVCNTR1&lt;n&gt;_EL0</a> does not have an offset, or is not implemented.
0b1	When read, means the offset <a href="#">AMEVCNTVOFF1&lt;n&gt;_EL2</a> is implemented for <a href="#">AMEVCNTR1&lt;n&gt;_EL0</a> .

### AMEVCNTR1<n>\_EL0, bit [n], for n = 150 to 015

Indicates which auxiliary counters [AMEVCNTR1<n>\\_EL0](#) are implemented.

AMEVCNTR1<n>_EL0	Meaning
0b0	When read, means that <a href="#">AMEVCNTR1&lt;n&gt;_EL0</a> is not implemented.
0b1	When read, means that <a href="#">AMEVCNTR1&lt;n&gt;_EL0</a> is implemented.

## Accessing the AMCG1IDR\_EL0

# AMCNTENSET1\_EL0, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1\_EL0 characteristics are:

## Purpose

Enable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>\\_EL0](#).

## Configuration

AArch64 System register AMCNTENSET1\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENSET1\[31:0\]](#).

AArch64 System register AMCNTENSET1\_EL0 bits [31:0] are architecturally mapped to External register [AMCNTENSET1\[31:0\]](#).

This register is present only when FEAT\_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1\_EL0 are UNDEFINED.

## Attributes

AMCNTENSET1\_EL0 is a 64-bit register.

## Field descriptions

The AMCNTENSET1\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																RES0															
RES0																P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:16]

Reserved, RES0.

### P<n>, bit [n], for n = 150 to 015

Activity monitor event counter enable bit for [AMEVCNTR1<n>\\_EL0](#).

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in [AMCGCR\\_EL0.CG1NC](#).

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that <a href="#">AMEVCNTR1&lt;n&gt;_EL0</a> is disabled. When written, has no effect.
0b1	When read, means that <a href="#">AMEVCNTR1&lt;n&gt;_EL0</a> is enabled. When written, enables <a href="#">AMEVCNTR1&lt;n&gt;_EL0</a> .

On a Cold reset, this field resets to 0.

## Accessing the AMCNTENSET1\_EL0

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENSET1\_EL0 are UNDEFINED.

**Note**

The number of auxiliary activity monitor counters implemented is zero when [AMCFGR\\_EL0.NCG](#) == 0b0000.

Accesses to this register use the following encodings:

MRS <Xt>, AMCNTENSET1\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0011	0b001

# APDAKeyLo\_EL1, Pointer Authentication Key A for Data (bits[63:0])

The APDAKeyLo\_EL1 characteristics are:

## Purpose

Holds bits[63:0] of key A used for authentication of data pointer values.

Note

The term APDAKey\_EL1 is used to describe the concatenation of [APDAKeyHi\\_EL1](#): [APDAKeyLo\\_EL1](#).

## Configuration

This register is present only when FEAT\_PAAuth is implemented. Otherwise, direct accesses to APDAKeyLo\_EL1 are UNDEFINED.

## Attributes

APDAKeyLo\_EL1 is a 64-bit register.

## Field descriptions

The APDAKeyLo\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the APDAKeyLo\_EL1

Accesses to this register use the following encodings:

# APGAKeyLo\_EL1, Pointer Authentication Key A for Code (bits[63:0])

The APGAKeyLo\_EL1 characteristics are:

## Purpose

Holds bits[63:0] of key used for generic pointer authentication code.

**Note**

The term APGAKey\_EL1 is used to describe the concatenation of [APGAKeyHi\\_EL1](#): [APGAKeyLo\\_EL1](#).

## Configuration

This register is present only when FEAT\_PAAuth is implemented. Otherwise, direct accesses to APGAKeyLo\_EL1 are UNDEFINED.

## Attributes

APGAKeyLo\_EL1 is a 64-bit register.

## Field descriptions

The APGAKeyLo\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:0]**

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the APGAKeyLo\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, APGAKeyLo\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0011	0b000

```

# APIBKeyLo\_EL1, Pointer Authentication Key B for Instruction (bits[63:0])

The APIBKeyLo\_EL1 characteristics are:

## Purpose

Holds bits[63:0] of key B used for authentication of instruction pointer values.

### Note

The term APIBKey\_EL1 is used to describe the concatenation of [APIBKeyHi\\_EL1](#): [APIBKeyLo\\_EL1](#).

## Configuration

This register is present only when FEAT\_PAAuth is implemented. Otherwise, direct accesses to APIBKeyLo\_EL1 are UNDEFINED.

## Attributes

APIBKeyLo\_EL1 is a 64-bit register.

## Field descriptions

The APIBKeyLo\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the APIBKeyLo\_EL1

Accesses to this register use the following encodings:

# CCSIDR2\_EL1, Current Cache Size ID Register 2

The CCSIDR2\_EL1 characteristics are:

## Purpose

When FEAT\_CCIDX is implemented, provides the information about the architecture of the currently selected cache from bits[63:32] of [CCSIDR\\_EL1](#).

When FEAT\_CCIDX is not implemented, this register is not implemented.

## Configuration

AArch64 System register CCSIDR2\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CCSIDR2\[31:0\]](#).

This register is present only when FEAT\_CCIDX is implemented. Otherwise, direct accesses to CCSIDR2\_EL1 are UNDEFINED.

In an AArch64 only implementation, it is IMPLEMENTATION DEFINED whether reading this register gives an UNKNOWN value or is UNDEFINED.

The implementation includes one CCSIDR2\_EL1 for each cache that it can access. [CSSELR\\_EL1](#) selects which Cache Size ID Register is accessible.

## Attributes

CCSIDR2\_EL1 is a 64-bit register.

## Field descriptions

The CCSIDR2\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
RES0								NumSets																							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:24]

Reserved, RES0.

### NumSets, bits [23:0]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

## Accessing the CCSIDR2\_EL1

If [CSSELR\\_EL1](#).Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR2\_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR2\_EL1 read is treated as NOP.
- The CCSIDR2\_EL1 read is UNDEFINED.
- The CCSIDR2\_EL1 read returns an UNKNOWN value.

Accesses to this register use the following encodings:

MRS <Xt>, CCSIDR2\_EL1

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented("FEAT_IDST") then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID2 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && HCR_EL2.TID4 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return CCSIDR2_EL1;
elseif PSTATE.EL == EL2 then
    return CCSIDR2_EL1;
elseif PSTATE.EL == EL3 then
    return CCSIDR2_EL1;

```

## Accessing the CCSIDR2\_EL1

If [CSSELR\\_EL1](#).Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR2\_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR2\_EL1 read is treated as NOP.
- The CCSIDR2\_EL1 read is UNDEFINED.
- The CCSIDR2\_EL1 read returns an UNKNOWN value.

Accesses to this register use the following encodings:

MRS <Xt>, CCSIDR2\_EL1

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID2 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && HCR_EL2.TID4 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return CCSIDR2_EL1;
elseif PSTATE.EL == EL2 then
    return CCSIDR2_EL1;
elseif PSTATE.EL == EL3 then
    return CCSIDR2_EL1;

# CCSIDR\_EL1, Current Cache Size ID Register

The CCSIDR\_EL1 characteristics are:

## Purpose

Provides information about the architecture of the currently selected cache.

## Configuration

AArch64 System register CCSIDR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CCSIDR\[31:0\]](#).

AArch64 System register CCSIDR\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [CCSIDR2\[31:0\]](#).

The implementation includes one CCSIDR\_EL1 for each cache that it can access. [CSSELR\\_EL1](#) selects which Cache Size ID Register is accessible.

## Attributes

CCSIDR\_EL1 is a 64-bit register.

## Field descriptions

The CCSIDR\_EL1 bit assignments are:

### When FEAT\_CCIDX is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								NumSets																							
RES0								Associativity																							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

### Bits [63:56]

Reserved, RES0.

### NumSets, bits [55:32]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

### Bits [31:24]

Reserved, RES0.

**Associativity, bits [23:3]**

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

**LineSize, bits [2:0]**

( $\log_2(\text{Number of bytes in cache line})$ ) - 4. For example:

- For a line length of 16 bytes:  $\log_2(16) = 4$ , LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes:  $\log_2(32) = 5$ , LineSize entry = 1.

When FEAT\_MTE is implemented and enabled, where a cache only holds Allocation tags, this field is RES0.

**Otherwise:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
UNKNOWN				NumSets																Associativity								LineSize			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Note**

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

**Bits [63:32]**

Reserved, RES0.

**Bits [31:28]**

Reserved, UNKNOWN.

**NumSets, bits [27:13]**

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

**Associativity, bits [12:3]**

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

**LineSize, bits [2:0]**

( $\log_2(\text{Number of bytes in cache line})$ ) - 4. For example:

- For a line length of 16 bytes:  $\log_2(16) = 4$ , LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes:  $\log_2(32) = 5$ , LineSize entry = 1.

**Accessing the CCSIDR\_EL1**

If CSSELR\_EL1.Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR\_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR\_EL1 read is treated as NOP.

- The CCSIDR\_EL1 read is UNDEFINED.
- The CCSIDR\_EL1 read returns an UNKNOWN value.

Accesses to this register use the following encodings:

MRS <Xt>, CCSIDR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented("FEAT_IDST") then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID2 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elseif EL2Enabled() && HCR_EL2.TID4 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);

# CFP RCTX, Control Flow Prediction Restriction by Context

The CFP RCTX characteristics are:

## Purpose

Control Flow Prediction Restriction by Context applies to all Control Flow Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, control flow prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

### Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

## Configuration

This instruction is present only when FEAT\_SPECRES is implemented. Otherwise, direct accesses to CFP RCTX are UNDEFINED.

## Attributes

CFP RCTX is a 64-bit System instruction.

## Field descriptions

The CFP RCTX input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0															GVMID	VMID																
RES0					NS	EL		RES0							GASID	ASID																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### Bits [63:49]

Reserved, RES0.

### GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

### VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR\\_EL2.E2H==0](#) or [HCR\\_EL2.TGE==0](#)).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR\\_EL2.E2H==0](#) or [HCR\\_EL2.TGE==0](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR\\_EL2.E2H==1](#) and [HCR\\_EL2.TGE==1](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

### Bits [31:27]

Reserved, RES0.

### NS, bit [26]

Security State. Defined values are:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When the instruction is executed in Non-secure state, this field has an Effective value of 1. Effective value of NS is 1.

### EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

### Bits [23:17]

Reserved, RES0.

### GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASID for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

### ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

## Executing the CFP RCTX instruction

Accesses to this instruction use the following encodings:

CFP RCTX, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b100

```

if PSTATE.EL == EL0 then

# CLIDR\_EL1, Cache Level ID Register

The CLIDR\_EL1 characteristics are:

## Purpose

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

## Configuration

AArch64 System register CLIDR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CLIDR\[31:0\]](#).

## Attributes

CLIDR\_EL1 is a 64-bit register.

## Field descriptions

The CLIDR\_EL1 bit assignments are:

6362616059585756555453525150494847																	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32													
RES0																	Ttype7Ttype<n>, bits																											
																	[2(n-1)+34:2(n-1)+33],		Ttype6ICB		Ttype5		Ttype4		Ttype3		Ttype2		Ttype1		ICB													
																	for n = 1 to 7																											
ICB		LoUU		LoC		LoUIS		Ctype7		Ctype6		Ctype5				Ctype4			Ctype3		Ctype2		Ctype1																					
3130292827262524232221201918171615												14				13			12		11		10		9		8		7		6		5		4		3		2		1		0	

### Bits [63:47]

Reserved, RES0.

**Ttype<n>, bits [2(n-1)+34:2(n-1)+33], for n = 71 to 17**

**When FEAT\_MTE is implemented:**

Tag cache type. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy.

Ttype<n>	Meaning
0b00	No Tag Cache.
0b01	Separate Allocation Tag Cache.
0b10	Unified Allocation Tag and Data cache, Allocation Tags and Data in unified lines.
0b11	Unified Allocation Tag and Data cache, Allocation Tags and Data in separate lines.

**Otherwise:**

Reserved, RES0.

**ICB, bits [32:30]**

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

The possible values are:

ICB	Meaning
0b000	Not disclosed by this mechanism.
0b001	L1 cache is the highest Inner Cacheable level.
0b010	L2 cache is the highest Inner Cacheable level.
0b011	L3 cache is the highest Inner Cacheable level.
0b100	L4 cache is the highest Inner Cacheable level.
0b101	L5 cache is the highest Inner Cacheable level.
0b110	L6 cache is the highest Inner Cacheable level.
0b111	L7 cache is the highest Inner Cacheable level.

**LoUU, bits [29:27]**

Level of Unification Uniprocessor for the cache hierarchy.

**Note**

When FEAT\_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

**LoC, bits [26:24]**

Level of Coherence for the cache hierarchy.

**LoUIS, bits [23:21]**

Level of Unification Inner Shareable for the cache hierarchy.

**Note**

When FEAT\_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

**Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 71 to 17**

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

Ctype<n>	Meaning
0b000	No cache.
0b001	Instruction cache only.
0b010	Data cache only.
0b011	Separate instruction and data caches.
0b100	Unified cache.

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

## Accessing the CLIDR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, CLIDR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b001

```

# CNTFRQ\_EL0, Counter-timer Frequency register

The CNTFRQ\_EL0 characteristics are:

## Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

## Configuration

AArch64 System register CNTFRQ\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [CNTFRQ\[31:0\]](#).

## Attributes

CNTFRQ\_EL0 is a 64-bit register.

## Field descriptions

The CNTFRQ\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

The CNTHCTL\_EL2 characteristics are:

## Purpose

Controls the generation of an event stream from the physical counter, and access from EL1 to the physical counter and the EL1 physical timer.

## Configuration

AArch64 System register CNTHCTL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHCTL\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

CNTHCTL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHCTL EL2 bit assignments are:

### When FEAT\_VHE is implemented and HCR\_EL2.E2H == 1:

6362616059585756555453525150	49	48	47	46	45	44	43	42	41	40	
							RES0				
RES0		EVNTIS	EL1NVVCT	EL1NVPCT	EL1TVCT	EL1TVT	ECV	EL1PTEN	EL1PCTEN	ELOPTEN	ELOVTE
3130292827262524232221201918	17	16	15	14	13	12	11	10	9	8	

**Bits [63:18]**

Reserved, RES0.

**EVNTIS, bit [17]**

**When FEAT\_ECV is implemented:**

Controls the scale of the generation of the event stream.

EVENTIS	Meaning
0b0	The CNTHCTL_EL2.EVNTI field applies to <a href="#">CNTPCT_ELO</a> [15:0].
0b1	The CNTHCTL_EL2.EVNTI field applies to <a href="#">CNTPCT_ELO</a> [23:8].

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EL1NVVCT, bit [16]****When FEAT\_ECV is implemented:**

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If (( <a href="#">HCR_EL2.E2H==1</a> && <a href="#">HCR_EL2.TGE==1</a> )    <a href="#">HCR_EL2.NV2==0</a>    <a href="#">HCR_EL2.NV1==1</a>    <a href="#">HCR_EL2.NV==0</a> ), this control does not cause any instructions to be trapped. If (( <a href="#">HCR_EL2.E2H==0</a>    <a href="#">HCR_EL2.TGE==0</a> ) && <a href="#">HCR_EL2.NV2==1</a> && <a href="#">HCR_EL2.NV1==0</a> && <a href="#">HCR_EL2.NV==1</a> ), then EL1 accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EL1NVPCT, bit [15]****When FEAT\_ECV is implemented:**

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVPCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If (( <a href="#">HCR_EL2.E2H==1</a> && <a href="#">HCR_EL2.TGE==1</a> )    <a href="#">HCR_EL2.NV2==0</a>    <a href="#">HCR_EL2.NV1==1</a>    <a href="#">HCR_EL2.NV==0</a> ), this control does not cause any instructions to be trapped. If ( <a href="#">HCR_EL2.E2H==0</a>    <a href="#">HCR_EL2.TGE==0</a> ) && <a href="#">HCR_EL2.NV2==1</a> && <a href="#">HCR_EL2.NV1==0</a> && <a href="#">HCR_EL2.NV==1</a> , then EL1 accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02, are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EL1TVCT, bit [14]**

**When FEAT\_ECV is implemented:**

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

EL1TVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	<p>If <a href="#">HCR_EL2</a>.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.</p> <p>If <a href="#">HCR_EL2</a>.E2H is 0 or <a href="#">HCR_EL2</a>.TGE is 0, then:</p> <ul style="list-style-type: none"> <li>In AArch64 state, traps EL0 and EL1 accesses to <a href="#">CNTVCT_EL0</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.EL0VCTEN.</li> <li>In AArch32 state, traps EL0 and EL1 accesses to <a href="#">CNTVCT</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.EL0VCTEN or <a href="#">CNTKCTL</a>.PL0VCTEN.</li> </ul>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EL1TVT, bit [13]****When FEAT\_ECV is implemented:**

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

EL1TVT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	<p>If <a href="#">HCR_EL2</a>.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.</p> <p>If <a href="#">HCR_EL2</a>.E2H is 0 or <a href="#">HCR_EL2</a>.TGE is 0, then:</p> <ul style="list-style-type: none"> <li>In AArch64 state, traps EL0 and EL1 accesses to <a href="#">CNTV_CTL_EL0</a>, <a href="#">CNTV_CVAL_EL0</a>, and <a href="#">CNTV_TVAL_EL0</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.EL0VTEN.</li> <li>In AArch32 state, traps EL0 and EL1 accesses to <a href="#">CNTV_CTL</a>, <a href="#">CNTV_CVAL</a>, and <a href="#">CNTV_TVAL</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.EL0VTEN or <a href="#">CNTKCTL</a>.PL0VTEN.</li> </ul>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**ECV, bit [12]****When FEAT\_ECV is implemented:**

Enables the Enhanced Counter Virtualization functionality registers.

ECV	Meaning
0b0	Enhanced Counter Virtualization functionality is disabled.
0b1	<p>When <a href="#">HCR_EL2</a>.{E2H, TGE} == {1, 1} or <a href="#">SCR_EL3</a>.{NS, EEL2} == {0, 0}, then Enhanced Counter Virtualization functionality is disabled.</p> <p>When <a href="#">SCR_EL3</a>.NS or <a href="#">SCR_EL3</a>.EEL2 are 1, and <a href="#">HCR_EL2</a>.E2H or <a href="#">HCR_EL2</a>.TGE are 0, then Enhanced Counter Virtualization functionality is enabled when EL2 is enabled for the current Security state. This means that:</p> <ul style="list-style-type: none"> <li>An MRS to <a href="#">CNTPCT_EL0</a> from either EL0 or EL1 that is not trapped will return the value (PCount&lt;63:0&gt; - <a href="#">CNTPOFF_EL2</a>&lt;63:0&gt;).</li> <li>The EL1 physical timer interrupt is triggered when ((PCount&lt;63:0&gt; - <a href="#">CNTPOFF_EL2</a>&lt;63:0&gt;) - PCVal&lt;63:0&gt;) is greater than or equal to 0. PCount&lt;63:0&gt; is the physical count returned when <a href="#">CNTPCT_EL0</a> is read from EL2 or EL3. PCVal&lt;63:0&gt; is the EL1 physical timer compare value for this timer.</li> </ul>

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EL1PTEN, bit [11]**

When [HCR\\_EL2](#).TGE is 0, traps EL0 and EL1 accesses to the E1 physical timer registers to EL2 when EL2 is enabled in the current Security state.

EL1PTEN	Meaning
0b0	<p>From AArch64 state: EL0 and EL1 accesses to the <a href="#">CNTP_CTL_EL0</a>, <a href="#">CNTP_CVAL_EL0</a>, and <a href="#">CNTP_TVAL_EL0</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.ELOPTEN.</p> <p>From AArch32 state: EL0 and EL1 accesses to the <a href="#">CNTP_CTL</a>, <a href="#">CNTP_CVAL</a>, and <a href="#">CNTP_TVAL</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.ELOPTEN or <a href="#">CNTKCTL</a>.PLOPTEN.</p>
0b1	This control does not cause any instructions to be trapped.

When [HCR\\_EL2](#).TGE is 1, this control does not cause any instructions to be trapped.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**EL1PCTEN, bit [10]**

When [HCR\\_EL2](#).TGE is 0, traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [CNTPCT\\_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRRC or MCRR accesses to [CNTPCT](#) are trapped to EL2, reported using EC syndrome value 0x04.

EL1PCTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the <a href="#">CNTPCT_EL0</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1.EL0PCTEN</a> . From AArch32 state: EL0 and EL1 accesses to the <a href="#">CNTPCT</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1.EL0PCTEN</a> or <a href="#">CNTKCTL.PL0PCTEN</a> .
0b1	This control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

#### ELOPTEN, bit [9]

When [HCR\\_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, traps EL0 accesses to the physical timer registers to EL2.

ELOPTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the <a href="#">CNTP_CTL_EL0</a> , <a href="#">CNTP_CVAL_EL0</a> , and <a href="#">CNTP_TVAL_EL0</a> registers are trapped to EL2. EL0 using AArch32: EL0 accesses to the <a href="#">CNTP_CTL</a> , <a href="#">CNTP_CVAL</a> and <a href="#">CNTP_TVAL</a> registers are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

#### ELOVTEN, bit [8]

When [HCR\\_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, traps EL0 accesses to the virtual timer registers to EL2.

ELOVTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the <a href="#">CNTV_CTL_EL0</a> , <a href="#">CNTV_CVAL_EL0</a> , and <a href="#">CNTV_TVAL_EL0</a> registers are trapped to EL2. EL0 using AArch32: EL0 accesses to the <a href="#">CNTV_CTL</a> , <a href="#">CNTV_CVAL</a> , and <a href="#">CNTV_TVAL</a> registers are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

#### EVNTI, bits [7:4]

Selects which bit of the counter register [CNTPCT\\_EL0](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT\_ECV is implemented, and CNTHCTL\_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register [CNTPCT\\_EL0](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

#### EVNTDIR, bit [3]

Controls which transition of the counter register [CNTPCT\\_EL0](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### EVNTEN, bit [2]

Enables the generation of an event stream from the counter register [CNTPCT\\_EL0](#).

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### EL0VCTEN, bit [1]

When [HCR\\_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, traps EL0 accesses to the frequency register and virtual counter register to EL2.

EL0VCTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the <a href="#">CNTVCT_EL0</a> are trapped to EL2. EL0 using AArch64: EL0 accesses to the <a href="#">CNTERQ_EL0</a> register are trapped to EL2, if <a href="#">CNTHCTL_EL2.EL0PCTEN</a> is also 0. EL0 using AArch32: EL0 accesses to the <a href="#">CNTVCT</a> are trapped to EL2. EL0 using AArch32: EL0 accesses to the <a href="#">CNTERQ</a> register are trapped to EL2, if <a href="#">CNTHCTL_EL2.EL0PCTEN</a> is also 0.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### EL0PCTEN, bit [0]

When [HCR\\_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, traps EL0 accesses to the frequency register and physical counter register to EL2.

EL0PCTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the <a href="#">CNTPCT_EL0</a> are trapped to EL2. EL0 using AArch64: EL0 accesses to the <a href="#">CNTERQ_EL0</a> register are trapped to EL2, if <a href="#">CNTHCTL_EL2.EL0VCTEN</a> is also 0. EL0 using AArch32: EL0 accesses to the <a href="#">CNTPCT</a> are trapped to EL2. EL0 using AArch32: EL0 accesses to the <a href="#">CNTERQ</a> and register are trapped to EL2, if <a href="#">CNTHCTL_EL2.EL0VCTEN</a> is also 0.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Otherwise:

This format applies in all Armv8.0 implementations, and it also contains a description of the behavior when EL3 is implemented and EL2 is not implemented.

**Bits [63:18]**

Reserved, RES0.

**EVNTIS, bit [17]**

When FEAT\_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTHCTL_EL2.EVNTI field applies to <a href="#">CNTPCT_ELO</a> [15:0].
0b1	The CNTHCTL_EL2.EVNTI field applies to <a href="#">CNTPCT_ELO</a> [23:8].

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**EL1NVVCT, bit [16]**

When FEAT\_ECV is implemented:

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If (( <a href="#">HCR_EL2.E2H</a> ==1 && <a href="#">HCR_EL2.TGE</a> ==1)    <a href="#">HCR_EL2.NV2</a> ==0    <a href="#">HCR_EL2.NV1</a> ==1    <a href="#">HCR_EL2.NV</a> ==0), this control does not cause any instructions to be trapped. If (( <a href="#">HCR_EL2.E2H</a> ==0    <a href="#">HCR_EL2.TGE</a> ==0) && <a href="#">HCR_EL2.NV2</a> ==1 && <a href="#">HCR_EL2.NV1</a> ==0 && <a href="#">HCR_EL2.NV</a> ==1), then EL1 accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**EL1NVPCT, bit [15]**

When FEAT\_ECV is implemented:

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVPCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If (( <a href="#">HCR_EL2.E2H</a> ==1 && <a href="#">HCR_EL2.TGE</a> ==1)    <a href="#">HCR_EL2.NV2</a> ==0    <a href="#">HCR_EL2.NV1</a> ==1    <a href="#">HCR_EL2.NV</a> ==0), this control does not cause any instructions to be trapped. If ( <a href="#">HCR_EL2.E2H</a> ==0    <a href="#">HCR_EL2.TGE</a> ==0) && <a href="#">HCR_EL2.NV2</a> ==1 && <a href="#">HCR_EL2.NV1</a> ==0 && <a href="#">HCR_EL2.NV</a> ==1, then EL1 accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02, are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### EL1TVCT, bit [14]

#### When FEAT\_ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

EL1TVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If <a href="#">HCR_EL2</a> .{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If <a href="#">HCR_EL2.E2H</a> is 0 or <a href="#">HCR_EL2.TGE</a> is 0, then: In AArch64 state, traps EL0 and EL1 accesses to <a href="#">CNTVCT_EL0</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1.EL0VCTEN</a> . In AArch32 state, traps EL0 and EL1 accesses to <a href="#">CNTVCT</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1.EL0VCTEN</a> or <a href="#">CNTKCTL.PL0VCTEN</a> .

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### EL1TVT, bit [13]

#### When FEAT\_ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

EL1TVT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If <a href="#">HCR_EL2</a> .{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If <a href="#">HCR_EL2</a> .E2H is 0 or <a href="#">HCR_EL2</a> .TGE is 0, then: <ul style="list-style-type: none"> <li>In AArch64 state, traps EL0 and EL1 accesses to <a href="#">CNTV_CTL_EL0</a>, <a href="#">CNTV_CVAL_EL0</a>, and <a href="#">CNTV_TVAL_EL0</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.EL0VTEN.</li> <li>In AArch32 state, traps EL0 and EL1 accesses to <a href="#">CNTV_CTL</a>, <a href="#">CNTV_CVAL</a>, and <a href="#">CNTV_TVAL</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.EL0VTEN or <a href="#">CNTKCTL</a>.PL0VTEN.</li> </ul>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### ECV, bit [12]

##### When FEAT\_ECV is implemented:

Enables the Enhanced Counter Virtualization functionality registers.

ECV	Meaning
0b0	Enhanced Counter Virtualization functionality is disabled.
0b1	When <a href="#">HCR_EL2</a> .{E2H, TGE} == {1, 1} or <a href="#">SCR_EL3</a> .{NS, EEL2} == {0, 0}, then Enhanced Counter Virtualization functionality is disabled. When <a href="#">SCR_EL3</a> .NS or <a href="#">SCR_EL3</a> .EEL2 are 1, and <a href="#">HCR_EL2</a> .E2H or <a href="#">HCR_EL2</a> .TGE are 0, then Enhanced Counter Virtualization functionality is enabled when EL2 is enabled for the current Security state. This means that: <ul style="list-style-type: none"> <li>An MRS to <a href="#">CNTPCT_EL0</a> from either EL0 or EL1 that is not trapped will return the value (PCount&lt;63:0&gt; - <a href="#">CNTPOFF_EL2</a>&lt;63:0&gt;).</li> <li>The EL1 physical timer interrupt is triggered when ((PCount&lt;63:0&gt; - <a href="#">CNTPOFF_EL2</a>&lt;63:0&gt;) - PCVal&lt;63:0&gt;) is greater than or equal to 0. PCount is the physical count returned when <a href="#">CNTPCT_EL0</a> is read from EL2 or EL3. PCVal&lt;63:0&gt; is the EL1 physical timer compare value for this timer.</li> </ul>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bits [11:8]

Reserved, RES0.

#### EVNTI, bits [7:4]

Selects which bit of the counter register [CNTPCT\\_EL0](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT\_ECV is implemented, and CNTHCTL\_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register [CNTPCT\\_EL0](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### EVNTDIR, bit [3]

Controls which transition of the counter register [CNTPCT\\_EL0](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### EVNTEN, bit [2]

Enables the generation of an event stream from the counter register [CNTPCT\\_EL0](#).

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

On a Warm reset, this **This** field resets to 0.

### EL1PCEN, bit [1]

Traps EL0 and EL1 accesses to the EL1 physical timer registers to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [CNTP\\_CTL\\_EL0](#), [CNTP\\_CVAL\\_EL0](#), [CNTP\\_TVAL\\_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x3 and MRRC and MCRR accesses are trapped to EL2, reported using EC syndrome value 0x04:
  - [CNTP\\_CTL](#), [CNTP\\_CVAL](#), [CNTP\\_TVAL](#).

EL1PCEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the <a href="#">CNTP_CTL_EL0</a> , <a href="#">CNTP_CVAL_EL0</a> , and <a href="#">CNTP_TVAL_EL0</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1.ELOPTEN</a> . From AArch32 state: EL0 and EL1 accesses to the <a href="#">CNTP_CTL</a> , <a href="#">CNTP_CVAL</a> , and <a href="#">CNTP_TVAL</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1.ELOPTEN</a> or <a href="#">CNTKCTL.PLOPTEN</a> .
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### EL1PCTEN, bit [0]

Traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [CNTPCT\\_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRRC or MCRR accesses to [CNTPCT](#) are trapped to EL2, reported using EC syndrome value 0x04.

EL1PCTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the <a href="#">CNTPCT_EL0</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1.EL0PCTEN</a> . From AArch32 state: EL0 and EL1 accesses to the <a href="#">CNTPCT</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1.EL0PCTEN</a> or <a href="#">CNTKCTL.PL0PCTEN</a> .
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

## Accessing the CNTHCTL\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHCTL\_EL2 or CNTKCTL\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTHCTL\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0001	0b000

```

(old)

## htmldiff from-

**(new)**

The CNTHP\_CTL\_EL2 characteristics are:

## Purpose

Control register for the EL2 physical timer.

## Configuration

AArch64 System register CNTHP\_CTL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHP\\_CTL\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHP\_CTL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHP CTL EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
																		RES0																	
RES0																														ISTATUS		IMASK		ENABLE	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHP\\_TVAL\\_EL2](#) continues to count down.

### Note

Disabling the output signal might be a power-saving option.

## Accessing the CNTHP\_CTL\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHP\\_CTL\\_EL2](#) or [CNTPT\\_CTL\\_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTHP\_CTL\_EL2

# CNTHP\_CVAL\_EL2, Counter-timer Physical Timer CompareValue register (EL2)

The CNTHP\_CVAL\_EL2 characteristics are:

## Purpose

Holds the compare value for the EL2 physical timer.

## Configuration

AArch64 System register CNTHP\_CVAL\_EL2 bits [63:0] are architecturally mapped to AArch32 System register [CNTHP\\_CVAL\[63:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHP\_CVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHP\_CVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When [CNTHP\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHP\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHP\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHP\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

## Accessing the CNTHP\_CVAL\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHP\\_CVAL\\_EL2](#) or [CNTP\\_CVAL\\_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# CNTHP\_TVAL\_EL2, Counter-timer Physical Timer TimerValue register (EL2)

The CNTHP\_TVAL\_EL2 characteristics are:

## Purpose

Holds the timer value for the EL2 physical timer.

## Configuration

AArch64 System register CNTHP\_TVAL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHP\\_TVAL\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHP\_TVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHP\_TVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TimerValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHP\\_CTL\\_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHP\\_CTL\\_EL2.ENABLE](#) is 1, the value returned is ([CNTHP\\_CVAL\\_EL2](#) - [CNTPCT\\_EL0](#)).

On a write of this register, [CNTHP\\_CVAL\\_EL2](#) is set to ([CNTPCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHP\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - [CNTHP\\_CVAL\\_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHP\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHP\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHP\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

## Accessing the CNTHP\_TVAL\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHP\\_TVAL\\_EL2](#) or [CNTP\\_TVAL\\_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTHP\_TVAL\_EL2

# CNTHPS\_CTL\_EL2, Counter-timer Secure Physical Timer Control register (EL2)

The CNTHPS\_CTL\_EL2 characteristics are:

## Purpose

Control register for the Secure EL2 physical timer.

## Configuration

AArch64 System register CNTHPS\_CTL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHPS\\_CTL\[31:0\]](#).

This register is present only when FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHPS\_CTL\_EL2 are UNDEFINED.

## Attributes

CNTHPS\_CTL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHPS\_CTL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the CNTHPS\_CTL\_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS\_CTL\_EL2.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHPS\\_TVAL\\_EL2](#) continues to count down.

### Note

Disabling the output signal might be a power-saving option.

The CNTHPS\_CVAL\_EL2 characteristics are:

## Purpose

Holds the compare value for the Secure EL2 physical timer.

## Configuration

AArch64 System register CNTHPS\_CVAL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHPS\\_CVAL\[31:0\]](#).

This register is present only when EL2 is implemented and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHPS\_CVAL\_EL2 are UNDEFINED.

## Attributes

CNTHPS\_CVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHPS\_CVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
																	CompareValue																
																	CompareValue																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When `CNTHPS_CTL_EL2.ENABLE` is 1, the timer condition is met when `(CNTPCT_EL0 - CompareValue)` is greater than or equal to zero. This means that `CompareValue` acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHPS\\_CTL\\_EL2](#).ISTATUS is set to 1.
- If [CNTHPS\\_CTL\\_EL2](#).IMASK is 0, an interrupt is generated.

When [CNTHPS\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPTCT\\_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

## Accessing the CNTHPS CVAL EL2

Accesses to this register use the following encodings:

# CNTHPS\_TVAL\_EL2, Counter-timer Secure Physical Timer TimerValue register (EL2)

The CNTHPS\_TVAL\_EL2 characteristics are:

## Purpose

Holds the timer value for the Secure EL2 physical timer.

## Configuration

AArch64 System register CNTHPS\_TVAL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHPS\\_TVAL\[31:0\]](#).

This register is present only when EL2 is implemented and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHPS\_TVAL\_EL2 are UNDEFINED.

## Attributes

CNTHPS\_TVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHPS\_TVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TimerValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHPS\\_CTL\\_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHPS\\_CTL\\_EL2.ENABLE](#) is 1, the value returned is ([CNTHPS\\_CVAL\\_EL2](#) - [CNTPCT\\_EL0](#)).

On a write of this register, [CNTHPS\\_CVAL\\_EL2](#) is set to ([CNTPCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHPS\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - [CNTHPS\\_CVAL\\_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHPS\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHPS\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHPS\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

The CNTHV\_CTL\_EL2 characteristics are:

## Purpose

Control register for the EL2 virtual timer.

# Configuration

AArch64 System register CNTHV\_CTL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHV\\_CTL\[31:0\]](#).

This register is present only when FEAT\_VHE is implemented. Otherwise, direct accesses to CNTHV\_CTL\_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHV CTL EL2 is a 64-bit register.

## Field descriptions

The CNTHV CTL EL2 bit assignments are:

**Bits [63:3]**

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHV\\_TVAL\\_EL2](#) continues to count down.

### Note

Disabling the output signal might be a power-saving option.

## Accessing the CNTHV\_CTL\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHV\\_CTL\\_EL2](#) or [CNTV\\_CTL\\_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTHV\_CTL\_EL2

# CNTHV\_CVAL\_EL2, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV\_CVAL\_EL2 characteristics are:

## Purpose

Holds the compare value for the EL2 virtual timer.

## Configuration

AArch64 System register CNTHV\_CVAL\_EL2 bits [63:0] are architecturally mapped to AArch32 System register [CNTHV\\_CVAL\[63:0\]](#).

This register is present only when FEAT\_VHE is implemented. Otherwise, direct accesses to CNTHV\_CVAL\_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHV\_CVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHV\_CVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																CompareValue															
																CompareValue															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When [CNTHV\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTVCT\\_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHV\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHV\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHV\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT\\_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

## Accessing the CNTHV\_CVAL\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHV\\_CVAL\\_EL2](#) or [CNTV\\_CVAL\\_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# CNTHV\_TVAL\_EL2, Counter-timer Virtual Timer TimerValue Register (EL2)

The CNTHV\_TVAL\_EL2 characteristics are:

## Purpose

Holds the timer value for the EL2 virtual timer.

## Configuration

AArch64 System register CNTHV\_TVAL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHV\\_TVAL\[31:0\]](#).

This register is present only when FEAT\_VHE is implemented. Otherwise, direct accesses to CNTHV\_TVAL\_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHV\_TVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHV\_TVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TimerValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHV\\_CTL\\_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHV\\_CTL\\_EL2.ENABLE](#) is 1, the value returned is ([CNTHV\\_CVAL\\_EL2](#) - [CNTVCT\\_EL0](#)).

On a write of this register, [CNTHV\\_CVAL\\_EL2](#) is set to ([CNTVCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHV\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTVCT\\_EL0](#) - [CNTHV\\_CVAL\\_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHV\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHV\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHV\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

## Accessing the CNTHV\_TVAL\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHV\\_TVAL\\_EL2](#) or [CNTV\\_TVAL\\_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# CNTHVS\_CTL\_EL2, Counter-timer Secure Virtual Timer Control register (EL2)

The CNTHVS\_CTL\_EL2 characteristics are:

## Purpose

Control register for the Secure EL2 virtual timer.

## Configuration

AArch64 System register CNTHVS\_CTL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHVS\\_CTL\[31:0\]](#).

This register is present only when EL2 is implemented and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHVS\_CTL\_EL2 are UNDEFINED.

## Attributes

CNTHVS\_CTL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHVS\_CTL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the CNTHVS\_CTL\_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the CNTHVS\_CTL\_EL2.ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHVS\\_TVAL\\_EL2](#) continues to count down.

### Note

Disabling the output signal might be a power-saving option.

## Accessing the CNTHVS\_CTL\_EL2

Accesses to this register use the following encodings:

# CNTHVS\_CVAL\_EL2, Counter-timer Secure Virtual Timer CompareValue register (EL2)

The CNTHVS\_CVAL\_EL2 characteristics are:

## Purpose

Holds the compare value for the Secure EL2 virtual timer.

## Configuration

AArch64 System register CNTHVS\_CVAL\_EL2 bits [63:0] are architecturally mapped to AArch32 System register [CNTHVS\\_CVAL\[63:0\]](#).

This register is present only when EL2 is implemented and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHVS\_CVAL\_EL2 are UNDEFINED.

## Attributes

CNTHVS\_CVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHVS\_CVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CompareValue, bits [63:0]

Holds the Secure EL2 virtual timer CompareValue.

When [CNTHVS\\_CTL\\_EL2](#).ENABLE is 1, the timer condition is met when ([CNTVCT\\_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHVS\\_CTL\\_EL2](#).ISTATUS is set to 1.
- If [CNTHVS\\_CTL\\_EL2](#).IMASK is 0, an interrupt is generated.

When [CNTHVS\\_CTL\\_EL2](#).ENABLE is 0, the timer condition is not met, but [CNTVCT\\_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

## Accessing the CNTHVS\_CVAL\_EL2

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, CNTHVS\_CVAL\_EL2

# CNTHVS\_TVAL\_EL2, Counter-timer Secure Virtual Timer TimerValue register (EL2)

The CNTHVS\_TVAL\_EL2 characteristics are:

## Purpose

Holds the timer value for the Secure EL2 virtual timer.

## Configuration

AArch64 System register CNTHVS\_TVAL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHVS\\_TVAL\[31:0\]](#).

This register is present only when EL2 is implemented and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHVS\_TVAL\_EL2 are UNDEFINED.

## Attributes

CNTHVS\_TVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHVS\_TVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TimerValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHVS\\_CTL\\_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHVS\\_CTL\\_EL2.ENABLE](#) is 1, the value returned is ([CNTHVS\\_CVAL\\_EL2](#) - [CNTVCT\\_EL0](#)).

On a write of this register, [CNTHVS\\_CVAL\\_EL2](#) is set to ([CNTVCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHVS\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when (([CNTVCT\\_EL0](#) - [CNTHVS\\_CVAL\\_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHVS\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHVS\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHVS\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

# CNTKCTL\_EL1, Counter-timer Kernel Control register

The CNTKCTL\_EL1 characteristics are:

## Purpose

When FEAT\_VHE is not implemented, or when [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, this register controls the generation of an event stream from the virtual counter, and access from EL0 to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

When FEAT\_VHE is implemented and [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this register does not cause any event stream from the virtual counter to be generated, and does not control access to the counters and timers. The access to counters and timers at EL0 is controlled by [CNTHCTL\\_EL2](#).

## Configuration

AArch64 System register CNTKCTL\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CNTKCTL\[31:0\]](#).

## Attributes

CNTKCTL\_EL1 is a 64-bit register.

## Field descriptions

The CNTKCTL\_EL1 bit assignments are:

6362616059585756555453525150	49	48474645444342	41	40	39383736	35	34	33	32
RES0									
RES0	EVENTIS	RES0	ELOPTEN	ELOVTEN	EVNTI	EVNTDIR	EVNTEN	ELOVCTEN	ELOPCTEN
3130292827262524232221201918	17	16151413121110	9	8	7654	3	2	1	0

### Bits [63:18]

Reserved, RES0.

### EVENTIS, bit [17]

When FEAT\_ECV is implemented:

Controls the scale of the generation of the event stream.

EVENTIS	Meaning
0b0	The CNTKCTL_EL1.EVNTI field applies to <a href="#">CNTVCT_ELO</a> [15:0].
0b1	The CNTKCTL_EL1.EVNTI field applies to <a href="#">CNTVCT_ELO</a> [23:8].

This control applies regardless of the value of the [CNTHCTL\\_EL2](#).ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**Bits [16:10]**

Reserved, RES0.

**ELOPTEN, bit [9]**

Traps EL0 accesses to the physical timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2.TGE](#) is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value 0x18:
  - [CNTP\\_CTL\\_EL0](#), [CNTP\\_CVAL\\_EL0](#), and [CNTP\\_TVAL\\_EL0](#).
- In AArch32 state, MRC and MCR accesses to the following registers are trapped, reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped, reported using EC syndrome value 0x04:
  - [CNTP\\_CTL](#), [CNTP\\_CVAL](#), [CNTP\\_TVAL](#).

ELOPTEN	Meaning
0b0	EL0 accesses to the physical timer registers are trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

When FEAT\_VHE is implemented and [HCR\\_EL2.{E2H, TGE}](#) is {1, 1}, this control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ELOVTEN, bit [8]**

Traps EL0 accesses to the virtual timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2.TGE](#) is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value 0x18:
  - [CNTV\\_CTL\\_EL0](#), [CNTV\\_CVAL\\_EL0](#), and [CNTV\\_TVAL\\_EL0](#).
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped using EC syndrome value 0x04:
  - [CNTV\\_CTL](#), [CNTV\\_CVAL](#), and [CNTV\\_TVAL](#).

ELOVTEN	Meaning
0b0	EL0 accesses to the virtual timer registers are trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT\_VHE is implemented and [HCR\\_EL2.{E2H, TGE}](#) is {1, 1}, this control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EVNTI, bits [7:4]**

Selects which bit of the counter register [CNTVCT\\_EL0](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT\_ECV is implemented, and CNTKCTL\_EL1.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register [CNTVCT\\_EL0](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EVNTDIR, bit [3]**

Controls which transition of the counter register [CNTVCT\\_EL0](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## EVNTEN, bit [2]

When FEAT\_VHE is not implemented, or when [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, enables the generation of an event stream from the counter register [CNTVCT\\_EL0](#).

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

When FEAT\_VHE is implemented and [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this control does not enable the event stream.

On a Warm reset, this **This** field resets to 0.

## ELOVCTEN, bit [1]

Traps EL0 accesses to the frequency register and virtual counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2](#).TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped and reported using EC syndrome value 0x18:
  - [CNTVCT\\_EL0](#) and if [CNTKCTL\\_EL1](#).ELOPCTEN is 0, [CNTFRQ\\_EL0](#).
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped and reported using EC syndrome value 0x04:
  - [CNTVCT](#) and if [CNTKCTL\\_EL1](#).ELOPCTEN is 0, [CNTFRQ](#).

ELOVCTEN	Meaning
0b0	EL0 accesses to the frequency register and virtual counter registers are trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT\_VHE is implemented and [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## ELOPCTEN, bit [0]

Traps EL0 accesses to the frequency register and physical counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2](#).TGE is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value 0x18:
  - [CNTPCT\\_EL0](#) and if [CNTKCTL\\_EL1](#).ELOVCTEN is 0, [CNTFRQ\\_EL0](#).
- In AArch32 state, MCR or MRC accesses the following registers are trapped, reported using EC syndrome value 0x03, MCRR or MRRC accesses are trapped and reported using EC syndrome value 0x04:
  - [CNTPCT](#) and if [CNTKCTL\\_EL1](#).ELOVCTEN is 0, [CNTFRQ](#).

ELOPCTEN	Meaning
0b0	EL0 accesses to the frequency register and physical counter register are trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT\_VHE is implemented and [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Accessing the CNTKCTL\_EL1

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTKCTL\_EL1 or CNTKCTL\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP\\_TVAL\\_EL0](#) continues to count down.

---

### Note

Disabling the output signal might be a power-saving option.

---

## Accessing the CNTP\_CTL\_EL0

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP\_CTL\_EL0 or CNTP\_CTL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# CNTP\_CVAL\_EL0, Counter-timer Physical Timer CompareValue register

The CNTP\_CVAL\_EL0 characteristics are:

## Purpose

Holds the compare value for the EL1 physical timer.

## Configuration

AArch64 System register CNTP\_CVAL\_EL0 bits [63:0] are architecturally mapped to AArch32 System register [CNTP\\_CVAL\[63:0\]](#).

## Attributes

CNTP\_CVAL\_EL0 is a 64-bit register.

## Field descriptions

The CNTP\_CVAL\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When [CNTP\\_CTL\\_EL0](#).ENABLE is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTP\\_CTL\\_EL0](#).ISTATUS is set to 1.
- If [CNTP\\_CTL\\_EL0](#).IMASK is 0, an interrupt is generated.

When [CNTP\\_CTL\\_EL0](#).ENABLE is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

## Accessing the CNTP\_CVAL\_EL0

When [HCR\\_EL2](#).E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP\_CVAL\_EL0 or CNTP\_CVAL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# CNTP\_TVAL\_EL0, Counter-timer Physical Timer TimerValue register

The CNTP\_TVAL\_EL0 characteristics are:

## Purpose

Holds the timer value for the EL1 physical timer.

## Configuration

AArch64 System register CNTP\_TVAL\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [CNTP\\_TVAL\[31:0\]](#).

## Attributes

CNTP\_TVAL\_EL0 is a 64-bit register.

## Field descriptions

The CNTP\_TVAL\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TimerValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If [CNTP\\_CTL\\_EL0](#).ENABLE is 0, the value returned is UNKNOWN.
- If [CNTP\\_CTL\\_EL0](#).ENABLE is 1, the value returned is ([CNTP\\_CVAL\\_EL0](#) - [CNTPCT\\_EL0](#)).

On a write of this register, [CNTP\\_CVAL\\_EL0](#) is set to ([CNTPCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP\\_CTL\\_EL0](#).ENABLE is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - [CNTP\\_CVAL\\_EL0](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTP\\_CTL\\_EL0](#).ISTATUS is set to 1.
- If [CNTP\\_CTL\\_EL0](#).IMASK is 0, an interrupt is generated.

When [CNTP\\_CTL\\_EL0](#).ENABLE is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

## Accessing the CNTP\_TVAL\_EL0

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic [CNTP\\_TVAL\\_EL0](#) or [CNTP\\_TVAL\\_EL02](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# CNTPOFF\_EL2, Counter-timer Physical Offset register

The CNTPOFF\_EL2 characteristics are:

## Purpose

Holds the 64-bit physical offset. This is the offset for the AArch64 physical timers and counters when Enhanced Counter Virtualization is enabled.

## Configuration

This register is present only when FEAT\_ECV is implemented. Otherwise, direct accesses to CNTPOFF\_EL2 are UNDEFINED.

The offsetting of the timers and counters based on EL2 using AArch64 apply at:

- EL1 when EL1 is using AArch64 or AArch32.
- EL0 when EL0 is using AArch64 or AArch32.

When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true:

- [CNTHCTL\\_EL2](#).ECV is 0.
- [SCR\\_EL3](#).ECVEn is 0.
- [HCR\\_EL2](#).{E2H, TGE} is {1, 1}.

## Attributes

CNTPOFF\_EL2 is a 64-bit register.

## Field descriptions

The CNTPOFF\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Physical offset																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Physical offset.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The CNTPS\_CTL\_EL1 characteristics are:

## Purpose

Control register for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

# Configuration

There are no configuration notes.

## Attributes

CNTPS\_CTL\_EL1 is a 64-bit register.

## Field descriptions

The CNTPS\_CTL\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32								
																	RES0																						
RES0																															ISTATUS			IMASK			ENABLE		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0								

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<b>ISTATUS</b>	<b>Meaning</b>
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTPS\\_TVAL\\_EL1](#) continues to count down.

### Note

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTPS\_CTL\_EL1

Accesses to this register use the following encodings:

# CNTPS\_TVAL\_EL1, Counter-timer Physical Secure Timer TimerValue register

The CNTPS\_TVAL\_EL1 characteristics are:

## Purpose

Holds the timer value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

## Configuration

There are no configuration notes.

## Attributes

CNTPS\_TVAL\_EL1 is a 64-bit register.

## Field descriptions

The CNTPS\_TVAL\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																TimerValue															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TimerValue, bits [31:0]

The TimerValue view of the secure physical timer.

On a read of this register:

- If [CNTPS\\_CTL\\_EL1.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTPS\\_CTL\\_EL1.ENABLE](#) is 1, the value returned is ([CNTPS\\_CVAL\\_EL1](#) - [CNTPCT\\_EL0](#)).

On a write of this register, [CNTPS\\_CVAL\\_EL1](#) is set to ([CNTPCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTPS\\_CTL\\_EL1.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - [CNTPS\\_CVAL\\_EL1](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTPS\\_CTL\\_EL1.ISTATUS](#) is set to 1.
- If [CNTPS\\_CTL\\_EL1.IMASK](#) is 0, an interrupt is generated.

When [CNTPS\\_CTL\\_EL1.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV\_TVAL\_EL0 continues to count down.

Note

Disabling the output signal might be a power-saving option.

Accessing the CNTV\_CTL\_EL0

When HCR\_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV\_CTL\_EL0 or CNTV\_CTL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTV\_CTL\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0011	0b001

```

if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CNTKCTL_EL1.EL0VTEN == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    elseif EL2Enabled() && HCR_EL2.<E2H,TGE> == '11' && CNTHCTL_EL2.EL0VTEN == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && CNTHCTL_EL2.EL1TVT == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && HCR_EL2.<E2H,TGE> == '11' && SCR_EL3.NS == '0' &&

# CNTV\_CVAL\_EL0, Counter-timer Virtual Timer CompareValue register

The CNTV\_CVAL\_EL0 characteristics are:

## Purpose

Holds the compare value for the virtual timer.

## Configuration

AArch64 System register CNTV\_CVAL\_EL0 bits [63:0] are architecturally mapped to AArch32 System register [CNTV\\_CVAL\[63:0\]](#).

## Attributes

CNTV\_CVAL\_EL0 is a 64-bit register.

## Field descriptions

The CNTV\_CVAL\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CompareValue, bits [63:0]

Holds the EL1 virtual timer CompareValue.

When [CNTV\\_CTL\\_EL0](#).ENABLE is 1, the timer condition is met when ([CNTVCT\\_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTV\\_CTL\\_EL0](#).ISTATUS is set to 1.
- If [CNTV\\_CTL\\_EL0](#).IMASK is 0, an interrupt is generated.

When [CNTV\\_CTL\\_EL0](#).ENABLE is 0, the timer condition is not met, but [CNTVCT\\_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

## Accessing the CNTV\_CVAL\_EL0

When [HCR\\_EL2](#).E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV\_CVAL\_EL0 or CNTV\_CVAL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# CNTV\_TVAL\_ELO, Counter-timer Virtual Timer TimerValue register

The CNTV\_TVAL\_ELO characteristics are:

## Purpose

Holds the timer value for the EL1 virtual timer.

## Configuration

AArch64 System register CNTV\_TVAL\_ELO bits [31:0] are architecturally mapped to AArch32 System register [CNTV\\_TVAL\[31:0\]](#).

## Attributes

CNTV\_TVAL\_ELO is a 64-bit register.

## Field descriptions

The CNTV\_TVAL\_ELO bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																TimerValue															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TimerValue, bits [31:0]

The TimerValue view of the EL1 virtual timer.

On a read of this register:

- If [CNTV\\_CTL\\_ELO](#).ENABLE is 0, the value returned is UNKNOWN.
- If [CNTV\\_CTL\\_ELO](#).ENABLE is 1, the value returned is ([CNTV\\_CVAL\\_ELO](#) - [CNTVCT\\_ELO](#)).

On a write of this register, [CNTV\\_CVAL\\_ELO](#) is set to ([CNTVCT\\_ELO](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTV\\_CTL\\_ELO](#).ENABLE is 1, the timer condition is met when ([CNTVCT\\_ELO](#) - [CNTV\\_CVAL\\_ELO](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTV\\_CTL\\_ELO](#).ISTATUS is set to 1.
- If [CNTV\\_CTL\\_ELO](#).IMASK is 0, an interrupt is generated.

When [CNTV\\_CTL\\_ELO](#).ENABLE is 0, the timer condition is not met, but [CNTVCT\\_ELO](#) continues to count, so the TimerValue view appears to continue to count down.

## Accessing the CNTV\_TVAL\_EL0

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic [CNTV\\_TVAL\\_EL0](#) or [CNTV\\_TVAL\\_EL02](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# CNTVOFF\_EL2, Counter-timer Virtual Offset register

The CNTVOFF\_EL2 characteristics are:

## Purpose

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in [CNTPCT\\_ELO](#) and the virtual count value visible in [CNTVCT\\_ELO](#).

## Configuration

AArch64 System register CNTVOFF\_EL2 bits [63:0] are architecturally mapped to AArch32 System register [CNTVOFF\[63:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

### Note

When EL2 is implemented and enabled in the current Security state, and is using AArch64, the virtual counter uses a fixed virtual offset of zero in the following situations:

- [HCR\\_EL2.E2H](#) is 1, and [CNTVCT\\_ELO](#) is read from EL2.
- [HCR\\_EL2.{E2H, TGE}](#) is {1, 1}, and either:
  - [CNTVCT\\_ELO](#) is read from EL0 or EL2.
  - [CNTVCT](#) is read from EL0.

## Attributes

CNTVOFF\_EL2 is a 64-bit register.

## Field descriptions

The CNTVOFF\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual offset																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Virtual offset																															

### Bits [63:0]

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTVOFF\_EL2

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, CNTVOFF\_EL2

# CONTEXTIDR\_EL1, Context ID Register (EL1)

The CONTEXTIDR\_EL1 characteristics are:

## Purpose

Identifies the current Process Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

## Configuration

AArch64 System register CONTEXTIDR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CONTEXTIDR\[31:0\]](#).

## Attributes

CONTEXTIDR\_EL1 is a 64-bit register.

## Field descriptions

The CONTEXTIDR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																PROCID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

#### Note

In AArch32 state, when [TTBCR](#).EAE is set to 0, [CONTEXTIDR](#).ASID holds the ASID.

In AArch64 state, CONTEXTIDR\_EL1 is independent of the ASID, and for the EL1&0 translation regime either [TTBR0\\_EL1](#) or [TTBR1\\_EL1](#) holds the ASID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CONTEXTIDR\_EL1

When [HCR\\_EL2](#).E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CONTEXTIDR\_EL1 or CONTEXTIDR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CONTEXTIDR\_EL1

# CPACR\_EL1, Architectural Feature Access Control Register

The CPACR\_EL1 characteristics are:

## Purpose

Controls access to trace, SVE, Advanced SIMD and floating-point functionality.

## Configuration

AArch64 System register CPACR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CPACR\[31:0\]](#).

When [HCR\\_EL2](#).{E2H, TGE} == {1, 1}, the fields in this register have no effect on execution at EL0 and EL1. In this case, the controls provided by [CPTR\\_EL2](#) are used.

## Attributes

CPACR\_EL1 is a 64-bit register.

## Field descriptions

The CPACR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0			TTA		RES0				FPEN		RES0		ZEN		RES0																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:29]

Reserved, RES0.

### TTA, bit [28]

Traps EL0 and EL1 System register accesses to all implemented trace registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2](#).{E2H, TGE} is {0,1}, from both Execution states as follows:

- In AArch64 state, accesses to trace registers are trapped, reported using [ESR\\_ELx.EC](#) syndrome value 0x18.
- In AArch32 state, MRC and MCR accesses to trace registers are trapped, reported using [ESR\\_ELx.EC](#) syndrome value 0x05.
- In AArch32 state, MRRC and MCRR accesses to trace registers are trapped, reported using [ESR\\_ELx.EC](#) syndrome value 0x0C.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	This control causes EL0 and EL1 System register accesses to all implemented trace registers to be trapped.

### Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT\_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR\_EL1.TTA is 1.
- The Armv8-A architecture does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not implemented, this bit is RES0.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

## Bits [27:22]

Reserved, RES0.

## FPEN, bits [21:20]

Traps EL0 and EL1 accesses to the SVE, Advanced SIMD, and floating-point registers to EL1, reported using ESR\_ELx.EC syndrome value 0x07, or to EL2 reported using ESR\_ELx.EC syndrome value 0x00, when EL2 is implemented and enabled for the current Security state and HCR\_EL2.{E2H, TGE} is {0,1}, from both Execution states as follows:

- In AArch64 state, accesses to FPCR, FPSR, any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
- In AArch32 state, FPSCR, and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPACR\_EL1.ZEN has precedence over the value of CPACR\_EL1.FPEN.

FPEN	Meaning
0b00	This control causes any instructions at EL0 or EL1 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by CPACR_EL1.ZEN.
0b01	This control causes any instructions at EL0 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, but unless they are not trapped, any instruction at EL1 to be trapped by CPACR_EL1.ZEN, but does not cause any instruction at EL1 to be trapped.
0b10	This control causes any instructions at EL0 or EL1 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, unless they are trapped by CPACR_EL1.ZEN.
0b11	This control does not cause any instructions to be trapped.

Writes to MVFR0, MVFR1 and MVFR2 from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

### Note

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to FPSID, MVFR0, MVFR1, MVFR2, and FPEXC are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR\_EL1.FPEN is not 0b11.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

## Bits [19:18]

Reserved, RES0.

**ZEN, bits [17:16]****When FEAT\_SVE is implemented:**

Traps SVE instructions and instructions that access SVE System registers at EL0 and EL1 execution to EL1, SVE or instructions to EL2 when it is implemented and instructions enabled that for directly the access current Security state and ZCR\_EL1 System register to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR\_EL2.{E2H, TGE} is {0,1}.

The exception is reported using ESR\_ELx.EC value 0x19.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPACR\_EL1.ZEN has precedence over the value of CPACR\_EL1.FPEN.

ZEN	Meaning
0b00	This control causes these instructions executed at EL0 or EL1 to be trapped.
0b01	This control causes these instructions executed at EL0 to be trapped, but does not cause any instruction at EL1 to be trapped.
0b10	This control causes these instructions executed at EL0 or EL1 to be trapped.
0b11	This control does not cause any instruction to be trapped.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [15:0]**

Reserved, RES0.

**Accessing the CPACR\_EL1**

When HCR\_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CPACR\_EL1 or CPACR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CPACR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b010

```

# CPP RCTX, Cache Prefetch Prediction Restriction by Context

The CPP RCTX characteristics are:

## Purpose

Cache Prefetch Prediction Restriction by Context applies to all Cache Allocation Resources that predict cache allocations based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, cache prefetch prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction applies to all:

- Instruction caches.
- Data caches.
- TLB prefetching hardware used by the executing PE that applies to the supplied context or contexts.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

### Note

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

## Configuration

This instruction is present only when FEAT\_SPECRES is implemented. Otherwise, direct accesses to CPP RCTX are UNDEFINED.

## Attributes

CPP RCTX is a 64-bit System instruction.

## Field descriptions

The CPP RCTX input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0															GVMID	VMID															
RES0					NS	EL	RES0								GASID	ASID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:49]

Reserved, RES0.

**GVMID, bit [48]**

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 and EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**VMID, bits [47:32]**

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR\\_EL2.E2H==0](#) or [HCR\\_EL2.TGE==0](#)).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR\\_EL2.E2H==0](#) or [HCR\\_EL2.TGE==0](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR\\_EL2.E2H==1](#) and [HCR\\_EL2.TGE==1](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**Bits [31:27]**

Reserved, RES0.

**NS, bit [26]**

Security State. **Defined values are:**

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

**When the instruction is executed in Non-secure state, this field has an Effective value of 1. Effective value of NS is 1.**

**EL, bits [25:24]**

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

**Bits [23:17]**

Reserved, RES0.

**GASID, bit [16]**

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASID for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

**ASID, bits [15:0]**

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

**Executing the CPP RCTX instruction**

Accesses to this instruction use the following encodings:

CPP RCTX, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b111

```
if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLR_EL1.EnRCTX == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    elseif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGITR_EL2.CPPRCTX == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && HCR_EL2.<E2H,TGE> == '11' && SCTLR_EL2.EnRCTX == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        CPP_RCTX(X[t]);
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.CPPRCTX == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        CPP_RCTX(X[t]);
elseif PSTATE.EL == EL2 then
    CPP_RCTX(X[t]);
elseif PSTATE.EL == EL3 then
    CPP_RCTX(X[t]);
```

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# CPTR\_EL2, Architectural Feature Trap Register (EL2)

The CPTR\_EL2 characteristics are:

## Purpose

- Trapping to EL2 of access to CPACR, CPACR\_EL1, trace functionality, and to SVE, Advanced SIMD and floating-point functionality.
- EL2 access to trace functionality, and to SVE, Advanced SIMD and floating-point functionality.

Controls trapping to EL2 of accesses to: CPACR, CPACR\_EL1, trace, Activity Monitor, SVE, Advanced SIMD and floating-point functionality.

## Configuration

AArch64 System register CPTR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register HCPTR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

CPTR\_EL2 is a 64-bit register.

## Field descriptions

The CPTR\_EL2 bit assignments are:

### When FEAT\_VHE is implemented and HCR\_EL2.E2H == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TCPAC	TAM	RES0	TTA	RES0								FPEN	RES0	ZEN	RES0																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TCPAC, bit [31]

When HCR\_EL2.TGE is 0, traps EL1 accesses to CPACR\_EL1 reported using ESR\_ELx.EC syndrome value 0x18, and accesses to CPACR reported using ESR\_ELx.EC syndrome value 0x03, to EL2 when EL2 is enabled in the current Security state.

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to CPACR_EL1 and CPACR are trapped to EL2 when EL2 is enabled in the current Security state.

When HCR\_EL2.TGE is 1, this control does not cause any instructions to be trapped.

### Note

[CPACR\\_EL1](#) and [CPACR](#) are not accessible at EL0.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

### TAM, bit [30]

When FEAT\_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using [ESR\\_ELx.EC](#) ~~EC~~ syndrome value 0x18:
  - [AMUSERENR\\_EL0](#), [AMCFGR\\_EL0](#), [AMCGCR\\_EL0](#), [AMCNTENCLR0\\_EL0](#), [AMCNTENCLR1\\_EL0](#), [AMCNTENSET0\\_EL0](#), [AMCNTENSET1\\_EL0](#), [AMCR\\_EL0](#), [AMEVCNTR0<n>\\_EL0](#), [AMEVCNTR1<n>\\_EL0](#), [AMEVTYPER0<n>\\_EL0](#), and [AMEVTYPER1<n>\\_EL0](#).
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using [ESR\\_ELx.EC](#) ~~EC~~ syndrome value 0x03:
  - [AMUSERENR](#), [AMCFGR](#), [AMCGCR](#), [AMCNTENCLR0](#), [AMCNTENCLR1](#), [AMCNTENSET0](#), [AMCNTENSET1](#), [AMCR](#), [AMEVTYPER0<n>](#), and [AMEVTYPER1<n>](#).
- In AArch32 state, MRRC or MCRR accesses to [AMEVCNTR0<n>](#) and [AMEVCNTR1<n>](#), are trapped to EL2, reported using [ESR\\_ELx.EC](#) ~~EC~~ syndrome value 0x04.

TAM	Meaning
0b0	Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.
0b1	Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### Bit [29]

Reserved, RES0.

### TTA, bit [28]

Traps System register accesses to all implemented trace registers to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to trace registers with op0=2, op1=1 ~~are trapped to EL2, and reported CRn<using EC syndrome value 0b1000~~ are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCR accesses to trace registers with cpnum=14, opc1=1, ~~and are CRn<trapped to EL2, reported using EC syndrome value 0b1000~~ are trapped to EL2, reported using EC syndrome value 0x05.
- ~~In AArch32 state, MRRC or MCRR accesses to trace registers with cpnum=14, opc1=1, are trapped to EL2, reported using EC syndrome value 0x0C.~~

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at EL0, EL1 or EL2, to execute a System register access to an implemented trace register is trapped to EL2 when EL2 is enabled in the current Security state, unless <a href="#">HCR_EL2.TGE</a> is 0 and it is trapped by <a href="#">CPACR.NSTRCDIS</a> or <a href="#">CPACR_EL1.TTA</a> . When <a href="#">HCR_EL2.TGE</a> is 1, any attempt at EL0 or EL2 to execute a System register access to an implemented trace register is trapped to EL2 when EL2 is enabled in the current Security state.

**Note**

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT\_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of [CPTR\\_EL2.TTA](#) is 1.
- EL2 does not provide traps on trace register accesses through the optional memory-mapped interface.

The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT\_ETMv4, EL0 access to the trace registers are UNDEFINED, and any resulting exception is higher priority than this trap exception that would be generated because the value of [CPTR\\_EL2.TTA](#) is 1.

EL2 does not provide traps on trace register accesses through the optional Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [27:22]**

Reserved, RES0.

**FPEN, bits [21:20]**

Traps execution at EL2, EL1, and EL0 of instructions that directly access the SVE, Advanced SIMD and floating-point registers to EL2 when EL2 is enabled in the current Security state, from both Execution states. [HCR\\_EL2.TGE](#) is 0, EL1 accesses to the SVE, Advanced SIMD and floating-point registers to EL2 when EL2 is enabled in the current Security state, from both Execution states.

The exception is reported using [ESR\\_ELx.EC](#) value 0x07.

Trapping behavior is affected by precedence as follows: A trap taken as a result of [CPTR\\_EL2.ZEN](#) has precedence over the value of [CPTR\\_EL2.FPEN](#).

FPEN	Meaning
0b00	This control causes any instructions at EL0, EL1, or EL2 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, subject to the exception prioritization rules, unless they are trapped by CPTR_EL2.ZEN.
0b01	When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes instructions at EL0 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, but unless does they not are caused trapped any instruction at EL2 to be trapped by CPTR_EL2.ZEN, but does not cause any instruction at EL2 to be trapped.
0b10	This control causes any instructions at EL0, EL1, or EL2 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, subject to the exception prioritization rules, unless they are trapped by CPTR_EL2.ZEN.
0b11	This control does not cause any instructions to be trapped.

Writes to [MVFR0](#), [MVFR1](#), and [MVFR2](#) from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

#### Note

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), and [FPEXC](#) are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR\_EL2.FPEN is not 0b11.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

#### Bits [19:18]

Reserved, RES0.

#### ZEN, bits [17:16]

When FEAT\_SVE is implemented:

Traps execution at EL2, EL1, and EL0 of SVE instructions, and or instructions that directly access SVE System registers to EL2 when EL2 is enabled in the current Security state. [ZCR\\_EL1](#) and [ZCR\\_EL2](#) System registers to EL2 when EL2 is enabled in the current Security state.

The exception is reported using ESR\_ELx.EC value 0x19.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR\_EL2.ZEN has precedence over the value of CPTR\_EL2.FPEN.

ZEN	Meaning
0b00	This control causes execution at EL2, EL1, and EL0 of these instructions to be trapped, subject to the exception prioritization rules.
0b01	When HCR_EL2.TGE is 0, this control does not cause any instruction to be trapped. When HCR_EL2.TGE is 1, this control causes these instructions executed at EL0 to be trapped, but does not cause any instruction at EL2 to be trapped.
0b10	This control causes execution at EL2, EL1, and EL0 of these instructions to be trapped, subject to the exception prioritization rules.
0b11	This control does not cause any instruction to be trapped.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**Bits [63:32]**

Reserved, RES0.

**TCPAC, bit [31]**

Traps EL1 accesses to [CPACR\\_EL1](#), reported using [ESR\\_ELx.EC](#) syndrome value 0x18 and accesses to [CPACR](#), reported using [ESR\\_ELx.EC](#) syndrome value 0x03, to EL2 when EL2 is enabled in the current Security state.

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to <a href="#">CPACR_EL1</a> and <a href="#">CPACR</a> are trapped to EL2 when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

**Note**

[CPACR\\_EL1](#) and [CPACR](#) are not accessible at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TAM, bit [30]****When FEAT\_AMUv1 is implemented:**

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using [ESR\\_ELx.EC](#) syndrome value 0x18:
  - [AMUSERENR\\_EL0](#), [AMCFGR\\_EL0](#), [AMCGCR\\_EL0](#), [AMCNTENCLR0\\_EL0](#), [AMCNTENCLR1\\_EL0](#), [AMCNTENSET0\\_EL0](#), [AMCNTENSET1\\_EL0](#), [AMCR\\_EL0](#), [AMEVCNTR0<n>\\_EL0](#), [AMEVCNTR1<n>\\_EL0](#), [AMEVTYPER0<n>\\_EL0](#), and [AMEVTYPER1<n>\\_EL0](#).
- In AArch32 state, MCR or MRC accesses to the following registers are trapped to EL2 and reported using [ESR\\_ELx.EC](#) syndrome value 0x03:
  - [AMUSERENR](#), [AMCFGR](#), [AMCGCR](#), [AMCNTENCLR0](#), [AMCNTENCLR1](#), [AMCNTENSET0](#), [AMCNTENSET1](#), [AMCR](#), [AMEVTYPER0<n>](#), and [AMEVTYPER1<n>](#).
- In AArch32 state, MCRR or MRRC accesses to [AMEVCNTR0<n>](#) and [AMEVCNTR1<n>](#), are trapped to EL2, reported using [ESR\\_ELx.EC](#) syndrome value 0x04.

TAM	Meaning
0b0	Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.
0b1	Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bits [29:21]

Reserved, RES0.

#### TTA, bit [20]

Traps System register accesses to all implemented trace registers to EL2 when EL2 is enabled in the current Security state, from both Execution states as follows:

- In AArch64 state, accesses to trace registers with op0=2, op1=1 are trapped to EL2, and reported CRn<using EC syndrome value 0b1000 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCR accesses to trace registers with cpnum=14, opc1=1 are trapped to EL2, and reported CRn<using EC syndrome value 0b1000 are trapped to EL2, reported using EC syndrome value 0x05.
- In AArch32 state, MRRC or MCRR accesses to trace registers with cpnum=14, opc1=1 are trapped to EL2, reported using EC syndrome value 0x0C.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at EL0, EL1, or EL2, to execute a System register access to an implemented trace register is trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by CPACR.TRCDIS or CPACR_EL1.TTA.

#### Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT\_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR\_EL2.TTA is 1.
- EL2 does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Bits [19:14]

Reserved, RES0.

#### Bits [13:12]

Reserved, RES1.

**Bit [11]**

Reserved, RES0.

**TFP, bit [10]**

Traps accesses to SVE, Advanced SIMD and floating-point functionality to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using **ESR\_ELx.EC** syndrome value 0x07:
  - **FPCR**, **FPSR**, **FPEXC32\_EL2**, any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-S31 registers.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using **ESR\_ELx.EC** syndrome value 0x07:
  - **MVFR0**, **MVFR1**, **MVFR2**, **FPSR**, **FPEXC**, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers. For the purposes of this trap, the architecture defines a VMSR access to **FPSID** from EL1 or higher as an access to a SIMD and floating-point register. Otherwise, permitted VMSR accesses to **FPSID** are ignored.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR\_EL2.TZ has precedence over the value of CPTR\_EL2.TFP.

TFP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at EL0, EL1 or EL2, to execute an instruction that uses the registers associated with SVE, Advanced SIMD and floating-point execution is trapped to EL2 when EL2 is enabled in the current Security state, subject to the exception prioritization rules, unless it is trapped by CPTR_EL2.TZ.

**Note**

**FPEXC32\_EL2** is not accessible from EL0 using AArch64.

**FPSID**, **MVFR0**, **MVFR1**, and **FPEXC** are not accessible from EL0 using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [9]**

Reserved, RES1.

**TZ, bit [8]**

When FEAT\_SVE is implemented:

Traps execution at EL2, EL1, or EL0 of SVE instructions and instructions that directly access SVE System registers to EL2 when EL2 is enabled in the current Security state. **ZCR\_EL2** and **ZCR\_EL1** System registers to EL2 when EL2 is enabled in the current Security state.

The exception is reported using **ESR\_ELx.EC** value 0x19.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR\_EL2.TZ has precedence over the value of CPTR\_EL2.TFP.

TZ	Meaning
0b0	This control does not cause any instruction to be trapped.
0b1	This control causes these instructions to be trapped, subject to the exception prioritization rules.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

# CPTR\_EL3, Architectural Feature Trap Register (EL3)

The CPTR\_EL3 characteristics are:

## Purpose

Controls trapping to EL3 of accesses to CPACR, CPACR\_EL1, HCPTR, CPTR\_EL2, trace, Activity Monitor and registers associated with SVE, Advanced SIMD and floating-point execution. Also controls EL3 access to trace functionality and registers associated with SVE, Advanced SIMD and floating-point execution.

## Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to CPTR\_EL3 are UNDEFINED.

## Attributes

CPTR\_EL3 is a 64-bit register.

## Field descriptions

The CPTR\_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																																	
TCPAC	TAM	RES0										TTA	RES0										TFP	RES0	EZ	RES0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### Bits [63:32]

Reserved, RES0.

### TCPAC, bit [31]

Traps all of the following to EL3, from both Security states and both Execution states.

- EL2 accesses to CPTR\_EL2, reported using ESR\_ELx.EC syndrome value 0x18, or HCPTR, reported using ESR\_ELx.EC syndrome value 0x03.
- EL2 and EL1 accesses to CPACR\_EL1 reported using ESR\_ELx.EC syndrome value 0x18, or CPACR reported using ESR\_ELx.EC syndrome value 0x03.

When CPTR\_EL3.TCPAC is:

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 accesses to the CPTR_EL2 or HCPTR, and EL2 and EL1 accesses to the CPACR_EL1 or CPACR, are trapped to EL3, unless they are trapped by CPTR_EL2.TCPAC.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TAM, bit [30]

When FEAT\_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL2, EL1 and EL0 accesses to all Activity Monitor registers to EL3.

Accesses to the Activity Monitors registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported with **ESR\_ELx.EC** syndrome value 0x18:
  - [AMUSERENR\\_EL0](#), [AMCFGR\\_EL0](#), [AMCGCR\\_EL0](#), [AMCNTENCLR0\\_EL0](#), [AMCNTENCLR1\\_EL0](#), [AMCNTENSET0\\_EL0](#), [AMCNTENSET1\\_EL0](#), [AMCR\\_EL0](#), [AMEVCNTR0<n>\\_EL0](#), [AMEVCNTR1<n>\\_EL0](#), [AMEVTYPEPER0<n>\\_EL0](#), and [AMEVTYPEPER1<n>\\_EL0](#).
- In AArch32 state, accesses with MRC or MCR to the following registers reported with **ESR\_ELx.EC** syndrome value 0x03:
  - [AMUSERENR](#), [AMCFGR](#), [AMCGCR](#), [AMCNTENCLR0](#), [AMCNTENCLR1](#), [AMCNTENSET0](#), [AMCNTENSET1](#), [AMCR](#), [AMEVTYPEPER0<n>](#), and [AMEVTYPEPER1<n>](#).
- In AArch32 state, accesses with MRRC or MCRR to the following registers, reported with **ESR\_ELx.EC** syndrome value 0x04:
  - [AMEVCNTR0<n>](#), [AMEVCNTR1<n>](#).

TAM	Meaning
0b0	Accesses from EL2, EL1, and EL0 to Activity Monitor registers are not trapped.
0b1	Accesses from EL2, EL1, and EL0 to Activity Monitor registers are trapped to EL3.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bits [29:21]

Reserved, RES0.

#### TTA, bit [20]

Traps System register accesses. Accesses to the trace registers, from all Exception levels, both Security states, and both Execution states are trapped to EL3 as follows:

- In AArch64 state, Trace registers with op0=2, op1=1, **are trapped to EL3 and CRn<reported using EC syndrome value 0b1000 are trapped to EL3 and reported using EC syndrome value 0x18.**
- In AArch32 state, accesses using MCR or MRC to the Trace registers with cpnum=14, **and opc1=1, and are CRn<reported using EC syndrome value 0b1000 are reported using EC syndrome value 0x05.**
- In AArch32 state, accesses using MCRR or MRRC to the Trace registers with cpnum=14 and opc1=1 are reported using EC syndrome value 0x0C.**

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any System register access to the trace registers is trapped to EL3, subject to the exception prioritization rules, unless it is trapped by <a href="#">CPACR.TRCDIS</a> , <a href="#">CPACR_EL1.TTA</a> or <a href="#">CPTR_EL2.TTA</a> .

If System register access to trace functionality is not supported, this bit is RES0.

#### Note

The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT\_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than this trap exception.

EL3 does not provide traps on trace register accesses through the Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, no side-effects occur before the exception is taken, see 'Traps on instructions'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bits [19:11]

Reserved, RES0.

## TFP, bit [10]

Traps all accesses to SVE, Advanced SIMD and floating-point functionality, from all Exception levels, both Security states, and both Execution states, to EL3. **Defined values are:**

This includes the following registers, all reported using **ESR\_ELx.EC** **EC syndrome** value 0x07:

- [FPCR](#), [FPSR](#), [FPEXC32\\_EL2](#), any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
- [MVFR0](#), [MVFR1](#), [MVFR2](#), [FPSCR](#), [FPEXC](#), and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers.

Permitted VMSR accesses to [FPSID](#) are ignored, but for the purposes of this trap the architecture define a VMSR access to the [FPSID](#) from EL1 or higher as an access to a SIMD and floating-point register.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR\_EL3.EZ has precedence over the value of CPTR\_EL3.TFP.

**Defined values are:**

TFP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at any Exception level to execute an instruction that uses the registers associated with SVE, Advanced SIMD and floating-point is trapped to EL3, subject to the exception prioritization <b>rules</b> . <b>rules, unless it is trapped by</b> <a href="#">CPTR_EL3.EZ</a> .

### Note

[FPEXC32\\_EL2](#) is not accessible from EL0 using AArch64.

[FPSID](#), [MVFR0](#), [MVFR1](#), and [FPEXC](#) are not accessible from EL0 using AArch32.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bit [9]

Reserved, RES0.

## EZ, bit [8]

**When FEAT\_SVE is implemented:**

Traps **executionall** **of** **accesses** **to** SVE **instructions** **functionality** and **instructions** **registers** **that** **from** **directly** **all** **access** **Exception** **the** **levels**, **and** **both** **Security** **states**, **to** **EL3**. [ZCR\\_EL3](#), [ZCR\\_EL2](#), and [ZCR\\_EL1](#) System registers, from all Exception levels and both Security states, to EL3.

The exception is reported using ESR\_ELx.EC value 0x19.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR\_EL3.EZ has precedence over the value of CPTR\_EL3.TFP.

EZ	Meaning
0b0	This control causes these instructions executed at any Exception level to be trapped, subject to the exception prioritization rules.
0b1	This control does not cause any instruction to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### Bits [7:0]

Reserved, RES0.

## Accessing the CPTR\_EL3

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, CPTR\_EL3

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>

# CSSELR\_EL1, Cache Size Selection Register

The CSSELR\_EL1 characteristics are:

## Purpose

Selects the current Cache Size ID Register, [CCSIDR\\_EL1](#), by specifying the required cache level and the cache type (either instruction or data cache).

## Configuration

AArch64 System register CSSELR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CSSELR\[31:0\]](#).

## Attributes

CSSELR\_EL1 is a 64-bit register.

## Field descriptions

The CSSELR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:5]

Reserved, RES0.

### TnD, bit [4]

When FEAT\_MTE is implemented:

Allocation Tag not Data bit.

TnD	Meaning
0b0	Data, Instruction or Unified cache.
0b1	Separate Allocation Tag cache.

When CSSELR\_EL1.InD == 1, this bit is RES0.

If CSSELR\_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR\_EL1 is UNKNOWN.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

### Level, bits [3:1]

Cache level of required cache.

Level	Meaning
0b000	Level 1 cache.
0b001	Level 2 cache.
0b010	Level 3 cache.
0b011	Level 4 cache.
0b100	Level 5 cache.
0b101	Level 6 cache.
0b110	Level 7 cache.

All other values are reserved.

If CSSELR\_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR\_EL1 is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## InD, bit [0]

Instruction not Data bit.

InD	Meaning
0b0	Data or unified cache.
0b1	Instruction cache.

If CSSELR\_EL1.Level is programmed to a cache level that is not implemented, then a read of CSSELR\_EL1 is CONSTRAINED UNPREDICTABLE, and returns UNKNOWN values for CSSELR\_EL1.{Level, InD}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CSSELR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, CSSELR\_EL1

op0	op1	CRn	CRm	op2

# DACR32\_EL2, Domain Access Control Register

The DACR32\_EL2 characteristics are:

## Purpose

Allows access to the AArch32 [DACR](#) register from AArch64 state only. Its value has no effect on execution in AArch64 state.

## Configuration

AArch64 System register DACR32\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [DACR\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to DACR32\_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

## Attributes

DACR32\_EL2 is a 64-bit register.

## Field descriptions

The DACR32\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

### Bits [63:32]

Reserved, RES0.

### D<n>, bits [2n+1:2n], for n = 150 to 015

Domain n access permission, where n = 0 to 15. Permitted values are:

D<n>	Meaning
0b00	No access. Any access to the domain generates a Domain fault.
0b01	Client. Accesses are checked against the permission bits in the translation tables.
0b11	Manager. Accesses are not checked against the permission bits in the translation tables.

The value 0b10 is reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the DACR32\_EL2

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, DACR32\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0000	0b000

# DAIF, Interrupt Mask Bits

The DAIF characteristics are:

## Purpose

Allows access to the interrupt mask bits.

## Configuration

There are no configuration notes.

## Attributes

DAIF is a 64-bit register.

## Field descriptions

The DAIF bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32			
																RES0																		
																				RES0		D		A	I	F	RES0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			

### Bits [63:10]

Reserved, RES0.

### D, bit [9]

Process state D mask. The possible values of this bit are:

D	Meaning
0b0	Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are not masked.
0b1	Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are masked.

When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

On a Warm reset, this field resets to 1.

### A, bit [8]

Error interrupt mask bit. The possible values of this bit are:

A	Meaning
0b0	Exception not masked.
0b1	Exception masked.

On a Warm reset, this field resets to 1.

**I, bit [7]**

IRQ mask bit. The possible values of this bit are:

I	Meaning
0b0	Exception not masked.
0b1	Exception masked.

On a Warm reset, this **This** field resets to 1.

**F, bit [6]**

FIQ mask bit. The possible values of this bit are:

F	Meaning
0b0	Exception not masked.
0b1	Exception masked.

On a Warm reset, this **This** field resets to 1.

**Bits [5:0]**

Reserved, RES0.

**Accessing the DAIF**

Accesses to this register use the following encodings:

# DBGBCR<n>\_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>\_EL1 characteristics are:

## Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>\\_EL1](#).

## Configuration

AArch64 System register DBGBCR<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBCR<n>\[31:0\]](#).

AArch64 System register DBGBCR<n>\_EL1 bits [31:0] are architecturally mapped to External register [DBGBCR<n>\\_EL1\[31:0\]](#).

If breakpoint n is not implemented, then accesses to this register are UNDEFINED.

## Attributes

DBGBCR<n>\_EL1 is a 64-bit register.

## Field descriptions

The DBGBCR<n>\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0								BT				LBN				SSC	HMC	RES0				BAS				RES0	PMC	E			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:24]

Reserved, RES0.

### BT, bits [23:20]

Breakpoint Type. Possible values are:

BT	Meaning
0b0000	Unlinked instruction address match. <a href="#">DBGBVR&lt;n&gt;_EL1</a> is the address of an instruction.
0b0001	As 0b0000, but linked to a Context matching breakpoint.
0b0010	Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of <a href="#">HCR_EL2.E2H</a> is 1, if either the PE is executing at EL0 with <a href="#">HCR_EL2.TGE</a> set to 1 or the PE is executing at EL2, then <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> must match the <a href="#">CONTEXTIDR_EL2</a> value. Otherwise, <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> must match the <a href="#">CONTEXTIDR_EL1</a> value
0b0011	As 0b0010, with linking enabled.
0b0110	Unlinked <a href="#">CONTEXTIDR_EL1</a> match. <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> is a Context ID compared against <a href="#">CONTEXTIDR_EL1</a> .
0b0111	As 0b0110, with linking enabled.
0b1000	Unlinked VMID match. <a href="#">DBGBVR&lt;n&gt;_EL1.VMID</a> is a VMID compared against <a href="#">VTTBR_EL2.VMID</a> .
0b1001	As 0b1000, with linking enabled.
0b1010	Unlinked VMID and Context ID match. <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> is a Context ID compared against <a href="#">CONTEXTIDR_EL1</a> , and <a href="#">DBGBVR&lt;n&gt;_EL1.VMID</a> is a VMID compared against <a href="#">VTTBR_EL2.VMID</a> .
0b1011	As 0b1010, with linking enabled.
0b1100	Unlinked <a href="#">CONTEXTIDR_EL2</a> match. <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID2</a> is a Context ID compared against <a href="#">CONTEXTIDR_EL2</a> .
0b1101	As 0b1100, with linking enabled.
0b1110	Unlinked Full Context ID match. <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> is compared against <a href="#">CONTEXTIDR_EL1</a> , and <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID2</a> is compared against <a href="#">CONTEXTIDR_EL2</a> .
0b1111	As 0b1110, with linking enabled.

All other values are reserved. Constraints on breakpoint programming mean other values are reserved under some conditions.

The fields that indicate when the breakpoint can be generated are: HMC, SSC, and PMC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved DBGBCR<n>\_EL1.BT values'.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved value, see 'Reserved DBGBCR<n>\_EL1.BT values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>\_EL1.E is 0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. ~~This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields.~~

The fields that indicate when the breakpoint can be generated are: HMC, SSC, and PMC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

~~For more information on the operation of the SSC, HMC, and PMC fields, and the effect of programming the fields to a reserved set of values, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved DBGBCR<n>\_EL1.{SSC, HMC, PMC} values'.~~

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>\_EL1.{SSC, HMC, PMC} values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On a Warm reset, the value of this field is unchanged.~~

## HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. ~~This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.~~

The fields that indicate when the breakpoint can be generated are: HMC, SSC, and PMC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

~~For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.~~

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information, see DBGBCR<n>\_EL1.SSC.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On a Warm reset, the value of this field is unchanged.~~

## Bits [12:9]

Reserved, RES0.

## BAS, bits [8:5]

### When AArch32 is supported at any Exception level:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	<a href="#">DBGBVR&lt;n&gt;_EL1</a>	Use for T32 instructions
0b1100	<a href="#">DBGBVR&lt;n&gt;_EL1</a> + 2	Use for T32 instructions
0b1111	<a href="#">DBGBVR&lt;n&gt;_EL1</a>	Use for A64 and A32 instructions

All other values are reserved. For more information, see 'Reserved DBGBCR<n>\_EL1.BAS values'.

For more information on using the BAS field in address match breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

#### Otherwise:

Reserved, RES1.

#### Bits [4:3]

Reserved, RES0.

#### PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>\_EL1.SSC description.

The fields that indicate when the breakpoint can be generated are: HMC, SSC, and PMC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information, see DBGBCR<n>\_EL1.SSC.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

#### E, bit [0]

Enable breakpoint [DBGBVR<n>\\_EL1](#).

E	Meaning
0b0	Breakpoint disabled.
0b1	Breakpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## Accessing the DBGBCR<n>\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, DBGBCR<n>\_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	n[3:0]	0b101

```

if PSTATE.EL == EL0 then

# DBGBVR<n>\_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>\_EL1 characteristics are:

## Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register [DBGBCR<n>\\_EL1](#).

## Configuration

AArch64 System register DBGBVR<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBVR<n>\[31:0\]](#).

AArch64 System register DBGBVR<n>\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [DBGXVR<n>\[31:0\]](#).

AArch64 System register DBGBVR<n>\_EL1 bits [63:0] are architecturally mapped to External register [DBGBVR<n>\\_EL1\[63:0\]](#).

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

## Attributes

How this register is interpreted depends on the value of [DBGBCR<n>\\_EL1](#).BT.

- When [DBGBCR<n>\\_EL1](#).BT is 0b000x, this register holds a virtual address.
- When [DBGBCR<n>\\_EL1](#).BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When [DBGBCR<n>\\_EL1](#).BT is 0b100x, this register holds a VMID.
- When [DBGBCR<n>\\_EL1](#).BT is 0b101x, this register holds a VMID and a Context ID.
- When [DBGBCR<n>\\_EL1](#).BT is 0b111x, this register holds two Context ID values.

For other values of [DBGBCR<n>\\_EL1](#).BT, this register is RES0.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

## Attributes

DBGBVR<n>\_EL1 is a 64-bit register.

## Field descriptions

The DBGBVR<n>\_EL1 bit assignments are:

### When DBGBCR<n>\_EL1.BT == 0b000x:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RESS[14:4]											Bits[52:49]		VA[52:49]		VA[48:2]																	
											VA[48:2]																	RES0				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### RESS[14:4], bits [63:53]

It is IMPLEMENTATION DEFINED whether:

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

- It Reads is return the value of the most significant bit of the VA for every bit in this field. CONSTRAINED UNPREDICTABLE whether the PE ignores this field when comparing an address.
- If Reads return the breakpointlast is value not context-aware, it is written. IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.

The PE ignores this field.

#### VA[52:49], bits [52:49]

When FEAT\_LVA is implemented:

#### VA[52:49], bits [52:49]

When FEAT\_LVA is implemented:

Extension to VA[48:2]. See VA[48:2] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

Otherwise:

Extension to RESS[14:4]. See RESS[14:4] for more details.

#### VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT\_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, bits VA[52:49] are part of the RESS field. RESS.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

#### Bits [1:0]

Reserved, RES0.

#### When DBGBCR<n>\_EL1.BT == 0b001x:

#### Bits [63:32]

Reserved, RES0.

#### ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR\\_EL2](#) when (FEAT\_VHE is implemented or, FEAT\_Debugv8p2 is implemented), [HCR\\_EL2.E2H](#) is 1, and either:

- The PE is executing at EL2.
- [HCR\\_EL2.TGE](#) is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against [CONTEXTIDR\\_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On a Warm reset, the value of this field is unchanged.~~

## When **DBGBCR<n>\_EL1.BT == 0b011x:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																ContextID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR\\_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On a Warm reset, the value of this field is unchanged.~~

## When **DBGBCR<n>\_EL1.BT == 0b100x** and **EL2 is implemented:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																VMID[15:8]								VMID[7:0]							
																RES0															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:48]

Reserved, RES0.

### VMID[15:8], bits [47:40]

When **FEAT\_VMID16** is implemented, **VTCTR\_EL2.VS == 1** and **EL2 is using AArch64:**

Extension to VMID[7:0]. See [DBGBCR<n>\\_EL1.VMID\[7:0\]](#) for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On a Warm reset, the value of this field is unchanged.~~

### Otherwise:

Reserved, RES0.

### VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCR\\_EL2.VS](#) is 0.
- FEAT\_VMID16 is not implemented.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On a Warm reset, the value of this field is unchanged.~~

#### Bits [31:0]

Reserved, RES0.

### When DBGVCR<n>\_EL1.BT == 0b101x and EL2 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																VMID[15:8]								VMID[7:0]							
ContextID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### Bits [63:48]

Reserved, RES0.

#### VMID[15:8], bits [47:40]

When FEAT\_VMID16 is implemented, VTCR\_EL2.VS == 1 and EL2 is using AArch64:

Extension to VMID[7:0]. See DBGVCR<n>\_EL1.VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On a Warm reset, the value of this field is unchanged.~~

#### Otherwise:

Reserved, RES0.

#### VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCR\\_EL2.VS](#) is 0.
- FEAT\_VMID16 is not implemented.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On a Warm reset, the value of this field is unchanged.~~

#### ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR\\_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On a Warm reset, the value of this field is unchanged.~~

## When DBGBCR<n>\_EL1.BT == 0b110x, EL2 is implemented and (FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented):

### ContextID2, bits [63:32]

Context ID value for comparison against [CONTEXTIDR\\_EL2](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

### Bits [31:0]

Reserved, RES0.

## When DBGBCR<n>\_EL1.BT == 0b111x, EL2 is implemented and (FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented):

### ContextID2, bits [63:32]

Context ID value for comparison against [CONTEXTIDR\\_EL2](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

### ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR\\_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## Accessing the DBGBVR<n>\_EL1

Accesses to this register use the following encodings:

# DBGCLAIMCLR\_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR\_EL1 characteristics are:

## Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

### Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET\\_EL1](#) register.

## Configuration

AArch64 System register DBGCLAIMCLR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMCLR\[31:0\]](#).

AArch64 System register DBGCLAIMCLR\_EL1 bits [31:0] are architecturally mapped to External register [DBGCLAIMCLR\\_EL1\[31:0\]](#).

An implementation must include eight CLAIM tag bits.

## Attributes

DBGCLAIMCLR\_EL1 is a 64-bit register.

## Field descriptions

The DBGCLAIMCLR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
RAZ/SBZ																CLAIM															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

### CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.

On a Warm reset, the value of this field is unchanged.

## Accessing the DBGCLAIMCLR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, DBGCLAIMCLR\_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0111	0b1001	0b110

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HDFGRTR_EL2.DBGCLAIM == '1'
then

# DBGDTRRX\_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX\_EL0 characteristics are:

## Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See [DBGDTR\\_EL0](#) for additional architectural mappings. It is a component of the Debug Communications Channel.

## Configuration

AArch64 System register DBGDTRRX\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRRXint\[31:0\]](#).

AArch64 System register DBGDTRRX\_EL0 bits [31:0] are architecturally mapped to External register [DBGDTRRX\\_EL0\[31:0\]](#).

## Attributes

DBGDTRRX\_EL0 is a 64-bit register.

## Field descriptions

The DBGDTRRX\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Update DTRRX																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### Bits [31:0]

Update DTRRX.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## Accessing the DBGDTRRX\_EL0

Accesses to this register use the following encodings:

# DBGDTRTX\_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX\_EL0 characteristics are:

## Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See [DBGDTR\\_EL0](#) for additional architectural mappings. It is a component of the Debug Communication Channel.

## Configuration

AArch64 System register DBGDTRTX\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRTXint\[31:0\]](#).

AArch64 System register DBGDTRTX\_EL0 bits [31:0] are architecturally mapped to External register [DBGDTRTX\\_EL0\[31:0\]](#).

## Attributes

DBGDTRTX\_EL0 is a 64-bit register.

## Field descriptions

The DBGDTRTX\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																Return DTRTX															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### Bits [31:0]

Return DTRTX.

Writes to this register:

- If TXfull is set to 1, set DTRRX and DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull is set to 1.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## Accessing the DBGDTRTX\_EL0

# DBGPRCR\_EL1, Debug Power Control Register

The DBGPRCR\_EL1 characteristics are:

## Purpose

Controls behavior of the PE on powerdown request.

## Configuration

AArch64 System register DBGPRCR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGPRCR\[31:0\]](#).

Bit [0] of this register is mapped to [EDPRCR.CORENPDRQ](#), bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

## Attributes

DBGPRCR\_EL1 is a 64-bit register.

## Field descriptions

The DBGPRCR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															CORENPDRQ
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:1]

Reserved, RES0.

### CORENPDRQ, bit [0]

When FEAT\_DoPD is implemented:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to its Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

**Note**

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

On a Warm reset, the value of this field is unchanged.

**Otherwise:**

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR.COREPURQ](#) on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

**Note**

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, this field resets to the value in [EDPRCR.COREPURQ](#).

On a Warm reset, the value of this field is unchanged.

**Accessing the DBGPRCR\_EL1**

### Bits [63:29]

Reserved, RES0.

### MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00001	Reserved.
0b00010	Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn\_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## Bits [23:21]

Reserved, RES0.

## WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

The fields that indicate when the watchpoint can be generated are: HMC, SSC, and PAC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions', and 'Reserved DBGBCR<n>\_EL1.{SSC, HMC, PMC} values'.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved value, see 'Reserved DBGBCR<n>\_EL1.{SSC, HMC, PMC} values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

The fields that indicate when the watchpoint can be generated are: HMC, SSC, and PAC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

For more information on the operation of these fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

### BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>\_EL1 is being watched.

BAS	Description
xxxxxxx1	Match byte at DBGWVR<n>_EL1
xxxxxx1x	Match byte at DBGWVR<n>_EL1 + 1
xxxxx1xx	Match byte at DBGWVR<n>_EL1 + 2
xxx1xxx	Match byte at DBGWVR<n>_EL1 + 3

In cases where DBGWVR<n>\_EL1 addresses a double-word:

BAS	Description, if DBGWVR<n>_EL1[2] == 0
xxx1xxxx	Match byte at DBGWVR<n>_EL1 + 4
xx1xxxxx	Match byte at DBGWVR<n>_EL1 + 5
x1xxxxxx	Match byte at DBGWVR<n>_EL1 + 6
1xxxxxxx	Match byte at DBGWVR<n>_EL1 + 7

If DBGWVR<n>\_EL1[2] == 1, only BAS[3:0] are used and BAS[7:4] are ignored. Arm deprecates setting DBGWVR<n>\_EL1[2] == 1.

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>\_EL1.BAS values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

### LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

### PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. ~~This field must be interpreted along with the SSC and HMC fields.~~

The fields that indicate when the watchpoint can be generated are: HMC, SSC, and PAC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

For more information on the operation of these fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

**E, bit [0]**

Enable watchpoint n. Possible values are:

E	Meaning
0b0	Watchpoint disabled.
0b1	Watchpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

**Accessing the DBGWCR<n>\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, DBGWCR<n>\_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	n[3:0]	0b111

# DBGWVR<n>\_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>\_EL1 characteristics are:

## Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>\\_EL1](#).

## Configuration

AArch64 System register DBGWVR<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWVR<n>\[31:0\]](#).

AArch64 System register DBGWVR<n>\_EL1 bits [63:0] are architecturally mapped to External register [DBGWVR<n>\\_EL1\[63:0\]](#).

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

## Attributes

DBGWVR<n>\_EL1 is a 64-bit register.

## Field descriptions

The DBGWVR<n>\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RESS[14:4]											Bits[52:49]		VA[52:49]		VA[48:2]																
VA[48:2]																														RES0	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### RESS[14:4], bits [63:53]

~~Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:~~

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

~~Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.~~

- ~~It~~ The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value. ~~CONSTRAINED UNPREDICTABLE~~ whether the PE ignores this field when comparing an address.
- ~~It~~ The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware. IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.

### VA[52:49], bits [52:49]

When FEAT\_LVA is implemented:

Extension to VA[48:2]. See VA[48:2] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

#### Otherwise:

Extension to RESS[14:4]. See RESS[14:4] for more details.

#### VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT\_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, bits VA[52:49] are part of the RESS field.

Arm deprecates setting DBGWVR<n>\_EL1[2] == 1.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

#### Bits [1:0]

Reserved, RES0.

## Accessing the DBGWVR<n>\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, DBGWVR<n>\_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	n[3:0]	0b110

# DC CGDSW, Clean of Data and Allocation Tags by Set/Way

The DC CGDSW characteristics are:

## Purpose

Clean data and Allocation Tags in data cache by set/way.

## Configuration

This instruction is present only when **FEAT\_MTE2** is **implemented** and **ID\_AA64PFR1\_EL1.MTE != 0b00001**. Otherwise, direct accesses to DC CGDSW are UNDEFINED.

## Attributes

DC CGDSW is a 64-bit System instruction.

## Field descriptions

The DC CGDSW input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																SetWay												Level			RES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$ ,  $L = \text{Log}_2(\text{LINELEN})$ ,  $B = (L + S)$ ,  $S = \text{Log}_2(\text{NSETS})$ .

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

### Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

### Bit [0]

Reserved, RES0.

## Executing the DC CGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC CGDSW, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1010	0b110

```

			RES0																												

### Bits [63:32]

Reserved, RES0.

### SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$ ,  $L = \text{Log}_2(\text{LINELEN})$ ,  $B = (L + S)$ ,  $S = \text{Log}_2(\text{NSETS})$ .

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

### Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

### Bit [0]

Reserved, RES0.

# DC CIGDSW, Clean and Invalidate of Data and Allocation Tags by Set/Way

The DC CIGDSW characteristics are:

## Purpose

Clean and Invalidate data and Allocation Tags in data cache by set/way.

## Configuration

This instruction is present only when `FEAT_MTE2` is implemented and `ID_AA64PFR1_EL1.MTE != 0b00001`. Otherwise, direct accesses to DC CIGDSW are UNDEFINED.

## Attributes

DC CIGDSW is a 64-bit System instruction.

## Field descriptions

The DC CIGDSW input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
SetWay																								Level				RES0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## Executing the DC CIGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is **CONSTRAINED UNPREDICTABLE** and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC CIGDSW, <Xt>

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b01	0b000	0b0111	0b1110	0b110

### Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

## Executing the DC CIGVAC instruction

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in 'Permission fault'.

Accesses to this instruction use the following encodings:

DC CIGVAC, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b1110	0b011

```

if PSTATE.EL == EL0 then

# DC GVA, Data Cache set Allocation Tag by VA

The DC GVA characteristics are:

## Purpose

Write a value to the Allocation Tags of a naturally aligned block of N bytes, where the size of N is identified in [DCZID\\_EL0](#). The Allocation Tag used is determined by the input address.

## Configuration

This instruction is present only when **FEAT\_MTE2**~~FEAT\_MTE~~ is implemented. Otherwise, direct accesses to DC GVA are UNDEFINED.

## Attributes

DC GVA is a 64-bit System instruction.

## Field descriptions

The DC GVA input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual address to use																															
Virtual address to use																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

## Executing the DC GVA instruction

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR\_ELx.ISS field is not set.

If the memory region being modified is any type of Device memory, this instruction can give an alignment fault that is prioritized in the same way as other alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of stores to each Allocation Tag within the block being accessed, and so it:

- Generates a Permission Fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings:

DC GVA, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0100	0b011

```

if PSTATE.EL == EL0 then

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC IGSW, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0110	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TSW == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.DCISW == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.SWI0 == '1' then
        DC_CIGSW(X[t]);
    elsif EL2Enabled() && HCR_EL2.<DC,VM> != '00' then

# DC IGVAC, Invalidate of Allocation Tags by VA to PoC

The DC IGVAC characteristics are:

## Purpose

Invalidate Allocation Tags in data cache by address to Point of Coherency.

## Configuration

This instruction is present only when ~~FEAT MTE2~~FEAT MTE is ~~implemented~~implemented and ~~ID\_AA64PFR1\_EL1.MTE != 0b0001.~~Otherwise, direct accesses to DC IGVAC are UNDEFINED.

## Attributes

DC IGVAC is a 64-bit System instruction.

## Field descriptions

The DC IGVAC input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual address to use																															
Virtual address to use																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

## Executing the DC IGVAC instruction

When the instruction is executed, it can generate a watchpoint, which is prioritized in the same way as other watchpoints. If a watchpoint is generated, the CM bit in the ESR\_ELx.ISS field is set to 1.

This instruction requires write access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in 'Permission fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings:

DC IGVAC, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0110	0b011

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TPCP == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.DCIVAC == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<DC,VM> != '00' then
        DC_CIGVAC(X[t]);
    else
        DC_IGVAC(X[t]);
elsif PSTATE.EL == EL2 then
    DC_IGVAC(X[t]);
elsif PSTATE.EL == EL3 then
    DC_IGVAC(X[t]);

Bits [23:13]

Reserved, RES0.

AET, bits [12:10]

Asynchronous Error Type. See the description of ESR\_ELx.AET for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort Type. See the description of ESR\_ELx.EA for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

Fault Status Code. See the description of ESR\_ELx.DFSC for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

When DISR\_EL1.IDS == 1:

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

Indicates the deferred SError interrupt type.

IDS	Meaning
0b1	Deferred error uses IMPLEMENTATION DEFINED format.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

IMPLEMENTATION DEFINED syndrome. See the description of ESR\_ELx[23:0] for an SError interrupt.

An indirect write to DISR\_EL1 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR\_EL1 occurring in program order after the ESB instruction.

- At EL2.
- At EL1 and (([SCR\\_EL3.NS](#) == 0 && [SCR\\_EL3.EEL2](#) == 0) || [HCR\\_EL2.AMO](#) == 0).

elsif PSTATE.EL == EL3 then
    DISR_EL1 = X[t];
endif

```

# DIT, Data Independent Timing

The DIT characteristics are:

## Purpose

Allows access to the Data Independent Timing bit.

## Configuration

This register is present only when FEAT\_DIT is implemented. Otherwise, direct accesses to DIT are UNDEFINED.

## Attributes

DIT is a 64-bit register.

## Field descriptions

The DIT bit assignments are:

### Bits [63:25]

Reserved, RES0.

### DIT, bit [24]

Data Independent Timing.

DIT	Meaning
0b0	The architecture makes no statement about the timing properties of any instructions.
0b1	The architecture requires that: <ul style="list-style-type: none"><li>The timing of every load and store instruction is insensitive to the value of the data being loaded or stored.</li><li>For certain data processing instructions, the instruction takes a time which is independent of:<ul style="list-style-type: none"><li>The values of the data supplied in any of its registers.</li><li>The values of the NZCV flags.</li></ul></li><li>For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on:<ul style="list-style-type: none"><li>The values of the data supplied in any of its registers.</li><li>The values of the NZCV flags.</li></ul></li></ul>

The data processing instructions affected by this bit are:

- All cryptographic instructions. These instructions are:

- AESD, AESE, AESIMC, AESMC, SHA1C, SHA1H, SHA1M, SHA1P, SHA1SU0, SHA1SU1, SHA256H, SHA256H2, SHA256SU0, SHA256SU1, SHA512H, SHA512H2, SHA512SU0, SHA512SU1, EOR3, RAX1, XAR, BCAX, SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, SM3PARTW2, SM4E, and SM4EKEY.
- A subset of those instructions which use the general-purpose register file. These instructions are:
  - ADC, ADCS, ADD, ADDS, AND, ANDS, ASR, ASRV, BFC, BFI, BFM, BFXIL, BIC, BICS, CCMN, CCMP, CFINV, CINC, CINV, CLS, CLZ, CMN, CMP, CNEG, CSEL, CSET, CSETM, CSINC, CSINV, CSNEG, EON, EOR, EXTR, LSL, LSLV, LSR, LSRV, MADD, MNEG, MOV, MOVK, MOVN, MOVZ, MSUB, MUL, MVN, NEG, NEGS, NGC, NGCS, NOP, ORN, ORR, RBIT, RET, REV, REV16, REV32, REV64, RMIF, ROR, RORV, SBC, SBCS, SBFIZ, SBFM, SBFX, SETF8, SETF16, SMADDL, SMNEGL, SMSUBL, SMULH, SMULL, SUB, SUBS, SXTB, SXTH, SXTW, TST, UBFIZ, UBFM, UBFX, UMADDL, UMNEGL, UMSUBL, UMULH, UMULL, UXTB, and UXTH.
- A subset of those instructions which use the SIMD&FP register file. These instructions are:
  - ABS, ADD, ADDHN, ADDHN2, ADDP, ADDV, AND, BIC, BIF, BIT, BSL, CLS, CLZ, CMEQ, CMGE, CMGT, CMHI, CMHS, CMLE, CMLT, CMTST, CNT, CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, CRC32CX, DUP, EOR, EXT, FCSEL, INS, MLA, MLS, MOV, MOVI, MUL, MVN, MVNI, NEG, NOT, ORN, ORR, PMUL, PMULL, PMULL2, RADDHN, RADDHN2, RBIT, REV16, REV32, RSHRN, RSHRN2, RSUBHN, RSUBHN2, SABA, SABD, SABAL, SABAL2, SABDL, SABDL2, SADALP, SADDL, SADDL2, SADDLP, SADDLV, SADDW, SADDW2, SHADD, SHL, SHLL, SHLL2, SHRN, SHRN2, SHSUB, SLI, SMAX, SMAXP, SMAXV, SMIN, SMINP, SMINV, SMLAL, SMLAL2, SMLSL, SMLSL2, SMOV, SMULL, SMULL2, SRI, SSSL, SSSL2, SSHR, SSRA, SSUBL, SSUBL2, SSUBW, SSUBW2, SUB, SUBHN, SUBHN2, SXTL, SXTL2, TBL, TBX, TRN1, TRN2, UABA, UABAL, UABAL2, UABD, UABDL, UABDL2, UADALP, UADDL, UADDL2, UADDLP, UADDLV, UADDW, UADDW2, UHADD, UHSUB, UMAX, UMAXP, UMAXV, UMIN, UMINP, UMINV, UMLAL, UMLAL2, UMLSL, UMOV, UMLSL2, UMULL, UMULL2, USHL, USHLL, USHLL2, USHR, USRA, USUBL, USUBL2, USUBW, USUBW2, UXTL, UXTL2, UZP1, UZP2, XTN, XTN2, ZIP1, and ZIP2.

### Note

The architecture makes no statement about the timing properties when the PSTATE.DIT bit is not set. However, it is likely that many of these instructions have timing that is invariant of the data in many situations.

In particular, Arm strongly recommends that the Armv8.3 pointer authentication instructions do not have their timing dependent on the key value used in the pointer authentication in all cases, regardless of the PSTATE.DIT bit.

On a Warm reset, this field resets to 0.

### Bits [23:0]

Reserved, RES0.

## Accessing the DIT

Accesses to this register use the following encodings:

MRS <Xt>, DIT

op0	op1	CRn	CRm	op2

# DSPSR\_EL0, Debug Saved Program Status Register

The DSPSR\_EL0 characteristics are:

## Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

## Configuration

AArch64 System register DSPSR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DSPSR\[31:0\]](#).

## Attributes

DSPSR\_EL0 is a 64-bit register.

## Field descriptions

The DSPSR\_EL0 bit assignments are:

### When AArch32 is supported at any Exception level and exiting Debug state to AArch32 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]	DIT	SSBS	PAN	SS	IL	GE	IT[7:2]	E	A	I	F	T	M[4]	M[3:0]												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### N, bit [31]

Negative Condition flag. Copied to PSTATE.N on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Copied to PSTATE.Z on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry Condition flag. Copied to PSTATE.C on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Copied to PSTATE.V on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Copied to PSTATE.Q on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Copied to PSTATE.IT[1:0] on exiting Debug state.

On exiting Debug state DSPSR\_EL0.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DIT, bit [24]**

**When FEAT\_DIT is implemented:**

Data Independent Timing. Copied to PSTATE.DIT on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SSBS, bit [23]**

**When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Copied to PSTATE.SSBS on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]**

**When FEAT\_PAN is implemented:**

Privileged Access Never. Copied to PSTATE.PAN on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SS, bit [21]**

Software Step. Copied to PSTATE.SS on exiting Debug state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## IL, bit [20]

Illegal Execution state. Copied to PSTATE.IL on exiting Debug state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## GE, bits [19:16]

Greater than or Equal flags. Copied to PSTATE.GE on exiting Debug state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## IT[7:2], bits [15:10]

If-Then. Copied to PSTATE.IT[7:2] on exiting Debug state.

DSPSR\_EL0.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## E, bit [9]

Endianness. Copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR\_EL0.E is RES0. If the implementation does not support little-endian operation, DSPSR\_EL0.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR\_EL0.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR\_EL0.E is RES1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## A, bit [8]

SError interrupt mask. Copied to PSTATE.A on exiting Debug state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## I, bit [7]

IRQ interrupt mask. Copied to PSTATE.I on exiting Debug state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## F, bit [6]

FIQ interrupt mask. Copied to PSTATE.F on exiting Debug state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## T, bit [5]

T32 Instruction set state. Copied to PSTATE.T on exiting Debug state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## M[4], bit [4]

Execution state. Copied to PSTATE.nRW on exiting Debug state.

M[4]	Meaning
0b1	AArch32 execution state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### M[3:0], bits [3:0]

AArch32 Mode. Copied to PSTATE.M[3:0] on exiting Debug state.

M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0110	Monitor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If DSPSR\_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## When AArch64 is supported at any Exception level and entering or exiting Debug state from or to AArch64 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	RES0	TCO	DIT	UAO	PAN	SS	IL	RES0								SSBS	BTYPE	D	A	I	F	RES0	M[4]	M[3:0]				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bits [27:26]

Reserved, RES0.

## TCO, bit [25]

### When FEAT\_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on entering Debug state, and copied to PSTATE.TCO on exiting Debug state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

## DIT, bit [24]

### When FEAT\_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

## UAO, bit [23]

### When FEAT\_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on entering Debug state, and copied to PSTATE.UAO on exiting Debug state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

## PAN, bit [22]

### When FEAT\_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:13]**

Reserved, RES0.

**SSBS, bit [12]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**BTYPE, bits [11:10]****When FEAT\_BTI is implemented:**

Branch Type Indicator. Set to the value of PSTATE.BTYPE on entering Debug state, and copied to PSTATE.BTYPE on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**D, bit [9]**

Debug exception mask. Set to the value of PSTATE.D on entering Debug state, and copied to PSTATE.D on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [5]**

Reserved, RES0.

**M[4], bit [4]**

Execution state. Set to 0b0, the value of PSTATE.nRW, on entering Debug state from AArch64 state, and copied to PSTATE.nRW on exiting Debug state.

M[4]	Meaning
0b0	AArch64 execution state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[3:0], bits [3:0]**

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.
0b1000	EL2t.
0b1001	EL2h.
0b1100	EL3t.
0b1101	EL3h.

Other values are reserved. If DPSR\_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on entering Debug state and copied to PSTATE.EL on exiting Debug state.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on entering Debug state and copied to PSTATE.SP on exiting Debug state

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DPSR\_EL0**

Accesses to this register use the following encodings:

MRS <Xt>, DPSR\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    return DSPSR_EL0;
```

MSR DSPSR\_EL0, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    DSPSR_EL0 = X[t];
```

# DVP RCTX, Data Value Prediction Restriction by Context

The DVP RCTX characteristics are:

## Purpose

Data Value Prediction Restriction by Context applies to all Data Value Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, data value prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

### Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

## Configuration

This instruction is present only when FEAT\_SPECRES is implemented. Otherwise, direct accesses to DVP RCTX are UNDEFINED.

## Attributes

DVP RCTX is a 64-bit System instruction.

## Field descriptions

The DVP RCTX input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0															GVMID	VMID															
RES0					NS	EL	RES0								GASID	ASID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:49]

Reserved, RES0.

### GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

### VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR\\_EL2.E2H==0](#) or [HCR\\_EL2.TGE==0](#)).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR\\_EL2.E2H==0](#) or [HCR\\_EL2.TGE==0](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR\\_EL2.E2H==1](#) and [HCR\\_EL2.TGE==1](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

### Bits [31:27]

Reserved, RES0.

### NS, bit [26]

Security State. **Defined values are:**

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

**When the instruction is executed in Non-secure state, this field has an Effective value of 1. Effective value of NS is 1.**

### EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

### Bits [23:17]

Reserved, RES0.

### GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

<b>GASID</b>	<b>Meaning</b>
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASID for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

### ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

## Executing the DVP RCTX instruction

Accesses to this instruction use the following encodings:

DVP RCTX, <Xt>

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b01	0b011	0b0111	0b0011	0b101

```

if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLR_EL1.EnRCTX == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&

# ELR\_EL1, Exception Link Register (EL1)

The ELR\_EL1 characteristics are:

## Purpose

When taking an exception to EL1, holds the address to return to.

## Configuration

There are no configuration notes.

## Attributes

ELR\_EL1 is a 64-bit register.

## Field descriptions

The ELR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Return address																															
Return address																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Return address.

An exception return from EL1 using AArch64 makes ELR\_EL1 become UNKNOWN.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the ELR\_EL1

When HCR\_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic ELR\_EL1 or ELR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, ELR\_EL1

op0	op1	CRn	CRm	op2

-------	----------------	-------

# ELR\_EL2, Exception Link Register (EL2)

The ELR\_EL2 characteristics are:

## Purpose

When taking an exception to EL2, holds the address to return to.

## Configuration

AArch64 System register ELR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ELR\\_hyp\[31:0\]](#).

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ELR\_EL2 is a 64-bit register.

## Field descriptions

The ELR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Return address																															
Return address																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Return address.

An exception return from EL2 using AArch64 makes ELR\_EL2 become UNKNOWN.

When EL2 is in AArch32 Execution state and an exception is taken from EL0, EL1, or EL2 to EL3 and AArch64 execution, the upper 32-bits of ELR\_EL2 are either set to 0 or hold the same value that they did before AArch32 execution. Which option is adopted is determined by an implementation, and might vary dynamically within an implementation. Correspondingly software must regard the value as being an UNKNOWN choice between the two values.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the ELR\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic ELR\_EL2 or ELR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# ERRSELR\_EL1, Error Record Select Register

The ERRSELR\_EL1 characteristics are:

## Purpose

Selects an error record to be accessed through the Error Record System registers.

## Configuration

AArch64 System register ERRSELR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERRSELR\[31:0\]](#).

This register is present only when FEAT\_RAS is implemented. Otherwise, direct accesses to ERRSELR\_EL1 are UNDEFINED.

If [ERRIDR\\_EL1](#) indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR\_EL1 is UNDEFINED or RES0.

## Attributes

ERRSELR\_EL1 is a 64-bit register.

## Field descriptions

The ERRSELR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																SEL															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:16]

Reserved, RES0.

### SEL, bits [15:0]

Selects the error record accessed through the ERX registers.

For example, if ERRSELR\_EL1.SEL is set to 0x0004, then direct reads and writes of [ERXSTATUS\\_EL1](#) access ERR4STATUS.

If ERRSELR\_EL1.SEL is set to a value greater than or equal to [ERRIDR\\_EL1](#).NUM, then all of the following apply:

- The value read back from ERRSELR\_EL1.SEL is UNKNOWN.
- One of the following occurs:
  - An UNKNOWN error record is selected.
  - The ERX\*\_EL1 registers are RAZ/WI.
  - ERX\*\_EL1 register reads and writes are NOPs.
  - ERX\*\_EL1 register reads and writes are UNDEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ERRSELR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ERRSELR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0011	0b001

```

The ESR\_EL1 characteristics are:

## Purpose

Holds syndrome information for an exception taken to EL1.

## Configuration

AArch64 System register ESR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DFSR\[31:0\]](#).

## Attributes

ESR\_EL1 is a 64-bit register.

## Field descriptions

The ESR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32					
RES0																																	ISS2			
EC						IL		ISS																												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					

ESR\_EL1 is made UNKNOWN as a result of an exception return from EL1.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL1, the value of ESR\_EL1 is UNKNOWN. The value written to ESR\_EL1 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

**Bits [63:37~~32~~]**

Reserved, RES0.

**ISS2, bits [36:32]**

**When FEAT\_LS64 is implemented:**

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

**Otherwise:**

Reserved, RES0.

**EC, bits [31:26]**

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	<a href="#">ISS encoding for exceptions with an unknown reason</a>	
0b000001	Trapped <b>WF*WFI</b> or <b>WFE</b> instruction execution. Conditional <b>WF*WFE</b> and <b>WFI</b> instructions that fail their condition code check do not cause an exception.	<a href="#">ISS encoding for an exception from a WF* instruction</a> <a href="#">ISS encoding for an exception from a WFI or WFE instruction</a>	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an MCR or MRC access</a>	When AArch32 is supported at any Exception level
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an MCRR or MRRC access</a>	When AArch32 is supported at any Exception level
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	<a href="#">ISS encoding for an exception from an MCR or MRC access</a>	When AArch32 is supported at any Exception level
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: <ul style="list-style-type: none"> <li>An STC to write data to memory from <a href="#">DBGDTRRXint.</a></li> <li>An LDC to read data from memory to <a href="#">DBGDTRTXint.</a></li> </ul>	<a href="#">ISS encoding for an exception from an LDC or STC instruction</a>	When AArch32 is supported at any Exception level
0b000111	Access to SVE, Advanced SIMD, or floating-point functionality trapped by <a href="#">CPACR_EL1.FPEN</a> , <a href="#">CPTR_EL2.FPEN</a> , <a href="#">CPTR_EL2.TFP</a> , or <a href="#">CPTR_EL3.TFP</a> control. Excludes exceptions resulting from <a href="#">CPACR_EL1</a> when the value of <a href="#">HCR_EL2.TGE</a> is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1'.	<a href="#">ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality resulting from the FPEN and TFP traps</a>	

0b001010	Trapped execution of an LD64B, ST64B, ST64BV, or ST64BV0 instruction.	<a href="#">ISS encoding for an exception from an LD64B or ST64B* instruction</a>	When FEAT_LS64 is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	<a href="#">ISS encoding for an exception from an MCRR or MRRC access</a>	When AArch32 is supported at any Exception level
0b001101	Branch Target Exception.	<a href="#">ISS encoding for an exception from Branch Target Identification instruction</a>	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>	
0b010001	SVC instruction execution in AArch32 state. This is reported in ESR_EL2 only when the exception is generated because the value of <a href="#">HCR_EL2.TGE</a> is 1.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch32 is supported at any Exception level
0b010101	SVC instruction execution in AArch64 state.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch64 is supported at any Exception level
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001, or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.	<a href="#">ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state</a>	When AArch64 is supported at any Exception level
0b011001	Access to SVE functionality trapped as a result of <a href="#">CPACR_EL1.ZEN</a> , <a href="#">CPTR_EL2.ZEN</a> , <a href="#">CPTR_EL2.TZ</a> , or <a href="#">CPTR_EL3.EZ</a> , that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an access to SVE functionality resulting from CPACR_EL1.ZEN, CPTER_EL2.ZEN, CPTER_EL2.TZ, or CPTER_EL3.EZ</a>	When FEAT_SVE is implemented
0b011100	Exception from a Pointer Authentication	<a href="#">ISS encoding for an exception</a>	When FEAT_FPAC

	instruction authentication failure	<a href="#">from a Pointer Authentication instruction authentication failure</a>	is implemented
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for <del>debug-related</del> exceptions.	<a href="#">ISS encoding for an exception from an Instruction Abort</a>	
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for <del>debug-related</del> exceptions.	<a href="#">ISS encoding for an exception from an Instruction Abort</a>	
0b100010	PC alignment fault exception.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>	
0b100100	Data Abort from a lower Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for <del>debug-related</del> exceptions.	<a href="#">ISS encoding for an exception from a Data Abort</a>	
0b100101	Data Abort taken without a change in Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for <del>debug-related</del> exceptions.	<a href="#">ISS encoding for an exception from a Data Abort</a>	

0b100110	SP alignment fault exception.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>	
0b101000	Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	<a href="#">ISS encoding for an exception from a trapped floating-point exception</a>	When AArch32 is supported at any Exception level
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	<a href="#">ISS encoding for an exception from a trapped floating-point exception</a>	When AArch64 is supported at any Exception level
0b101111	SError interrupt.	<a href="#">ISS encoding for an SError interrupt</a>	
0b110000	Breakpoint exception from a lower Exception level.	<a href="#">ISS encoding for an exception from a Breakpoint or Vector Catch debug exception</a>	
0b110001	Breakpoint exception taken without a change in Exception level.	<a href="#">ISS encoding for an exception from a Breakpoint or Vector Catch debug exception</a>	
0b110010	Software Step exception from a lower Exception level.	<a href="#">ISS encoding for an exception from a Software Step exception</a>	
0b110011	Software Step exception taken without a change in Exception level.	<a href="#">ISS encoding for an exception from a Software Step exception</a>	
0b110100	Watchpoint exception from a lower Exception level.	<a href="#">ISS encoding for an exception from a Watchpoint exception</a>	
0b110101	Watchpoint exception taken without a change in Exception level.	<a href="#">ISS encoding for an exception from a</a>	

0b111000	BKPT instruction execution in AArch32 state.	<a href="#">Watchpoint exception ISS encoding for an exception from execution of a Breakpoint instruction</a>	When AArch32 is supported at any Exception level
0b111100	BRK instruction execution in AArch64 state. This is reported in <a href="#">ESR_EL3</a> only if a BRK instruction is executed.	<a href="#">ISS encoding for an exception from execution of a Breakpoint instruction</a>	When AArch64 is supported at any Exception level

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: <ul style="list-style-type: none"> <li>• An SError interrupt.</li> <li>• An Instruction Abort exception.</li> <li>• A PC alignment fault exception.</li> <li>• An SP alignment fault exception.</li> <li>• A Data Abort exception for which the value of the ISV bit is 0.</li> <li>• An Illegal Execution state exception.</li> <li>• Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning: <ul style="list-style-type: none"> <li>◦ 0b0: 16-bit T32 BKPT instruction.</li> <li>◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction.</li> </ul> </li> <li>• An exception reported using EC value 0b000000.</li> </ul>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b1111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:

- The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
- The value 0b11111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

## ISS encoding for exceptions with an unknown reason

### Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR\\_EL1](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by [HCR\\_EL2](#).HCD or [SCR\\_EL3](#).HCE.
  - An SMC instruction when disabled by [SCR\\_EL3](#).SMD.
  - An HLT instruction when disabled by [EDSCR](#).HDE.
- Attempted execution of an MSR or MRS instruction to access [SP\\_EL0](#) when the value of [SPSel](#).SP is 0.
- Attempted execution of an MSR or MRS instruction using a [\\_EL12](#) register name when [HCR\\_EL2](#).E2H == 0.
- Attempted execution, in Debug state, of:
  - A DCPS1 instruction when the value of [HCR\\_EL2](#).TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  - A DCPS3 instruction when the value of [EDSCR](#).SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13\_mon. See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- In Debug state when the value of [EDSCR](#).SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to [SPSR\\_mon](#), [SP\\_mon](#), or [LR\\_mon](#).
- An exception that is taken to EL2 because the value of [HCR\\_EL2](#).TGE is 1 that, if the value of [HCR\\_EL2](#).TGE was 0 would have been reported with an [ESR\\_ELx](#).EC value of 0b000111.

**ISS encoding for an exception from a ~~WF\*~~WFI or WFE instruction**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0										TI									

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:21]**

Reserved, RES0.

**TI, bits [1:0]**

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b00	WFI trapped.	
0b01	WFE trapped.	
0b10	WFIIT trapped.	When FEAT_WFxT is implemented
0b11	WFET trapped.	When FEAT_WFxT is implemented

When ~~This field resets to an architecturally UNKNOWN value.~~ FEAT\_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- [SCTLR\\_EL1](#).{nTWE, nTWI}.
- [HCR\\_EL2](#).{TWE, TWI}.
- [SCR\\_EL3](#).{TWE, TWI}.

## ISS encoding for an exception from an MCR or MRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc2			Opc1			CRn			Rt			CRm			Direction				

### CV, bit [24]

Condition code valid. ~~Possible values of this bit are:~~

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

### Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, ELOPCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#) or [CPACR](#) using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HSTR\\_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL\\_EL2](#).EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL3](#).TCPAC, for accesses to [CPACR](#) from EL1 and EL2, and accesses to [HCPTR](#) from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- For information on other traps using EC value 0b000011, see 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- If FEAT\_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [CPACR\\_EL1](#).TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [HCR\\_EL2](#).TID0, for accesses to the [JIDR](#) register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and AArch-DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL3](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR\\_EL3](#).TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR\\_EL3](#).TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- [HCR\\_EL2](#).TID0, for accesses to the [FPSID](#) register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- [HCR\\_EL2](#).TID3, for accesses to registers in ID group 3 including [MVFR0](#), [MVFR1](#) and [MVFR2](#), VMRS access trapped to EL2.

## ISS encoding for an exception from an **LD64BMCRR** or **ST64B\*MRRC** instruction access

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

**ISS, bits [24:0]**

ISSCV	Meaning
0b00000000000000000000000000000b0	ST64BVThe instructionCOND trapped. field is not valid.
0b00000000000000000000000000000b1	ST64BV0The instructionCOND trapped. field is valid.
0b0000000000000000000000000000010	LD64B or ST64B instruction trapped.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

**Opc1, bits [19:16]**

The Opc1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**Bit [15]**

Reserved, RES0.

**Rt2, bits [14:10]**

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [HSTR\\_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL\\_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT\_FGT is implemented, [HDFGRTR\\_EL2](#).PMCCNTR\_EL0 for MRRC access and [HDFGWTR\\_EL2](#).PMCCNTR\_EL0 for MCRR access to [PMCCNTR](#) at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug ROM registers [DBGDSAR](#) and [DBGDRAR](#) at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.

- **MDCR\_EL2**.TDRA, for accesses to Debug ROM registers **DBGDRAR** and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **MDCR\_EL3**.TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- **CPACR\_EL1**.TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **CPTR\_EL2**.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **CPTR\_EL3**.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

**Note**

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

All other exceptions values taken are from reserved. AArch64, CV is set to 1.

## ISS encoding for an exception from an MCRRLDC or MRRCSTC access instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc1imm8				RES0	Rt2Rn				RtOffset				CRmAM				Direction		

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Opc1imm8, bits [19:16]

The Opc1imm8 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### BitBits [15:10]

Reserved, RES0.

#### Rt2Rn, bits [149:105]

The Rt2Rn value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a Warmliteral resetform of the LDC or STC instruction, this field resets to an architecturallyis UNKNOWN value.

This field resets to an architecturally UNKNOWN value.

#### Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

#### AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to Systemmemory. register space. MCRRSTC instruction.
0b1	Read from Systemmemory. register space. MRRCLDC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for generating the exception traps that are reported using EC value 0b0001000b000110:

- CNTKCTL\_EL1**.{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- MDSCR\_EL1**.TDCC, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** trapped to EL1 or EL2.
- PMUSERENR\_EL0**.{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- MDCR\_EL2**.TDA, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** MCR or MRC access trapped to EL2.
- AMUSERENR\_EL0**.{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- MDCR\_EL3**.TDA, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** MCR or MRC access trapped to EL3.
- HCR\_EL2**.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == If is implemented, **MDCR\_EL2**.TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and **MDCR\_EL3**0b1111FEAT\_FGT).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL2.EL3.
- HSTR\_EL2**.T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- CNTHCTL\_EL2**.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- MDCR\_EL2**.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- CPTR\_EL2**.TAM, for accesses to Activity Monitors registers registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- MDCR\_EL3**.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- CPTR\_EL3**.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT\_FGT is implemented, **HDFGRTR\_EL2**.PMCCNTR\_EL0 for MRRC access and **HDFGWTR\_EL2**.PMCCNTR\_EL0 for MCRR access to **PMCCNTR** at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- MDSCR\_EL1**.TDCC, for accesses to the Debug ROM registers **DBGDSAR** and **DBGDRAR** at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.

- **MDCR\_EL2.TDRA**, for accesses to Debug ROM registers **DBGDRAR** and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **MDCR\_EL3.TDA**, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- **CPACR\_EL1.TTA** for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **CPTR\_EL2.TTA**, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **CPTR\_EL3.TTA**, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

---

#### Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

---

### ISS encoding for an exception from an LDCaccess to SVE, Advanced SIMD or STCfloating-point instructionfunctionality, resulting from the FPEN and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				imm8RES0				RES0				Rn				Offset				AM		Direction	

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

#### CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.

- With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### imm8, Bits [19:120]

The immediate value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [11:10]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- CPACR\_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.
- CPTR\_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.
- CPTR\_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL3.

#### Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- [MDCR\\_EL1.TDCC](#), for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) trapped to EL1 or EL2.
- [MDCR\\_EL2.TDA](#), for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL2.
- [MDCR\\_EL3.TDA](#), for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL3.
- If FEAT\_FGT is implemented, [MDCR\\_EL2.TDCC](#) for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3.TDCC](#) for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

### ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the CPACR\_EL1.ZEN, FPENCPTTR\_EL2.ZEN, and CPTR\_EL2.TZ, TFP or traps CPTR\_EL3.EZ

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CVRES0		COND													RES0									

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SVE SIMD System and registers, floating-point ZCR\_ELx System and registers. ID\_AA64ZFR0\_EL1.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

### CV, Bits bit [24:0]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:0]**

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value: 0b000111:

- CPTR\_EL3.EZ, for accesses to SVE functionality and registers from all Exception levels, trapped to EL3.
- CPACR\_EL1.FPENZEN, for accesses to SIMD SVE and registers floating-point at registers EL0 or EL1, trapped to EL1.EL2.
- CPTR\_EL2.TFPZEN, for accesses to SIMD SVE and registers floating-point at registers EL0, EL1, or EL2, trapped to EL2.
- CPTR\_EL3.CPTR\_EL2.TFPTZ, for accesses to SIMD SVE instructions and floating-point instructions that access SVE System registers at EL0, EL1, or EL2, trapped to EL3.EL2.

**ISS encoding for an exception from an access illegal to Execution SVE functionality state, resulting from a CPACR\_EL1.ZEN, PC CPTR\_EL2.ZEN, or CPTR\_EL2.TZ, SP or alignment CPTR\_EL3.EZ fault**

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE System register, ZCR\_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

**Bits [24:0]**

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b011001:

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

- [CPACR\\_EL1.ZEN](#), for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL2.
- [CPTR\\_EL2.ZEN](#), for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- [CPTR\\_EL2.TZ](#), for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- [CPTR\\_EL3.EZ](#), for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

## ISS encoding for an exception from an HVC Illegal Execution state, or a SVC PC instruction or SP alignment fault execution

**Bits [24:16]**

**Bits [24:0]**

Reserved, RES0.

**imm16, bits [15:0]**

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT\_FGT is implemented, [HFGITR\\_EL2](#).{SVC\_EL1, SVC\_EL0} control fine-grained traps on SVC execution.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions, see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

## ISS encoding for an exception from HVC SMC or instruction SVC execution in execution AArch32 state

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR\\_EL2.TSC](#) is 1, the ISS encoding is as shown in the diagram.

### CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

**CCKNOWNPASS, bit [19]**

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

**Note**

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

This field resets to an architecturally UNKNOWN value.

**Bits [18:0]****Bits [24:16]**

Reserved, RES0.

HCR\_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

**imm16, bits [15:0]**

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT\_FGT is implemented, HFGITR\_EL2.{SVC\_EL1, SVC\_EL0} control fine-grained traps on SVC execution.

## ISS encoding for an exception from SMC instruction execution in AArch32AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV		COND		CCKNOWNPASS																				RES0

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR\\_EL2.TSC](#) is 1, the ISS encoding is as shown in the diagram.

### CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

**Note**

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

#### Bits [24:16]

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [18:0]

Reserved, RES0.

#### imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

This field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR\_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

HCR\_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

### ISS encoding for an exception from SMCMSR, MRS, or System instruction execution in AArch64 state

#### Bits [24:22]

#### Bits [24:16]

Reserved, RES0.

#### imm16Op0, bits [15:0]

The Op0 value of the immediate field from the issued SMC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Op2, bits [19:17]

The Op2 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**Op1, bits [16:14]**

The Op1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer.

This field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

This field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- [SCTLR\\_EL1](#).UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UCT, for accesses to [CTR\\_EL0](#) using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [CPACR\\_EL1](#).TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL\\_EL1](#).{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.

- [HCR\\_EL2](#).TLTB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TTRF, for accesses to the trace filter register, [TRFCR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL\\_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).AT, for execution of AT S1E\* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- [SCR\\_EL3](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3](#).ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TCPAC, for accesses to [CPTR\\_EL2](#) and [CPACR\\_EL1](#) using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TTRF, for accesses to the filter trace control registers, [TRFCR\\_EL1](#) and [TRFCR\\_EL2](#), using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT\_EVT is implemented the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - [HCR\\_EL2](#).{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - [HCR2](#).{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT\_FGT is implemented:
  - [SCR\\_EL3](#).FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - [HFGTR\\_EL2](#) for reads and [HFGWTR\\_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - [HFGITR\\_EL2](#) for execution of system instructions, MSR or MRS access trapped to EL2.
  - [HDFGTR\\_EL2](#) for reads and [HDFGWTR\\_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - [HAFGTR\\_EL2](#) for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR\_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

## ISS encoding for an **exception IMPLEMENTATION** from **DEFINED MSR, exception MRS, to** or System instruction execution in AArch64 state **EL3**

#### **Op0, bits [21:20]**

The Op0 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **Op2, bits [19:17]**

The Op2 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **Op1, bits [16:14]**

The Op1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **CRn, bits [13:10]**

The CRn value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **CRm, bits [4:1]**

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- [SCTLR\\_EL1](#).UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UCT, for accesses to [CTR\\_EL0](#) using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [CPACR\\_EL1](#).TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL\\_EL1](#).{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TTRF, for accesses to the trace filter control register, [TRFCR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL\\_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.

- [CPTR\\_EL2.TAM](#), for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2.APK](#), for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2.{NV, NV1}](#), for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2.AT](#), for execution of AT S1E\* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2.{TERR, FIEN}](#), for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- [SCR\\_EL3.APK](#), for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3.ST](#), for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3.{TERR, FIEN}](#), for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3.TCPAC](#), for accesses to [CPTR\\_EL2](#) and [CPACR\\_EL1](#) using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3.TTA](#), for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3.TTRF](#), for accesses to the trace filter control registers, [TRFCR\\_EL1](#) and [TRFCR\\_EL2](#), using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3.TDA](#), for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3.TDOSA](#), for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3.TPM](#), for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3.TAM](#), for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT\_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - [HCR\\_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}](#).
  - [HCR2.{TTLBIS, TICAB, TOCU, TID4}](#).
- If FEAT\_FGT is implemented:
  - [SCR\\_EL3.FGTEn](#), for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - [HFGTR\\_EL2](#) for reads and [HFGWTR\\_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - [HFGITR\\_EL2](#) for execution of system instructions, MSR or MRS access trapped to EL2
  - [HDFGTR\\_EL2](#) for reads and [HDFGWTR\\_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - [HAFGTR\\_EL2](#) for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

## ISS encoding for an IMPLEMENTATION exception DEFINED from exception an to Instruction EL3 Abort

### Bits [24:13]

Reserved, RES0.

### SET, bits [12:11]

When FEAT\_RAS is implemented:

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception. The possible values of this field are:

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

#### Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is only valid if the IFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

#### EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

#### Bit [8]

Reserved, RES0.

#### S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk.

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

### Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

## IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from **ana** InstructionData Abort

### ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults reported in ESR\_EL2 except the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

ISV is 0 for all faults reported in ESR\_EL1 or ESR\_EL3.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When the RAS Extension is not implemented, the value of ISV on a synchronous External abort on a stage 2 translation table walk is IMPLEMENTATION DEFINED.

When FEAT\_MTE is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR\_ELx.FNV is 0 and FAR\_ELx is valid.

This field resets to an architecturally UNKNOWN value.

**SAS, bits [23:22]**

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

**SSE, bit [21]**

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

**SRT, bits [20:16]**

Syndrome Register Transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

**SF, bit [15]**

Width of the register accessed by the instruction is Sixty-Four. When ISV is 1, the possible values of this bit are:

SF	Meaning
0b0	Instruction loads/stores a 32-bit wide register.
0b1	Instruction loads/stores a 64-bit wide register.

**Note**

This field specifies the register width identified by the instruction, not the Execution state.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

**AR, bit [14]****When ISV == '1':**

Acquire/Release. The possible values of this bit are:

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

**Otherwise:****Bits [24:13]**

Reserved, RES0.

**SETVNCR, bits [12:11]****When FEAT\_RAS is implemented:**

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

Indicates that the fault came from use of VNCR\_EL2 register by EL1 code.

SETVNCR	Meaning
0b00	Recoverable state (UER). The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b10	Uncontainable (UC). The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b11	Restartable state (UEO).

This field is 0 in ESR\_EL1.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SET, bits [12:11]****When FEAT\_RAS is implemented:**

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception. The possible values of this field are:

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the **IFSC****DFSC** code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### **FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<b>FnV</b>	<b>Meaning</b>
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the **IFSC****DFSC** code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### **EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

<b>CM</b>	<b>Meaning</b>
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The <b>DC ZVA</b> , <b>DC GVA</b> , and <b>DC GZVA</b> instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

This field resets to an architecturally UNKNOWN value.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### **BitCM, bit [8]**

Reserved, Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction: RES0.

#### **S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<b>S1PTW</b>	<b>Meaning</b>
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bit WnR, bit [6]

Reserved Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are: RES0.

#### IFSC, bits [5:0]

Instruction Fault Status Code.

IFSCWnR	Meaning	Applies when
0b0000000b0	Address Abort size caused fault, by level 0 instruction of reading translation from ora translation memory table base register location.	
0b0000010b1	Address Abort size caused fault, by level 1 instruction writing to a memory location.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or	When FEAT_RAS is not implemented

	hardware update of translation table, level 1.	
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

This field resets to an architecturally UNKNOWN value.

#### DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

### Note

Because Access flag faults and Permission faults can **only** result **only** from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from a **Datatrapped** **Abortfloating-point** **exception**

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

### ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR\_EL2, ISV is 1 when FEAT\_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR\_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR\_EL1 or ESR\_EL3, ISV is 1 when FEAT\_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR\_EL1 or ESR\_EL3.

When FEAT\_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT\_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT\_MTE is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR\_ELx.FNV is 0 and FAR\_ELx is valid.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SAS, bits [23:22]****When ISV == '1':**

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV							RES0							VECITR		IDF	RES0	IXF	UFF	OFF	DZF	IOF	

**Bit [24]**

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SSETFV, bit [21:23]****When ISV == '1':**

Syndrome Trapped Sign Fault Extend. Valid For bit. a Indicates by whether the IDF, halfword IXF, or UFF, word OFF, load operation DZF, indicates and whether IOF the bits data hold item valid must information be about sign trapped extended. floating-point exceptions. The possible values of this bit are:

SSETFV	Meaning
0b0	Sign-extension not required. The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	Data item must be sign-extended. One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information see 'Floating-point exceptions and exception traps'.

When It is FEAT\_LS64 IMPLEMENTATION DEFINED is whether implemented, this if field is memory set accesste generated 0 by on an ST64BV, exception ST64BV0, generated ST64B, by ora LD64Btrapped instruction floating generates point a exception Data from Abort for a Translation vector fault, Access flag fault, or Permission fault, then this field is 0. instruction.

**Note**

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

This field resets to an architecturally UNKNOWN value.

**Bits [22:11]**

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SRTVECTR, bits [20:16]****When ISV == '1':**

SyndroneFor Registera Transfer, trapped Whenfloating-point exception from an instruction executed in AArch32 state this field is FEAT\_LS64RES1 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xt.

IfFor thea exceptiontrapped, wasfloating-point takenexception from an Exceptioninstruction levelexecuted thatin isAArch64 usingstate AArch32, this thenfield this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' UNKNOWN.

This field isresets to an architecturally UNKNOWN when the value of ISV isvalue. UNKNOWN.

**IDF, bit [7]**

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SF, bit [15]****When ISV == '1':**

Width of the register accessed by the instruction is Sixty-Four.

SFIDF	Meaning
0b0	InstructionInput loads/storesdenormal afloating-point 32-bitexception widehas register.not occurred.
0b1	InstructionInput loads/storesdenormal afloating-point 64-bitexception wideoccurred register.during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

**Bits [6:5]****Note**

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### ARIXF, bit [144]

When ISV == '1':

Acquire/Release.

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

ARIXF	Meaning
0b0	Instruction Inexact did floating-point not exception have acquire/release semantics. occurred.
0b1	Instruction Inexact did floating-point have exception acquire/release semantics. occurred during execution of the reported instruction.

When This field resets to an architecturally FEAT\_LS64 UNKNOWN is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0. value.

#### UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### VNCR, bit [13]

When FEAT\_NV2 is implemented:

Indicates that the fault came from use of VNCR\_EL2 register by EL1 code.

VNCRUFF	Meaning
0b0	The Underflow fault floating-point was exception has not generated by the use of occurred. VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b1	The Underflow fault floating-point was exception generated occurred by during execution of the use reported of instruction. VNCR_EL2, by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR\_EL1.

This field resets to an architecturally UNKNOWN value.

**OFF, bit [2]**

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SET, bits [12:11]****When FEAT\_RAS is implemented and FEAT\_LS64 is not implemented:**

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception.

SET/OFF	Meaning
0b000b0	Recoverable Overflow state floating-point exception has not occurred.
0b100b1	Uncontainable Overflow (UC) floating-point exception occurred during execution of the reported instruction.
0b11	Restartable state (UEO).

All other values are reserved.

This field resets to an architecturally UNKNOWN value.

**DZF, bit [1]**

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When FEAT\_LS64 is implemented:**

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

LST/DZF	Meaning
0b010b0	An Divide ST64BV by instruction Zero generated floating-point the exception Data has Abort not occurred.
0b100b1	An Divide LD64B by or Zero ST64B floating-point instruction exception generated occurred during execution of the Data reported Abort instruction.
0b11	An ST64BV0 instruction generated the Data Abort.

All other values are reserved.

This field resets to an architecturally UNKNOWN value.

**IOF, bit [0]**

Invalid Operation floating-point exception trapped bit. If the TFF field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

This field is valid only if the DFSC code is 0b110101. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnVIOF	Meaning
0b0	FARInvalid isOperation valid, floating-point exception has not occurred.
0b1	FARInvalid isOperation notfloating-point valid, exception andoccurred holdsduring anexecution of the reported instruction. UNKNOWN value.

This field isresets validto onlyan if the DFSC code isarchitecturally 0b010000UNKNOWN. It is RES0 for all other aborts.value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the [FPCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the [FPSCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CM, bit [8]**

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The <a href="#">DC ZVA</a> , <a href="#">DC GVA</a> , and <a href="#">DC GZVA</a> instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk.

<b>S1PTW</b>	<b>Meaning</b>
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**WnR, bit [6]**

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

<b>WnR</b>	<b>Meaning</b>
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DFSC, bits [5:0]**

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented

0b100001	Alignment fault.	
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

#### Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exceptionError from a trapped floating-point exceptioninterrupt

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	IDS	TFV	RES0					RES0	IESB					VECITRAET	IDFEA	RES0	IXFDFSC	UFF	OFF	DZF	IOF			

### IDS, bit [24]

IMPLEMENTATION DEFINED syndrome. Possible values of this bit are:

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
<b>Note</b> If the RAS Extension is not implemented bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

#### Note

This field was previously called ISV.

This field resets to an architecturally UNKNOWN value.

### Bits [23:14]

#### Bit [24]

Reserved, RES0.

**TFVIESB, bit [23:13]****When FEAT\_IESB is implemented:**

Trapped Implicit Fault error Valid synchronization bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions event.

TFVIESB	Meaning
0b0	The IDF, Error IXF, interrupt UFF, was OFF, either DZF, not and synchronized IOF by bits the do implicit not error hold synchronization valid event information or about not trapped taken floating-point exceptions and are immediately UNKNOWN.
0b1	One The or Error more interrupt floating-point was exceptions synchronized occurred by during an operation performed while executing the reported implicit instruction. error The synchronization IDF, event IXF, UFF, OFF, DZF, and IOF taken bits indicate trapped floating-point exceptions that occurred. For more information, see immediately. 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

This field resets to an architecturally UNKNOWN value.

**Otherwise:****Note**

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [22:11]**

Reserved, RES0.

**VECITRAET, bits [12:10:8]****When FEAT\_RAS is implemented:**

For Asynchronous a Error trapped floating-point exception from an instruction executed in AArch32 state this field is Type. RES1.

For When a trapped floating-point exception from an instruction executed in AArch64 state this field DFSC is UNKNOWN 0b010001., describes the PE error state after taking the SError interrupt exception. The possible values of this field are:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IDF, bit [7]**

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).
IDFAET	Meaning
0b00b000	InputUncontainable denormal floating-point exception has not occurred.(UC).
0b10b001	InputUnrecoverable denormalstate floating-point exception occurred during execution of the reported instruction.(UEU).

OnAll aother Warmvalues reset,are this field resets to an architecturallyreserved. UNKNOWN value.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

#### Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

This field resets to an architecturally UNKNOWN value.

Otherwise:

#### Bits [6:5]

Reserved, RES0.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

#### Bits [8:6]

Reserved, RES0.

#### DFSC, bits [5:0]

When FEAT\_RAS is implemented:

Data Fault Status Code.

#### IXFEA, bit [49]

When FEAT\_RAS is implemented:

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION-DEFINED classification of External aborts.

IXFDFSC	Meaning
0b00b0000000	InexactUncategorized floating-point exception has not occurred.error.
0b10b010001	InexactAsynchronous floating-pointError exception occurred during execution of the reported instruction.interrupt.

OnAll aother Warmvalues reset,are this field resets to an architecturallyreserved, UNKNOWN value.

This field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the **FPCR**.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the **FPSCR**.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

## ISS encoding for an SError exception interrupt from a Breakpoint or Vector Catch debug exception

### Bits [24:6]

#### IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
<b>Note</b> If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

#### Note

This field was previously called ISV.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [23:14]

Reserved, RES0.

### IESBIFSC, bitbits [13:0]

When FEAT\_IESB is implemented:

ImplicitInstruction errorFault synchronizationStatus event.Code.

IESBIFSC	Meaning
0b00b100010	The Debug SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is resets valid to only an if the DFSC code is architecturally 0b010001UNKNOWN. It is RES0 for all other errors.value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**AET, bits [12:10]****When FEAT\_RAS is implemented:**

Asynchronous Error Type.

When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

AET	Meaning
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EA, bit [9]****When FEAT\_RAS is implemented:**

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [8:6]**

Reserved, RES0.

**DFSC, bits [5:0]****When FEAT\_RAS is implemented:**

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### ISS encoding for an exception from a BreakpointSoftware or Vector Catch debugStep exception

#### ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

This field resets to an architecturally UNKNOWN value.

#### Bits [23:7]

#### Bits [24:6]

Reserved, RES0.

#### EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

This field resets to an architecturally UNKNOWN value.

#### IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

For more information about generating these exceptions, see 'Software Step exceptions'.

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

## ISS encoding for an exception from a Software StepWatchpoint exception

### Bits [24:15]

Reserved, RES0.

### Bit [14]

Reserved, RES0.

### VNCR, bit [13]

When FEAT\_NV2 is implemented:

Indicates that the watchpoint came from use of VNCR\_EL2 register by EL1 code.

### ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	VNCR	Meaning
0b0		EX bit is RES0. The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1		EXThe bitwatchpoint iswas valid.generated by the use of VNCR_EL2 by EL1 code.

SeeThis thefield EXis bit0 descriptionin for more information.ESR\_EL1.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

Otherwise:

### Bits [23:7]

Reserved, RES0.

### CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction.

### EX, Bits bit [612:9]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

Reserved, RES0.

EXCM	Meaning
0b0	An instruction Watchpoint exception other than a Load-Exclusive generated instruction was stepped. execution of one of the System instructions identified in the description of value 1.
0b1	A Load-Exclusive Watchpoint instruction exception was stepped. generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

If this field ISV resets bit is set to 0, and this bit is architecturally RES0 UNKNOWN, indicating no syndrome data is available.

#### Bit [7]

Reserved, RES0.

#### WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### IFSC, bits [5:0]

Instruction Fault Status Code.

0b1	Watchpoint exception caused by an instruction writing to a memory location.
IFSCWnR	Meaning
0b1000100b0	Debug Watchpoint exception. exception caused by an instruction reading from a memory location.

On a Watchpoint Warm exceptions reset on cache maintenance and address translation instructions, this field bit resets always to returns an architecturally value of 1, UNKNOWN value.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

This field resets to an architecturally UNKNOWN value.

#### DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

For more information about generating these exceptions, see 'Software Step exceptions'.

## ISS encoding for an exception from execution of a Watchpoint Breakpoint exception instruction

### Bits [24:16]

### Bits [24:15]

Reserved, RES0.

### Bit Comment, bits [14:0]

Reserved Set to the instruction comment field value, zero-extended as necessary, RES0.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

### VNCR, bit [13]

#### When FEAT\_NV2 is implemented:

Indicates that the watchpoint came from use of VNCR\_EL2 register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR\_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### Bits [12:9]

Reserved, RES0.

### CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [7]

Reserved, RES0.

### WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

### ISS encoding for an exception from execution ERET, of ERETA or Breakpoint ERETA instruction

This EC value applies when FEAT\_FGT is implemented, or when HCR\_EL2.NV is 1.

### Bits [24:2]

### Bits [24:16]

Reserved, RES0.

### Comment ERET, bits [15:0]

SetIndicates to whether the an ERET or ERETA\* instruction comment was field trapped value, to zero EL2. extendedPossible as values necessary are:

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

This field resets to an architecturally UNKNOWN value.

#### ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2. Possible values are:

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [HCR\\_EL2.NV](#).

If FEAT\_FGT is implemented, [HFGITR\\_EL2](#).ERET controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

### ISS encoding for an exception from an Branch ERET, Target ERETAA, or ERETAB instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
											RES0												ERETBTYP		ERETA	

This EC value applies when FEAT\_FGT is implemented, or when [HCR\\_EL2.NV](#) is 1.

#### Bits [24:2]

Reserved, RES0.

#### ERETBTYP, bits [1:0]

Indicates whether field [PSTATE.BTYPE](#) was value trapped that generated EL2 the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [HCR\\_EL2.NV](#).

If FEAT\_FGT is implemented, [HFGITR\\_EL2.ERET](#) controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

## ISS encoding for an exception from Brancha TargetPointer IdentificationAuthentication instruction when HCR\_EL2.API == 0 || SCR\_EL3.API == 0

Bits [24:0]

Bits [24:2]

Reserved, RES0.

For more information about generating these exceptions, see:

- [HCR\\_EL2.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- [SCR\\_EL3.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

BTYP, bits [1:0]

This field is set to the PSTATE.BTYP value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

## ISS encoding for an exception from a Pointer Authentication instruction when authentication HCR\_EL2.API == 0 || SCR\_EL3.API == 0 failure

Bits [24:2]

Bits [24:0]

Reserved, RES0.

**Bit [1]**

This field indicates whether the exception is as a result of an Instruction key or a Data key.

	Meaning
0b0	Instruction Key.
0b1	Data Key.

This field resets to an architecturally UNKNOWN value.

**Bit [0]**

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

This field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETA, ERETB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

For more information about generating these exceptions, see:

- [HCR\\_EL2.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- [SCR\\_EL3.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

## ISS encoding for an exception from a Pointer Authentication instruction authentication failure

**Bits [24:2]**

Reserved, RES0.

**Bit [1]**

This field indicates whether the exception is as a result of an Instruction key or a Data key.

	Meaning
0b0	Instruction Key.
0b1	Data Key.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETA, ERETB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

## Accessing the ESR\_EL1

When HCR\_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic ESR\_EL1 or ESR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, ESR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0010	0b000

```

if PSTATE.EL == EL0 then

# ESR\_EL2, Exception Syndrome Register (EL2)

The ESR\_EL2 characteristics are:

## Purpose

Holds syndrome information for an exception taken to EL2.

## Configuration

AArch64 System register ESR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HSR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ESR\_EL2 is a 64-bit register.

## Field descriptions

The ESR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
EC																ISS															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ESR\_EL2 is made UNKNOWN as a result of an exception return from EL2.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of ESR\_EL2 is UNKNOWN. The value written to ESR\_EL2 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

### Bits [63:37:32]

Reserved, RES0.

### ISS2, bits [36:32]

#### When FEAT\_LS64 is implemented:

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

#### Otherwise:

Reserved, RES0.

**EC, bits [31:26]**

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	<a href="#">ISS encoding for exceptions with an unknown reason</a>	
0b000001	Trapped <b>WF*WFI</b> or <b>WFE</b> instruction execution. Conditional <b>WF*WFE</b> and <b>WFI</b> instructions that fail their condition code check do not cause an exception.	<a href="#">ISS encoding for an exception from a WF* instruction</a> <a href="#">ISS encoding for an exception from a WFI or WFE instruction</a>	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an MCR or MRC access</a>	When AArch32 is supported at any Exception level
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an MCRR or MRRC access</a>	When AArch32 is supported at any Exception level
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	<a href="#">ISS encoding for an exception from an MCR or MRC access</a>	When AArch32 is supported at any Exception level
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: <ul style="list-style-type: none"> <li>An STC to write data to memory from <a href="#">DBGDTRRXint.</a></li> <li>An LDC to read data from memory to <a href="#">DBGDTRTXint.</a></li> </ul>	<a href="#">ISS encoding for an exception from an LDC or STC instruction</a>	When AArch32 is supported at any Exception level
0b000111	Access to SVE, Advanced SIMD, or floating-point functionality trapped by <a href="#">CPACR_EL1.FPEN</a> , <a href="#">CPTR_EL2.FPEN</a> , <a href="#">CPTR_EL2.TFP</a> , or <a href="#">CPTR_EL3.TFP</a> control. Excludes exceptions resulting from <a href="#">CPACR_EL1</a> when the value of <a href="#">HCR_EL2.TGE</a> is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1'.	<a href="#">ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality resulting from the FPEN and TFP traps</a>	

0b001000	Trapped VMRS access, from ID group trap, that is not reported using EC 0b000111.	<a href="#">ISS encoding for an exception from an MCR or MRC access</a>	When AArch32 is supported at any Exception level
0b001001	Trapped use of a Pointer authentication instruction because HCR_EL2.API == 0    SCR_EL3.API == 0.	<a href="#">ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0    SCR_EL3.API == 0</a>	When FEAT_PAuth is implemented
0b001010	Trapped execution of an LD64B, ST64B, ST64BV, or ST64BV0 instruction.	<a href="#">ISS encoding for an exception from an LD64B or ST64B* instruction</a>	When FEAT_LS64 is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	<a href="#">ISS encoding for an exception from an MCRR or MRRC access</a>	When AArch32 is supported at any Exception level
0b001101	Branch Target Exception.	<a href="#">ISS encoding for an exception from Branch Target Identification instruction</a>	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>	
0b010001	SVC instruction execution in AArch32 state. This is reported in ESR_EL2 only when the exception is generated because the value of <a href="#">HCR_EL2.TGE</a> is 1.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch32 is supported at any Exception level
0b010010	HVC instruction execution in AArch32 state, when HVC is not disabled.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch32 is supported at any Exception level
0b010011	SMC instruction execution in AArch32 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of <a href="#">HCR_EL2.TSC</a> is 1.	<a href="#">ISS encoding for an exception from SMC instruction execution in AArch32 state</a>	When AArch32 is supported at any Exception level
0b010101	SVC instruction execution in AArch64 state.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch64 is supported at any Exception level

0b010110	HVC instruction execution in AArch64 state, when HVC is not disabled.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch64 is supported at any Exception level
0b010111	SMC instruction execution in AArch64 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of <a href="#">HCR_EL2.TSC</a> is 1.	<a href="#">ISS encoding for an exception from SMC instruction execution in AArch64 state</a>	When AArch64 is supported at any Exception level
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.	<a href="#">ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state</a>	When AArch64 is supported at any Exception level
0b011001	Access to SVE functionality trapped as a result of <a href="#">CPACR_EL1.ZEN</a> , <a href="#">CPTR_EL2.ZEN</a> , <a href="#">CPTR_EL2.TZ</a> , or <a href="#">CPTR_EL3.EZ</a> , that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an access to SVE functionality resulting from CPACR_EL1.ZEN, CPTER_EL2.ZEN, CPTER_EL2.TZ, or CPTER_EL3.EZ</a>	When FEAT_SVE is implemented
0b011010	Trapped ERET, ERETAA, or ERETAB instruction execution.	<a href="#">ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction</a>	When FEAT_PAuth is implemented and FEAT_NV is implemented
0b011100	Exception from a Pointer Authentication instruction authentication failure	<a href="#">ISS encoding for an exception from a Pointer Authentication instruction authentication failure</a>	When FEAT_FPAC is implemented
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses	<a href="#">ISS encoding for an exception from an Instruction Abort</a>	

	and synchronous External aborts, including synchronous parity or ECC errors. Not used for <del>debug-related</del> exceptions.	
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for <del>debug-related</del> exceptions.	<a href="#">ISS encoding for an exception from an Instruction Abort</a>
0b100010	PC alignment fault exception.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>
0b100100	Data Abort from a lower Exception level, excluding Data Aborts taken to EL2 as a result of accesses generated associated with <a href="#">VNCR_EL2</a> as part of nested virtualization support. These Data Aborts might be generated from Exception levels in any Execution state. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for <del>debug-related</del> exceptions.	<a href="#">ISS encoding for an exception from a Data Abort</a>
0b100101	Data Abort without a change in Exception level, or Data Aborts taken to EL2 as a result of accesses generated associated with <a href="#">VNCR_EL2</a> as part of nested virtualization support. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts,	<a href="#">ISS encoding for an exception from a Data Abort</a>

	including synchronous parity or ECC errors. Not used for <del>debug-related</del> <del>debug-related</del> exceptions.		
0b100110	SP alignment fault exception.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>	
0b101000	Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	<a href="#">ISS encoding for an exception from a trapped floating-point exception</a>	When AArch32 is supported at any Exception level
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	<a href="#">ISS encoding for an exception from a trapped floating-point exception</a>	When AArch64 is supported at any Exception level
0b101111	SError interrupt.	<a href="#">ISS encoding for an SError interrupt</a>	
0b110000	Breakpoint exception from a lower Exception level.	<a href="#">ISS encoding for an exception from a Breakpoint or Vector Catch debug exception</a>	
0b110001	Breakpoint exception taken without a change in Exception level.	<a href="#">ISS encoding for an exception from a Breakpoint or Vector Catch debug exception</a>	
0b110010	Software Step exception from a lower Exception level.	<a href="#">ISS encoding for an exception from a Software Step exception</a>	
0b110011	Software Step exception taken without a change in Exception level.	<a href="#">ISS encoding for an exception from a Software Step exception</a>	
0b110100	Watchpoint from a lower Exception level, excluding Watchpoint Exceptions taken to	<a href="#">ISS encoding for an exception from a</a>	

	EL2 as a result of accesses generated associated with <a href="#">VNCR_EL2</a> as part of nested virtualization support. These Watchpoint Exceptions might be generated from Exception levels using any Execution state.	<a href="#">Watchpoint exception</a>	
0b110101	Watchpoint exceptions without a change in Exception level, or Watchpoint exceptions taken to EL2 as a result of accesses generated associated with <a href="#">VNCR_EL2</a> as part of nested virtualization support.	<a href="#">ISS encoding for an exception from a Watchpoint exception</a>	
0b111000	BKPT instruction execution in AArch32 state.	<a href="#">ISS encoding for an exception from execution of a Breakpoint instruction</a>	When AArch32 is supported at any Exception level
0b111010	Vector Catch exception from AArch32 state. The only case where a Vector Catch exception is taken to an Exception level that is using AArch64 is when the exception is routed to EL2 and EL2 is using AArch64.	<a href="#">ISS encoding for an exception from a Breakpoint or Vector Catch debug exception</a>	When AArch32 is supported at any Exception level
0b111100	BRK instruction execution in AArch64 state. This is reported in <a href="#">ESR_EL3</a> only if a BRK instruction is executed.	<a href="#">ISS encoding for an exception from execution of a Breakpoint instruction</a>	When AArch64 is supported at any Exception level

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

## IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: <ul style="list-style-type: none"> <li>• An SError interrupt.</li> <li>• An Instruction Abort exception.</li> <li>• A PC alignment fault exception.</li> <li>• An SP alignment fault exception.</li> <li>• A Data Abort exception for which the value of the ISV bit is 0.</li> <li>• An Illegal Execution state exception.</li> <li>• Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning: <ul style="list-style-type: none"> <li>◦ 0b0: 16-bit T32 BKPT instruction.</li> <li>◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction.</li> </ul> </li> <li>• An exception reported using EC value 0b000000.</li> </ul>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b1111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value 0b1111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

## ISS encoding for exceptions with an unknown reason

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

## Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions or System registers that are not implemented in the implementation.

- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR\\_EL1](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by [HCR\\_EL2](#).HCD or [SCR\\_EL3](#).HCE.
  - An SMC instruction when disabled by [SCR\\_EL3](#).SMD.
  - An HLT instruction when disabled by [EDSCR](#).HDE.
- Attempted execution of an MSR or MRS instruction to access [SP\\_EL0](#) when the value of [SPSel](#).SP is 0.
- Attempted execution of an MSR or MRS instruction using a [\\_EL12](#) register name when [HCR\\_EL2](#).E2H == 0.
- Attempted execution, in Debug state, of:
  - A DCPS1 instruction when the value of [HCR\\_EL2](#).TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  - A DCPS3 instruction when the value of [EDSCR](#).SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13\_mon. See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- In Debug state when the value of [EDSCR](#).SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to [SPSR\\_mon](#), [SP\\_mon](#), or [LR\\_mon](#).
- An exception that is taken to EL2 because the value of [HCR\\_EL2](#).TGE is 1 that, if the value of [HCR\\_EL2](#).TGE was 0 would have been reported with an ESR\_ELx.EC value of 0b000111.

## ISS encoding for an exception from a [WF\\*](#) ~~WFI~~ or ~~WFE~~ instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			TI

### CV, bit [24]

Condition code valid. ~~Possible values of this bit are:~~

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [19:21]

Reserved, RES0.

#### TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b000b0	WFI trapped.	
0b010b1	WFE trapped.	
0b10	WFIT trapped.	When FEAT_WFxT is implemented
0b11	WFET trapped.	When FEAT_WFxT is implemented

When this field resets to an architecturally FEAT\_WFxT UNKNOWN is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- [SCTLR\\_EL1](#).{nTWE, nTWI}.
- [HCR\\_EL2](#).{TWE, TWI}.
- [SCR\\_EL3](#).{TWE, TWI}.

## ISS encoding for an exception from an MCR or MRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc2		Opc1		CRn				Rt				CRm				Direction			

#### CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc2, bits [19:17]**

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc1, bits [16:14]**

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#) or [CPACR](#) using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HSTR\\_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL\\_EL2](#).EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL3](#).TCPAC, for accesses to [CPACR](#) from EL1 and EL2, and accesses to [HCPTR](#) from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- For information on other traps using EC value 0b000011, see 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- If FEAT\_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [CPACR\\_EL1](#).TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [HCR\\_EL2](#).TID0, for accesses to the [JIDR](#) register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.

- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and AArch-DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL3](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR\\_EL3](#).TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR\\_EL3](#).TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- [HCR\\_EL2](#).TID0, for accesses to the [FPSID](#) register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- [HCR\\_EL2](#).TID3, for accesses to registers in ID group 3 including [MVFR0](#), [MVFR1](#) and [MVFR2](#), VMRS access trapped to EL2.

## ISS encoding for an exception from an LD64BMCRR or ST64B\*MRRC instruction access

### CV, bit [24]

Condition-code valid. Possible values of this bit are:

### ISS, bits [24:0]

ISSCV	Meaning
0b0000000000000000000000000b0	ST64BVThe instructionCOND trapped, field is not valid.
0b0000000000000000000000000b1	ST64BV0The instructionCOND trapped, field is valid.
0b000000000000000000000000010	LD64B or ST64B instruction trapped.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.

- If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

#### **Opc1, bits [19:16]**

The Opc1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

#### **Bit [15]**

Reserved, RES0.

#### **Rt2, bits [14:10]**

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field resets to an architecturally UNKNOWN value.

#### **Rt, bits [9:5]**

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field resets to an architecturally UNKNOWN value.

#### **CRm, bits [4:1]**

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

#### **Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- **CNTKCTL\_EL1**.{ELOPTEN, EL0VTEN, ELOPCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.

- **PMUSERENR\_EL0**.{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **AMUSERENR\_EL0**.{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **HCR\_EL2**.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **HSTR\_EL2**.T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CNTHCTL\_EL2**.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **MDCR\_EL2**.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CPTR\_EL2**.TAM, for accesses to Activity Monitors registers registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **MDCR\_EL3**.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- **CPTR\_EL3**.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT\_FGT is implemented, **HDFGRTR\_EL2**.PMCCNTR\_EL0 for MRRC access and **HDFGWTR\_EL2**.PMCCNTR\_EL0 for MCRR access to **PMCCNTR** at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- **MDSCR\_EL1**.TDCC, for accesses to the Debug ROM registers **DBGDSAR** and **DBGDRAR** at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **MDCR\_EL2**.TDRA, for accesses to Debug ROM registers **DBGDRAR** and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **MDCR\_EL3**.TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- **CPACR\_EL1**.TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **CPTR\_EL2**.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **CPTR\_EL3**.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

#### Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

All other exceptions values taken are from reserved. AArch64, CV is set to 1.

## ISS encoding for an exception from an MCRRLDC or MRRCSTC access instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc1imm8				RES0	Rt2Rn				RtOffset				CRmAM				Direction		

### CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.

- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Opc1imm8, bits [19:16]

The Opc1imm8 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## BitBits [15:10]

Reserved, RES0.

## Rt2Rn, bits [149:105]

The Rt2Rn value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a Warm literal reset form of the LDC or STC instruction, this field resets to an architecturally UNKNOWN value.

This field resets to an architecturally UNKNOWN value.

## Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

**AM, bits [3:1]**

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to System memory, register space. MCRRSTC instruction.
0b1	Read from System memory, register space. MRRLDC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for generating the exception traps that are reported using EC value 0b0001000b000110:

- CNTKCTL\_EL1**.{ELOPTEN, EL0VTEN, ELOPCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- MDSCR\_EL1**.TDCC, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** trapped to EL1 or EL2.
- PMUSERENR\_EL0**.{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- MDCR\_EL2**.TDA, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** MCR or MRC access trapped to EL2.
- AMUSERENR\_EL0**.{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- MDCR\_EL3**.TDA, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** MCR or MRC access trapped to EL3.

- **HCR\_EL2**.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2. If implemented, **MDCR\_EL2**.TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and **MDCR\_EL3**.0b1111FEAT\_FGT).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL2.EL3.
- **HSTR\_EL2**.T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CNTHCTL\_EL2**.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **MDCR\_EL2**.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CPTR\_EL2**.TAM, for accesses to Activity Monitors registers registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **MDCR\_EL3**.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- **CPTR\_EL3**.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT\_FGT is implemented, **HDFGRTR\_EL2**.PMCCNTR\_EL0 for MRRC access and **HDFGWTR\_EL2**.PMCCNTR\_EL0 for MCRR access to **PMCCNTR** at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- **MDSCR\_EL1**.TDCC, for accesses to the Debug ROM registers **DBGDSAR** and **DBGDRAR** at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **MDCR\_EL2**.TDRA, for accesses to Debug ROM registers **DBGDRAR** and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **MDCR\_EL3**.TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- **CPACR\_EL1**.TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **CPTR\_EL2**.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **CPTR\_EL3**.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

#### Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

## ISS encoding for an exception from an LDCaccess to SVE, Advanced SIMD or STCfloating-point instructionfunctionality, resulting from the FPen and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				imm8RES0				RES0				Rn				Offset				AM		Direction	

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

### CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### imm8, Bits [19:12]

The immediate value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [11:10]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- CPACR\_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.
- CPTR\_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.
- CPTR\_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL3.

### Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Offset, bit [4]**

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AM, bits [3:1]**

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- [MDSCR\\_EL1](#).TDCC, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) trapped to EL1 or EL2.
- [MDCR\\_EL2](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL2.
- [MDCR\\_EL3](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL3.
- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

**ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the CPACR\_EL1.ZEN, FPENCPTR\_EL2.ZEN, and CPTR\_EL2.TZ, TFP or traps CPTR\_EL3.EZ**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CVRES0		COND													RES0									

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SVE SIMD System and registers, floating-point ZCR\_ELx System and registers. ID\_AA64ZFR0\_EL1.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

### CV, Bits bit [24:0]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [19:0]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value: 0b000111:

- CPTR\_EL3.EZ, for accesses to SVE functionality and registers from all Exception levels, trapped to EL3.
- CPACR\_EL1.FPENZEN, for accesses to SIMD SVE and registers floating-point at registers EL0 or EL1, trapped to EL1.EL2.
- CPTR\_EL2.TFPZEN, for accesses to SIMD SVE and registers floating-point at registers EL0, EL1, or EL2, trapped to EL2.
- CPTR\_EL3.CPTR\_EL2.TFPTZ, for accesses to SIMD SVE instructions and floating-point instructions that access SVE System registers at EL0, EL1, or EL2, trapped to EL3.EL2.

## ISS encoding for an exception from an accessIllegal toExecution SVE functionality state, resulting or from a CPACR\_EL1.ZEN, PC CPTR\_EL2.ZEN, or CPTR\_EL2.TZ, SP or alignment CPTR\_EL3.EZ fault

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE System register, ZCR\_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

### Bits [24:0]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b011001:

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

- CPACR\_EL1.ZEN, for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL2.
- CPTR\_EL2.ZEN, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- CPTR\_EL2.TZ, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- CPTR\_EL3.EZ, for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

## ISS encoding for an exception from an HVC Illegal Execution state, or a SVC PC instruction or SP alignment fault execution

### Bits [24:16]

### Bits [24:0]

Reserved, RES0.

### imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT\_FGT is implemented, [HFGITR\\_EL2](#).{SVC\_EL1, SVC\_EL0} control fine-grained traps on SVC execution.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions, see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

## ISS encoding for an exception from HVC SMC or instruction SVC execution in execution AArch32 state

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR\\_EL2](#).TSC is 1, the ISS encoding is as shown in the diagram.

### CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

### CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

#### Note

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

This field resets to an architecturally UNKNOWN value.

### Bits [18:0]

### Bits [24:16]

Reserved, RES0.

HCR\_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

### imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT\_FGT is implemented, [HFGITR\\_EL2](#).{SVC\_EL1, SVC\_EL0} control fine-grained traps on SVC execution.

## ISS encoding for an exception from SMC instruction execution in AArch32AArch64 state

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR\\_EL2](#).TSC is 1, the ISS encoding is as shown in the diagram.

### CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CCKNOWNPASS, bit [19]**

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

**Note**

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

**Bits [24:16]**

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [18:0]**

Reserved, RES0.

**imm16, bits [15:0]**

The value of the immediate field from the issued SMC instruction.

This field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR\_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

HCR\_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

## ISS encoding for an exception from **SMCMSR, MRS, or System** instruction execution in AArch64 state

**Bits [24:22]****Bits [24:16]**

Reserved, RES0.

**imm16Op0, bits [15:0]**

The **Op0** value of the immediate field from the issued **SMC** instruction.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Op2, bits [19:17]**

The **Op2** value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**Op1, bits [16:14]**

The **Op1** value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The **CRn** value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The **Rt** value from the issued instruction, the general-purpose register used for the transfer.

This field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The **CRm** value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

This field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- **SCTLR\_EL1**.UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR\_EL1**.UCT, for accesses to **CTR\_EL0** using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR\_EL1**.DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **SCTLR\_EL1**.UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **CPACR\_EL1**.TIA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- **MDSCR\_EL1**.TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TTRF, for accesses to the trace filter register, [TRFCR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL\\_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).AT, for execution of AT S1E\* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- [SCR\\_EL3](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3](#).ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TCPAC, for accesses to [CPTR\\_EL2](#) and [CPACR\\_EL1](#) using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TTRF, for accesses to the filter trace control registers, [TRFCR\\_EL1](#) and [TRFCR\\_EL2](#), using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.

- If FEAT\_EVT is implemented the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - HCR\_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - HCR2.{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT\_FGT is implemented:
  - SCR\_EL3.FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - HFGTR\_EL2 for reads and HFGWTR\_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - HFGITR\_EL2 for execution of system instructions, MSR or MRS access trapped to EL2
  - HDEGTR\_EL2 for reads and HDEGWTR\_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - HAFGTR\_EL2 for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR\_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

**ISS encoding for an exception IMPLEMENTATION from DEFINED MSR, exception MRS, to or System instruction execution in AArch64 state EL3**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0 IMPLEMENTATION DEFINED			Op0		Op2		Op1		CRn				Rt				CRm				Direction			

#### IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

#### Bits [24:22]

Reserved, RES0.

#### Op0, bits [21:20]

The Op0 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Op2, bits [19:17]

The Op2 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Op1, bits [16:14]

The Op1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- [SCTLR\\_EL1](#).UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UCT, for accesses to [CTR\\_EL0](#) using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [CPACR\\_EL1](#).TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.

- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TTRF, for accesses to the trace filter control register, [TRFCR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL\\_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).AT, for execution of AT S1E\* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- [SCR\\_EL3](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3](#).ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TCPAC, for accesses to [CPTR\\_EL2](#) and [CPACR\\_EL1](#) using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TTRF, for accesses to the trace filter control registers, [TRFCR\\_EL1](#) and [TRFCR\\_EL2](#), using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT\_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - [HCR\\_EL2](#).{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - [HCR2](#).{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT\_FGT is implemented:
  - [SCR\\_EL3](#).FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - [HFGTR\\_EL2](#) for reads and [HFGWTR\\_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - [HFGITR\\_EL2](#) for execution of system instructions, MSR or MRS access trapped to EL2
  - [HDFGRTR\\_EL2](#) for reads and [HDFGWTR\\_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - [HAFGRTR\\_EL2](#) for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

ISS encoding for an **IMPLEMENTATION exception** **DEFINED** from **exception** **an** **to** **Instruction** **EL3** **Abort**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																								

**Bits [24:13]**

Reserved, RES0.

**SET, bits [12:11]**

When FEAT\_RAS is implemented:

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception. The possible values of this field are:

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is only valid if the IFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

**Bit [8]**

Reserved, RES0.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk.

<b>S1PTW</b>	<b>Meaning</b>
<b>0b0</b>	Fault not on a stage 2 translation for a stage 1 translation table walk.
<b>0b1</b>	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

#### Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

## IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from **ana** InstructionData Abort

### ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults reported in ESR\_EL2 except the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

ISV is 0 for all faults reported in ESR\_EL1 or ESR\_EL3.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When the RAS Extension is not implemented, the value of ISV on a synchronous External abort on a stage 2 translation table walk is IMPLEMENTATION DEFINED.

When FEAT\_MTE is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR\_ELx.FNV is 0 and FAR\_ELx is valid.

This field resets to an architecturally UNKNOWN value.

### SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

### SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

### SRT, bits [20:16]

Syndrome Register Transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

### SF, bit [15]

Width of the register accessed by the instruction is Sixty-Four. When ISV is 1, the possible values of this bit are:

SF	Meaning
0b0	Instruction loads/stores a 32-bit wide register.
0b1	Instruction loads/stores a 64-bit wide register.

#### Note

This field specifies the register width identified by the instruction, not the Execution state.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

### AR, bit [14]

When ISV == '1':

Acquire/Release. The possible values of this bit are:

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Otherwise:

#### Bits [24:13]

Reserved, RES0.

#### SETVNCR, bits [12:11]

When FEAT\_RAS is implemented:

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

Indicates that the fault came from use of VNCR\_EL2 register by EL1 code.

SETVNCR	Meaning
0b00	Recoverable state (UER). The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b10	Uncontainable (UC). The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b11	Restartable state (UEO).

This field is 0 in ESR\_EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

#### SET, bits [12:11]

When FEAT\_RAS is implemented:

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception. The possible values of this field are:

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

#### Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the **IFSC** code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The <b>DC ZVA</b> , <b>DC GVA</b> , and <b>DC GZVA</b> instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

This field resets to an architecturally UNKNOWN value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**BitCM, bit [8]**

Reserved. Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction: RES0.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**BitWnR, bit [6]**

Reserved. Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are: RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code.

IFSCWnR	Meaning	Applies when
0b0000000b0	Address size fault, by level 0 instruction of reading translation from ora translation memory table base register location.	
0b0000010b1	Address size fault, by level 1 instruction writing to a memory location.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or	When FEAT_RAS is not implemented

	hardware update of translation table, level 1.	
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

This field resets to an architecturally UNKNOWN value.

#### DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

### Note

Because Access flag faults and Permission faults can **only** result **only** from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from a **Datatrapped** **Abortfloating-point** **exception**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	SAS	SSE			SRT			SF	AR	VNCR	Bits[12:11]	FnV	EA	CM	S1PTW	WnR					DFSC			

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

### ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR\_EL2, ISV is 1 when FEAT\_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR\_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR\_EL1 or ESR\_EL3, ISV is 1 when FEAT\_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR\_EL1 or ESR\_EL3.

When FEAT\_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT\_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT\_MTE is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR\_ELx.FNV is 0 and FAR\_ELx is valid.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SAS, bits [23:22]****When ISV == '1':**

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV							RES0							VECITR		IDF	RES0	IXF	UFF	OFF	DZF		IOF

**Bit [24]**

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SSETFV, bit [21:23]****When ISV == '1':**

Syndrome Trapped Sign Fault Extend. Valid For bit. a Indicates by whether the IDF, halfword IXF, or UFF, word OFF, load operation DZF, indicates and whether IOF the bits data hold item valid must information be about sign trapped extended floating-point exceptions. The possible values of this bit are:

SSETFV	Meaning
0b0	Sign-extension not required. The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	Data item must be sign-extended. One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information see 'Floating-point exceptions and exception traps'.

When It is FEAT\_LS64 IMPLEMENTATION DEFINED is whether implemented, this if field is memory set accesste generated 0 by on an ST64BV, exception ST64BV0, generated ST64B, by ora LD64Btrapped instructionfloating generatespoint aexception Datafrom Abort for a Translationvector fault, Access flag fault, or Permission fault, then this field is 0.instruction.

**Note**

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

This field resets to an architecturally UNKNOWN value.

**Bits [22:11]**

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SRTVECTR, bits [20:16]****When ISV == '1':**

Syndromes For Register Transfer, trapped. When floating-point exception from an instruction executed in AArch32 state this field is FEAT\_LS64RES1 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xt.

If for the exception trapped, was floating-point taken exception from an Exception instruction level executed that in is AArch64 using state AArch32, this then field this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' UNKNOWN.

This field is resets to an architecturally UNKNOWN when the value of ISV is value. UNKNOWN.

**IDF, bit [7]**

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SF, bit [15]****When ISV == '1':**

Width of the register accessed by the instruction is Sixty-Four.

SFIDF	Meaning
0b0	InstructionInput loads/storesdenormal a floating-point 32-bitexception widehas register not occurred.
0b1	InstructionInput loads/storesdenormal a floating-point 64-bitexception wideoccurred register during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

**Bits [6:5]****Note**

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### ARIXF, bit [144]

When ISV == '1':

Acquire/Release.

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

ARIXF	Meaning
0b0	InstructionInexact didfloating-point notexception havehas acquire/releasenot semantics.occurred.
0b1	InstructionInexact didfloating-point haveexception acquire/releaseoccurred semantics.during execution of the reported instruction.

WhenThis field resets to an architecturally FEAT\_LS64UNKNOWN is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.value.

#### UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### VNCR, bit [13]

When FEAT\_NV2 is implemented:

Indicates that the fault came from use of VNCR\_EL2 register by EL1 code.

VNCRUFF	Meaning
0b0	TheUnderflow faultfloating-point wasexception has not generated by the use ofoccurred. VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b1	TheUnderflow faultfloating-point wasexception generatedoccurred byduring execution of the use reported ofinstruction. VNCR_EL2, by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR\_EL1.

This field resets to an architecturally UNKNOWN value.

**OFF, bit [2]**

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SET, bits [12:11]****When FEAT\_RAS is implemented and FEAT\_LS64 is not implemented:**

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception.

SET/OFF	Meaning
0b000b0	Recoverable Overflow state floating-point exception has not occurred.
0b100b1	Uncontainable Overflow (UC) floating-point exception occurred during execution of the reported instruction.
0b11	Restartable state (UEO).

All other values are reserved.

This field resets to an architecturally UNKNOWN value.

**DZF, bit [1]**

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When FEAT\_LS64 is implemented:**

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

LST/DZF	Meaning
0b010b0	An Divide ST64BV by instruction Zero generated floating-point the exception Data has Abort not occurred.
0b100b1	An Divide LD64B by or Zero ST64B floating-point instruction exception generated occurred during execution of the Data reported Abort instruction.
0b11	An ST64BV0 instruction generated the Data Abort.

All other values are reserved.

This field resets to an architecturally UNKNOWN value.

**IOF, bit [0]**

Invalid Operation floating-point exception trapped bit. If the TFF field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

This field is valid only if the DFSC code is 0b110101. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnVIOF	Meaning
0b0	FARInvalid isOperation valid, floating-point exception has not occurred.
0b1	FARInvalid isOperation notfloating-point valid, exception andoccurred holdsduring anexecution of the reported instruction. UNKNOWN value.

This field isresets validto onlyan if the DFSC code isarchitecturally 0b010000UNKNOWN. It is RES0 for all other aborts.value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the [FPCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the [FPSCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CM, bit [8]**

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The <a href="#">DC ZVA</a> , <a href="#">DC GVA</a> , and <a href="#">DC GZVA</a> instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk.

<b>S1PTW</b>	<b>Meaning</b>
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**WnR, bit [6]**

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

<b>WnR</b>	<b>Meaning</b>
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DFSC, bits [5:0]**

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented

0b100001	Alignment fault.	
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

#### Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exceptionError from a trapped floating-point exceptioninterrupt

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	IDS	TFV	RES0					RES0	IESB					VEC	ITRA	ET	IDFEA	RES0	IXFDF	SC	UFF	OFF	DZF	IOF

### IDS, bit [24]

IMPLEMENTATION DEFINED syndrome. Possible values of this bit are:

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
<b>Note</b> If the RAS Extension is not implemented bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

#### Note

This field was previously called ISV.

This field resets to an architecturally UNKNOWN value.

### Bits [23:14]

#### Bit [24]

Reserved, RES0.

**TFVIESB, bit [23:13]****When FEAT\_IESB is implemented:**

Trapped Implicit Fault error Valid synchronization bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions event.

TFVIESB	Meaning
0b0	The IDF, Error IXF, interrupt UFF, was OFF, either DZF, not and synchronized IOF by bits the do implicit not error hold synchronization valid event information or about not trapped taken floating-point exceptions and are immediately UNKNOWN.
0b1	One The or Error more interrupt floating-point was exceptions synchronized occurred by during an operation performed while executing the reported implicit instruction. error The synchronization IDF, event IXF, UFF, OFF, DZF, and IOF taken bits indicate trapped floating-point exceptions that occurred. For more information, see immediately. 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

This field resets to an architecturally UNKNOWN value.

**Otherwise:****Note**

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [22:11]**

Reserved, RES0.

**VECITRAET, bits [12:10:8]****When FEAT\_RAS is implemented:**

For Asynchronous a Error trapped floating-point exception from an instruction executed in AArch32 state this field is Type. RES1.

For When a trapped floating-point exception from an instruction executed in AArch64 state this field DFSC is UNKNOWN 0b010001., describes the PE error state after taking the SError interrupt exception. The possible values of this field are:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IDF, bit [7]**

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).
IDFAET	Meaning
0b00b000	InputUncontainable denormal floating-point exception has not occurred.(UC).
0b10b001	InputUnrecoverable denormalstate floating-point exception occurred during execution of the reported instruction.(UEU).

OnAll aother Warmvalues reset,are this field resets to an architecturallyreserved. UNKNOWN value.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

#### Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

This field resets to an architecturally UNKNOWN value.

Otherwise:

#### Bits [6:5]

Reserved, RES0.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

#### Bits [8:6]

Reserved, RES0.

#### DFSC, bits [5:0]

When FEAT\_RAS is implemented:

Data Fault Status Code.

#### IXFEA, bit [49]

When FEAT\_RAS is implemented:

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION-DEFINED classification of External aborts.

IXFDFSC	Meaning
0b00b0000000	InexactUncategorized floating-point exception has not occurred.
0b10b010001	InexactAsynchronous floating-pointError exception occurred during execution of the reported instruction.

OnAll aother Warmvalues reset,are this field resets to an architecturallyreserved, UNKNOWN value.

This field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the **FPCR**.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the **FPSCR**.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

## ISS encoding for an SError exception interrupt from a Breakpoint or Vector Catch debug exception

### Bits [24:6]

#### IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
<b>Note</b> If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

#### Note

This field was previously called ISV.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [23:14]

Reserved, RES0.

### IESBIFSC, bits [13:0]

When FEAT\_IESB is implemented:

Implicit Instruction error Fault synchronization Status event Code.

IESBIFSC	Meaning
0b00b100010	The Debug SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is resets valid to only an if the DFSC code is architecturally 0b010001UNKNOWN. It is RES0 for all other errors.value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**AET, bits [12:10]****When FEAT\_RAS is implemented:**

Asynchronous Error Type.

When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

AET	Meaning
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EA, bit [9]****When FEAT\_RAS is implemented:**

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [8:6]**

Reserved, RES0.

**DFSC, bits [5:0]****When FEAT\_RAS is implemented:**

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### ISS encoding for an exception from a BreakpointSoftware or Vector Catch debugStep exception

#### ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

This field resets to an architecturally UNKNOWN value.

#### Bits [23:7]

#### Bits [24:6]

Reserved, RES0.

#### EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

This field resets to an architecturally UNKNOWN value.

#### IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

For more information about generating these exceptions, see 'Software Step exceptions'.

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

## ISS encoding for an exception from a Software Step Watchpoint exception

### Bits [24:15]

Reserved, RES0.

### Bit [14]

Reserved, RES0.

### VNCR, bit [13]

When FEAT\_NV2 is implemented:

Indicates that the watchpoint came from use of VNCR\_EL2 register by EL1 code.

### ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	VNCR	Meaning
0b0		EX bit is RES0. The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1		EXThe bitwatchpoint iswas valid.generated by the use of VNCR_EL2 by EL1 code.

SeeThis thefield EXis bit0 descriptionin for more information.ESR\_EL1.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

Otherwise:

### Bits [23:7]

Reserved, RES0.

### CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction.

### EX, Bits bit [6:12:9]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

Reserved, RES0.

EXCM	Meaning
0b0	An instruction Watchpoint exception other than a Load-Exclusive generated instruction was stepped. execution of one of the System instructions identified in the description of value 1.
0b1	A Load-Exclusive Watchpoint instruction exception was stepped. generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

If this field ISV resets bit is set to 0, and this bit is architecturally RES0 UNKNOWN, indicating no syndrome data is available.

#### Bit [7]

Reserved, RES0.

#### WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### IFSC, bits [5:0]

Instruction Fault Status Code.

0b1	Watchpoint exception caused by an instruction writing to a memory location.
IFSCWnR	Meaning
0b1000100b0	Debug Watchpoint exception. exception caused by an instruction reading from a memory location.

On a Watchpoint Warm exceptions reset on cache maintenance and address translation instructions, this field bit resets always to returns an architecturally value of 1, UNKNOWN value.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

This field resets to an architecturally UNKNOWN value.

#### DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

For more information about generating these exceptions, see 'Software Step exceptions'.

## ISS encoding for an exception from execution of a Watchpoint Breakpoint exception instruction

### Bits [24:16]

### Bits [24:15]

Reserved, RES0.

### Bit Comment, bits [14:0]

Reserved Set to the instruction comment field value, zero-extended as necessary, RES0.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

### VNCR, bit [13]

#### When FEAT\_NV2 is implemented:

Indicates that the watchpoint came from use of VNCR\_EL2 register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR\_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### Bits [12:9]

Reserved, RES0.

### CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [7]

Reserved, RES0.

### WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

### ISS encoding for an exception from execution ERET, of ERETA or Breakpoint ERETA instruction

This EC value applies when FEAT\_FGT is implemented, or when HCR\_EL2.NV is 1.

### Bits [24:2]

### Bits [24:16]

Reserved, RES0.

### Comment ERET, bits [15:0]

SetIndicates to whether the an ERET or ERETA\* instruction comment was field trapped value, to zero EL2. extendedPossible as values necessary are:

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

This field resets to an architecturally UNKNOWN value.

### ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2. Possible values are:

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [HCR\\_EL2.NV](#).

If FEAT\_FGT is implemented, [HFGITR\\_EL2](#).ERET controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

## ISS encoding for an exception from an Branch ERET, Target ERETAA, or ERETAB instruction

This EC value applies when FEAT\_FGT is implemented, or when [HCR\\_EL2.NV](#) is 1.

### Bits [24:2]

Reserved, RES0.

### ERETBT, bit [1:0]

Indicates whether field [PSTATE.BTYPE](#) was value trapped that generated EL2 the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [HCR\\_EL2.NV](#).

If FEAT\_FGT is implemented, [HFGITR\\_EL2.ERET](#) controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

## ISS encoding for an exception from Brancha TargetPointer IdentificationAuthentication instruction when HCR\_EL2.API == 0 || SCR\_EL3.API == 0

Bits [24:0]

Bits [24:2]

Reserved, RES0.

For more information about generating these exceptions, see:

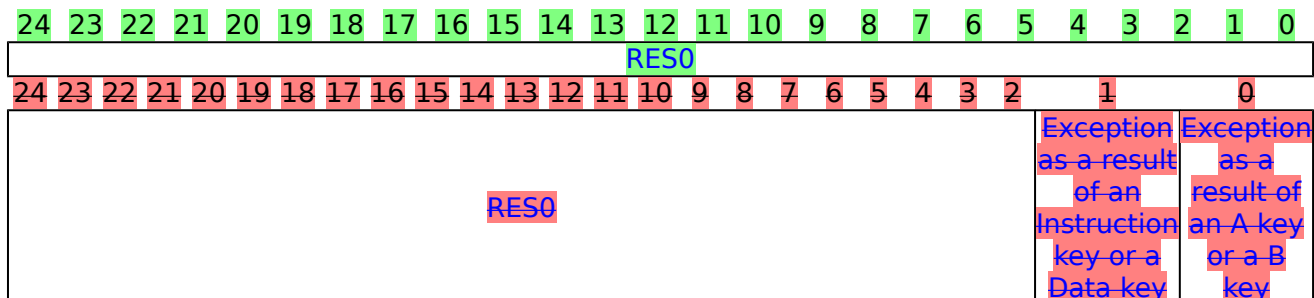

- [HCR\\_EL2.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- [SCR\\_EL3.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

BTYP, bits [1:0]

This field is set to the PSTATE.BTYP value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

## ISS encoding for an exception from a Pointer Authentication instruction when authentication HCR\_EL2.API == 0 || SCR\_EL3.API == 0 failure

Bits [24:2]

Bits [24:0]

Reserved, RES0.

**Bit [1]**

This field indicates whether the exception is as a result of an Instruction key or a Data key.

	Meaning
0b0	Instruction Key.
0b1	Data Key.

This field resets to an architecturally UNKNOWN value.

**Bit [0]**

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

This field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETA, ERETB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

For more information about generating these exceptions, see:

- [HCR\\_EL2.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- [SCR\\_EL3.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

## ISS encoding for an exception from a Pointer Authentication instruction authentication failure

**Bits [24:2]**

Reserved, RES0.

**Bit [1]**

This field indicates whether the exception is as a result of an Instruction key or a Data key.

	Meaning
0b0	Instruction Key.
0b1	Data Key.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETA, ERETB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

## Accessing the ESR\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic ESR\_EL2 or ESR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, ESR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0010	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return ESR_EL1;
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return ESR_EL2;
elsif PSTATE.EL == EL3 then
    return ESR_EL2;

```

MSR ESR\_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0010	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        ESR_EL1 = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then

# ESR\_EL3, Exception Syndrome Register (EL3)

The ESR\_EL3 characteristics are:

## Purpose

Holds syndrome information for an exception taken to EL3.

## Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to ESR\_EL3 are UNDEFINED.

## Attributes

ESR\_EL3 is a 64-bit register.

## Field descriptions

The ESR\_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															ISS2
EC						IL	ISS																								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ESR\_EL3 is made UNKNOWN as a result of an exception return from EL3.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL3, the value of ESR\_EL3 is UNKNOWN. The value written to ESR\_EL3 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

### Bits [63:37:32]

Reserved, RES0.

### ISS2, bits [36:32]

#### When FEAT\_LS64 is implemented:

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

#### Otherwise:

Reserved, RES0.

### EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	<a href="#">ISS encoding for exceptions with an unknown reason</a>	
0b000001	Trapped <del>WF*WFI or WFE</del> instruction execution. Conditional <del>WF*WFE and WFI</del> instructions that fail their condition code check do not cause an exception.	<a href="#">ISS encoding for an exception from a WF* instruction</a> <a href="#">ISS encoding for an exception from a WFI or WFE instruction</a>	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an MCR or MRC access</a>	When AArch32 is supported at any Exception level
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an MCRR or MRRC access</a>	When AArch32 is supported at any Exception level
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	<a href="#">ISS encoding for an exception from an MCR or MRC access</a>	When AArch32 is supported at any Exception level
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: <ul style="list-style-type: none"> <li>An STC to write data to memory from <a href="#">DBGDTRRXint.</a></li> <li>An LDC to read data from memory to <a href="#">DBGDTRTXint.</a></li> </ul>	<a href="#">ISS encoding for an exception from an LDC or STC instruction</a>	When AArch32 is supported at any Exception level
0b000111	Access to SVE, Advanced SIMD, or floating-point functionality trapped by <a href="#">CPACR_EL1.FPEN</a> , <a href="#">CPTR_EL2.FPEN</a> , <a href="#">CPTR_EL2.TFP</a> , or <a href="#">CPTR_EL3.TFP</a> control. Excludes exceptions resulting from <a href="#">CPACR_EL1</a> when the value of <a href="#">HCR_EL2.TGE</a> is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'The EC used to report an exception routed to	<a href="#">ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps</a>	

0b001001	EL2 because HCR_EL2.TGE is 1'. Trapped use of a Pointer authentication instruction because HCR_EL2.API == 0    SCR_EL3.API == 0.	<a href="#">ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0    SCR_EL3.API == 0</a>	When FEAT_PAuth is implemented
0b001010	Trapped execution of an LD64B, ST64B, ST64BV, or ST64BV0 instruction.	<a href="#">ISS encoding for an exception from an LD64B or ST64B* instruction</a>	When FEAT_LS64 is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	<a href="#">ISS encoding for an exception from an MCRR or MRRC access</a>	When AArch32 is supported at any Exception level
0b001101	Branch Target Exception.	<a href="#">ISS encoding for an exception from Branch Target Identification instruction</a>	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>	
0b010011	SMC instruction execution in AArch32 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of <a href="#">HCR_EL2.TSC</a> is 1.	<a href="#">ISS encoding for an exception from SMC instruction execution in AArch32 state</a>	When AArch32 is supported at any Exception level
0b010101	SVC instruction execution in AArch64 state.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch64 is supported at any Exception level
0b010110	HVC instruction execution in AArch64 state, when HVC is not disabled.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch64 is supported at any Exception level
0b010111	SMC instruction execution in AArch64 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of <a href="#">HCR_EL2.TSC</a> is 1.	<a href="#">ISS encoding for an exception from SMC instruction execution in AArch64 state</a>	When AArch64 is supported at any Exception level
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000,	<a href="#">ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state</a>	When AArch64 is supported at any Exception level

	0b000001 or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.		
0b011001	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ</a>	When FEAT_SVE is implemented
0b011100	Exception from a Pointer Authentication instruction authentication failure	<a href="#">ISS encoding for an exception from a Pointer Authentication instruction authentication failure</a>	When FEAT_FPAC is implemented
0b011111	IMPLEMENTATION DEFINED exception to EL3.	<a href="#">ISS encoding for an IMPLEMENTATION DEFINED exception to EL3</a>	
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug- related debug related exceptions.	<a href="#">ISS encoding for an exception from an Instruction Abort</a>	
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug- related debug related exceptions.	<a href="#">ISS encoding for an exception from an Instruction Abort</a>	
0b100010	PC alignment fault exception.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>	

0b100100	Data Abort from a lower Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for <del>debug-related</del> exceptions.	<a href="#">ISS encoding for an exception from a Data Abort</a>	
0b100101	Data Abort taken without a change in Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for <del>debug-related</del> exceptions.	<a href="#">ISS encoding for an exception from a Data Abort</a>	
0b100110	SP alignment fault exception.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>	
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	<a href="#">ISS encoding for an exception from a trapped floating-point exception</a>	When AArch64 is supported at any Exception level
0b101111	SError interrupt.	<a href="#">ISS encoding for an SError interrupt</a>	
0b111100	BRK instruction execution in AArch64 state. This is reported in <a href="#">ESR_EL3</a> only if a	<a href="#">ISS encoding for an exception from execution of a Breakpoint instruction</a>	When AArch64 is supported at any Exception level

BRK instruction is executed.

All other EC values are reserved by Arm, and:

- Unused values in the range 0b0000000 - 0b1011100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b1011101 - 0b1111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: <ul style="list-style-type: none"> <li>• An SError interrupt.</li> <li>• An Instruction Abort exception.</li> <li>• A PC alignment fault exception.</li> <li>• An SP alignment fault exception.</li> <li>• A Data Abort exception for which the value of the ISV bit is 0.</li> <li>• An Illegal Execution state exception.</li> <li>• Any debug exception except for Breakpoint instruction exceptions.</li> <li>• An exception reported using EC value 0b0000000.</li> </ul>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value 0b11111.

When the EC field is 0b0000000, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

## ISS encoding for exceptions with an unknown reason

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												

## Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR\\_EL1](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by [HCR\\_EL2](#).HCD or [SCR\\_EL3](#).HCE.
  - An SMC instruction when disabled by [SCR\\_EL3](#).SMD.
  - An HLT instruction when disabled by [EDSCR](#).HDE.
- Attempted execution of an MSR or MRS instruction to access [SP\\_EL0](#) when the value of [SPSel](#).SP is 0.
- Attempted execution of an MSR or MRS instruction using a [\\_EL12](#) register name when [HCR\\_EL2](#).E2H == 0.
- Attempted execution, in Debug state, of:
  - A DCPS1 instruction when the value of [HCR\\_EL2](#).TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  - A DCPS3 instruction when the value of [EDSCR](#).SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13\_mon. See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- In Debug state when the value of [EDSCR](#).SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to [SPSR\\_mon](#), [SP\\_mon](#), or [LR\\_mon](#).
- An exception that is taken to EL2 because the value of [HCR\\_EL2](#).TGE is 1 that, if the value of [HCR\\_EL2](#).TGE was 0 would have been reported with an ESR\_ELx.EC value of 0b000111.

## ISS encoding for an exception from a [WF\\*](#)~~WFI~~ or ~~WFE~~ instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			TI

### CV, bit [24]

Condition code valid. [Possible values of this bit are:](#)

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bits [19:21]

Reserved, RES0.

## TI, bit [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b00	WFI trapped.	
0b01	WFE trapped.	
0b10	WFIT trapped.	When FEAT_WFxT is implemented
0b11	WFET trapped.	When FEAT_WFxT is implemented

When this field resets to an architecturally UNKNOWN is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- [SCTLR\\_EL1](#).{nTWE, nTWI}.
- [HCR\\_EL2](#).{TWE, TWI}.
- [SCR\\_EL3](#).{TWE, TWI}.

## ISS encoding for an exception from an MCR or MRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc2		Opc1		CRn				Rt				CRm				Direction			

## CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- [CNTKCTL\\_EL1](#).{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#) or [CPACR](#) using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HSTR\\_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL\\_EL2](#).EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL3](#).TCPAC, for accesses to [CPACR](#) from EL1 and EL2, and accesses to [HCPTR](#) from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- For information on other traps using EC value 0b000011, see 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- If FEAT\_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [CPACR\\_EL1](#).TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [HCR\\_EL2](#).TID0, for accesses to the [JIDR](#) register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and AArch-DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL3](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR\\_EL3](#).TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR\\_EL3](#).TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- [HCR\\_EL2](#).TID0, for accesses to the [FPSID](#) register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- [HCR\\_EL2](#).TID3, for accesses to registers in ID group 3 including [MVFR0](#), [MVFR1](#) and [MVFR2](#), VMRS access trapped to EL2.

## ISS encoding for an exception from an LD64B\*MCRR or ST64B\*MRRC instruction access

### CV, bit [24]

Condition code valid. Possible values of this bit are:

### ISS, bits [24:0]

ISSCV	Meaning
0b0000000000000000000000000b0	ST64BVThe instructionCOND trapped. field is not valid.
0b0000000000000000000000000b1	ST64BV0The instructionCOND trapped. field is valid.
0b000000000000000000000000010	LD64B or ST64B instruction trapped.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field resets to an architecturally UNKNOWN value.

**Opc1, bits [19:16]**

The Opc1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**Bit [15]**

Reserved, RES0.

**Rt2, bits [14:10]**

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

This field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [HSTR\\_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL\\_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT\_FGT is implemented, [HDFGRTR\\_EL2](#).PMCCNTR\_EL0 for MRRC access and [HDFGWTR\\_EL2](#).PMCCNTR\_EL0 for MCRR access to [PMCCNTR](#) at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug ROM registers [DBGDSAR](#) and [DBGDRAR](#) at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL3](#).TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- [CPACR\\_EL1](#).TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [CPTR\\_EL2](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL3](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

#### Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

All other exceptions values taken are from reserved. AArch64, CV is set to 1.

## ISS encoding for an exception from an MCRRLDC or MRRCSTC access instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc1imm8				RES0	Rt2Rn				RtOffset				CRmAM				Direction		

**CV, bit [24]**

Condition code valid. ~~Possible values of this bit are:~~

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**Opc1imm8, bits [19:16]**

The ~~Opc1~~immediate value from the issued instruction.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**BitBits [15:10]**

Reserved, RES0.

**Rt2Rn, bits [149:105]**

The ~~Rt2Rn~~ value from the issued instruction, the ~~second~~ general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On ~~This~~ field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a ~~Warm~~literal ~~reset~~form of the LDC or STC instruction, this field ~~resets to an~~ architecturally ~~is~~ UNKNOWN ~~value.~~

This field resets to an architecturally UNKNOWN value.

#### Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

#### AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

This field resets to an architecturally UNKNOWN value.

#### Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### CRm, bits [4:1]

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to System memory, register space. MCRRSTC instruction.
0b1	Read from System memory, register space. MRRCLDC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for generating the exception traps that are reported using EC value 0b0001000b000110:

- **CNTKCTL\_EL1**.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **MDSCR\_EL1**.TDCC, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** trapped to EL1 or EL2.
- **PMUSERENR\_EL0**.{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **MDCR\_EL2**.TDA, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** MCR or MRC access trapped to EL2.
- **AMUSERENR\_EL0**.{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- **MDCR\_EL3**.TDA, for accesses using AArch32 state, LDC access to **DBGDTRTXint** or STC access to **DBGDTRRXint** MCR or MRC access trapped to EL3.
- **HCR\_EL2**.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == If is implemented, **MDCR\_EL2**.TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and **MDCR\_EL3**0b1111FEAT\_FGT).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL2.EL3.
- **HSTR\_EL2**.T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CNTHCTL\_EL2**.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **MDCR\_EL2**.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **CPTR\_EL2**.TAM, for accesses to Activity Monitors registers registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- **MDCR\_EL3**.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- **CPTR\_EL3**.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT\_FGT is implemented, **HDFGRTR\_EL2**.PMCCNTR\_EL0 for MRRC access and **HDFGWTR\_EL2**.PMCCNTR\_EL0 for MCRR access to **PMCCNTR** at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- **MDSCR\_EL1**.TDCC, for accesses to the Debug ROM registers **DBGDSAR** and **DBGDRAR** at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **MDCR\_EL2**.TDRA, for accesses to Debug ROM registers **DBGDRAR** and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **MDCR\_EL3**.TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- **CPACR\_EL1**.TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- **CPTR\_EL2**.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- **CPTR\_EL3**.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

#### Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

### ISS encoding for an exception from an LDCaccess to SVE, Advanced SIMD or STCfloating-point instructionfunctionality, resulting from the FPEN and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				imm8RES0				RES0				Rn				Offset				AM		Direction	

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.

- ~~Accesses to the Advanced SIMD and floating-point System registers.~~

~~For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.~~

## CV, bit [24]

Condition code valid. ~~Possible values of this bit are:~~

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

## COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

## imm8, ~~Bits~~ bits [19:120]

The immediate value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bits [11:10]

Reserved, RES0.

~~The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:~~

- ~~CPACR\_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.~~
- ~~CPTR\_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.~~
- ~~CPTR\_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL3.~~

**Rn, bits [9:5]**

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Offset, bit [4]**

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AM, bits [3:1]**

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- [MDSCR\\_EL1.TDCC](#), for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) trapped to EL1 or EL2.
- [MDCR\\_EL2.TDA](#), for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL2.
- [MDCR\\_EL3.TDA](#), for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL3.

- If FEAT\_FGT is implemented, **MDCR\_EL2.TDCC** for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and **MDCR\_EL3.TDCC** for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

## ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the CPACR\_EL1.ZEN, FPENCPTR\_EL2.ZEN, and CPTR\_EL2.TZ, TFP or traps CPTR\_EL3.EZ

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SVE SIMD System and registers, floating-point ZCR\_ELx System and registers, ID\_AA64ZFR0\_EL1.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

### CV, Bits bit [24:0]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:0]**

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value: 0b000111:

- CPTR\_EL3.EZ, for accesses to SVE functionality and registers from all Exception levels, trapped to EL3.
- CPACR\_EL1.FPENZEN, for accesses to SIMD/SVE and registers floating-point at registers EL0 or EL1, trapped to EL1/EL2.
- CPTR\_EL2.TFPZEN, for accesses to SIMD/SVE and registers floating-point at registers EL0, EL1, or EL2, trapped to EL2.
- CPTR\_EL3/CPTR\_EL2.TFPTZ, for accesses to SIMD/SVE instructions and floating-point instructions that access SVE System registers at EL0, EL1, or EL2, trapped to EL3/EL2.

**ISS encoding for an exception from an access/illegal to Execution SVE functionality state, resulting from a CPACR\_EL1.ZEN, PC CPTR\_EL2.ZEN, or CPTR\_EL2.TZ, SP or alignment CPTR\_EL3.EZ fault**

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE System register, ZCR\_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

**Bits [24:0]**

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b011001:

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

- CPACR\_EL1.ZEN, for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL2.
- CPTR\_EL2.ZEN, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- CPTR\_EL2.TZ, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- CPTR\_EL3.EZ, for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

**ISS encoding for an exception from an HVC Illegal Execution state, or a SVC PC instruction or SP alignment fault execution**

**Bits [24:16]****Bits [24:0]**

Reserved, RES0.

**imm16, bits [15:0]**

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT\_FGT is implemented, [HFGITR\\_EL2](#).{SVC\_EL1, SVC\_EL0} control fine-grained traps on SVC execution.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions, see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

## ISS encoding for an exception from HVC instruction or SVC instruction in AArch32 state

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR\\_EL2](#).TSC is 1, the ISS encoding is as shown in the diagram.

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.

- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is only valid if CCKNOWNPASS is 1, otherwise it is RES0.

This field resets to an architecturally UNKNOWN value.

### CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

#### Note

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

This field resets to an architecturally UNKNOWN value.

### Bits [18:0]

### Bits [24:16]

Reserved, RES0.

HCR\_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

**imm16, bits [15:0]**

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT\_FGT is implemented, [HFGITR\\_EL2](#).{SVC\_EL1, SVC\_EL0} control fine-grained traps on SVC execution.

## ISS encoding for an exception from SMC instruction execution in AArch32AArch64 state

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR\\_EL2](#).TSC is 1, the ISS encoding is as shown in the diagram.

**CV, bit [24]**

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

#### Note

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

### Bits [24:16]

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [18:0]

Reserved, RES0.

### imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

This field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR\_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

HCR\_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

## ISS encoding for an exception from **SMCMSR, MRS, or System** instruction execution in **AArch64** state

### Bits [24:22]

### Bits [24:16]

Reserved, RES0.

### imm16Op0, bits [15:21:020]

The Op0 value of the immediate field from the issued SMC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Op2, bits [19:17]

The Op2 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

### Op1, bits [16:14]

The Op1 value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

### CRn, bits [13:10]

The CRn value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

### Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

This field resets to an architecturally UNKNOWN value.

### CRm, bits [4:1]

The CRm value from the issued instruction.

This field resets to an architecturally UNKNOWN value.

### Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

This field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- [SCTLR\\_EL1](#).UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UCT, for accesses to [CTR\\_EL0](#) using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [CPACR\\_EL1](#).TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, ELOPCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TLTB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TTRF, for accesses to the trace filter register, [TRFCR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown-debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL\\_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).AT, for execution of AT S1E\* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.

- **SCR\_EL3.APK**, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **SCR\_EL3.ST**, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **SCR\_EL3.{TERR, FIEN}**, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **CPTR\_EL3.TCPAC**, for accesses to **CPTR\_EL2** and **CPACR\_EL1** using AArch64 state, MSR or MRS access trapped to EL3.
- **CPTR\_EL3.TTA**, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **MDCR\_EL3.TTRE**, for accesses to the filter trace control registers, **TRFCR\_EL1** and **TRFCR\_EL2**, using AArch64 state, MSR or MRS access trapped to EL3.
- **MDCR\_EL3.TDA**, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **MDCR\_EL3.TDOSA**, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **MDCR\_EL3.TPM**, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- **CPTR\_EL3.TAM**, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If **FEAT\_EVT** is implemented the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - **HCR\_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}**.
  - **HCR2.{TTLBIS, TICAB, TOCU, TID4}**.
- If **FEAT\_FGT** is implemented:
  - **SCR\_EL3.FGTEn**, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - **HFGTR\_EL2** for reads and **HFGWTR\_EL2** for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - **HEGTR\_EL2** for execution of system instructions, MSR or MRS access trapped to EL2
  - **HDFGTR\_EL2** for reads and **HDFGWTR\_EL2** for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - **HAFGTR\_EL2** for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

**HCR\_EL2.TSC** describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

**ISS encoding for an exception IMPLEMENTATION from DEFINED MSR, exception MRS, to or System instruction execution in AArch64 state EL3**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0 IMPLEMENTATION DEFINED			Op0		Op2		Op1		CRn			Rt			CRm			Direction						

**IMPLEMENTATION DEFINED, bits [24:0]**

IMPLEMENTATION DEFINED.

This field resets to an architecturally UNKNOWN value.

**Bits [24:22]**

Reserved, RES0.

**Op0, bits [21:20]**

The Op0 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Op2, bits [19:17]**

The Op2 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Op1, bits [16:14]**

The Op1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- [SCTLR\\_EL1](#).UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UCT, for accesses to [CTR\\_EL0](#) using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [CPACR\\_EL1](#).TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TTRF, for accesses to the trace filter control register, [TRFCR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL\\_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).AT, for execution of AT S1E\* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- [SCR\\_EL3](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3](#).ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TCPAC, for accesses to [CPTR\\_EL2](#) and [CPACR\\_EL1](#) using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TTRF, for accesses to the trace filter control registers, [TRFCR\\_EL1](#) and [TRFCR\\_EL2](#), using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.

- If FEAT\_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - [HCR\\_EL2](#).{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - [HCR2](#).{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT\_FGT is implemented:
  - [SCR\\_EL3](#).FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - [HFGTR\\_EL2](#) for reads and [HFGWTR\\_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - [HFGITR\\_EL2](#) for execution of system instructions, MSR or MRS access trapped to EL2
  - [HDFGTR\\_EL2](#) for reads and [HDFGWTR\\_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - [HAFGTR\\_EL2](#) for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

## ISS encoding for an IMPLEMENTATION exception DEFINED from exceptionan to Instruction EL3Abort

### Bits [24:13]

Reserved, RES0.

### SET, bits [12:11]

When FEAT\_RAS is implemented:

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception. The possible values of this field are:

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

### Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

### FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<b>FnV</b>	<b>Meaning</b>
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is only valid if the IFSC code is 0b010000. It is RES0 for all other aborts.

This field resets to an architecturally UNKNOWN value.

#### **EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

This field resets to an architecturally UNKNOWN value.

#### **Bit [8]**

Reserved, RES0.

#### **S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk.

<b>S1PTW</b>	<b>Meaning</b>
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

This field resets to an architecturally UNKNOWN value.

#### **Bit [6]**

Reserved, RES0.

#### **IFSC, bits [5:0]**

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

#### Note

Because Access flag faults and Permission faults can only result from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

This field resets to an architecturally UNKNOWN value.

## IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from ana InstructionData Abort

### ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults reported in ESR\_EL2 except the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

ISV is 0 for all faults reported in ESR\_EL1 or ESR\_EL3.

When the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When the RAS Extension is not implemented, the value of ISV on a synchronous External abort on a stage 2 translation table walk is IMPLEMENTATION DEFINED.

When FEAT\_MTE is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR\_ELx.FNV is 0 and FAR\_ELx is valid.

This field resets to an architecturally UNKNOWN value.

### SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

### SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

### SRT, bits [20:16]

Syndrome Register Transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32 then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

### SF, bit [15]

Width of the register accessed by the instruction is Sixty-Four. When ISV is 1, the possible values of this bit are:

SF	Meaning
0b0	Instruction loads/stores a 32-bit wide register.
0b1	Instruction loads/stores a 64-bit wide register.

#### Note

This field specifies the register width identified by the instruction, not the Execution state.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

This field resets to an architecturally UNKNOWN value.

### AR, bit [14]

When ISV == '1':

Acquire/Release. The possible values of this bit are:

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

Otherwise:

#### Bits [24:13]

Reserved, RES0.

#### SETVNCR, bits [12:11]

When FEAT\_RAS is implemented:

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

Indicates that the fault came from use of VNCR\_EL2 register by EL1 code.

SETVNCR	Meaning
0b00	Recoverable state (UER). The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b10	Uncontainable (UC). The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b11	Restartable state (UEO).

This field is 0 in ESR\_EL1.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

#### SET, bits [12:11]

When FEAT\_RAS is implemented:

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception. The possible values of this field are:

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

#### Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the **IFSC**~~DFSC~~ code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this~~This~~ field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The <b>DC ZVA</b> , <b>DC GVA</b> , and <b>DC GZVA</b> instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

~~This field resets to an architecturally UNKNOWN value.~~

On a Warm reset, this~~This~~ field resets to an architecturally UNKNOWN value.

**BitCM, bit [8]**

**Reserved**Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction: **RES0**.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this~~This~~ field resets to an architecturally UNKNOWN value.

**BitWnR, bit [6]**

**Reserved**Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are: **RES0**.

**IFSC, bits [5:0]**

Instruction Fault Status Code.

IFSCWnR	Meaning	Applies when
0b0000000b0	Address size fault, by level 0 instruction of reading translation from ora translation memory table base register location.	
0b0000010b1	Address size fault, by level 1 instruction writing to a memory location.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or	When FEAT_RAS is not implemented

	hardware update of translation table, level 1.	
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

This field resets to an architecturally UNKNOWN value.

#### DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

### Note

Because Access flag faults and Permission faults can **only** result **only** from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from a **Datatrapped** **Abortfloating-point** **exception**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	SAS	SSE			SRT			SF	AR	VNCR	Bits[12:11]	FnV	EA	CM	S1PTW	WnR					DFSC			

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

### ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR\_EL2, ISV is 1 when FEAT\_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR\_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR\_EL1 or ESR\_EL3, ISV is 1 when FEAT\_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR\_EL1 or ESR\_EL3.

When FEAT\_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT\_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT\_MTE is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR\_ELx.FNV is 0 and FAR\_ELx is valid.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SAS, bits [23:22]****When ISV == '1':**

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV							RES0							VECITR		IDF	RES0	IXF	UFF	OFF	DZF		IOF

**Bit [24]**

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SSETFV, bit [21:23]****When ISV == '1':**

Syndrome Trapped Sign Fault Extend Valid For bit, a indicates by whether the IDF, halfword IXF, or UFF, word OFF, load operation DZF, indicates and whether IOF the bits data hold item valid must information be about sign trapped extended floating-point exceptions. The possible values of this bit are:

SSETFV	Meaning
0b0	Sign-extension not required. The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	Data item must be sign-extended. One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information see 'Floating-point exceptions and exception traps'.

When It is FEAT\_LS64 IMPLEMENTATION DEFINED is whether implemented, this if field is memory set accesste generated 0 by on an ST64BV, exception ST64BV0, generated ST64B, by ora LD64Btrapped instructionfloating generates point aexception Datafrom Abort for a Translationvector fault, Access flag fault, or Permission fault, then this field is 0.instruction.

**Note**

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

This field resets to an architecturally UNKNOWN value.

**Bits [22:11]**

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SRTVECTR, bits [20:16]****When ISV == '1':**

Syndromes For Register Transfer, trapped. When floating-point exception from an instruction executed in AArch32 state this field is FEAT\_LS64RES1 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xt.

If for the exception trapped, was floating-point taken exception from an Exception instruction level executed that in is AArch64 using state AArch32, this then field this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states' UNKNOWN.

This field is resets to an architecturally UNKNOWN when the value of ISV is value. UNKNOWN.

**IDF, bit [7]**

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SF, bit [15]****When ISV == '1':**

Width of the register accessed by the instruction is Sixty-Four.

SFIDF	Meaning
0b0	InstructionInput loads/storesdenormal a floating-point 32-bitexception widehas register not occurred.
0b1	InstructionInput loads/storesdenormal a floating-point 64-bitexception wideoccurred register during execution of the reported instruction.

This field resets to an architecturally UNKNOWN value.

**Bits [6:5]****Note**

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### ARIXF, bit [144]

When ISV == '1':

Acquire/Release.

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

ARIXF	Meaning
0b0	Instruction Inexact did floating-point not exception have acquire/release semantics. occurred.
0b1	Instruction Inexact did floating-point have exception acquire/release semantics. occurred during execution of the reported instruction.

When This field resets to an architecturally FEAT\_LS64 UNKNOWN is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0. value.

#### UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### VNCR, bit [13]

When FEAT\_NV2 is implemented:

Indicates that the fault came from use of VNCR\_EL2 register by EL1 code.

VNCRUFF	Meaning
0b0	The Underflow fault floating-point was exception has not generated by the use of occurred. VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b1	The Underflow fault floating-point was exception generated occurred by during execution of the use reported of instruction. VNCR_EL2, by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR\_EL1.

This field resets to an architecturally UNKNOWN value.

**OFF, bit [2]**

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SET, bits [12:11]****When FEAT\_RAS is implemented and FEAT\_LS64 is not implemented:**

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception.

SET/OFF	Meaning
0b000b0	Recoverable Overflow state floating-point exception has not occurred.
0b100b1	Uncontainable Overflow (UC) floating-point exception occurred during execution of the reported instruction.
0b11	Restartable state (UEO).

All other values are reserved.

This field resets to an architecturally UNKNOWN value.

**DZF, bit [1]**

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When FEAT\_LS64 is implemented:**

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

LST/DZF	Meaning
0b010b0	An Divide ST64BV by instruction Zero generated floating-point the exception Data has Abort not occurred.
0b100b1	An Divide LD64B by or Zero ST64B floating-point instruction exception generated occurred during execution of the Data reported Abort instruction.
0b11	An ST64BV0 instruction generated the Data Abort.

All other values are reserved.

This field resets to an architecturally UNKNOWN value.

**IOF, bit [0]**

Invalid Operation floating-point exception trapped bit. If the TFF field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

This field is valid only if the DFSC code is 0b110101. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnVIOF	Meaning
0b0	FARInvalid isOperation valid, floating-point exception has not occurred.
0b1	FARInvalid isOperation notfloating-point valid, exception andoccurred holdsduring anexecution of the reported instruction. UNKNOWN value.

This field isresets validto onlyan if the DFSC code isarchitecturally 0b010000UNKNOWN. It is RES0 for all other aborts.value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the [FPCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the [FPSCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CM, bit [8]**

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The <a href="#">DC ZVA</a> , <a href="#">DC GVA</a> , and <a href="#">DC GZVA</a> instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk.

<b>S1PTW</b>	<b>Meaning</b>
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**WnR, bit [6]**

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

<b>WnR</b>	<b>Meaning</b>
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DFSC, bits [5:0]**

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented

0b100001	Alignment fault.	
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

#### Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exceptionError from a trapped floating-point exceptioninterrupt

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	IDS	TFV	RES0					RES0	IESB					VEC	ITRA	ET	IDFEA	RES0	IXFDFSC	UFF	OFFDZF	IOF		

### IDS, bit [24]

IMPLEMENTATION DEFINED syndrome. Possible values of this bit are:

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
<b>Note</b> If the RAS Extension is not implemented bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

#### Note

This field was previously called ISV.

This field resets to an architecturally UNKNOWN value.

### Bits [23:14]

#### Bit [24]

Reserved, RES0.

**TFVIESB, bit [23:13]****When FEAT\_IESB is implemented:**

Trapped Implicit Fault error Valid synchronization bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions event.

TFVIESB	Meaning
0b0	The IDF, Error IXF, interrupt UFF, was OFF, either DZF, not and synchronized IOF by bits the do implicit not error hold synchronization valid event information or about not trapped taken floating-point exceptions and are immediately UNKNOWN.
0b1	One The or Error more interrupt floating-point was exceptions synchronized occurred by during an operation performed while executing the reported implicit instruction. error The synchronization IDF, event IXF, UFF, OFF, DZF, and IOF taken bits indicate trapped floating-point exceptions that occurred. For more information, see immediately. 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

This field resets to an architecturally UNKNOWN value.

**Otherwise:****Note**

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [22:11]**

Reserved, RES0.

**VECITRAET, bits [12:10:8]****When FEAT\_RAS is implemented:**

For Asynchronous a Error trapped floating-point exception from an instruction executed in AArch32 state this field is Type. RES1.

For When a trapped floating-point exception from an instruction executed in AArch64 state this field DFSC is UNKNOWN 0b010001., describes the PE error state after taking the SError interrupt exception. The possible values of this field are:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IDF, bit [7]**

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).
IDFAET	Meaning
0b00b000	InputUncontainable denormal floating-point exception has not occurred.(UC).
0b10b001	InputUnrecoverable denormalstate floating-point exception occurred during execution of the reported instruction.(UEU).

OnAll aother Warmvalues reset,are this field resets to an architecturallyreserved. UNKNOWN value.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

#### Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

This field resets to an architecturally UNKNOWN value.

Otherwise:

#### Bits [6:5]

Reserved, RES0.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

#### Bits [8:6]

Reserved, RES0.

#### DFSC, bits [5:0]

When FEAT\_RAS is implemented:

Data Fault Status Code.

#### IXFEA, bit [49]

When FEAT\_RAS is implemented:

Inexact floating-point exception trapped bit. If the TFEV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION-DEFINED classification of External aborts.

IXFDFSC	Meaning
0b00b0000000	InexactUncategorized floating-point exception has not occurred.error.
0b10b010001	InexactAsynchronous floating-pointError exception occurred during execution of the reported instruction.interrupt.

OnAll aother Warmvalues reset,are this field resets to an architecturallyreserved, UNKNOWN value.

This field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the **FPCR**.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the **FPSCR**.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

## ISS encoding for an SError exception interrupt from a Breakpoint or Vector Catch debug exception

### Bits [24:6]

#### IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
<b>Note</b> If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

#### Note

This field was previously called ISV.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [23:14]

Reserved, RES0.

### IESBIFSC, bitbits [13:0]

When FEAT\_IESB is implemented:

ImplicitInstruction errorFault synchronizationStatus event.Code.

IESBIFSC	Meaning
0b00b100010	The Debug SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is resets valid to only an if the DFSC code is architecturally 0b010001UNKNOWN. It is RES0 for all other errors.value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**AET, bits [12:10]****When FEAT\_RAS is implemented:**

Asynchronous Error Type.

When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

AET	Meaning
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EA, bit [9]****When FEAT\_RAS is implemented:**

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [8:6]**

Reserved, RES0.

**DFSC, bits [5:0]****When FEAT\_RAS is implemented:**

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

## ISS encoding for an exception from a BreakpointSoftware or Vector Catch debugStep exception

### ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

This field resets to an architecturally UNKNOWN value.

### Bits [23:7]

### Bits [24:6]

Reserved, RES0.

### EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

This field resets to an architecturally UNKNOWN value.

### IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

For more information about generating these exceptions, see 'Software Step exceptions'.

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

## ISS encoding for an exception from a Software StepWatchpoint exception

### Bits [24:15]

Reserved, RES0.

### Bit [14]

Reserved, RES0.

### VNCR, bit [13]

When FEAT\_NV2 is implemented:

Indicates that the watchpoint came from use of VNCR\_EL2 register by EL1 code.

### ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	VNCR	Meaning
0b0		EX bit is RES0. The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1		EXThe bitwatchpoint iswas valid.generated by the use ofVNCR_EL2 by EL1 code.

SeeThis thefield EXis bit0 descriptionin for more information.ESR\_EL1.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

Otherwise:

### Bits [23:7]

Reserved, RES0.

### CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction.

### EX, Bits bit [612:9]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

Reserved, RES0.

EXCM	Meaning
0b0	An instruction Watchpoint exception other than a Load-Exclusive generated instruction was stepped. execution of one of the System instructions identified in the description of value 1.
0b1	A Load-Exclusive Watchpoint instruction exception was stepped. generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

If this field ISV resets bit is set to 0, and this bit is architecturally RES0 UNKNOWN, indicating no syndrome data is available.

#### Bit [7]

Reserved, RES0.

#### WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### IFSC, bits [5:0]

Instruction Fault Status Code.

0b1	Watchpoint exception caused by an instruction writing to a memory location.
IFSCWnR	Meaning
0b1000100b0	Debug Watchpoint exception. exception caused by an instruction reading from a memory location.

On a Watchpoint Warm exceptions reset on cache maintenance and address translation instructions, this field bit resets always to returns an architecturally value of 1, UNKNOWN value.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

This field resets to an architecturally UNKNOWN value.

#### DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

For more information about generating these exceptions, see 'Software Step exceptions'.

## ISS encoding for an exception from execution of a Watchpoint Breakpoint exception instruction

### Bits [24:16]

### Bits [24:15]

Reserved, RES0.

### Bit Comment, bits [14:0]

Reserved Set to the instruction comment field value, zero-extended as necessary, RES0.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

### VNCR, bit [13]

#### When FEAT\_NV2 is implemented:

Indicates that the watchpoint came from use of VNCR\_EL2 register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR\_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### Bits [12:9]

Reserved, RES0.

### CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [7]

Reserved, RES0.

### WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

### ISS encoding for an exception from execution ERET, of ERETA or Breakpoint ERETA instruction

This EC value applies when FEAT\_FGT is implemented, or when HCR\_EL2.NV is 1.

### Bits [24:2]

### Bits [24:16]

Reserved, RES0.

### Comment ERET, bits [15:0]

SetIndicates to whether the an ERET or ERETA\* instruction comment was field trapped value, to zero EL2. extendedPossible as values necessary are:

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

This field resets to an architecturally UNKNOWN value.

#### ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2. Possible values are:

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

This field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [HCR\\_EL2.NV](#).

If FEAT\_FGT is implemented, [HFGITR\\_EL2](#).ERET controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

### ISS encoding for an exception from an Branch ERET, Target ERETAA, or ERETAB instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
											RES0												ERETBTTYPE		ERETA	

This EC value applies when FEAT\_FGT is implemented, or when [HCR\\_EL2.NV](#) is 1.

#### Bits [24:2]

Reserved, RES0.

#### ERETBTTYPE, bits [1:0]

Indicates whether field `an` is ERET set or to ERETAA\*the instruction PSTATE.BTYPE was value trapped that to generated EL2.the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [HCR\\_EL2.NV](#).

If FEAT\_FGT is implemented, [HFGITR\\_EL2.ERET](#) controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

## ISS encoding for an exception from Brancha TargetPointer IdentificationAuthentication instruction when HCR\_EL2.API == 0 || SCR\_EL3.API == 0

Bits [24:0]

Bits [24:2]

Reserved, RES0.

For more information about generating these exceptions, see:

- [HCR\\_EL2.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- [SCR\\_EL3.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

BTYP, bits [1:0]

This field is set to the PSTATE.BTYP value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

## ISS encoding for an exception from a Pointer Authentication instruction when authentication HCR\_EL2.API == 0 || SCR\_EL3.API == 0 failure

Bits [24:2]

Bits [24:0]

Reserved, RES0.

**Bit [1]**

This field indicates whether the exception is as a result of an Instruction key or a Data key.

	Meaning
0b0	Instruction Key.
0b1	Data Key.

This field resets to an architecturally UNKNOWN value.

**Bit [0]**

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

This field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETA, ERETB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

For more information about generating these exceptions, see:

- [HCR\\_EL2.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- [SCR\\_EL3.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

## ISS encoding for an exception from a Pointer Authentication instruction authentication failure

**Bits [24:2]**

Reserved, RES0.

**Bit [1]**

This field indicates whether the exception is as a result of an Instruction key or a Data key.

	Meaning
0b0	Instruction Key.
0b1	Data Key.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETA, ERETB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

## Accessing the ESR\_EL3

Accesses to this register use the following encodings:

MRS <Xt>, ESR\_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return ESR_EL3;
```

MSR ESR\_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0101	0b0010	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    ESR_EL3 = X[t];

```

# FAR\_EL1, Fault Address Register (EL1)

The FAR\_EL1 characteristics are:

## Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL1.

## Configuration

AArch64 System register FAR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DFAR\[31:0\] \(NS\)](#).

AArch64 System register FAR\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [IFAR\[31:0\] \(NS\)](#).

## Attributes

FAR\_EL1 is a 64-bit register.

## Field descriptions

The FAR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Faulting Virtual Address for synchronous exceptions taken to EL1																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL1. Exceptions that set the FAR\_EL1 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). [ESR\\_EL1](#).EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which  $\text{TCR\_ELx.TBI}\{\text{<0|1>}\} == 1$  for the translation regime in use when the abort was generated, then the top eight bits of FAR\_EL1 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if [ESR\\_EL1](#).FnV is 0, and the FAR\_EL1 is UNKNOWN if [ESR\\_EL1](#).FnV is 1.

For all other exceptions taken to EL1, the FAR\_EL1 is UNKNOWN.

If a memory fault that sets FAR\_EL1, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR\_EL1 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by [DC ZVA](#).

If the exception that updates FAR\_EL1 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR\_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state'.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL0 makes FAR\_EL1 become UNKNOWN.

### Note

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR\_EL1 is made UNKNOWN on an exception return from EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the FAR\_EL1

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic FAR\_EL1 or FAR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, FAR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0110	0b0000	0b000

```

if PSTATE.EL == EL0 then

# FAR\_EL2, Fault Address Register (EL2)

The FAR\_EL2 characteristics are:

## Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL2.

## Configuration

AArch64 System register FAR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HDFAR\[31:0\]](#).

AArch64 System register FAR\_EL2 bits [63:32] are architecturally mapped to AArch32 System register [HIFAR\[31:0\]](#).

AArch64 System register FAR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [DFAR\[31:0\]](#) (S) when EL2 is implemented.

AArch64 System register FAR\_EL2 bits [63:32] are architecturally mapped to AArch32 System register [IFAR\[31:0\]](#) (S) when EL2 is implemented.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

FAR\_EL2 is a 64-bit register.

## Field descriptions

The FAR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL2. Exceptions that set the FAR\_EL2 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). [ESR\\_EL2](#).EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which  $\text{TCR\_ELx.TBI}\{<0|1>\} == 1$  for the translation regime in use when the abort was generated, then the top eight bits of FAR\_EL2 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if [ESR\\_EL2](#).FnV is 0, and the FAR\_EL2 is UNKNOWN if [ESR\\_EL2](#).FnV is 1.

For all other exceptions taken to EL2, the FAR\_EL2 is UNKNOWN.

If a memory fault that sets FAR\_EL2, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR\_EL2 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by [DC ZVA](#).

If the exception that updates FAR\_EL2 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR\_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state'.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL1 or EL0 makes FAR\_EL2 become UNKNOWN.

### Note

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR\_EL2 is made UNKNOWN on an exception return from EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the FAR\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic FAR\_EL2 or FAR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, FAR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0110	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return FAR_EL1;
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return FAR_EL2;
elsif PSTATE.EL == EL3 then
    return FAR_EL2;

```

# FAR\_EL3, Fault Address Register (EL3)

The FAR\_EL3 characteristics are:

## Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort and PC alignment fault exceptions that are taken to EL3.

## Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to FAR\_EL3 are UNDEFINED.

## Attributes

FAR\_EL3 is a 64-bit register.

## Field descriptions

The FAR\_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Faulting Virtual Address for synchronous exceptions taken to EL3																															
Faulting Virtual Address for synchronous exceptions taken to EL3																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL3. Exceptions that set the FAR\_EL3 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), and PC alignment faults (EC 0x22). [ESR\\_EL3](#).EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which  $\text{TCR\_ELx.TBI}\{<0|1>\} == 1$  for the translation regime in use when the abort was generated, then the top eight bits of FAR\_EL3 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if [ESR\\_EL3](#).FnV is 0, and the FAR\_EL3 is UNKNOWN if [ESR\\_EL3](#).FnV is 1.

For all other exceptions taken to EL3, the FAR\_EL3 is UNKNOWN.

If a memory fault that sets FAR\_EL3, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR\_EL3 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by [DC ZVA](#).

If the exception that updates FAR\_EL3 is taken from an Exception Level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR\_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state'.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL2, EL1 or EL0 makes FAR\_EL3 become UNKNOWN.

### Note

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR\_EL3 is made UNKNOWN on an exception return from EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the FAR\_EL3

Accesses to this register use the following encodings:

MRS <Xt>, FAR\_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0110	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return FAR_EL3;
```

MSR FAR\_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0110	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    FAR_EL3 = X[t];
```

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# FPCR, Floating-point Control Register

The FPCR characteristics are:

## Purpose

Controls floating-point behavior.

## Configuration

The named fields in this register map to the equivalent fields in the AArch32 [FPSCR](#).

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

## Attributes

FPCR is a 64-bit register.

## Field descriptions

The FPCR bit assignments are:

### Bits [63:27]

Reserved, RES0.

### AHP, bit [26]

Alternative half-precision control bit.~~bit:~~

AHP	Meaning
0b0	IEEE half-precision format selected.
0b1	Alternative half-precision format selected.

This bit is ~~only~~ used only for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the FEAT\_FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

On a Warm reset, this~~This~~ field resets to an architecturally UNKNOWN value.

### DN, bit [25]

Default NaN mode control bit.~~bit:~~

DN	Meaning
0b0	NaN operands propagate through to the output of a floating-point operation.
0b1	Any operation involving one or more NaNs returns the Default NaN. If FPCR.AH is 1, this bit has no effect on the output of the FMAX, FMAXP, FMAXV, FMIN, FMINP, and FMINV instructions, and a default NaN is never returned as a result of these instructions.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## FZ, bit [24]

Flush-to-zero mode control bit.

FZ	Meaning
0b0	Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
0b1	Flush-to-zero mode enabled. If FPCR.AH is 1: <ul style="list-style-type: none"> <li>This bit does not generate Input Denormal exceptions.</li> <li>This bit does not cause input denormal operands to be flushed to zero.</li> <li>When the output is flushed to zero: <ul style="list-style-type: none"> <li>An Inexact floating-point exception is generated.</li> <li>The test for a denormalized number for half-precision, single-precision, and double-precision numbers occurs after rounding with an unbounded exponent.</li> </ul> </li> </ul>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

This bit has no effect on half-precision calculations.

If the result of an FMAX, FMAXP, FMAXV, FMIN, FMINP, or FMINV instruction is a denormalized number, it is not flushed to zero, regardless of the value of this bit.

This field resets to an architecturally UNKNOWN value.

Denormalized outputs of the following instructions, as determined after rounding with an unbounded exponent, are not affected by the value of this bit:

- The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions.
- Single-precision and double-precision FRECPPE, FRECPSP, FRECPX, FRSQRTE, and FRSQRTS instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## RMode, bits [23:22]

Rounding Mode control field.

RMode	Meaning
0b00	Round to Nearest (RN) mode.
0b01	Round towards Plus Infinity (RP) mode.
0b10	Round towards Minus Infinity (RM) mode.
0b11	Round towards Zero (RZ) mode.

The specified rounding mode is used by both scalar and Advanced SIMD floating-point instructions.

If FPCR.AH is 1, then the following instructions use Round to Nearest mode regardless of the value of this bit:

This field resets to an architecturally UNKNOWN value.

- The FRECPPE, FRECPSP, FRECPX, FRSQRTE, and FRSQRTS instructions.
- The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Stride, bits [21:20]

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state.

This field is included only for context saving and restoration of the AArch32 [FPSCR](#).Stride field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### FZ16, bit [19]

When FEAT\_FP16 is implemented:

Flush-to-zero mode control bit on half-precision data-processing instructions.

FZ16	Meaning
0b0	Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
0b1	Flush-to-zero mode enabled. If FPCR.AH is 1: <ul style="list-style-type: none"> <li>When the output is flushed to zero:               <ul style="list-style-type: none"> <li>An Inexact floating-point exception is generated.</li> <li>The test for a denormalized number for half-precision, single-precision, and double-precision numbers occurs after rounding with an unbounded exponent.</li> </ul> </li> </ul>

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations. A half-precision floating-point number that is flushed to zero as a result of the value of the FZ16 bit does not generate an Input Denormal exception.

If the result of an FMAX, FMAXP, FMAXV, FMIN, FMINP, or FMINV instruction is a denormalized number, it is not flushed to zero, regardless of the value of this bit.

This field resets to an architecturally UNKNOWN value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### Len, bits [18:16]

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state.

This field is included only for context saving and restoration of the AArch32 [FPSCR](#).Len field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IDE, bit [15]

Input Denormal floating-point exception trap enable.

IDE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, then the <a href="#">FPSCR</a> .IDC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the <a href="#">FPSCR</a> .IDC bit. The trap handling software can decide whether to set the <a href="#">FPSCR</a> .IDC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Bits [14:13]

Reserved, RES0.

#### IXE, bit [12]

Inexact floating-point exception trap enable.

IXE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, then the <b>FPSR</b> .IXC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the <b>FPSR</b> .IXC bit. The trap handling software can decide whether to set the <b>FPSR</b> .IXC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### UFE, bit [11]

Underflow floating-point exception trap enable.

UFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, then the <b>FPSR</b> .UFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs and Flush-to-zero is not enabled, the PE does not update the <b>FPSR</b> .UFC bit. The trap handling software can decide whether to set the <b>FPSR</b> .UFC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### OFE, bit [10]

Overflow floating-point exception trap enable.

OFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, then the <b>FPSR</b> .OFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the <b>FPSR</b> .OFC bit. The trap handling software can decide whether to set the <b>FPSR</b> .OFC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### DZE, bit [9]

Divide by Zero floating-point exception trap enable.

DZE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, then the FPSR.DZC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.DZC bit. The trap handling software can decide whether to set the FPSR.DZC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

## IOE, bit [8]

Invalid Operation floating-point exception trap enable.

IOE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, then the FPSR.IOC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IOC bit. The trap handling software can decide whether to set the FPSR.IOC bit to 1.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

## Bits [7:30]

Reserved, RES0.

## NEP, bit [2]

### When FEAT\_AFP is implemented:

Controls how the output elements other than the lowest element of the vector are determined for Advanced SIMD scalar instructions.

NEP	Meaning
0b0	Does not affect how the output elements other than the lowest are determined for Advanced SIMD scalar instructions.
0b1	<p>The output elements other than the lowest are taken from the following registers:</p> <ul style="list-style-type: none"> <li>For 3-input scalar versions of the FMLA (by element) and FMLS (by element) instructions, the &lt;Hd&gt;, &lt;Sd&gt;, or &lt;Dd&gt; register.</li> <li>For 3-input versions of the FMADD, FMSUB, FNMADD, and FNMSUB instructions, the &lt;Ha&gt;, &lt;Sa&gt;, or &lt;Da&gt; register.</li> <li>For 2-input scalar versions of the FACGE, FACGT, FCMEQ (register), FCMGE (register), and FCMGT (register) instructions, the &lt;Hm&gt;, &lt;Sm&gt;, or &lt;Dm&gt; register.</li> <li>For 2-input scalar versions of the FABD, FADD (scalar), FDIV (scalar), FMAX (scalar), FMAXNM (scalar), FMIN (scalar), FMINNM (scalar), FMUL (by element), FMUL (scalar), FMULX, FNMUL (scalar), FRECPs, FRSQRTs, and FSUB (scalar) instructions, the &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register.</li> <li>For 1-input scalar versions of the following instructions, the &lt;Hd&gt;, &lt;Sd&gt;, or &lt;Dd&gt; register: <ul style="list-style-type: none"> <li>The (vector) versions of the FCVTAS, FCVTAU, FCVTMS, FCVTMU, FCVTNS, FCVTNU, FCVTPS, and FCVTPU instructions.</li> <li>The (vector, fixed-point) and (vector, integer) versions of the FCVTZS, FCVTZU, SCVTF, and UCVTF instructions.</li> <li>The (scalar) versions of the FABS, FNEG, FRINT32X, FRINT32Z, FRINT64X, FRINT64Z, FRINTA, FRINTI, FRINTM, FRINTN, FRINTP, FRINTX, FRINTZ, and FSQRT instructions.</li> <li>The (scalar, fixed-point) and (scalar, integer) versions of the SCVTF and UCVTF instructions.</li> <li>The BFCVT, FCVT, FCVTXN, FRECPe, FRECPX, and FRSQRTE instructions.</li> </ul> </li> </ul>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### AH, bit [1]

##### When FEAT\_AFP is implemented:

Alternate Handling. Controls alternate handling of denormalized floating-point numbers.

AH	Meaning
0b0	Does not affect handling of denormalized floating-point numbers.
0b1	<p>The sign-bit of the default NaN encoding is set to 1.</p> <p>For all floating-point instructions other than BFDOT and BFMMLA, detection of underflow occurs after rounding with an unbounded exponent.</p> <p>If an operation, other than FMAX, FMAXP, FMAXV, FMIN, FMINP, and FMINV, has two floating-point inputs in the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register or the &lt;Vm&gt;, &lt;Hm&gt;, &lt;Sm&gt;, or &lt;Dm&gt; register, and two NaN inputs, then the output is derived from the NaN held in the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register, regardless of whether any input is a signaling NaN or a quiet NaN.</p> <p>For the BFMLALB, BFMLALT, FCMLA, FMADD, FMLA, FMLAL, FMLAL2, FMLSL, FMLSL2, FMSUB, FNMADD, and FNMSUB instructions, regardless of whether any input is a signaling NaN or a quiet NaN:</p> <ul style="list-style-type: none"> <li>If the operation has three NaN inputs, then the output is derived from the NaN held in the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register.</li> <li>If the operation has two NaN inputs and the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register holds a NaN, then the output is derived from the NaN held in that register.</li> <li>If the operation has two NaN inputs and the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register does not hold a NaN, then the output is derived from the NaN held in the &lt;Hm&gt;, &lt;Sm&gt;, or &lt;Dm&gt; register.</li> </ul> <p>The FMAX, FMAXP, FMAXV, FMIN, FMINP, and FMINV instructions change their algorithm to calculate the minimum and maximum so that:</p> <ul style="list-style-type: none"> <li>If the result is a denormalized number, it is not flushed to zero, regardless of FPCR.FZ or FPCR.FZ16.</li> <li>If either input is a quiet NaN or a signaling NaN, then the second operand is returned as the result of the instruction and an Invalid Operation floating-point exception is generated.</li> <li>If the two operands are +0 and -0 in any order, the second operand of the instruction is returned as the result of the instruction.</li> <li>FPCR.DN has no effect on the output and a default NaN is never returned as the result of the instruction.</li> </ul> <p>The FCVTAS, FCVTAU, FCVTMS, FCVTMU, FCVTNS, FCVTNU, FCVTPS, FCVTPU, FCVTZS, FCVTZU, FJCVTZS, FRINT32X, FRINT32Z, FRINT64X, FRINT64Z, FRINTA, FRINTI, FRINTM, FRINTN, FRINTP, FRINTX, and FRINTZ instructions never generate an Input Denormal floating-point exception.</p> <p>The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions:</p> <ul style="list-style-type: none"> <li>Use Round to Nearest rounding mode, regardless of the rounding mode selected in FPCR.RMode.</li> <li>Flush all denormalized inputs to zero, retaining the sign, regardless of FPCR.FIZ.</li> <li>Flush all denormalized outputs, as determined after rounding with an unbounded exponent, to zero, retaining the sign, regardless of FPCR.FZ.</li> <li>Do not generate any floating-point exceptions, regardless of their input or output values.</li> </ul> <p>The FRECPPE, FRECPSP, FRECPX, FRSQRTE, and FRSQRTPS instructions:</p> <ul style="list-style-type: none"> <li>Use Round to Nearest rounding mode, regardless of the rounding mode selected in FPCR.RMode.</li> <li>Do not generate any floating-point exceptions.</li> <li>The single-precision and double-precision variants of these instructions: <ul style="list-style-type: none"> <li>Flush all denormalized inputs to zero, retaining the sign, regardless of FPCR.FIZ.</li> <li>Flush all denormalized outputs, as determined after rounding with an unbounded exponent, to zero, retaining the sign, regardless of FPCR.FZ.</li> </ul> </li> </ul> <p>When the output is flushed to zero:</p> <ul style="list-style-type: none"> <li>An Inexact floating-point exception is generated.</li> </ul>

- The test for a denormalized number for half-precision, single-precision, and double-precision numbers occurs after rounding with an unbounded exponent.

If FPCR.FZ is 1, this does not cause any Input Denormal exceptions and does not cause input denormal operands to be flushed to zero. If FPCR.FIZ is 0, any operation that unpacks a denormalized floating-point number, other than a BFloat or half-precision number, will generate an Input Denormal floating-point exception, except when:

- One of the other operands of the instruction is a NaN.
- The operation also generates an Invalid Operation floating-point exception or a Divide by Zero floating-point exception.
- The operation was generated by a BFCVT, BFCVTN, BFCVTN2, or BFCVTNT instruction.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### FIZ, bit [0]

**When FEAT\_AFP is implemented:**

Flush Inputs to Zero. Controls whether single-precision, double-precision, and BFloat16 input operands that are denormalized numbers are flushed to zero.

FIZ	Meaning
0b0	<p>If FPCR.AH is 0, does not affect whether denormalized floating-point inputs are flushed to zero.</p> <p>If FPCR.AH is 1, any operation that unpacks a single-precision or double-precision denormalized floating-point number will generate an Input Denormal floating-point exception, except when:</p> <ul style="list-style-type: none"> <li>• One of the other operands of the instruction is a NaN.</li> <li>• The operation also generates an Invalid Operation floating-point exception or a Divide by Zero floating-point exception.</li> <li>• The operation was generated by a BFCVTN, BFCVTN2, BFCVT, or a BFCVTNT instruction.</li> </ul>
0b1	<p>All single-precision, double-precision, and BFloat16 input operands that are denormalized numbers, except FABS and FNEG, are flushed to zero, retaining the sign.</p> <p>If FPCR.AH is 1 or FPCR.FZ is 0, denormalized numbers that are flushed to zero by this field do not generate an Input Denormal exception.</p>

The following instructions are not affected by the value of this bit:

- The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions.
- Single-precision and double-precision variants of the FRECP, FRECPX, FRSQRT, and FRSQRTS instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

## Accessing the FPCR

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, FPCR

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0100	0b000

# FPEXC32\_EL2, Floating-Point Exception Control register

The FPEXC32\_EL2 characteristics are:

## Purpose

Allows access to the AArch32 register [FPEXC](#) from AArch64 state only. Its value has no effect on execution in AArch64 state.

## Configuration

AArch64 System register FPEXC32\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [FPEXC\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to FPEXC32\_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

## Attributes

FPEXC32\_EL2 is a 64-bit register.

## Field descriptions

The FPEXC32\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
EX	EN	DEX	FP2V	VV	TFV	RES0										VECITR					IDF	RES0	IXF	UFF	OFF	DZF	IOF				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### EX, bit [31]

Exception bit. From Armv8, this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EN, bit [30]

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the [FPEXC](#) or [FPSID](#).
- VMRS accesses from the [FPEXC](#), [FPSID](#), [MVFR0](#), [MVFR1](#), or [MVFR2](#).

EN	Meaning
0b0	Accesses to the <a href="#">FPSCR</a> , and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.
0b1	This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- [CPACR](#).cp10, or, if executing at EL0, [CPACR\\_EL1](#).FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - [HCPTR](#).TCP10, or if EL2 is using AArch64, [CPTR\\_EL2](#).TFP.
  - [NSACR](#).cp10, or if EL3 is using AArch64, [CPTR\\_EL3](#).TFP.
- For Advanced SIMD instructions only:
  - [CPACR](#).ASEDIS.
  - If executing in Non-secure state, [HCPTR](#).TASE and [NSACR](#).NSTRCDIS.

See the descriptions of the controls for more information.

### Note

When executing at EL0 using AArch32:

- If EL1 is using AArch64 then behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of [HCR\\_EL2](#).{RW, TGE} is {1, 1} then behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of [HCR\\_EL2](#).{RW, TGE} is {0, 1} then it is IMPLEMENTATION DEFINED whether the behavior is:
  - As if the value of FPEXC.EN is 1.
  - Determined by the value of FPEXC32\_EL2.EN, as described in this field description. However, Arm deprecates using the value of FPEXC32\_EL2.EN to determine behavior.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### DEX, bit [29]

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC32\_EL2.TFV field is valid.

The meaning of this bit is:

DEX	Meaning
0b0	The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC32_EL2.TFV is RW then it is invalid and UNKNOWN. If FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
0b1	The exception was generated during the execution of an unallocated encoding. FPEXC32_EL2.TFV is valid and indicates the cause of the exception.

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the AArch32 [FPSCR](#).{Stride, Len} fields as RAZ, this bit is RES0.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

**FP2V, bit [28]**

FPINST2 instruction valid bit. From Armv8, this bit is RES0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**VV, bit [27]**

VECITR valid bit. From Armv8, this bit is RES0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**TFV, bit [26]**

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

TFV	Meaning
0b0	The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of <a href="#">FPSCR</a> .{Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.
0b1	FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements [FPSCR](#).{Stride, Len} as RAZ, this bit is RAO/WI.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [25:11]**

Reserved, RES0.

**VECITR, bits [10:8]**

Vector iteration count. From Armv8, this field is RES1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**IDF, bit [7]**

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while [FPSCR](#).IDE was 1:

IDF	Meaning
0b0	Input Denormal exception has not occurred.
0b1	Input Denormal exception has occurred.

Input Denormal exceptions can occur only when [FPSCR](#).FZ is 1.

**Note**

---

A half-precision floating-point value that is flushed to zero because the value of [FPSCR.FZ16](#) is 1 does not generate an Input Denormal exception.

---

This bit must be cleared to 0 by the exception-handling routine.

When the value of [FPEXC32\\_EL2.TFV](#) is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### Bits [6:5]

Reserved, RES0.

### IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of [FPEXC.TFV](#) is 1. When valid, it indicates whether an Inexact exception occurred while [FPSCR.IXE](#) was 1:

IXF	Meaning
0b0	Inexact exception has not occurred.
0b1	Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of [FPEXC.TFV](#) is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of [FPEXC.TFV](#) is 1. When valid, it indicates whether an Underflow exception occurred while [FPSCR.UFE](#) was 1:

UFF	Meaning
0b0	Underflow exception has not occurred.
0b1	Underflow exception has occurred.

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when [FPSCR.FZ16](#) is 0.
- Otherwise only when [FPSCR.FZ](#) is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of [FPEXC32\\_EL2.TFV](#) is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of [FPEXC.TFV](#) is 1. When valid, it indicates whether an Overflow exception occurred while [FPSCR.OFE](#) was 1:

OFF	Meaning
0b0	Overflow exception has not occurred.
0b1	Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

### DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while [FPSCR.DZE](#) was 1:

DZF	Meaning
0b0	Divide by Zero exception has not occurred.
0b1	Divide by Zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

### IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while [FPSCR.IOE](#) was 1:

IOF	Meaning
0b0	Invalid Operation exception has not occurred.
0b1	Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

## Accessing the FPEXC32\_EL2

Accesses to this register use the following encodings:

# FPSR, Floating-point Status Register

The FPSR characteristics are:

## Purpose

Provides floating-point system status information.

## Configuration

The named fields in this register map to the equivalent fields in the AArch32 [FPSCR](#).

## Attributes

FPSR is a 64-bit register.

## Field descriptions

The FPSR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	QC	RES0																		IDC	RES0	IXC	UFC	OFC	DZC	IOC		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### N, bit [31]

When AArch32 is supported at any Exception level and AArch32 floating-point is implemented:

Negative condition flag for AArch32 floating-point comparison operations.

#### Note

AArch64 floating-point comparisons set the PSTATE.N flag instead.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

### Z, bit [30]

When AArch32 is supported at any Exception level and AArch32 floating-point is implemented:

Zero condition flag for AArch32 floating-point comparison operations.

#### Note

---

AArch64 floating-point comparisons set the PSTATE.Z flag instead.

---

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**C, bit [29]**

**When AArch32 is supported at any Exception level and AArch32 floating-point is implemented:**

Carry condition flag for AArch32 floating-point comparison operations.

---

**Note**

AArch64 floating-point comparisons set the PSTATE.C flag instead.

---

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**V, bit [28]**

**When AArch32 is supported at any Exception level and AArch32 floating-point is implemented:**

Overflow condition flag for AArch32 floating-point comparison operations.

---

**Note**

AArch64 floating-point comparisons set the PSTATE.V flag instead.

---

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**QC, bit [27]**

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [26:8]**

Reserved, RES0.

**IDC, bit [7]**

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.IDE](#) bit. This bit is **only** set to 1 to indicate a floating-point exception **only** if [FPCR.IDE](#) is **0.0**, or if trapping software sets it.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bits [6:5]

Reserved, RES0.

## IXC, bit [4]

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact exception floating-point has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.IXE](#) bit. This bit is **only** set to 1 to indicate a floating-point exception **only** if [FPCR.IXE](#) is **0.0**, or if trapping software sets it.

The criteria for the Inexact floating-point exception to occur are different in Flush-to-zero mode. For details, see 'Flush-to-zero'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## UFC, bit [3]

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.UFE](#) bit. This bit is **only** set to 1 to indicate a floating-point exception **only** if [FPCR.UFE](#) is **0**, or **Flush-to-zero** if **trapping enabled**, software sets it.

The criteria for the Underflow floating-point exception to occur are different in Flush-to-zero mode. For details, see 'Flush-to-zero'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## OFC, bit [2]

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.OFE](#) bit. This bit is **only** set to 1 to indicate a floating-point exception **only** if [FPCR.OFE](#) is **0.0**, or if trapping software sets it.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## DZC, bit [1]

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.DZE](#) bit. This bit is **only** set to 1 to indicate a floating-point exception **only** if [FPCR.DZE](#) is **0.0**, or if trapping software sets it.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## IOC, bit [0]

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.IOE](#) bit. This bit is **only** set to 1 to indicate a floating-point exception **only** if [FPCR.IOE](#) is **0.0**, or if trapping software sets it.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

# GCR\_EL1, Tag Control Register.

The GCR\_EL1 characteristics are:

## Purpose

Tag Control Register.

## Configuration

This register is present only when FEAT\_MTE2FEAT\_MTE is implementedimplemented and ID\_AA64PFR1\_EL1.MTE != 0b0001. Otherwise, direct accesses to GCR\_EL1 are UNDEFINED.

## Attributes

GCR\_EL1 is a 64-bit register.

## Field descriptions

The GCR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
																RES0																	
RES0																RRND	Exclude																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### Bits [63:17]

Reserved, RES0.

### RRND, bit [16]

Controls generation of tag values by the IRG instruction.

RRND	Meaning
0b0	IRG generates a tag value as defined by RandomTag().
0b1	IRG generates an implementation-specific tag value with a distribution of tag values no worse than generated with GCR_EL1.RRND == 0.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Exclude, bits [15:0]

Allocation Tag values excluded from selection by ChooseNonExcludedTag().

If all bits of GCR\_EL1.Exclude are 1, then the Allocation Tag value 0 will be used.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the GCR\_EL1

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, GCR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b110

The GMID\_EL1 characteristics are:

## Purpose

Indicates the block size that is accessed by the LDGM and STGM System instructions.

## Configuration

This register is present only when FEAT\_MTE2 is implemented and ID\_AA64PFR1\_EL1.MTE != 0b0001. Otherwise, direct accesses to GMID\_EL1 are UNDEFINED.

## Attributes

GMID\_EL1 is a 64-bit register.

## Field descriptions

The GMID\_EL1 bit assignments are:

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

**Bits [63:4]**

Reserved, RES0.

**BS, bits [3:0]**

Log2 of the block size in words. The minimum supported size is 16B (value == 2) and the maximum is 256B (value == 6).

## Accessing the GMID EL1

Accesses to this register use the following encodings:

~~MRS <Xt>, GMID EL1~~

CRn	op0	op1	op2	CRm
0b0000	0b11	0b001	0b100	0b0000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented("FEAT_IDST") then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID5 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return GMID_EL1;
    elseif PSTATE.EL == EL2 then
        return GMID_EL1;
    elseif PSTATE.EL == EL3 then
        return GMID_EL1;

```

## Accessing the GMID\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, GMID EL1

CRn	op0	op1	op2	CRm
0b0000	0b11	0b001	0b100	0b0000

```

# HACR\_EL2, Hypervisor Auxiliary Control Register

The HACR\_EL2 characteristics are:

## Purpose

Controls trapping to EL2 of IMPLEMENTATION DEFINED aspects of EL1 or EL0 operation.

### Note

Arm recommends that the values in this register do not cause unnecessary traps to EL2 when [HCR\\_EL2](#).{E2H, TGE} == {1, 1}.

## Configuration

AArch64 System register HACR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HACR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

HACR\_EL2 is a 64-bit register.

## Field descriptions

The HACR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the HACR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, HACR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b111

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    return HACR_EL2;
elseif PSTATE.EL == EL3 then
    return HACR_EL2;

```

MSR HACR\_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b111

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    HACR_EL2 = X[t];
elseif PSTATE.EL == EL3 then
    HACR_EL2 = X[t];

```

# HAFGRTR\_EL2, Hypervisor Activity Monitors Fine-Grained Read Trap Register

The HAFGRTR\_EL2 characteristics are:

## Purpose

Provides controls for traps of MRS reads of Activity Monitors System registers.

## Configuration

This register is present only when FEAT\_AMUv1 is implemented and FEAT\_FGT is implemented. Otherwise, direct accesses to HAFGRTR\_EL2 are UNDEFINED.

## Attributes

HAFGRTR\_EL2 is a 64-bit register.

## Field descriptions

The HAFGRTR\_EL2 bit assignments are:

63	62	61	60	59	58
AMEVTYPER16_EL0	AMEVCNTR16_EL0	AMEVTYPER15_EL0	AMEVCNTR15_EL0	AMEVTYPER14_EL0	AMEVCNTR14_EL0
31	30	29	28	27	26

### Bits [63:50]

Reserved, RES0.

AMEVTYPER1<x>\_EL0AMEVTYPER115\_EL0, bit [19+2x], for x = 15 to 049]

Trap MRS reads of AMEVTYPER115\_EL0 at EL1 and EL0 using AArch64 and AMEVTYPER1<x>\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER1<x> reads of AMEVTYPER115 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER1<x>_EL0	AMEVTYPER115_EL0	Meaning
0b0		MRS reads of AMEVTYPER115_EL0 at EL1 and EL0 using AArch64 and AMEVTYPER1<x>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER1<x> reads of AMEVTYPER115 at EL0 using AArch32 are not affected by this bit.
0b1		If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPER115_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value AMEVTYPER1&lt;x&gt;_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPER115 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value AMEVTYPER1&lt;x&gt; at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### AMEVCNTR1<x>\_EL0, bit [18+2x], for x = 15 to 048]

Trap MRS reads of AMEVCNTR115\_EL0 at EL1 and EL0 using AArch64 and AMEVCNTR1<x>\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR1<x> reads of AMEVCNTR115 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR1<x>_EL0	AMEVCNTR115_EL0	Meaning
0b0		MRS reads of AMEVCNTR115_EL0 at EL1 and EL0 using AArch64 and AMEVCNTR1<x>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR1<x> reads of AMEVCNTR115 at EL0 using AArch32 are not affected by this bit.
0b1		If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR115_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value AMEVCNTR1&lt;x&gt;_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR115 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value AMEVCNTR1&lt;x&gt; at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

Trap MRS reads of AMEVTYPER114\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER114 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER114_EL0	Meaning
0b0	MRS reads of AMEVTYPER114_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER114 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPER114_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPER114 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVCNTR114\_EL0, bit [46]

Trap MRS reads of AMEVCNTR114\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR114 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR114_EL0	Meaning
0b0	MRS reads of AMEVCNTR114_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR114 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR114_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR114 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVTYPER113\_EL0, bit [45]

Trap MRS reads of AMEVTYPER113\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER113 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER113_EL0	Meaning
0b0	MRS reads of AMEVTYPER113_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER113 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPER113_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPER113 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVCNTR113\_EL0, bit [44]

Trap MRS reads of AMEVCNTR113\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR113 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR113_EL0	Meaning
0b0	MRS reads of AMEVCNTR113_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR113 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR113_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR113 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVTYPER112\_EL0, bit [43]

Trap MRS reads of AMEVTYPER112\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER112 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER112_EL0	Meaning
0b0	MRS reads of AMEVTYPER112_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER112 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPER112_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPER112 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVCNTR112\_EL0, bit [42]

Trap MRS reads of AMEVCNTR112\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR112 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR112_EL0	Meaning
0b0	MRS reads of AMEVCNTR112_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR112 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR112_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR112 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVTYPER111\_EL0, bit [41]

Trap MRS reads of AMEVTYPER111\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER111 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER111_EL0	Meaning
0b0	MRS reads of AMEVTYPER111_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER111 at EL0 using AArch32 are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPER111_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPER111 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVCNTR111\_EL0, bit [40]

Trap MRS reads of AMEVCNTR111\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR111 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR111_EL0	Meaning
0b0	MRS reads of AMEVCNTR111_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR111 at EL0 using AArch32 are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR111_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR111 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVTYPER110\_EL0, bit [39]

Trap MRS reads of AMEVTYPER110\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER110 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER110_EL0	Meaning
0b0	MRS reads of AMEVTYPER110_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER110 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPER110_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPER110 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVCNTR110\_EL0, bit [38]

Trap MRS reads of AMEVCNTR110\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR110 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR110_EL0	Meaning
0b0	MRS reads of AMEVCNTR110_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR110 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR110_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR110 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVTYPER19\_EL0, bit [37]

Trap MRS reads of AMEVTYPER19\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER19 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER19_EL0	Meaning
0b0	MRS reads of AMEVTYPER19_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER19 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPER19_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPER19 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVCNTR19\_EL0, bit [36]

Trap MRS reads of AMEVCNTR19\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR19 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR19_EL0	Meaning
0b0	MRS reads of AMEVCNTR19_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR19 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR19_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR19 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVTYPEPER18\_EL0, bit [35]

Trap MRS reads of AMEVTYPEPER18\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPEPER18 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPEPER18_EL0	Meaning
0b0	MRS reads of AMEVTYPEPER18_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPEPER18 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPEPER18_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPEPER18 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVCNTR18\_EL0, bit [34]

Trap MRS reads of AMEVCNTR18\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR18 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR18_EL0	Meaning
0b0	MRS reads of AMEVCNTR18_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR18 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR18_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR18 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

### AMEVTYPER17\_EL0, bit [33]

Trap MRS reads of AMEVTYPER17\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER17 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER17_EL0	Meaning
0b0	MRS reads of AMEVTYPER17_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER17 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPER17_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPER17 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

### AMEVCNTR17\_EL0, bit [32]

Trap MRS reads of AMEVCNTR17\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR17 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR17_EL0	Meaning
0b0	MRS reads of AMEVCNTR17_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR17 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR17_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR17 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

**AMEVTYPER16\_EL0, bit [31]**

Trap MRS reads of AMEVTYPER16\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER16 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER16_EL0	Meaning
0b0	MRS reads of AMEVTYPER16_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER16 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTE == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPER16_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPER16 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

**AMEVCNTR16\_EL0, bit [30]**

Trap MRS reads of AMEVCNTR16\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR16 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR16_EL0	Meaning
0b0	MRS reads of AMEVCNTR16_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR16 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTE == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR16_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR16 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

**AMEVTYPER15\_EL0, bit [29]**

Trap MRS reads of AMEVTYPER15\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER15 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER15_EL0	Meaning
0b0	MRS reads of AMEVTYPER15_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER15 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPER15_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPER15 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVCNTR15\_EL0, bit [28]

Trap MRS reads of AMEVCNTR15\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR15 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR15_EL0	Meaning
0b0	MRS reads of AMEVCNTR15_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR15 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR15_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR15 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVTYPER14\_EL0, bit [27]

Trap MRS reads of AMEVTYPER14\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER14 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER14_EL0	Meaning
0b0	MRS reads of AMEVTYPER14_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER14 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPER14_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPER14 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

**AMEVCNTR14\_EL0, bit [26]**

Trap MRS reads of AMEVCNTR14\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR14 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR14_EL0	Meaning
0b0	MRS reads of AMEVCNTR14_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR14 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR14_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR14 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

**AMEVTYPEPER13\_EL0, bit [25]**

Trap MRS reads of AMEVTYPEPER13\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPEPER13 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPEPER13_EL0	Meaning
0b0	MRS reads of AMEVTYPEPER13_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPEPER13 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPEPER13_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPEPER13 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

**AMEVCNTR13\_EL0, bit [24]**

Trap MRS reads of AMEVCNTR13\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR13 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR13_EL0	Meaning
0b0	MRS reads of AMEVCNTR13_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR13 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR13_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR13 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

### AMEVTYPER12\_EL0, bit [23]

Trap MRS reads of AMEVTYPER12\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER12 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER12_EL0	Meaning
0b0	MRS reads of AMEVTYPER12_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER12 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPER12_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPER12 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

### AMEVCNTR12\_EL0, bit [22]

Trap MRS reads of AMEVCNTR12\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR12 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR12_EL0	Meaning
0b0	MRS reads of AMEVCNTR12_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR12 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR12_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR12 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

**AMEVTYPER11\_EL0, bit [21]**

Trap MRS reads of AMEVTYPER11\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER11 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER11_EL0	Meaning
0b0	MRS reads of AMEVTYPER11_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER11 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPER11_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPER11 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

**AMEVCNTR11\_EL0, bit [20]**

Trap MRS reads of AMEVCNTR11\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR11 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR11_EL0	Meaning
0b0	MRS reads of AMEVCNTR11_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR11 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR11_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR11 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

**AMEVTYPER10\_EL0, bit [19]**

Trap MRS reads of AMEVTYPER10\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER10 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPE10_EL0	Meaning
0b0	MRS reads of AMEVTYPE10_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPE10 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVTYPE10_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVTYPE10 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMEVCNTR10\_EL0, bit [18]

Trap MRS reads of AMEVCNTR10\_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR10 at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR10_EL0	Meaning
0b0	MRS reads of AMEVCNTR10_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR10 at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of AMEVCNTR10_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of AMEVCNTR10 at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

#### AMCNTEN1, bit [17]

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### AMCNTEN<x>, AMEVTYPE114\_EL0, bit [17x], for x = 1 to 047

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of AMCNTENCLR<x>\_EL0 and AMCNTENSET<x>\_EL0.
- At EL1 and EL0 using AArch64: MRS reads of [AMCNTENCLR1\\_EL0](#) and [AMCNTENSET1\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of AMCNTENCLR<x> and AMCNTENSET<x>.
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [AMCNTENCLR1](#) and [AMCNTENSET1](#).

AMCNTEN<x>_AMCNTEN1	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the read generates a higher priority exception: 0b1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MRS reads at EL1 and EL0 using AArch64 of <a href="#">AMCNTENCLR&lt;x&gt;_EL0</a> and <a href="#">AMCNTENSET&lt;x&gt;_EL0</a> are trapped to EL2 and reported with EC syndrome value <a href="#">AMCNTENCLR1_EL0</a> and <a href="#">AMCNTENSET1_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads at EL0 using AArch32 of <a href="#">AMCNTENCLR&lt;x&gt;</a> and <a href="#">AMCNTENSET&lt;x&gt;</a> are trapped to EL2 and reported with EC syndrome value <a href="#">AMCNTENCLR1</a> and <a href="#">AMCNTENSET1</a> are trapped to EL2 and reported with EC syndrome value 0x03, unless the read generates a higher priority exception.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Bits [16:5]

Reserved, RES0.

#### AMEVCNTR0<x>\_EL0, bit [x+1], for x = 30 to 03

Trap MRS reads of [AMEVCNTR0<x>\\_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [AMEVCNTR0<x>](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR0<x>_EL0	Meaning
0b0	MRS reads of <a href="#">AMEVCNTR0&lt;x&gt;_EL0</a> at EL1 and EL0 using AArch64 and MRC reads of <a href="#">AMEVCNTR0&lt;x&gt;</a> at EL0 using AArch32 are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the read generates a higher priority exception: 0b1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MRS reads of <a href="#">AMEVCNTR0&lt;x&gt;_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of <a href="#">AMEVCNTR0&lt;x&gt;</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

#### AMCNTEN0, bit [0]

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of [AMCNTENCLR0\\_EL0](#) and [AMCNTENSET0\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [AMCNTENCLR0](#) and [AMCNTENSET0](#).

AMCNTEN0	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads at EL1 and EL0 using AArch64 of <a href="#">AMCNTENCLR0_EL0</a> and <a href="#">AMCNTENSET0_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18;</li> <li>MRC reads at EL0 using AArch32 of <a href="#">AMCNTENCLR0</a> and <a href="#">AMCNTENSET0</a> are trapped to EL2 and reported with EC syndrome value 0x03, unless the read generates a higher priority exception.</li> </ul>

In a system where the PE resets into EL2, this field resets to 0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

## Accessing the HAFGRTR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, HAFGRTR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b110

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x1E8];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && SCR_EL3.FGTEn == '0' then
        UNDEFINED;
    elsif HaveEL(EL3) && SCR_EL3.FGTEn == '0' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return HAFGRTR_EL2;
elsif PSTATE.EL == EL3 then
    return HAFGRTR_EL2;

```

MSR HAFGRTR\_EL2, <Xt>

# HCR\_EL2, Hypervisor Configuration Register

The HCR\_EL2 characteristics are:

## Purpose

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

## Configuration

AArch64 System register HCR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HCR\[31:0\]](#).  
AArch64 System register HCR\_EL2 bits [63:32] are architecturally mapped to AArch32 System register [HCR2\[31:0\]](#).  
If EL2 is not implemented, this register is RES0 from EL3.  
The bits in this register behave as if they are 0 for all purposes other than direct reads of the register if EL2 is not enabled in the current Security state.

## Attributes

HCR\_EL2 is a 64-bit register.

## Field descriptions

The HCR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45
TWEDEL				TWEDEn	TID5	DCT	ATA	TTLBOS	TTLBIS	EnSCXT	TOCU	AMVOFFEN	TICAB	TID4	RES0	FIEN	FWB	NV2
RW	TRVM	HCD	TDZ	TGE	TVM	TTLB	TPU	Bit[23]	TPCP	TSW	TACR	TIDCP	TSC	TID3	TID2	TID1	TID0	TWE
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13

### TWEDEL, bits [63:60]

#### When FEAT\_TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when HCR\_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by HCR\_EL2.TWE as  $2^{(TWEDEL + 8)}$  cycles.  
This field resets to an architecturally UNKNOWN value.

### TWEDEL, bits [63:60]

#### When FEAT\_TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when HCR\_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE\* caused by HCR\_EL2.TWE as  $2^{(TWEDEL + 8)}$  cycles.  
On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### TWEDEn, bit [59]

**When FEAT\_TWED is implemented:**

TWE Delay Enable. Enables a configurable delayed trap of the WFE\* instruction caused by HCR\_EL2.TWE.

TWEDen	Meaning
0b0	The delay for taking thea WFE trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking thea WFE trap is at least the number of cycles defined in HCR_EL2.TWEDEL.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TID5, bit [58]****When FEAT\_MTE2FEAT\_MTE is implemented:**

Trap ID group 5. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- [GMID\\_EL1](#).

TID5	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 5 registers are trapped to EL2.

When the value of HCR\_EL2.{E2H, TGE} is {1, 1}, this field has an Effective value of 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DCT, bit [57]****When FEAT\_MTE2FEAT\_MTE is implemented:**

Default Cacheability Tagging. When HCR\_EL2.DC is in effect, controls whether stage 1 translations are treated as Tagged or Untagged.

DCT	Meaning
0b0	Stage 1 translations are treated as Untagged.
0b1	Stage 1 translations are treated as Tagged.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**ATA, bit [56]****When FEAT\_MTE2FEAT\_MTE is implemented:**

Allocation Tag Access. When [HCR\\_EL2](#).{E2H,TGE} != {1,1}, controls EL1 and EL0 access to Allocation Tags.

When access is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
- MRS and MSR instructions at EL1 using [GCR\\_EL1](#), [RGSR\\_EL1](#), [TFSR\\_EL1](#), [TFSR\\_EL2](#), or [TFSRE0\\_EL1](#) that are not UNDEFINED are trapped to EL2.

ATA	Meaning
0b0	Access is prevented.
0b1	Access is not prevented.

This field is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

#### TTLBOS, bit [55]

When FEAT\_EVT is implemented:

Trap TLB maintenance instructions that operate on the Outer Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

[TLBI VMALLE1OS](#), [TLBI VAE1OS](#), [TLBI ASIDE1OS](#), [TLBI VAAE1OS](#), [TLBI VALE1OS](#), [TLBI VAALE1OS](#), [TLBI RVAE1OS](#), [TLBI RVAAE1OS](#), [TLBI RVALE1OS](#), and [TLBI RVAALE1OS](#).

TTLBOS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

#### TTLBIS, bit [54]

When FEAT\_EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, [TLBI VMALLE1IS](#), [TLBI VAE1IS](#), [TLBI ASIDE1IS](#), [TLBI VAAE1IS](#), [TLBI VALE1IS](#), [TLBI VAALE1IS](#), [TLBI RVAE1IS](#), [TLBI RVAAE1IS](#), [TLBI RVALE1IS](#), and [TLBI RVAALE1IS](#).
- When EL1 is using AArch32, [TLBIALLIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAIS](#), [TLBIMVALIS](#), and [TLBIMVAALIS](#).

TTLBIS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### EnSCXT, bit [53]

When FEAT\_CSV2 is implemented:

Enable Access to the [SCXTNUM\\_EL1](#) and [SCXTNUM\\_EL0](#) registers. The defined values are:

EnSCXT	Meaning
0b0	When (HCR_EL2.TGE==0 or HCR_EL2.E2H==0) and EL2 is enabled in the current Security state, EL1 and EL0 access to <a href="#">SCXTNUM_EL0</a> and EL1 access to <a href="#">SCXTNUM_EL1</a> is disabled by this mechanism, causing an exception to EL2, and the values of these registers to be treated as 0. When ((HCR_EL2.TGE==1 and HCR_EL2.E2H==1) and EL2 is enabled in the current Security state, EL0 access to <a href="#">SCXTNUM_EL0</a> is disabled by this mechanism, causing an exception to EL2, and the value of this register to be treated as 0.
0b1	This control does not cause accesses to <a href="#">SCXTNUM_EL0</a> or <a href="#">SCXTNUM_EL1</a> to be trapped.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### TOCU, bit [52]

When FEAT\_EVT is implemented:

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When [SCTLR\\_EL1](#).UCI is 1, HCR\_EL2.{TGE, E2H} is not {1, 1}, and EL0 is using AArch64, [IC IVAU](#), [DC CVAU](#).
- When EL1 is using AArch64, [IC IVAU](#), [IC IALLU](#), [DC CVAU](#).
- When EL1 is using AArch32, [ICIMVAU](#), [IC IALLU](#), [DCCMVAU](#).

#### Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- [IC IALLUIS](#) and [IC IALLU](#) are always UNDEFINED at EL0 using AArch64.
- [ICIMVAU](#), [IC IALLU](#), [IC IALLUIS](#), and [DCCMVAU](#) are always UNDEFINED at EL0 using AArch32.

TOCU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### AMVOFFEN, bit [51]

When FEAT\_AMUv1p1 is implemented:

Activity Monitors Virtual Offsets Enable.

AMVOFFEN	Meaning
0b0	Virtualization of the Activity Monitors is disabled. Indirect reads of the virtual offset registers are zero.
0b1	Virtualization of the Activity Monitors is enabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### TICAB, bit [50]

When FEAT\_EVT is implemented:

Trap ICIALLUIS/IC IALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, [IC IALLUIS](#).
- When EL1 is using AArch32, [ICIALLUIS](#).

TICAB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified instructions is trapped to EL2.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

**TID4, bit [49]****When FEAT\_EVT is implemented:**

Trap ID group 4. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- EL1 reads of [CCSIDR\\_EL1](#), [CCSIDR2\\_EL1](#), [CLIDR\\_EL1](#), and [CSSELR\\_EL1](#).
- EL1 writes to [CSSELR\\_EL1](#).

AArch32:

- EL1 reads of [CCSIDR](#), [CCSIDR2](#), [CLIDR](#), and [CSSELR](#).
- EL1 writes to [CSSELR](#).

TID4	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.

When FEAT\_VHE is implemented, and the value of HCR\_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [48]**

Reserved, RES0.

**FIEN, bit [47]****When FEAT\_RASv1p1 is implemented:**

Fault Injection Enable. Unless this bit is set to 1, accesses to the [ERXPFPCDN\\_EL1](#), [ERXPFPCCTL\\_EL1](#), and [ERXPFPCFE\\_EL1](#) registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18.

FIEN	Meaning
0b0	Accesses to the specified registers from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

If EL2 is disabled in the current Security state, the Effective value of HCR\_EL2.FIEN is 0b1.

If [ERRIDR\\_EL1](#).NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FWB, bit [46]****When FEAT\_S2FWB is implemented:**

Forced Write-Back. Defines the combined cacheability attributes in a 2 stage translation regime.

**Note**

When **FEAT\_MTE2** is implemented, if the stage 1 page or block descriptor specifies the Tagged attribute, the final memory type is Tagged only if the final cacheable memory type is Inner and Outer Write-back cacheable and the final allocation hints are Read-Allocate, Write-Allocate.

<b>FWB</b>	<b>Meaning</b>
0b0	<p>When this bit is 0, then:</p> <ul style="list-style-type: none"> <li>The combination of stage 1 and stage 2 translations on memory type and cacheability attributes are as described in the Armv8.0 architecture. For more information, see 'Combining the stage 1 and stage 2 attributes, EL1&amp;0 translation regime'.</li> <li>The encoding of the stage 2 memory type and cacheability attributes in bits[5:2] of the stage 2 page or block descriptors are as described in the Armv8.0 architecture.</li> </ul>
0b1	<p>When this bit is 1, then:</p> <ul style="list-style-type: none"> <li>Bit[5] of stage 2 page or block descriptor is RES0.</li> <li>When bit[4] of stage 2 page or block descriptor is 1 and when: <ul style="list-style-type: none"> <li>Bits[3:2] of stage 2 page or block descriptor are 0b11, the resultant memory type and inner or outer cacheability attribute is the same as the stage 1 memory type and inner or outer cacheability attribute.</li> <li>Bits[3:2] of stage 2 page or block descriptor are 0b10, the resultant memory type and attribute is Normal Write-Back.</li> <li>Bits[3:2] of stage 2 page or block descriptor are 0b0x, the resultant memory type will be Normal Non-cacheable except where the stage 1 memory type was Device-&lt;attr&gt; the resultant memory type will be Device-&lt;attr&gt;</li> </ul> </li> <li>When bit[4] of stage 2 page or block descriptor is 0 the memory type is Device, and when: <ul style="list-style-type: none"> <li>Bits[3:2] of stage 2 page or block descriptor are 0b00, the stage 2 memory type is Device-nGnRnE.</li> <li>Bits[3:2] of stage 2 page or block descriptor are 0b01, the stage 2 memory type is Device-nGnRE.</li> <li>Bits[3:2] of stage 2 page or block descriptor are 0b10, the stage 2 memory type is Device-nGRE.</li> <li>Bits[3:2] of stage 2 page or block descriptor are 0b11, the stage 2 memory type is Device-GRE.</li> </ul> </li> <li>If the stage 1 translation specifies a cacheable memory type, then the stage 1 cache allocation hint is applied to the final cache allocation hint where the final memory type is cacheable.</li> <li>If the stage 1 translation does not specify a cacheable memory type, then if the final memory type is cacheable, it is treated as read allocate, write allocate.</li> </ul> <p>The stage 1 and stage 2 memory types are combined in the manner described in 'Combining the stage 1 and stage 2 attributes, EL1&amp;0 translation regime'.</p>

In Secure state, this bit applies to both the Secure stage 2 translation and the Non-secure stage 2 translation.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NV2, bit [45]**

**When FEAT\_NV2 is implemented:**

Nested Virtualization. Changes the behaviors of HCR\_EL2.{NV1NV, NVNV1} to provide a mechanism for hardware to transform reads and writes from System registers into reads and writes from memory.

NV2	Meaning
0b0	This bit has no effect on the behavior of HCR_EL2.{NV1NV, NVNV1}. The behavior of HCR_EL2.{NV1NV, NVNV1} is as defined for FEAT_NV.
0b1	Redefines behavior of HCR_EL2.{NV1NV, NVNV1} to enable: <ul style="list-style-type: none"> <li>Transformation of read/writes to registers into read/writes to memory.</li> <li>Redirection of EL2 registers to EL1 registers.</li> </ul> Any exception taken from EL1 and taken to EL1 causes SPSR_EL1.M[3:2] to be set to 0b10 and not 0b01.

When HCR\_EL2.NV is 0, the Effective value of this field is 0.

~~This field resets to an architecturally UNKNOWN value.~~

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**AT, bit [44]****When FEAT\_NV is implemented:**

Address Translation. EL1 execution of the following address translation instructions is trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- AT S1E0R, AT S1E0W, AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP.

AT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified instructions is trapped to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NV1, bit [43]****When FEAT\_NV2 is implemented:**

Nested Virtualization.

NV1	Meaning
0b0	If HCR_EL2.{NV2NV, NVNV2} are both 1, accesses executed from EL1 to implemented EL12, EL02, or EL2 registers are transformed to loads and stores. If HCR_EL2.NV2 is 0 or HCR_EL2.{NV2NV, NVNV2} == {10, 01}, this control does not cause any instructions to be trapped.
0b1	If HCR_EL2.NV2 is 1, accesses executed from EL1 to implemented EL2 registers are transformed to loads and stores. If HCR_EL2.NV2 is 0, EL1 accesses to VBAR_EL1, ELR_EL1, and SPSR_EL1, and are trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value FEAT_CSV2 is implemented, SCXTNUM_EL1, are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.

If HCR\_EL2.NV2 is 1, the value of HCR\_EL2.NV1 defines which EL1 register accesses are transformed to loads and stores. These transformed accesses have priority over the trapping of registers.

The trapping of EL1 registers caused by other control bits has priority over the transformation of these accesses.

If a register is specified that is not implemented by an implementation, then access to that register are UNDEFINED.

For the list of registers affected, see 'Enhanced support for nested virtualization'.

If HCR\_EL2.{NV1NV, NVNV1} is {01, 10}, any exception taken from EL1, and taken to EL1, causes the SPSR\_EL1.M[3:2] to be set to 0b10, and not 0b01.

If HCR\_EL2.{NV1NV, NVNV1} is {1, 1}, then:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR\* instructions are treated as the equivalent LDR\* instructions, and the STTR\* instructions are treated as the equivalent STR\* instructions.

If HCR\_EL2.{NV, NV1, NVNV2} are {0, 1, 0}, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR\_EL2.NV is 1 and HCR\_EL2.NV1 is 1 for all purposes other than reading than reading back the value of the HCR\_EL2.NV bit.
- Behaving as if HCR\_EL2.NV is 0 and HCR\_EL2.NV1 is 0 for all purposes other than reading than reading back the value of the HCR\_EL2.NV1 bit.
- Behaving with regard to the HCR\_EL2.NV and HCR\_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### When FEAT\_NV is implemented:

Nested Virtualization. EL1 accesses to certain registers are trapped to EL2, when EL2 is enabled in the current Security state.

NV1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to VBAR_EL1, ELR_EL1, SPSR_EL1 are trapped to EL2, and when EL2 is enabled in the current Security state, when reported using EC syndrome value FEAT_CSV2 is implemented, SCXTNUM_EL1, are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.

If HCR\_EL2.NV is 1 and HCR\_EL2.NV1 is 0, then the following effects also apply:

- Any exception taken from EL1, and taken to EL1, causes the SPSR\_EL1.M[3:2] to be set to 0b10, and not 0b01.

If the bits HCR\_EL2.NV and HCR\_EL2.NV1 are both set to 1, then the following effects also apply:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.

- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR\* instructions are treated as the equivalent LDR\* instructions, and the STTR\* instructions are treated as the equivalent STR\* instructions.

If HCR\_EL2.NV is 0 and HCR\_EL2.NV1 is 1, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR\_EL2.NV is 1 and HCR\_EL2.NV1 is 1 for all purposes other than reading than reading back the value of the HCR\_EL2.NV bit.
- Behaving as if HCR\_EL2.NV is 0 and HCR\_EL2.NV1 is 0 for all purposes other than reading than reading back the value of the HCR\_EL2.NV1 bit.
- Behaving with regard to the HCR\_EL2.NV and HCR\_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

## NV, bit [42]

When FEAT\_NV2 is implemented:

Nested Virtualization.

When HCR\_EL2.NV2 is 1, redefines register accesses so that:

- Instructions accessing the Special purpose registers [SPSR\\_EL2](#) and [ELR\\_EL2](#) instead access [SPSR\\_EL1](#) and [ELR\\_EL1](#) respectively.
- Instructions accessing the System registers [ESR\\_EL2](#) and [FAR\\_EL2](#) instead access [ESR\\_EL1](#) and [FAR\\_EL1](#).

When HCR\_EL2.NV2 is 0, or if FEAT\_NV2 is not implemented, traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

NV	Meaning
0b0	When this bit is set to 0, then the PE behaves as if HCR_EL2.NV2 is 0 for all purposes other than reading this register. This control does not cause any instructions to be trapped. When HCR_EL2.NV2 is 1, no FEAT_NV2 functionality is implemented.
0b1	When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the <a href="#">CurrentEL</a> register return a value of 0x2. When HCR_EL2.NV2 is 1, this control redefines EL1 register accesses so that instructions accessing <a href="#">SPSR_EL2</a> , <a href="#">ELR_EL2</a> , <a href="#">ESR_EL2</a> , and <a href="#">FAR_EL2</a> instead access <a href="#">SPSR_EL1</a> , <a href="#">ELR_EL1</a> , <a href="#">ESR_EL1</a> , and <a href="#">FAR_EL1</a> respectively.

When HCR\_EL2.NV2 is 0, or if FEAT\_NV2 is not implemented, then:

- The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:
  - Registers accessed using MRS or MSR with a name ending in \_EL2, except [SP\\_EL2](#).
  - Registers accessed using MRS or MSR with a name ending in \_EL12.
  - Registers accessed using MRS or MSR with a name ending in \_EL02.
  - Special-purpose registers [SPSR\\_irq](#), [SPSR\\_abt](#), [SPSR\\_und](#) and [SPSR\\_fiq](#), accessed using MRS or MSR.
  - Special-purpose register [SP\\_EL1](#) accessed using the dedicated MRS or MSR instruction.

- The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:
  - EL2 translation regime Address Translation instructions and TLB maintenance instructions.
  - EL1 translation regime Address Translation instructions and TLB maintenance instructions that are **only** accessible **only** from EL2 and EL3.
- The instructions for which the execution is trapped as follows:
  - SMC in an implementation that does not include EL3 and when HCR\_EL2.TSC is 1. HCR\_EL2.TSC bit is not RES0 in this case. This is reported using EC syndrome value 0x17.
  - The ERET, ERETAA, and ERETAB instructions, reported using EC syndrome value 0x1A.

---

**Note**

The priority of this trap is higher than the priority of the HCR\_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

---

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**When FEAT\_NV is implemented:**

Nested Virtualization. Traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

The possible values are:

NV	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the <a href="#">CurrentEL</a> register return a value of 0x2.

The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:

- Registers accessed using MRS or MSR with a name ending in \_EL2, except [SP\\_EL2](#).
- Registers accessed using MRS or MSR with a name ending in \_EL12.
- Registers accessed using MRS or MSR with a name ending in \_EL02.
- Special-purpose registers [SPSR\\_irq](#), [SPSR\\_abt](#), [SPSR\\_und](#) and [SPSR\\_fiq](#), accessed using MRS or MSR.
- Special-purpose register [SP\\_EL1](#) accessed using the dedicated MRS or MSR instruction.

The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:

- EL2 translation regime Address Translation instructions and TLB maintenance instructions.
- EL1 translation regime Address Translation instructions and TLB maintenance instructions that are **only** accessible **only** from EL2 and EL3.

The execution of the ERET, ERETAA, and ERETAB instructions are trapped and reported using EC syndrome value 0x1A

---

**Note**

The priority of this trap is higher than the priority of the HCR\_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

---

The execution of the SMC instructions in an implementation that does not include EL3 and when HCR\_EL2.TSC is 1 are trapped and reported using EC syndrome value 0x17. HCR\_EL2.TSC bit is not RES0 in this case.

This bit is permitted to be cached in a TLB.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**API, bit [41]****When FEAT\_PAuth is implemented:**

Controls the use of instructions related to Pointer Authentication:

- In EL0, when HCR\_EL2.TGE==0 or HCR\_EL2.E2H==0, and the associated [SCTLR\\_EL1.En<N><M>==1](#).
- In EL1, the associated [SCTLR\\_EL1.En<N><M>==1](#).

Traps are reported using EC syndrome value 0x09. The Pointer Authentication instructions trapped are:

- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB.
- PACGA, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB.
- RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB, LDRAA and LDRAB.

API	Meaning
0b0	<p>The instructions related to Pointer Authentication are trapped to EL2, when EL2 is enabled in the current Security state and the instructions are enabled for the EL1&amp;0 translation regime, from:</p> <ul style="list-style-type: none"> <li>• EL0 when HCR_EL2.TGE==0 or HCR_EL2.E2H==0.</li> <li>• EL1.</li> </ul> <p>If HCR_EL2.NV is 1, the HCR_EL2.NV trap takes precedence over the HCR_EL2.API trap for the ERETAA and ERETAB instructions.</p> <p>If EL2 is implemented and enabled in the current Security state and <a href="#">HFGITR_EL2.ERET == 1</a>, execution at EL1 using AArch64 of ERETAA or ERETAB instructions is reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the HCR_EL2.API == 0.</p>
0b1	This control does not cause any instructions to be trapped.

If FEAT\_PAuth is implemented but EL2 is not implemented or disabled in the current Security state, the system behaves as if this bit is 1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**APK, bit [40]****When FEAT\_PAuth is implemented:**

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers from EL1 to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- [APIAKeyLo\\_EL1](#), [APIAKeyHi\\_EL1](#), [APIBKeyLo\\_EL1](#), [APIBKeyHi\\_EL1](#), [APDAKeyLo\\_EL1](#), [APDAKeyHi\\_EL1](#), [APDBKeyLo\\_EL1](#), [APDBKeyHi\\_EL1](#), [APGAKeyLo\\_EL1](#), and [APGAKeyHi\\_EL1](#).

APK	Meaning
0b0	Access to the registers holding "key" values for pointer authentication from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

**Note**

If FEAT\_PAuth is implemented but EL2 is not implemented or is disabled in the current Security state, the system behaves as if this bit is 1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [39]**

Reserved, RES0.

**MIOCNCNCE, bit [38]**

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the EL1&0 translation regimes.

MIOCNCNCE	Meaning
0b0	For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.
0b1	For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

For more information see 'Mismatched memory attributes'.

This field can be implemented as RAZ/WI.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**TEA, bit [37]**

**When FEAT\_RAS is implemented:**

Route synchronous External abort exceptions to EL2.

TEA	Meaning
0b0	This control does not cause exceptions to be routed from EL0 and EL1 to EL2.
0b1	Route synchronous External abort exceptions from EL0 and EL1 to EL2, when EL2 is enabled in the current Security state, if not routed to EL3.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TERR, bit [36]**

**When FEAT\_RAS is implemented:**

Trap Error record accesses. Trap accesses to the RAS error registers from EL1 to EL2 as follows:

- If EL1 is using AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:

- [ERRIDR\\_EL1](#), [ERRSELR\\_EL1](#), [ERXADDR\\_EL1](#), [ERXCTLR\\_EL1](#), [ERXFR\\_EL1](#), [ERXMISC0\\_EL1](#), [ERXMISC1\\_EL1](#), and [ERXSTATUS\\_EL1](#).
- When FEAT\_RASv1p1 is implemented, [ERXMISC2\\_EL1](#), and [ERXMISC3\\_EL1](#).
- If EL1 is using AArch32 state, MCR or MRC accesses are trapped to EL2, reported using EC syndrome value 0x03, MCRR or MRRC accesses are trapped to EL2, reported using EC syndrome value 0x04:
  - [ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#).
  - When FEAT\_RASv1p1 is implemented, [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), and [ERXMISC7](#).

<b>TERR</b>	<b>Meaning</b>
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses to the specified registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### TLOR, bit [35]

#### When FEAT\_LOR is implemented:

Trap LOR registers. Traps Non-secure EL1 accesses to [LORSA\\_EL1](#), [LOREA\\_EL1](#), [LORN\\_EL1](#), [LORC\\_EL1](#), and [LORID\\_EL1](#) registers to EL2.

<b>TLOR</b>	<b>Meaning</b>
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 accesses to the LOR registers are trapped to EL2.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### E2H, bit [34]

#### When FEAT\_VHE is implemented:

EL2 Host. Enables a configuration where a Host Operating System is running in EL2, and the Host Operating System's applications are running in EL0.

<b>E2H</b>	<b>Meaning</b>
0b0	The facilities to support a Host Operating System at EL2 are disabled.
0b1	The facilities to support a Host Operating System at EL2 are enabled.

For information on the behavior of this bit see 'Behavior of HCR\_EL2.E2H'.

This bit is permitted to be cached in a TLB.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

**ID, bit [33]**

Stage 2 Instruction access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR\_EL2.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

ID	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime.
0b1	Forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**CD, bit [32]**

Stage 2 Data access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR\_EL2.VM==1, this control forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

CD	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime for data accesses and translation table walks.
0b1	Forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**RW, bit [31]**

**When AArch32 is supported at any Exception level:**

Execution state control for lower Exception levels:

RW	Meaning
0b0	Lower levels are all AArch32.
0b1	The Execution state for EL1 is AArch64. The Execution state for EL0 is determined by the current value of PSTATE.nRW when executing at EL0.

If AArch32 state is not supported by the implementation at EL1, then this bit is RAO/WI.

In an implementation that includes EL3, when EL2 is not enabled in Secure state, the PE behaves as if this bit has the same value as the [SCR\\_EL3](#).RW bit for all purposes other than a direct read or write access of HCR\_EL2.

The RW bit is permitted to be cached in a TLB.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 1 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAO/WI.

**TRVM, bit [30]**

Trap Reads of Virtual Memory controls. Traps EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18.
  - [SCTLR\\_EL1](#), [TTBR0\\_EL1](#), [TTBR1\\_EL1](#), [TCR\\_EL1](#), [ESR\\_EL1](#), [FAR\\_EL1](#), [AFSR0\\_EL1](#), [AFSR1\\_EL1](#), [MAIR\\_EL1](#), [AMAIR\\_EL1](#), [CONTEXTIDR\\_EL1](#).
- If EL1 is using AArch32 state, accesses using MRC to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MRRC are trapped to EL2 and reported using EC syndrome value 0x04:
  - [SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIR0](#), [MAIR1](#), [AMAIR0](#), [AMAIR1](#), [CONTEXTIDR](#).

TRVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 read accesses to the specified Virtual Memory controls are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**Note**

EL2 provides a second stage of address translation, that a hypervisor can use to remap the address map defined by a Guest OS. In addition, a hypervisor can trap attempts by a Guest OS to write to the registers that control the memory system. A hypervisor might use this trap as part of its virtualization of memory management.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**HCD, bit [29]**

When EL3 is not implemented:

HVC instruction disable. Disables EL1 execution of HVC instructions, from both Execution states, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x00.

HCD	Meaning
0b0	HVC instruction execution is enabled at EL2 and EL1.
0b1	HVC instructions are UNDEFINED at EL2 and EL1. Any resulting exception is taken to the Exception level at which the HVC instruction is executed.

**Note**

HVC instructions are always UNDEFINED at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**TDZ, bit [28]**

Trap [DC ZVA](#) instructions. Traps EL0 and EL1 execution of [DC ZVA](#) instructions to EL2, when EL2 is enabled in the current Security state, from AArch64 state only, reported using EC syndrome value 0x18.

If [FEAT\\_MTE2](#) is implemented, this trap also applies to [DC GVA](#) and [DC GZVA](#).

TDZ	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	In AArch64 state, any attempt to execute an instruction this trap applies to at EL1, or at EL0 when the instruction is not UNDEFINED at EL0, is trapped to EL2 when EL2 is enabled in the current Security state. Reading the <a href="#">DCZID_EL0</a> returns a value that indicates that the instructions this trap applies to are not supported.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## TGE, bit [27]

Trap General Exceptions, from EL0.

TGE	Meaning
0b0	This control has no effect on execution at EL0.
0b1	When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0. When EL2 is enabled in the current Security state, in all cases: <ul style="list-style-type: none"> <li>All exceptions that would be routed to EL1 are routed to EL2.</li> <li>If EL1 is using AArch64, the <a href="#">SCTLR_EL1</a>.M field is treated as being 0 for all purposes other than returning the result of a direct read of <a href="#">SCTLR_EL1</a>.</li> <li>If EL1 is using AArch32, the <a href="#">SCTLR</a>.M field is treated as being 0 for all purposes other than returning the result of a direct read of <a href="#">SCTLR</a>.</li> <li>All virtual interrupts are disabled.</li> <li>Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled.</li> <li>An exception return to EL1 is treated as an illegal exception return.</li> <li>The <a href="#">MDCR_EL2</a>.{TDRA, TDOSA, TDA, TDE} fields are treated as being 1 for all purposes other than returning the result of a direct read of <a href="#">MDCR_EL2</a>.</li> </ul> In addition, when EL2 is enabled in the current Security state, if: <ul style="list-style-type: none"> <li>HCR_EL2.E2H is 0, the Effective values of the <a href="#">HCR_EL2</a>.{FMO, IMO, AMO} fields are 1.</li> <li>HCR_EL2.E2H is 1, the Effective values of the <a href="#">HCR_EL2</a>.{FMO, IMO, AMO} fields are 0.</li> </ul> For further information on the behavior of this bit when E2H is 1, see 'Behavior of HCR_EL2.E2H'.

HCR\_EL2.TGE must not be cached in a TLB.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## TVM, bit [26]

Trap Virtual Memory controls. Traps EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18:
  - [SCTLR\\_EL1](#), [TTBR0\\_EL1](#), [TTBR1\\_EL1](#), [TCR\\_EL1](#), [ESR\\_EL1](#), [FAR\\_EL1](#), [AFSR0\\_EL1](#), [AFSR1\\_EL1](#), [MAIR\\_EL1](#), [AMAIR\\_EL1](#), [CONTEXTIDR\\_EL1](#).
- If EL1 is using AArch32 state, accesses using MCR to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MCRR are trapped to EL2 and reported using EC syndrome value 0x04:
  - [SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIR0](#), [MAIR1](#), [AMAIR0](#), [AMAIR1](#), [CONTEXTIDR](#).

TVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 write accesses to the specified EL1 virtual memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## TTLB, bit [25]

Trap TLB maintenance instructions. Traps EL1 execution of TLB maintenance instructions to EL2, when EL2 is enabled in the current Security state, as follows:

- When EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
  - [TLBI VMALLE1](#), [TLBI VAE1](#), [TLBI ASIDE1](#), [TLBI VAAE1](#), [TLBI VALE1](#), [TLBI VAALE1](#).
  - [TLBI VMALLE1IS](#), [TLBI VAE1IS](#), [TLBI ASIDE1IS](#), [TLBI VAAE1IS](#), [TLBI VALE1IS](#), [TLBI VAALE1IS](#).
  - If FEAT\_TLBIOS is implemented, this trap applies to [TLBI VMALLE1OS](#), [TLBI VAE1OS](#), [TLBI ASIDE1OS](#), [TLBI VAAE1OS](#), [TLBI VALE1OS](#), [TLBI VAALE1OS](#).
  - If FEAT\_TLBIRANGE is implemented, this trap applies to [TLBI RVAE1](#), [TLBI RVAE1IS](#), [TLBI RVAE1OS](#), [TLBI RVAE1IS](#), [TLBI RVAE1OS](#).
  - If FEAT\_TLBIOS and FEAT\_TLBIRANGE are implemented, this trap applies to [TLBI RVAE1OS](#), [TLBI RVAE1IS](#), [TLBI RVAE1OS](#), [TLBI RVAE1IS](#).
- When EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
  - [TLBIALLIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAAIS](#), [TLBIMVALIS](#), [TLBIMVAALIS](#).
  - [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [TLBIMVAA](#), [TLBIMVAL](#), [TLBIMVAAL](#).
  - [ITLBIALL](#), [ITLBIASID](#), [ITLBIASID](#).
  - [DTLBIALL](#), [DTLBIASID](#), [DTLBIASID](#).

TTLB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

## Note

The TLB maintenance instructions are UNDEFINED at EL0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of [SCTLR\\_EL1.UCI](#) is not 0, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - [IC IVAU](#), [DC CVAU](#). If the value of [SCTLR\\_EL1.UCI](#) is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - [IC IVAU](#), [IC IALLU](#), [IC IALLUIS](#), [DC CVAU](#).
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - [ICIMVAU](#), [IC IALLU](#), [IC IALLUIS](#), [DCCMVAU](#).

## Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- [IC IALLUIS](#) and [IC IALLU](#) are always UNDEFINED at EL0 using AArch64.
- [ICIMVAU](#), [ICIALLU](#), [ICIALUIS](#), and [DCCMVAU](#) are always UNDEFINED at EL0 using AArch32.

TPU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TPCP, bit [23]

When FEAT\_DPB is implemented:

Trap data or unified cache maintenance instructions that operate to the Point of Coherency or Persistence. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of [SCTLR\\_EL1](#).UCI is not 0, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
  - [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#). If the value of [SCTLR\\_EL1](#).UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
  - [DC IVAC](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#).
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
  - [DCIMVAC](#), [DCCIMVAC](#), [DCCMVAC](#).

If FEAT\_DPB2 is implemented, this trap also applies to [DC CVADP](#).

If [FEAT\\_MTE2](#) is implemented, this trap also applies to [DC CIGVAC](#), [DC CIGDVAC](#), [DC IGVAC](#), [DC IGDVAC](#), [DC CGVAC](#), [DC CGDVAC](#), [DC CGVAP](#) and [DC CGDVAP](#).

If FEAT\_DPB2 and [FEAT\\_MTE2](#) are implemented, this trap also applies to [DC CGVADP](#) and [DC CGDVADP](#).

### Note

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
  - AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
  - [DCIMVAC](#), [DCCIMVAC](#), and [DCCMVAC](#) are always UNDEFINED at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2 it is named TPCP.

TPCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If [HCR\\_EL2](#).{E2H, TGE} is set to {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

#### Otherwise:

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of [SCTLR\\_EL1](#).UCI is not 0, accesses to the following registers are trapped and reported using EC syndrome value 0x18:
  - [DC CIVAC](#), [DC CVAC](#). However, if the value of [SCTLR\\_EL1](#).UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, accesses to [DC IVAC](#), [DC CIVAC](#), [DC CVAC](#) are trapped and reported using EC syndrome value 0x18.
- When EL1 is using AArch32, accesses to [DCIMVAC](#), [DCCIMVAC](#), and [DCCMVAC](#) are trapped and reported using EC syndrome value 0x03.

#### Note

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
  - AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
  - [DCIMVAC](#), [DCCIMVAC](#), and [DCCMVAC](#) are always UNDEFINED at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2 it is named TPCP.

TPC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

#### TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to [DC ISW](#), [DC CSW](#), [DC CISW](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL1 is using AArch32 state, accesses to [DCISW](#), [DCCSW](#), [DCCISW](#) are trapped to EL2, reported using EC syndrome value 0x03.

If [FEAT\\_MTE2](#)~~FEAT\_MTE~~ is implemented, this trap also applies to [DC IGSW](#), [DC IGDSW](#), [DC CGSW](#), [DC CGDW](#), [DC CIGSW](#), and [DC CIGDSW](#).

#### Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TSW	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## TACR, bit [21]

Trap Auxiliary Control Registers. Traps EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, accesses to [ACTLR\\_EL1](#) to EL2, are trapped to EL2 and reported using EC syndrome value 0x18.
- If EL1 is using AArch32 state, accesses to [ACTLR](#) and, if implemented, [ACTLR2](#) are trapped to EL2 and reported using EC syndrome value 0x03.

TACR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

### Note

[ACTLR\\_EL1](#) is not accessible at EL0

[ACTLR](#), and [ACTLR2](#) are not accessible at EL0.

The Auxiliary Control Registers are IMPLEMENTATION DEFINED registers that might implement global control bits for the PE.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps EL1 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, access to any of the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome 0x18:
  - IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}.
  - IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the [S3\\_op1\\_Cn\\_Cm\\_op2](#) register name.
- In AArch32 state, MCR and MRC access to instructions with the following encodings are trapped and reported using EC syndrome 0x03:
  - All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}.
  - All coproc==p15, CRn==c10, opc1 == {0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}.
  - All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

When the value of [HCR\\_EL2.TIDCP](#) is 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from EL0 is trapped to EL2. If it is not, then it is UNDEFINED, and any attempt to access it from EL0 generates an exception that is taken to EL1.

TIDCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to or execution of the specified encodings reserved for IMPLEMENTATION DEFINED functionality are trapped to EL2, when EL2 is enabled in the current Security state.

An implementation can also include IMPLEMENTATION DEFINED registers that provide additional controls, to give finer-grained control of the trapping of IMPLEMENTATION DEFINED features.

### Note

Arm expects the trapping of EL0 accesses to these functions to EL2 to be unusual, and used only when the hypervisor is virtualizing EL0 operation. Arm

strongly recommends that unless the hypervisor must virtualize EL0 operation, an EL0 access to any of these functions is UNDEFINED, as it would be if the implementation did not include EL2. The PE then takes any resulting exception to EL1.

The trapping of accesses to these registers from EL1 is higher priority than an exception resulting from the register access being UNDEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TSC, bit [19]

Trap SMC instructions. Traps EL1 execution of SMC instructions to EL2, when EL2 is enabled in the current Security state.

If execution is in AArch64 state, the trap is reported using EC syndrome value 0x17.

If execution is in AArch32 state, the trap is reported using EC syndrome value 0x13.

#### Note

[HCR\\_EL2](#).TSC traps execution of the SMC instruction. It is not a routing control for the SMC exception. Trap exceptions and SMC exceptions have different preferred return addresses.

TSC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	<p>If EL3 is implemented, then any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state, regardless of the value of <a href="#">SCR_EL3</a>.SMD.</p> <p>If EL3 is not implemented, FEAT_NV is implemented, and HCR_EL2.NV is 1, then any attempt to execute an SMC instruction at EL1 using AArch64 is trapped to EL2, when EL2 is enabled in the current Security state.</p> <p>If EL3 is not implemented, and either FEAT_NV is not implemented or HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether:</p> <ul style="list-style-type: none"> <li>Any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state.</li> <li>Any attempt to execute an SMC instruction is UNDEFINED.</li> </ul>

In AArch32 state, the Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

SMC instructions are UNDEFINED at EL0.

If EL3 is not implemented and HCR\_EL2.NV is 0, it is IMPLEMENTATION DEFINED whether this bit is:

- RES0.
- Implemented with the functionality as described in HCR\_EL2.TSC.

When [HCR\\_EL2](#).TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TID3, bit [18]

Trap ID group 3. Traps EL1 reads of group 3 ID registers to EL2, when EL2 is enabled in the current Security state, as follows:

In AArch64 state:

- Reads of the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - [ID\\_PFR0\\_EL1](#), [ID\\_PFR1\\_EL1](#), [ID\\_PFR2\\_EL1](#), [ID\\_DFR0\\_EL1](#), [ID\\_AFR0\\_EL1](#), [ID\\_MMFR0\\_EL1](#), [ID\\_MMFR1\\_EL1](#), [ID\\_MMFR2\\_EL1](#), [ID\\_MMFR3\\_EL1](#), [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#),

[ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), [ID\\_ISAR4\\_EL1](#), [ID\\_ISAR5\\_EL1](#), [MVFR0\\_EL1](#), [MVFR1\\_EL1](#), [MVFR2\\_EL1](#).

- [ID\\_AA64PFR0\\_EL1](#), [ID\\_AA64PFR1\\_EL1](#), [ID\\_AA64DFR0\\_EL1](#), [ID\\_AA64DFR1\\_EL1](#), [ID\\_AA64ISAR0\\_EL1](#), [ID\\_AA64ISAR1\\_EL1](#), [ID\\_AA64MMFR0\\_EL1](#), [ID\\_AA64MMFR1\\_EL1](#), [ID\\_AA64AFR0\\_EL1](#), [ID\\_AA64AFR1\\_EL1](#).
- If FEAT\_FGT is implemented:
  - [ID\\_MMFR4\\_EL1](#) and [ID\\_MMFR5\\_EL1](#) are trapped to EL2.
  - [ID\\_AA64MMFR2\\_EL1](#) and [ID\\_ISAR6\\_EL1](#) are trapped to EL2.
  - [ID\\_DFR1\\_EL1](#) is trapped to EL2.
  - [ID\\_AA64ZFR0\\_EL1](#) is trapped to EL2.
  - [ID\\_AA64ISAR2\\_EL1](#) is This trapped field traps all MRS accesses to EL2 registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.
  - This field traps all MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.
- If FEAT\_FGT is not implemented:
  - [ID\\_MMFR4\\_EL1](#) and [ID\\_MMFR5\\_EL1](#) are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_MMFR4\\_EL1](#) or [ID\\_MMFR5\\_EL1](#) are trapped to EL2.
  - [ID\\_AA64MMFR2\\_EL1](#) and [ID\\_ISAR6\\_EL1](#) are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_AA64MMFR2\\_EL1](#) or [ID\\_ISAR6\\_EL1](#) are trapped to EL2.
  - [ID\\_DFR1\\_EL1](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_DFR1\\_EL1](#) are trapped to EL2.
  - [ID\\_AA64ZFR0\\_EL1](#) is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to [ID\\_AA64ZFR0\\_EL1](#) are trapped to EL2.
  - [ID\\_AA64ISAR2\\_EL1](#) is trapped to EL2, unless implemented as RAZ then Otherwise it is IMPLEMENTATION DEFINED whether accesses to [ID\\_AA64ISAR2\\_EL1](#) are whether trapped this bit traps MRS accesses to EL2 registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.
  - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.

In AArch32 state:

- VMRS access to [MVFR0](#), [MVFR1](#), and [MVFR2](#), are trapped to EL2, reported using EC syndrome value 0x08, unless access is also trapped by [HCPTR](#) which takes priority.
- MRC access to the following registers are trapped to EL2, reported using EC syndrome value 0x03:
  - [ID\\_PFR0](#), [ID\\_PFR1](#), [ID\\_PFR2](#), [ID\\_DFR0](#), [ID\\_AFR0](#), [ID\\_MMFR0](#), [ID\\_MMFR1](#), [ID\\_MMFR2](#), [ID\\_MMFR3](#), [ID\\_ISAR0](#), [ID\\_ISAR1](#), [ID\\_ISAR2](#), [ID\\_ISAR3](#), [ID\\_ISAR4](#), [ID\\_ISAR5](#).
  - If FEAT\_FGT is implemented:
    - [ID\\_MMFR4](#) and [ID\\_MMFR5](#) are trapped to EL2.
    - [ID\\_ISAR6](#) is trapped to EL2.
    - [ID\\_DFR1](#) is trapped to EL2.
    - This field traps all MRC accesses to encodings in the following range that are not already mentioned in this field description: coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

- If FEAT\_FGT is not implemented:

- [ID\\_MMFR4](#) and [ID\\_MMFR5](#) are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_MMFR4](#) or [ID\\_MMFR5](#) are trapped.
- [ID\\_ISAR6](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_ISAR6](#) are trapped to EL2.
- [ID\\_DFR1](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_DFR1](#) are trapped to EL2.
- Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps all MRC accesses to registers in the following range not already mentioned in this field description with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

TID3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 3 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

### TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, reads of [CTR\\_EL0](#), [CCSIDR\\_EL1](#), [CCSIDR2\\_EL1](#), [CLIDR\\_EL1](#), and [CSSELR\\_EL1](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 is using AArch64 and the value of [SCTLR\\_EL1.UCT](#) is not 0, reads of [CTR\\_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18. If the value of [SCTLR\\_EL1.UCT](#) is 0 then EL0 reads of [CTR\\_EL0](#) are UNDEFINED and any resulting exception takes precedence over this trap.
- If EL1 is using AArch64, writes to [CSSELR\\_EL1](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL1 is using AArch32, reads of [CTR](#), [CCSIDR](#), [CCSIDR2](#), [CLIDR](#), and [CSSELR](#) are trapped to EL2, reported using EC syndrome value 0x03.
- If EL1 is using AArch32, writes to [CSSELR](#) are trapped to EL2, reported using EC syndrome value 0x03.

TID2	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 2 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2.{E2H, TGE}](#) is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

### TID1, bit [16]

Trap ID group 1. Traps EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, accesses of [REVIDR\\_EL1](#), [AIDR\\_EL1](#), reported using EC syndrome value 0x18.
- In AArch32 state, accesses of [TCMTR](#), [TLBTR](#), [REVIDR](#), [AIDR](#), reported using EC syndrome value 0x03.

TID1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 1 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**TID0, bit [15]**

**When AArch32 is supported at any Exception level:**

Trap ID group 0. Traps the following register accesses to EL2:

- EL1 reads of the [JIDR](#), reported using EC syndrome value 0x05.
- If the [JIDR](#) is RAZ from EL0, EL0 reads of the [JIDR](#), reported using EC syndrome value 0x05.
- EL1 accesses using VMRS of the [FPSID](#), reported using EC syndrome value 0x08.

**Note**

- It is IMPLEMENTATION DEFINED whether the [JIDR](#) is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then any resulting exception takes precedence over this trap.
- The [FPSID](#) is not accessible at EL0 using AArch32.
- Writes to the [FPSID](#) are ignored, and not trapped by this control.

TID0	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 0 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TWE, bit [14]**

Traps EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT\_WFxT is implemented, this trap also applies to the WFET instruction.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by <a href="#">SCTLR.nTWE</a> or <a href="#">SCTLR_EL1.nTWE</a> .

In AArch32 state, the attempted execution of a conditional WFE instruction is **only** trapped **only** if the instruction passes its condition code check.

**Note**

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TWI, bit [13]**

Traps EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT\_WFxT is implemented, this trap also applies to the WFIT instruction.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by <a href="#">SCTLR.nTWI</a> or <a href="#">SCTLR_EL1.nTWI</a> .

In AArch32 state, the attempted execution of a conditional WFI instruction is **only** trapped **only** if the instruction passes its condition code check.

**Note**

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**DC, bit [12]**

Default Cacheability.

DC	Meaning
0b0	This control has no effect on the EL1&0 translation regime.
0b1	In both Security states: <ul style="list-style-type: none"> <li>When EL1 is using AArch64, the PE behaves as if the value of the <a href="#">SCTLR_EL1.M</a> field is 0 for all purposes other than returning the value of a direct read of <a href="#">SCTLR_EL1</a>.</li> <li>When EL1 is using AArch32, the PE behaves as if the value of the <a href="#">SCTLR.M</a> field is 0 for all purposes other than returning the value of a direct read of <a href="#">SCTLR</a>.</li> <li>The PE behaves as if the value of the HCR_EL2.VM field is 1 for all purposes other than returning the value of a direct read of HCR_EL2.</li> <li>The memory type produced by stage 1 of the EL1&amp;0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.</li> </ul>

This field has no effect on the EL2, EL2&0, and EL3 translation regimes.

This field is permitted to be cached in a TLB.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this field.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**BSU, bits [11:10]**

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from EL1 or EL0:

BSU	Meaning
0b00	No effect.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0b00 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**FB, bit [9]**

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from EL1:

AArch32: [BPIALL](#), [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [DTLBIALL](#), [DTLBIMVA](#), [DTLBIASID](#), [ITLBIALL](#), [ITLBIMVA](#), [ITLBIASID](#), [TLBIMVAA](#), [ICIALLU](#), [TLBIMVAL](#), [TLBIMVAAL](#).

AArch64: [TLBIMVAALE1](#), [TLBIVAAE1](#), [TLBIASIDE1](#), [TLBIVAAE1](#), [TLBIVALE1](#), [TLBIVAALE1](#), [ICIALLU](#), [TLBIVAAE1](#), [TLBIVAAE1](#), [TLBIVALE1](#), [TLBIVAALE1](#).

FB	Meaning
0b0	This field has no effect on the operation of the specified instructions.
0b1	When one of the specified instruction is executed at EL1, the instruction is broadcast within the Inner Shareable shareability domain.

When [HCR\\_EL2](#).TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**VSE, bit [8]**

Virtual SError interrupt.

VSE	Meaning
0b0	This mechanism is not making a virtual SError interrupt pending.
0b1	A virtual SError interrupt is pending because of this mechanism.

The virtual SError interrupt is **only** enabled **only** when the value of [HCR\\_EL2](#).{TGE, AMO} is {0, 1}.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**VI, bit [7]**

Virtual IRQ Interrupt.

VI	Meaning
0b0	This mechanism is not making a virtual IRQ pending.
0b1	A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of [HCR\\_EL2](#).{TGE, IMO} is {0, 1}.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**VF, bit [6]**

Virtual FIQ Interrupt.

VF	Meaning
0b0	This mechanism is not making a virtual FIQ pending.
0b1	A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR\_EL2.{TGE, FMO} is {0, 1}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AMO, bit [5]**

Physical SError interrupt routing.

AMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> <li>Physical SError interrupts are not taken to EL2.</li> <li>When the value of <a href="#">HCR_EL2.TGE</a> is 0, if the PE is executing at EL2 using AArch64, physical SError interrupts are not taken unless they are routed to EL3 by the <a href="#">SCR_EL3.EA</a> bit.</li> <li>Virtual SError interrupts are disabled.</li> </ul>
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> <li>Physical SError interrupts are taken to EL2, unless they are routed to EL3.</li> <li>When the value of HCR_EL2.TGE is 0, then virtual SError interrupts are enabled.</li> </ul>

If EL2 is enabled in the current Security state and the value of HCR\_EL2.TGE is 1:

- Regardless of the value of the AMO bit physical asynchronous External aborts and SError interrupts target EL2 unless they are routed to EL3.
- When FEAT\_VHE is not implemented, or if [HCR\\_EL2.E2H](#) is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When FEAT\_VHE is implemented and [HCR\\_EL2.E2H](#) is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IMO, bit [4]**

Physical IRQ Routing.

IMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> <li>Physical IRQ interrupts are not taken to EL2.</li> <li>When the value of <a href="#">HCR_EL2.TGE</a> is 0, if the PE is executing at EL2 using AArch64, physical IRQ interrupts are not taken unless they are routed to EL3 by the <a href="#">SCR_EL3.IRQ</a> bit.</li> <li>Virtual IRQ interrupts are disabled.</li> </ul>
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> <li>Physical IRQ interrupts are taken to EL2, unless they are routed to EL3.</li> <li>When the value of HCR_EL2.TGE is 0, then Virtual IRQ interrupts are enabled.</li> </ul>

If EL2 is enabled in the current Security state, and the value of HCR\_EL2.TGE is 1:

- Regardless of the value of the IMO bit, physical IRQ Interrupts target EL2 unless they are routed to EL3.
- When FEAT\_VHE is not implemented, or if [HCR\\_EL2.E2H](#) is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.

- When FEAT\_VHE is implemented and [HCR\\_EL2.E2H](#) is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### FMO, bit [3]

Physical FIQ Routing.

FMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> <li>Physical FIQ interrupts are not taken to EL2.</li> <li>When the value of <a href="#">HCR_EL2.TGE</a> is 0, if the PE is executing at EL2 using AArch64, physical FIQ interrupts are not taken unless they are routed to EL3 by the <a href="#">SCR_EL3.FIQ</a> bit.</li> <li>Virtual FIQ interrupts are disabled.</li> </ul>
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> <li>Physical FIQ interrupts are taken to EL2, unless they are routed to EL3.</li> <li>When <a href="#">HCR_EL2.TGE</a> is 0, then Virtual FIQ interrupts are enabled.</li> </ul>

If EL2 is enabled in the current Security state and the value of [HCR\\_EL2.TGE](#) is 1:

- Regardless of the value of the FMO bit, physical FIQ Interrupts target EL2 unless they are routed to EL3.
- When FEAT\_VHE is not implemented, or if [HCR\\_EL2.E2H](#) is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When FEAT\_VHE is implemented and [HCR\\_EL2.E2H](#) is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### PTW, bit [2]

Protected Table Walk. In the EL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs, then the value of this bit determines the behavior:

PTW	Meaning
0b0	The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.
0b1	The memory access generates a stage 2 Permission fault.

This field is permitted to be cached in a TLB.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### SWIO, bit [1]

Set/Way Invalidation Override. Causes EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way:

SWIO	Meaning
0b0	This control has no effect on the operation of data cache invalidate by set/way instructions.
0b1	Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When the value of this bit is 1:

AArch32: [DCISW](#) performs the same invalidation as a [DCCISW](#) instruction.

AArch64: [DC ISW](#) performs the same invalidation as a [DC CISCW](#) instruction.

This bit can be implemented as RES1.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the EL1&0 translation regime, when EL2 is enabled in the current Security state.

VM	Meaning
0b0	EL1&0 stage 2 address translation disabled.
0b1	EL1&0 stage 2 address translation enabled.

When the value of this bit is 1, data cache invalidate instructions executed at EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the [HCR\\_EL2.SWIO](#) bit.

This bit is permitted to be cached in a TLB.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Accessing the HCR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, HCR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x078];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HCR_EL2;
elsif PSTATE.EL == EL3 then
    return HCR_EL2;

```

MSR HCR\_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x078] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HCR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    HCR_EL2 = X[t];

```

**Otherwise:**

Reserved, RES0.

**FnXS, bit [3]****When FEAT\_XS is implemented:**

Determines the behavior of TLBI instructions affected by the XS attribute.

This control bit also determines whether an AArch64 DSB instruction behaves as a DSB instruction with an nXS qualifier when executed at EL0 and EL1.

FnXS	Meaning
0b0	This control does not have any effect on the behavior of the TLBI maintenance instructions.
0b1	A TLBI maintenance instruction without the nXS qualifier executed at EL1 behaves in the same way as the corresponding TLBI maintenance instruction with the nXS qualifier. An AArch64 DSB instruction executed at EL1 or EL0 behaves in the same way as the corresponding DSB instruction with the nXS qualifier executed at EL1 or EL0.

This bit is permitted to be cached in a TLB.

**Otherwise:**

Reserved, RES0.

**EnASR, bit [2]****When FEAT\_LS64 is implemented:**

When [HCR\\_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an ST64BV instruction at EL0 or EL1 to EL2.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL2 if the execution is not trapped by <a href="#">SCTLR_EL1</a> .EnASR. Execution of an ST64BV instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR\_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**EnALS, bit [1]****When FEAT\_LS64 is implemented:**

When [HCR\\_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 or EL1 to EL2.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2 if the execution is not trapped by <a href="#">SCTLR_EL1</a> .EnALS. Execution of an LD64B or ST64B instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR\_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

**Otherwise:**

Reserved, RES0.

### EnAS0, bit [0]

**When FEAT\_LS64 is implemented:**

When [HCR\\_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an ST64BV0 instruction at EL0 or EL1 to EL2.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL2 if the execution is not trapped by <a href="#">SCTLR_EL1</a> .EnAS0.
	Execution of an ST64BV0 instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR\_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

**Otherwise:**

Reserved, RES0.

## Accessing the HCRX\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, HCRX\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0010	0b010

The HDFGRTR\_EL2 characteristics are:

## Purpose

Provides controls for traps of MRS and MRC reads of debug, trace, PMU, and Statistical Profiling System registers.

## Configuration

This register is present only when FEAT\_FGT is implemented. Otherwise, direct accesses to HDFGRTR\_EL2 are UNDEFINED.

## Attributes

HDFGRTR\_EL2 is a 64-bit register.

## Field descriptions

The HDFGRTR\_EL2 bit assignments are:

63	62	61	60	59	58	57
RES0	nPMSNEVFR_EL1	PMCEIDn_EL0	RES0	PMUSERENR_EL0	PMCEIDn_EL0	RES0
PMISRR_EL1	PMISDR_EL1	PMISCR_EL1	PMISFCR_EL1	PMISEVFR_EL1	PMISCR_EL1	PMISBSR_EL1
31	30	29	28	27	26	25

### Bits [63:59]

**Bit [63]**

Reserved, RES0.

**nPMSNEVFR\_EL1PMCEIDn\_EL0, bit [6258]**

When **FEAT\_SPEv1p2****FEAT\_PMUv3** is implemented:

Trap MRS reads of [PMSNEVER\\_EL1](#) at EL1 using AArch64 to EL2.

nPMSNEVFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state then MRS reads of <a href="#">PMSNEVFR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of <a href="#">PMSNEVFR_EL1</a> are not affected by this bit.

This bit is ignored by the PE and treated as zero when EL3 is implemented and `SCR_EL3.FGTEn == 0b0`.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [61:59]**

Reserved, RES0.

**PMCEIDn\_EL0, bit [58]****When FEAT\_PMUv3 is implemented:**

Trap MRS reads of PMCEID<n>\_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCEIDn_EL0	Meaning
0b0	MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the read generates a higher priority exception: 0b1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MRS reads of PMCEID&lt;n&gt;_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of PMCEID&lt;n&gt; at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMUSERENR\_EL0, bit [57]****When FEAT\_PMUv3 is implemented:**

Trap MRS reads of [PMUSERENR\\_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [PMUSERENR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMUSERENR_EL0	Meaning
0b0	MRS reads of <a href="#">PMUSERENR_EL0</a> at EL1 and EL0 using AArch64 and MRC reads of <a href="#">PMUSERENR</a> at EL0 using AArch32 are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the read generates a higher priority exception: 0b1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MRS reads of <a href="#">PMUSERENR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of <a href="#">PMUSERENR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [56:49]**

Reserved, RES0.

**TRCVICTLR, bit [48]**

**When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MRS reads of [TRCVICTLR](#) at EL1 using AArch64 to EL2.

TRCVICTLR	Meaning
0b0	MRS reads of <a href="#">TRCVICTLR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1, 0b1</b> , then MRS reads of <a href="#">TRCVICTLR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCSTATR, bit [47]**

**When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MRS reads of [TRCSTATR](#) at EL1 using AArch64 to EL2.

TRCSTATR	Meaning
0b0	MRS reads of <a href="#">TRCSTATR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1, 0b1</b> , then MRS reads of <a href="#">TRCSTATR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCSSCSRn, bit [46]**

**When FEAT\_ETMv4 is implemented, [TRCSSCSR<n>](#) are implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MRS reads of [TRCSSCSR<n>](#) at EL1 using AArch64 to EL2.

TRCSSCSRn	Meaning
0b0	MRS reads of <a href="#">TRCSSCSR&lt;n&gt;</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MRS reads of <a href="#">TRCSSCSR&lt;n&gt;</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Single-shot Comparator n is not implemented, a read of [TRCSSCSR<n>](#) is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

On This **abit** Warm reset, in a system where the PE resets into EL2, this field resets to **0** if [TRCSSCSR<n>](#) **0** **RES0** are not implemented.

Otherwise:

Reserved, RES0.

### TRCSEQSTR, bit [45]

When FEAT\_ETMv4 is implemented, **TRCSEQSTR is implemented** and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of [TRCSEQSTR](#) at EL1 using AArch64 to EL2.

TRCSEQSTR	Meaning
0b0	MRS reads of <a href="#">TRCSEQSTR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MRS reads of <a href="#">TRCSEQSTR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

On This **abit** Warm reset, in a system where the PE resets into EL2, this field resets to **0** if [TRCSEQSTR](#) **0** **RES0** is not implemented.

Otherwise:

Reserved, RES0.

### TRCPRGCTLR, bit [44]

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of [TRCPRGCTLR](#) at EL1 using AArch64 to EL2.

TRCPRGCTLR	Meaning
0b0	MRS reads of <a href="#">TRCPRGCTLR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MRS reads of <a href="#">TRCPRGCTLR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCOSLSR, bit [43]**

**When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MRS reads of [TRCOSLSR](#) at EL1 using AArch64 to EL2.

TRCOSLSR	Meaning
0b0	MRS reads of <a href="#">TRCOSLSR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MRS reads of <a href="#">TRCOSLSR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [42]**

Reserved, RES0.

**TRCIMSPECn, bit [41]**

**When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MRS reads of [TRCIMSPEC<n>](#) at EL1 using AArch64 to EL2.

TRCIMSPECn	Meaning
0b0	MRS reads of <a href="#">TRCIMSPEC&lt;n&gt;</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MRS reads of <a href="#">TRCIMSPEC&lt;n&gt;</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If [TRCIMSPEC<n>](#) is not implemented, a read of [TRCIMSPEC<n>](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCID, bit [40]**

**When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [TRCDEVARCH](#).
- [TRCDEVID](#).
- TRCIDR<n>.

TRCID	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### Bits [39:38]

Reserved, RES0.

#### TRCCNTVRn, bit [37]

When FEAT\_ETMv4 is implemented, TRCCNTVR<n> are implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of [TRCCNTVR<n>](#) at EL1 using AArch64 to EL2.

TRCCNTVRn	Meaning
0b0	MRS reads of <a href="#">TRCCNTVR&lt;n&gt;</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">TRCCNTVR&lt;n&gt;</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Counter n is not implemented, a read of [TRCCNTVR<n>](#) is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

On this bit Warm reset, in a system where the PE resets into EL2, this field resets to 0 if [TRCCNTVR<n>](#) RES0 are not implemented.

Otherwise:

Reserved, RES0.

#### TRCCLAIM, bit [36]

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [TRCCLAIMCLR](#).
- [TRCCLAIMSET](#).

TRCCLAIM	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TRCAUXCTLR, bit [35]

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of [TRCAUXCTLR](#) at EL1 using AArch64 to EL2.

TRCAUXCTLR	Meaning
0b0	MRS reads of <a href="#">TRCAUXCTLR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">TRCAUXCTLR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TRCAUTHSTATUS, bit [34]

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of [TRCAUTHSTATUS](#) at EL1 using AArch64 to EL2.

TRCAUTHSTATUS	Meaning
0b0	MRS reads of <a href="#">TRCAUTHSTATUS</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">TRCAUTHSTATUS</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TRC, bit [33]

**When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [TRCACATR<n>](#).
- [TRCACVR<n>](#).
- [TRCBBCTLR](#).
- [TRCCCCTLR](#).
- [TRCCIDCCTLR0](#). [TRCCIDCCTLR<n>](#).
- [TRCCIDCCTLR1](#). [TRCCIDCVR<n>](#).
- [TRCCIDCVR<n>](#). [TRCCNTCTLR<n>](#).
- [TRCCNTCTLR<n>](#). [TRCCNTRLDVR<n>](#).
- [TRCCNTRLDVR<n>](#). [TRCCONFIGR](#).
- [TRCCONFIGR](#). [TRCEVENTCTL0R](#).
- [TRCEVENTCTL0R](#). [TRCEVENTCTL1R](#).
- [TRCEVENTCTL1R](#).
- [TRCEXTINSELR](#).
- [TRCQCTLR](#).
- [TRCRSCTLR<n>](#).
- [TRCSEQEVR<n>](#).
- [TRCSEQRSTEVR](#).
- [TRCSSCCR<n>](#).
- [TRCSSPCICR<n>](#).
- [TRCSTALLCTLR](#).
- [TRCSYNCPR](#).
- [TRCTRACEIDR](#).
- [TRCTSCTLR](#).
- [TRCVIIECTLR](#).
- [TRCVIPCSSCTLR](#).
- [TRCVISSCTLR](#).
- [TRCVMIDCCTLR0](#). [TRCVMIDCCTLR<n>](#).
- [TRCVMIDCCTLR1](#). [TRCVMIDCVR<n>](#).
- [TRCVMIDCVR<n>](#).

TRC	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

A read of an unimplemented register is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMSLATFR\_EL1, bit [32]****When FEAT\_SPE is implemented:**

Trap MRS reads of [PMSLATFR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSLATFR_EL1	Meaning
0b0	MRS reads of <a href="#">PMSLATFR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">PMSLATFR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### PMSIRR\_EL1, bit [31]

When FEAT\_SPE is implemented:

Trap MRS reads of [PMSIRR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSIRR_EL1	Meaning
0b0	MRS reads of <a href="#">PMSIRR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">PMSIRR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### PMSIDR\_EL1, bit [30]

When FEAT\_SPE is implemented:

Trap MRS reads of [PMSIDR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSIDR_EL1	Meaning
0b0	MRS reads of <a href="#">PMSIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">PMSIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**PMSICR\_EL1, bit [29]****When FEAT\_SPE is implemented:**Trap MRS reads of [PMSICR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMSICR_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">PMSICR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">PMSICR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMSFCR\_EL1, bit [28]****When FEAT\_SPE is implemented:**Trap MRS reads of [PMSFCR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMSFCR_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">PMSFCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">PMSFCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMSEVFR\_EL1, bit [27]****When FEAT\_SPE is implemented:**Trap MRS reads of [PMSEVFR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMSEVFR_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">PMSEVFR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">PMSEVFR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMSCR\_EL1, bit [26]****When FEAT\_SPE is implemented:**Trap MRS reads of [PMSCR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSCR_EL1	Meaning
0b0	MRS reads of <a href="#">PMSCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTE <sub>n</sub> == 1, 0b1, then MRS reads of <a href="#">PMSCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMBSR\_EL1, bit [25]****When FEAT\_SPE is implemented:**Trap MRS reads of [PMBSR\\_EL1](#) at EL1 using AArch64 to EL2.

PMBSR_EL1	Meaning
0b0	MRS reads of <a href="#">PMBSR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTE <sub>n</sub> == 1, 0b1, then MRS reads of <a href="#">PMBSR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMBPTR\_EL1, bit [24]****When FEAT\_SPE is implemented:**Trap MRS reads of [PMBPTR\\_EL1](#) at EL1 using AArch64 to EL2.

PMBPTR_EL1	Meaning
0b0	MRS reads of <a href="#">PMBPTR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTE <sub>n</sub> == 1, 0b1, then MRS reads of <a href="#">PMBPTR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMBLIMITR\_EL1, bit [23]****When FEAT\_SPE is implemented:**

Trap MRS reads of [PMBLIMITR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMBLIMITR_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">PMBLIMITR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">PMBLIMITR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMMIR\_EL1, bit [22]****When FEAT\_PMUv3 is implemented:**

Trap MRS reads of [PMMIR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMMIR_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">PMMIR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">PMMIR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [21:20]**

Reserved, RES0.

**PMSELR\_ELO, bit [19]****When FEAT\_PMUv3 is implemented:**

Trap MRS reads of [PMSELR\\_ELO](#) at EL1 and EL0 using AArch64 and MRC reads of [PMSELR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSELR_EL0	Meaning
0b0	MRS reads of <a href="#">PMSELR_EL0</a> at EL1 and EL0 using AArch64 and MRC reads of <a href="#">PMSELR</a> at EL0 using AArch32 are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the read generates a higher priority exception: 0b1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MRS reads of <a href="#">PMSELR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of <a href="#">PMSELR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

### PMOVS, bit [18]

#### When FEAT\_PMuV3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of [PMOVSLR\\_EL0](#) and [PMOVSSET\\_EL0](#).
- At EL1 and EL0 using AArch64: MRS reads of [PMOVSLR\\_EL0](#) and [PMOVSSET\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [PMOVS](#) and [PMOVSSET](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [PMOVS](#) and [PMOVSSET](#).

PMOVS	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the read generates a higher priority exception: 0b1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MRS reads at EL1 and EL0 using AArch64 of <a href="#">PMOVSLR_EL0</a> and <a href="#">PMOVSSET_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads at EL0 using AArch32 of <a href="#">PMOVS</a> and <a href="#">PMOVSSET</a> are trapped to EL2 and reported with EC syndrome value 0x03, unless the read generates a higher priority exception.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

**PMINTEN, bit [17]**

When FEAT\_PMuV3 is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [PMINTENCLR\\_EL1](#).
- [PMINTENSET\\_EL1](#).

PMINTEN	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**PMCNTEN, bit [16]**

When FEAT\_PMuV3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of [PMCNTENCLR\\_EL0](#) and [PMCNTENSET\\_EL0](#).
- At EL1 and EL0 using AArch64: MRS reads of [PMCNTENCLR\\_EL0](#) and [PMCNTENSET\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [PMCNTENCLR](#) and [PMCNTENSET](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [PMCNTENCLR](#) and [PMCNTENSET](#).

PMCNTEN	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2.{E2H,TGE}</a> != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , then, unless the read generates a higher priority exception: <b>0b1</b> , then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>• MRS reads at EL1 and EL0 using AArch64 of <a href="#">PMCNTENCLR_EL0</a> and <a href="#">PMCNTENSET_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>• MRC reads at EL0 using AArch32 of <a href="#">PMCNTENCLR</a> and <a href="#">PMCNTENSET</a> are trapped to EL2 and reported with EC syndrome value 0x03, unless the read generates a higher priority exception.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**PMCCNTR\_EL0, bit [15]**

**When FEAT\_PMuV3 is implemented:**

Trap MRS reads of [PMCCNTR\\_EL0](#) at EL1 and EL0 using AArch64 and MRC and MRRC reads of [PMCCNTR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCNTR_EL0	Meaning
0b0	MRS reads of <a href="#">PMCCNTR_EL0</a> at EL1 and EL0 using AArch64 and MRC and MRRC reads of <a href="#">PMCCNTR</a> at EL0 using AArch32 are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the read generates a higher priority exception: 0b1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MRS reads of <a href="#">PMCCNTR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC and MRRC reads of <a href="#">PMCCNTR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03 (for MRC) or 0x04 (for MRRC).</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMCCFILTR\_EL0, bit [14]****When FEAT\_PMuV3 is implemented:**

Trap MRS reads of [PMCCFILTR\\_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [PMCCFILTR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCFILTR_EL0	Meaning
0b0	MRS reads of <a href="#">PMCCFILTR_EL0</a> at EL1 and EL0 using AArch64 and MRC reads of <a href="#">PMCCFILTR</a> at EL0 using AArch32 are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the read generates a higher priority exception: 0b1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MRS reads of <a href="#">PMCCFILTR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of <a href="#">PMCCFILTR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

[PMCCFILTR\\_EL0](#) can also be accessed in AArch64 state using [PMXEVTYPER\\_EL0](#) when [PMSELR\\_EL0](#).SEL == 31, and [PMCCFILTR](#) can also be accessed in AArch32 state using [PMXEVTYPER](#) when [PMSELR](#).SEL == 31.

Setting this bit to 1 has no effect on accesses to [PMXEVTYPER\\_EL0](#) and [PMXEVTYPER](#), regardless of the value of [PMSELR\\_EL0](#).SEL or [PMSELR](#).SEL.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMEVTYPERn\_EL0, bit [13]**

When FEAT\_PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of [PMEVTYPER<n>\\_EL0](#) and [PMXEVTYPER\\_EL0](#).
- At EL1 and EL0 using AArch64: MRS reads of [PMEVTYPER<n>\\_EL0](#) and [PMXEVTYPER\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [PMEVTYPER<n>](#) and [PMXEVTYPER](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [PMEVTYPER<n>](#) and [PMXEVTYPER](#).

PMEVTYPERn_EL0	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the read generates a higher priority exception: 0b1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>• MRS reads at EL1 and EL0 using AArch64 of <a href="#">PMEVTYPER&lt;n&gt;_EL0</a> and <a href="#">PMXEVTYPER_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>• MRC reads at EL0 using AArch32 of <a href="#">PMEVTYPER&lt;n&gt;</a> and <a href="#">PMXEVTYPER</a> are trapped to EL2 and reported with EC syndrome value 0x03, unless the read generates a higher priority exception.</li> </ul>

When FEAT\_FGT is implemented, then, regardless of the value of this bit, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of [PMEVTYPER<n>\\_EL0](#), or, if n is not 31, a read of [PMXEVTYPER\\_EL0](#) when [PMSELR\\_EL0](#).SEL == n.
  - In AArch32 state, a read of [PMEVTYPER<n>](#), or, if n is not 31, a read of [PMXEVTYPER](#) when [PMSELR](#).SEL == n.
- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of [PMEVTYPER<n>\\_EL0](#), or, if n is not 31, a read of [PMXEVTYPER\\_EL0](#) when [PMSELR\\_EL0](#).SEL == n.
  - In AArch32 state, a read of [PMEVTYPER<n>](#), or, if n is not 31, a read of [PMXEVTYPER](#) when [PMSELR](#).SEL == n.
- If event counter n is implemented and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:

If event counter n is implemented and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:

- In AArch64 state, a read of [PMEVTYPER<n>\\_EL0](#), or a read of [PMXEVTYPER\\_EL0](#) when [PMSELR\\_EL0](#).SEL == n, reported with EC syndrome value 0x18.
- In AArch64 state, a read of [PMEVTYPER<n>\\_EL0](#), or a read of [PMXEVTYPER\\_EL0](#) when [PMSELR\\_EL0](#).SEL == n, reported with EC syndrome value 0x18.
- In AArch32 state, a read of [PMEVTYPER<n>](#), or a read of [PMXEVTYPER](#) when [PMSELR](#).SEL == n, reported with EC syndrome value 0x03.
- In AArch32 state, a read of [PMEVTYPER<n>](#), or a read of [PMXEVTYPER](#) when [PMSELR](#).SEL == n, reported with EC syndrome value 0x03.

See also HDFGRTR\_EL2.PMCCFILTR\_EL0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### PMEVCNTRn\_EL0, bit [12]

When FEAT\_PMuV3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of [PMEVCNTR<n>\\_EL0](#) and [PMXVCNTR\\_EL0](#).
- At EL1 and EL0 using AArch64: MRS reads of [PMEVCNTR<n>\\_EL0](#) and [PMXVCNTR\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [PMEVCNTR<n>](#) and [PMXVCNTR](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [PMEVCNTR<n>](#) and [PMXVCNTR](#).

PMEVCNTRn_EL0	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the read generates a higher priority exception: 0b1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MRS reads at EL1 and EL0 using AArch64 of <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> and <a href="#">PMXVCNTR_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads at EL0 using AArch32 of <a href="#">PMEVCNTR&lt;n&gt;</a> and <a href="#">PMXVCNTR</a> are trapped to EL2 and reported with EC syndrome value 0x03, unless the read generates a higher priority exception.</li> </ul>

When FEAT\_FGT is implemented, then, regardless of the value of this bit, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of [PMEVCNTR<n>\\_EL0](#), or a read of [PMXVCNTR\\_EL0](#) when [PMSELR\\_EL0](#).SEL == n.
  - In AArch32 state, a read of [PMEVCNTR<n>](#), or a read of [PMXVCNTR](#) when [PMSELR](#).SEL == n.
- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of [PMEVCNTR<n>\\_EL0](#), or a read of [PMXVCNTR\\_EL0](#) when [PMSELR\\_EL0](#).SEL == n.
  - In AArch32 state, a read of [PMEVCNTR<n>](#), or a read of [PMXVCNTR](#) when [PMSELR](#).SEL == n.
- If event counter n is implemented, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:

If event counter n is implemented, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:

- In AArch64 state, a read of [PMEVCNTR<n>\\_EL0](#), or a read of [PMXVCNTR\\_EL0](#) when [PMSELR\\_EL0](#).SEL == n, reported with EC syndrome value 0x18.
- In AArch64 state, a read of [PMEVCNTR<n>\\_EL0](#), or a read of [PMXVCNTR\\_EL0](#) when [PMSELR\\_EL0](#).SEL == n, reported with EC syndrome value 0x18.
- In AArch32 state, a read of [PMEVCNTR<n>](#), or a read of [PMXVCNTR](#) when [PMSELR](#).SEL == n, reported with EC syndrome value 0x03.

- In AArch32 state, a read of [PMEVCNTR<n>](#), or a read of [PMXEVCNTR](#) when [PMSELR.SEL == n](#), reported with EC syndrome value 0x03.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### OSDLR\_EL1, bit [11]

When FEAT\_DoubleLock is implemented:

Trap MRS reads of [OSDLR\\_EL1](#) at EL1 using AArch64 to EL2.

OSDLR_EL1	Meaning
0b0	MRS reads of <a href="#">OSDLR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn == 1</a> , 0b1, then MRS reads of <a href="#">OSDLR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### OSECCR\_EL1, bit [10]

Trap MRS reads of [OSECCR\\_EL1](#) at EL1 using AArch64 to EL2.

OSECCR_EL1	Meaning
0b0	MRS reads of <a href="#">OSECCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn == 1</a> , 0b1, then MRS reads of <a href="#">OSECCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### OSLSR\_EL1, bit [9]

Trap MRS reads of [OSLSR\\_EL1](#) at EL1 using AArch64 to EL2.

OSLSR_EL1	Meaning
0b0	MRS reads of <a href="#">OSLSR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn == 1</a> , 0b1, then MRS reads of <a href="#">OSLSR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### Bit [8]

Reserved, RES0.

**DBGPRCR\_EL1, bit [7]**

Trap MRS reads of [DBGPRCR\\_EL1](#) at EL1 using AArch64 to EL2.

DBGPRCR_EL1	Meaning
0b0	MRS reads of <a href="#">DBGPRCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">DBGPRCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DBGAUTHSTATUS\_EL1, bit [6]**

Trap MRS reads of [DBGAUTHSTATUS\\_EL1](#) at EL1 using AArch64 to EL2.

DBGAUTHSTATUS_EL1	Meaning
0b0	MRS reads of <a href="#">DBGAUTHSTATUS_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">DBGAUTHSTATUS_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DBGCLAIM, bit [5]**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [DBGCLAIMCLR\\_EL1](#).
- [DBGCLAIMSET\\_EL1](#).

DBGCLAIM	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**MDSCR\_EL1, bit [4]**

Trap MRS reads of [MDSCR\\_EL1](#) at EL1 using AArch64 to EL2.

MDSCR_EL1	Meaning
0b0	MRS reads of <a href="#">MDSCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">MDSCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### DBGWVRn\_EL1, bit [3]

Trap MRS reads of [DBGWVR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

DBGWVRn_EL1	Meaning
0b0	MRS reads of <a href="#">DBGWVR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">DBGWVR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint n is not implemented, a read of [DBGWVR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### DBGWCRn\_EL1, bit [2]

Trap MRS reads of [DBGWCR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

DBGWCRn_EL1	Meaning
0b0	MRS reads of <a href="#">DBGWCR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">DBGWCR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint n is not implemented, a read of [DBGWCR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### DBGBVRn\_EL1, bit [1]

Trap MRS reads of [DBGBVR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

DBGBVRn_EL1	Meaning
0b0	MRS reads of <a href="#">DBGBVR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">DBGBVR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint n is not implemented, a read of [DBGBVR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### DBGBCRn\_EL1, bit [0]

Trap MRS reads of [DBGBCR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

DBGBCRn_EL1	Meaning
0b0	MRS reads of <a href="#">DBGBCR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">DBGBCR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint n is not implemented, a read of [DBGBCR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

## Accessing the HDFGRTR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, HDFGRTR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x1D0];

# HDFGWTR\_EL2, Hypervisor Debug Fine-Grained Write Trap Register

The HDFGWTR\_EL2 characteristics are:

## Purpose

Provides controls for traps of MSR and MCR writes of debug, trace, PMU, and Statistical Profiling System registers.

## Configuration

This register is present only when FEAT\_FGT is implemented. Otherwise, direct accesses to HDFGWTR\_EL2 are UNDEFINED.

## Attributes

HDFGWTR\_EL2 is a 64-bit register.

## Field descriptions

The HDFGWTR\_EL2 bit assignments are:

63	62	61	60	59	58	57
RES0	nPMSNEVFR_EL1PMUSERENR_EL0	RES0			PMUSERENR_EL0	
PMSIRR_EL1	RES0	PMSICR_EL1	PMSFCR_EL1	PMSEVFR_EL1	PMSCR_EL1	PMBSR_EL1
31	30	29	28	27	26	25

Bits [63:58]

Bit [63]

Reserved, RES0.

nPMSNEVFR\_EL1PMUSERENR\_EL0, bit [62:57]

When FEAT\_SPEv1p2FEAT\_PMUv3 is implemented:

Trap MSR writes of PMSNEVFR\_EL1PMUSERENR\_EL0 at EL1 using AArch64 to EL2.

<b>nPMSNEVR_EL1PMUSERENR_EL0</b>	<b>Meaning</b>
0b0	If EL2 is implemented and enabled in the current Security state then MSR writes of <b>PMUSERENR_EL0</b> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the affected write generates a higher priority exception.
0b1	MSR writes of <b>PMUSERENR_EL0</b> are not affected by this bit. If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <b>SCR_EL3.FGTEn</b> == 1, MSR writes of <b>PMUSERENR_EL0</b> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

This bit is ignored by the PE and treated as zero when EL3 is implemented and **SCR\_EL3.FGTEn** == 0b0.

In a system where the PE resets into EL2, this field resets to 0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### Bits [61:58]

Reserved, RES0.

#### PMUSERENR\_EL0, bit [57]

##### When FEAT\_PMuV3 is implemented:

Trap MSR writes of **PMUSERENR\_EL0** at EL1 using AArch64 to EL2.

<b>PMUSERENR_EL0</b>	<b>Meaning</b>
0b0	MSR writes of <b>PMUSERENR_EL0</b> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <b>SCR_EL3.FGTEn</b> == 0b1, then MSR writes of <b>PMUSERENR_EL0</b> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### Bits [56:50]

Reserved, RES0.

#### TRFCR\_EL1, bit [49]

**When FEAT\_TRF is implemented:**

Trap MSR writes of [TRFCR\\_EL1](#) at EL1 using AArch64 to EL2.

TRFCR_EL1	Meaning
0b0	MSR writes of <a href="#">TRFCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MSR writes of <a href="#">TRFCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCVICTLR, bit [48]****When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MSR writes of [TRCVICTLR](#) at EL1 using AArch64 to EL2.

TRCVICTLR	Meaning
0b0	MSR writes of <a href="#">TRCVICTLR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MSR writes of <a href="#">TRCVICTLR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [47]**

Reserved, RES0.

**TRCSSCSRn, bit [46]****When FEAT\_ETMv4 is implemented, [TRCSSCSR<n>](#) are implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MSR writes of [TRCSSCSR<n>](#) at EL1 using AArch64 to EL2.

TRCSSCSRn	Meaning
0b0	MSR writes of <a href="#">TRCSSCSR&lt;n&gt;</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MSR writes of <a href="#">TRCSSCSR&lt;n&gt;</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Single-shot Comparator n is not implemented, a write of [TRCSSCSR<n>](#) is UNDEFINED.

**In a system where the PE resets into EL2, this field resets to 0.**

On this bit Warm reset, in a system where the PE resets into EL2, this field resets to 0 if TRCSSCSR<n>RES0 are not implemented.

Otherwise:

Reserved, RES0.

### TRCSEQSTR, bit [45]

When FEAT\_ETMv4 is implemented, TRCSEQSTR is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCSEQSTR at EL1 using AArch64 to EL2.

TRCSEQSTR	Meaning
0b0	MSR writes of TRCSEQSTR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, 0b1, then MSR writes of TRCSEQSTR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

In a system where the PE resets into EL2, this field resets to 0.

On this bit Warm reset, in a system where the PE resets into EL2, this field resets to 0 if TRCSEQSTR RES0 is not implemented.

Otherwise:

Reserved, RES0.

### TRCPRGCTLR, bit [44]

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCPRGCTLR at EL1 using AArch64 to EL2.

TRCPRGCTLR	Meaning
0b0	MSR writes of TRCPRGCTLR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, 0b1, then MSR writes of TRCPRGCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### Bit [43]

Reserved, RES0.

### TRCOSLAR, bit [42]

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented and FEAT\_ETMv4 is implemented:

Trap MSR writes of TRCOSLAR at EL1 using AArch64 to EL2.

TRCOSLAR	Meaning
0b0	MSR writes of TRCOSLAR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MSR writes of TRCOSLAR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TRCIMSPECn, bit [41]

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of [TRCIMSPEC<n>](#) at EL1 using AArch64 to EL2.

TRCIMSPECn	Meaning
0b0	MSR writes of <a href="#">TRCIMSPEC&lt;n&gt;</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MSR writes of <a href="#">TRCIMSPEC&lt;n&gt;</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If [TRCIMSPEC<n>](#) is not implemented, a write of [TRCIMSPEC<n>](#) is UNDEFINED.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### Bits [40:38]

Reserved, RES0.

### TRCCNTVRn, bit [37]

When FEAT\_ETMv4 is implemented, **TRCCNTVR<n> are implemented** and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of [TRCCNTVR<n>](#) at EL1 using AArch64 to EL2.

TRCCNTVRn	Meaning
0b0	MSR writes of <a href="#">TRCCNTVR&lt;n&gt;</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MSR writes of <a href="#">TRCCNTVR&lt;n&gt;</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Counter n is not implemented, a write of [TRCCNTVR<n>](#) is UNDEFINED.

In a system where the PE resets into EL2, this field resets to 0.

On this bit Warm reset, in a system where the PE resets into EL2, this field resets to 0 if TRCCNTVR<n>RES0 are not implemented.

Otherwise:

Reserved, RES0.

### TRCCLAIM, bit [36]

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [TRCCLAIMCLR](#).
- [TRCCLAIMSET](#).

TRCCLAIM	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TRCAUXCTLR, bit [35]

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of [TRCAUXCTLR](#) at EL1 using AArch64 to EL2.

TRCAUXCTLR	Meaning
0b0	MSR writes of <a href="#">TRCAUXCTLR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">TRCAUXCTLR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### Bit [34]

Reserved, RES0.

**TRC, bit [33]**

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [TRCACATR<n>](#).
- [TRCACVR<n>](#).
- [TRCBBCTLR](#).
- [TRCCCCTLR](#).
- [TRCCIDCCTLR0](#). [TRCCIDCCTLR<n>](#).
- [TRCCIDCCTLR1](#). [TRCCIDCVR<n>](#).
- [TRCCIDCVR<n>](#). [TRCCNTCTLR<n>](#).
- [TRCCNTCTLR<n>](#). [TRCCNTRLDVR<n>](#).
- [TRCCNTRLDVR<n>](#). [TRCCONFIGR](#).
- [TRCCONFIGR](#). [TRCEVENTCTL0R](#).
- [TRCEVENTCTL0R](#). [TRCEVENTCTL1R](#).
- [TRCEVENTCTL1R](#). [TRCEXTINSEL](#), if FEAT\_ETMv4 is implemented.
- [TRCEXTINSEL](#). [TRCRSCTLR<n>](#).
- [TRCOCTLR](#). [TRCSEQEVR<n>](#).
- [TRCRSCTLR<n>](#). [TRCSEQRSTEVR](#).
- [TRCSEQEVR<n>](#). [TRCSSCCR<n>](#).
- [TRCSEQRSTEVR](#). [TRCSSPCICR<n>](#).
- [TRCSSCCR<n>](#). [TRCSTALLCTLR](#).
- [TRCSSPCICR<n>](#). [TRCSYNCPR](#).
- [TRCSTALLCTLR](#). [TRCTRACEIDR](#).
- [TRCSYNCPR](#). [TRCTSCTLR](#).
- [TRCTRACEIDR](#). [TRCVIIECTLR](#).
- [TRCTSCTLR](#). [TRCVIPCSSCTLR](#).
- [TRCVIIECTLR](#). [TRCVISSCTLR](#).
- [TRCVIPCSSCTLR](#). [TRCVMIDCCTLR<n>](#).
- [TRCVISSCTLR](#). [TRCVMIDCVR<n>](#).
- [TRCVMIDCCTLR0](#).
- [TRCVMIDCCTLR1](#).
- [TRCVMIDCVR<n>](#).

TRC	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

A write of an unimplemented register is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**PMSLATFR\_EL1, bit [32]**

When FEAT\_SPE is implemented:

Trap MSR writes of [PMSLATFR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSLATFR_EL1	Meaning
0b0	MSR writes of <a href="#">PMSLATFR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1, 0b1</b> , then MSR writes of <a href="#">PMSLATFR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### PMSIRR\_EL1, bit [31]

When FEAT\_SPE is implemented:

Trap MSR writes of [PMSIRR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSIRR_EL1	Meaning
0b0	MSR writes of <a href="#">PMSIRR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1, 0b1</b> , then MSR writes of <a href="#">PMSIRR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### Bit [30]

Reserved, RES0.

### PMSICR\_EL1, bit [29]

When FEAT\_SPE is implemented:

Trap MSR writes of [PMSICR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSICR_EL1	Meaning
0b0	MSR writes of <a href="#">PMSICR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1, 0b1</b> , then MSR writes of <a href="#">PMSICR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**PMSFCR\_EL1, bit [28]****When FEAT\_SPE is implemented:**Trap MSR writes of [PMSFCR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMSFCR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">PMSFCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MSR writes of <a href="#">PMSFCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.**Otherwise:**

Reserved, RES0.

**PMSEVFR\_EL1, bit [27]****When FEAT\_SPE is implemented:**Trap MSR writes of [PMSEVFR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMSEVFR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">PMSEVFR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MSR writes of <a href="#">PMSEVFR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.**Otherwise:**

Reserved, RES0.

**PMSCR\_EL1, bit [26]****When FEAT\_SPE is implemented:**Trap MSR writes of [PMSCR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMSCR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">PMSCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MSR writes of <a href="#">PMSCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.**Otherwise:**

Reserved, RES0.

**PMBSR\_EL1, bit [25]****When FEAT\_SPE is implemented:**Trap MSR writes of [PMBSR\\_EL1](#) at EL1 using AArch64 to EL2.

PMBSR_EL1	Meaning
0b0	MSR writes of <a href="#">PMBSR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MSR writes of <a href="#">PMBSR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.**Otherwise:**

Reserved, RES0.

**PMBPTR\_EL1, bit [24]****When FEAT\_SPE is implemented:**Trap MSR writes of [PMBPTR\\_EL1](#) at EL1 using AArch64 to EL2.

PMBPTR_EL1	Meaning
0b0	MSR writes of <a href="#">PMBPTR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MSR writes of <a href="#">PMBPTR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.**Otherwise:**

Reserved, RES0.

**PMBLIMITR\_EL1, bit [23]****When FEAT\_SPE is implemented:**Trap MSR writes of [PMBLIMITR\\_EL1](#) at EL1 using AArch64 to EL2.

PMBLIMITR_EL1	Meaning
0b0	MSR writes of <a href="#">PMBLIMITR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MSR writes of <a href="#">PMBLIMITR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.**Otherwise:**

Reserved, RES0.

**Bit [22]**

Reserved, RES0.

**PMCR\_ELO, bit [21]**

When FEAT\_PMUv3 is implemented:

Trap MSR writes of [PMCR\\_ELO](#) at EL1 and EL0 using AArch64 and MCR writes of [PMCR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCR_ELO	Meaning
0b0	MSR writes of <a href="#">PMCR_ELO</a> at EL1 and EL0 using AArch64 and MCR writes of <a href="#">PMCR</a> at EL0 using AArch32 are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the write generates a higher priority exception: 0b1, then, unless the write generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MSR writes of <a href="#">PMCR_ELO</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR writes of <a href="#">PMCR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**PMSWINC\_ELO, bit [20]**

When FEAT\_PMUv3 is implemented:

Trap MSR writes of [PMSWINC\\_ELO](#) at EL1 and EL0 using AArch64 and MCR writes of [PMSWINC](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSWINC_ELO	Meaning
0b0	MSR writes of <a href="#">PMSWINC_ELO</a> at EL1 and EL0 using AArch64 and MCR writes of <a href="#">PMSWINC</a> at EL0 using AArch32 are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the write generates a higher priority exception: 0b1, then, unless the write generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MSR writes of <a href="#">PMSWINC_ELO</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR writes of <a href="#">PMSWINC</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**PMSELR\_EL0, bit [19]****When FEAT\_PMUv3 is implemented:**

Trap MSR writes of [PMSELR\\_EL0](#) at EL1 and EL0 using AArch64 and MCR writes of [PMSELR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSELR_EL0	Meaning
0b0	MSR writes of <a href="#">PMSELR_EL0</a> at EL1 and EL0 using AArch64 and MCR writes of <a href="#">PMSELR</a> at EL0 using AArch32 are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the write generates a higher priority exception: 0b1, then, unless the write generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MSR writes of <a href="#">PMSELR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR writes of <a href="#">PMSELR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMOVS, bit [18]****When FEAT\_PMUv3 is implemented:**

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of [PMOVSCLR\\_EL0](#) and [PMOVSSET\\_EL0](#).
- At EL1 and EL0 using AArch64: MSR writes of [PMOVSCLR\\_EL0](#) and [PMOVSSET\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of [PMOVS](#) and [PMOVSSET](#).
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of [PMOVS](#) and [PMOVSSET](#).

PMOVS	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the write generates a higher priority exception: 0b1, then, unless the write generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MSR writes at EL1 and EL0 using AArch64 of <a href="#">PMOVSCLR_EL0</a> and <a href="#">PMOVSSET_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR writes at EL0 using AArch32 of <a href="#">PMOVS</a> and <a href="#">PMOVSSET</a> are trapped to EL2 and reported with EC syndrome value 0x03, unless the write generates a higher priority exception.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMINTEN, bit [17]****When FEAT\_PMUv3 is implemented:**

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [PMINTENCLR\\_EL1](#).
- [PMINTENSET\\_EL1](#).

PMINTEN	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , <b>0b1</b> , then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMCNTEN, bit [16]****When FEAT\_PMUv3 is implemented:**

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of [PMCNTENCLR\\_EL0](#) and [PMCNTENSET\\_EL0](#).
- At EL1 and EL0 using AArch64: MSR writes of [PMCNTENCLR\\_EL0](#) and [PMCNTENSET\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of [PMCNTENCLR](#) and [PMCNTENSET](#).
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of [PMCNTENCLR](#) and [PMCNTENSET](#).

PMCNTEN	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2.{E2H,TGE}</a> != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , then, unless the write generates a higher priority exception: <b>0b1</b> , then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> <li>• MSR writes at EL1 and EL0 using AArch64 of <a href="#">PMCNTENCLR_EL0</a> and <a href="#">PMCNTENSET_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>• MCR writes at EL0 using AArch32 of <a href="#">PMCNTENCLR</a> and <a href="#">PMCNTENSET</a> are trapped to EL2 and reported with EC syndrome value 0x03, unless the write generates a higher priority exception.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMCCNTR\_EL0, bit [15]****When FEAT\_PMUv3 is implemented:**

Trap MSR writes of [PMCCNTR\\_EL0](#) at EL1 and EL0 using AArch64 and MCR and MCRR writes of [PMCCNTR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCNTR_EL0	Meaning
0b0	MSR writes of <a href="#">PMCCNTR_EL0</a> at EL1 and EL0 using AArch64 and MCR and MCRR writes of <a href="#">PMCCNTR</a> at EL0 using AArch32 are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the write generates a higher priority exception: 0b1, then, unless the write generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MSR writes of <a href="#">PMCCNTR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR and MCRR writes of <a href="#">PMCCNTR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03 (for MCR) or 0x04 (for MCRR).</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMCCFILTR\_EL0, bit [14]****When FEAT\_PMUv3 is implemented:**

Trap MSR writes of [PMCCFILTR\\_EL0](#) at EL1 and EL0 using AArch64 and MCR writes of [PMCCFILTR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCFILTR_EL0	Meaning
0b0	MSR writes of <a href="#">PMCCFILTR_EL0</a> at EL1 and EL0 using AArch64 and MCR writes of <a href="#">PMCCFILTR</a> at EL0 using AArch32 are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the write generates a higher priority exception: 0b1, then, unless the write generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MSR writes of <a href="#">PMCCFILTR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR writes of <a href="#">PMCCFILTR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

[PMCCFILTR\\_EL0](#) can also be accessed in AArch64 state using [PMXEVTYPER\\_EL0](#) when [PMSELR\\_EL0](#).SEL == 31, and [PMCCFILTR](#) can also be accessed in AArch32 state using [PMXEVTYPER](#) when [PMSELR](#).SEL == 31.

Setting this bit to 1 has no effect on accesses to [PMXEVTYPER\\_EL0](#) and [PMXEVTYPER](#), regardless of the value of [PMSELR\\_EL0](#).SEL or [PMSELR](#).SEL.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### PMEVTYPEPn\_EL0, bit [13]

When FEAT\_PMuV3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of `PMEVTYPEP<n>_EL0` and `PMXEVTYPEn_EL0`.
- At EL1 and EL0 using AArch64: MSR writes of `PMEVTYPEP<n>_EL0` and `PMXEVTYPEn_EL0`.
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of `PMEVTYPEP<n>` and `PMXEVTYPEn`.
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of `PMEVTYPEP<n>` and `PMXEVTYPEn`.

PMEVTYPEPn_EL0	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <code>HCR_EL2.{E2H,TGE} != {1,1}</code> , EL1 is using AArch64, and either EL3 is not implemented or <code>SCR_EL3.FGTEn == 1</code> , then, unless the write generates a higher priority exception: 0b1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> <li>MSR writes at EL1 and EL0 using AArch64 of <code>PMEVTYPEP&lt;n&gt;_EL0</code> and <code>PMXEVTYPEn_EL0</code> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR writes at EL0 using AArch32 of <code>PMEVTYPEP&lt;n&gt;</code> and <code>PMXEVTYPEn</code> are trapped to EL2 and reported with EC syndrome value 0x03, unless the write generates a higher priority exception.</li> </ul>

When FEAT\_FGT is implemented, then, regardless of the value of this bit, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a write of `PMEVTYPEP<n>_EL0`, or, if n is not 31, a write of `PMXEVTYPEn_EL0` when `PMSELR_EL0.SEL == n`.
  - In AArch32 state, a write of `PMEVTYPEP<n>`, or, if n is not 31, a write of `PMXEVTYPEn` when `PMSELR.SEL == n`.
- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a write of `PMEVTYPEP<n>_EL0`, or, if n is not 31, a write of `PMXEVTYPEn_EL0` when `PMSELR_EL0.SEL == n`.
  - In AArch32 state, a write of `PMEVTYPEP<n>`, or, if n is not 31, a write of `PMXEVTYPEn` when `PMSELR.SEL == n`.
- If event counter n is implemented and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:

If event counter n is implemented and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:

- In AArch64 state, a write of `PMEVTYPEP<n>_EL0`, or a write of `PMXEVTYPEn_EL0` when `PMSELR_EL0.SEL == n`, reported with EC syndrome value 0x18.
- In AArch64 state, a write of `PMEVTYPEP<n>_EL0`, or a write of `PMXEVTYPEn_EL0` when `PMSELR_EL0.SEL == n`, reported with EC syndrome value 0x18.

- In AArch32 state, a write of `PMEVTYPER<n>`, or a write of `PMXEVTYPER` when `PMSELR.SEL == n`, reported with EC syndrome value `0x03`.
- In AArch32 state, a write of `PMEVTYPER<n>`, or a write of `PMXEVTYPER` when `PMSELR.SEL == n`, reported with EC syndrome value `0x03`.

See also HDFGWTR\_EL2.PMCCFILTR\_EL0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

## PMEVCNTRn\_EL0, bit [12]

When FEAT\_PMuV3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of `PMEVCNTR<n>_EL0` and `PMXEVCNTR_EL0`.
- At EL1 and EL0 using AArch64: MSR writes of `PMEVCNTR<n>_EL0` and `PMXEVCNTR_EL0`.
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of `PMEVCNTR<n>` and `PMXEVCNTR`.
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of `PMEVCNTR<n>` and `PMXEVCNTR`.

PMEVCNTRn_EL0	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <code>HCR_EL2.{E2H,TGE} != {1,1}</code>, EL1 is using AArch64, and either EL3 is not implemented or <code>SCR_EL3.FGTEn == 1</code>, then, unless the write generates a higher priority exception: 0b1, then, unless the write generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>• MSR writes at EL1 and EL0 using AArch64 of <code>PMEVCNTR&lt;n&gt;_EL0</code> and <code>PMXEVCNTR_EL0</code> are trapped to EL2 and reported with EC syndrome value <code>0x18</code>.</li> <li>• MCR writes at EL0 using AArch32 of <code>PMEVCNTR&lt;n&gt;</code> and <code>PMXEVCNTR</code> are trapped to EL2 and reported with EC syndrome value <code>0x03</code>, unless the write generates a higher priority exception.</li> </ul>

When FEAT\_FGT is implemented, then, regardless of the value of this bit, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a write of `PMEVCNTR<n>_EL0`, or a write of `PMXEVCNTR_EL0` when `PMSELR_EL0.SEL == n`.
  - In AArch32 state, a write of `PMEVCNTR<n>`, or a write of `PMXEVCNTR` when `PMSELR.SEL == n`.
- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a write of `PMEVCNTR<n>_EL0`, or a write of `PMXEVCNTR_EL0` when `PMSELR_EL0.SEL == n`.
  - In AArch32 state, a write of `PMEVCNTR<n>`, or a write of `PMXEVCNTR` when `PMSELR.SEL == n`.
- If event counter n is implemented, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:

If event counter *n* is implemented, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:

- In AArch64 state, a write of [PMEVCNTR<n>\\_EL0](#), or a write of [PMXVCNTR\\_EL0](#) when [PMSELR\\_EL0.SEL == n](#), reported with EC syndrome value 0x18.
- In AArch64 state, a write of [PMEVCNTR<n>\\_EL0](#), or a write of [PMXVCNTR\\_EL0](#) when [PMSELR\\_EL0.SEL == n](#), reported with EC syndrome value 0x18.
- In AArch32 state, a write of [PMEVCNTR<n>](#), or a write of [PMXVCNTR](#) when [PMSELR.SEL == n](#), reported with EC syndrome value 0x03.
- In AArch32 state, a write of [PMEVCNTR<n>](#), or a write of [PMXVCNTR](#) when [PMSELR.SEL == n](#), reported with EC syndrome value 0x03.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### OSDLR\_EL1, bit [11]

When FEAT\_DoubleLock is implemented:

Trap MSR writes of [OSDLR\\_EL1](#) at EL1 using AArch64 to EL2.

OSDLR_EL1	Meaning
0b0	MSR writes of <a href="#">OSDLR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn == 1</a> , 0b1, then MSR writes of <a href="#">OSDLR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### OSECCR\_EL1, bit [10]

Trap MSR writes of [OSECCR\\_EL1](#) at EL1 using AArch64 to EL2.

OSECCR_EL1	Meaning
0b0	MSR writes of <a href="#">OSECCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn == 1</a> , 0b1, then MSR writes of <a href="#">OSECCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### Bit [9]

Reserved, RES0.

### OSLAR\_EL1, bit [8]

Trap MSR writes of [OSLAR\\_EL1](#) at EL1 using AArch64 to EL2.

OSLAR_EL1	Meaning
0b0	MSR writes of <a href="#">OSLAR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MSR writes of <a href="#">OSLAR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DBGPRCR\_EL1, bit [7]

Trap MSR writes of [DBGPRCR\\_EL1](#) at EL1 using AArch64 to EL2.

DBGPRCR_EL1	Meaning
0b0	MSR writes of <a href="#">DBGPRCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MSR writes of <a href="#">DBGPRCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Bit [6]

Reserved, RES0.

#### DBGCLAIM, bit [5]

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [DBGCLAIMCLR\\_EL1](#).
- [DBGCLAIMSET\\_EL1](#).

DBGCLAIM	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### MDSCR\_EL1, bit [4]

Trap MSR writes of [MDSCR\\_EL1](#) at EL1 using AArch64 to EL2.

MDSCR_EL1	Meaning
0b0	MSR writes of <a href="#">MDSCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MSR writes of <a href="#">MDSCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DBGWVRn\_EL1, bit [3]

Trap MSR writes of [DBGWVR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

DBGWVRn_EL1	Meaning
0b0	MSR writes of <a href="#">DBGWVR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">DBGWVR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of [DBGWVR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DBGWCRn\_EL1, bit [2]

Trap MSR writes of [DBGWCR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

DBGWCRn_EL1	Meaning
0b0	MSR writes of <a href="#">DBGWCR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">DBGWCR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of [DBGWCR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DBGBVRn\_EL1, bit [1]

Trap MSR writes of [DBGBVR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

DBGBVRn_EL1	Meaning
0b0	MSR writes of <a href="#">DBGBVR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">DBGBVR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of [DBGBVR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DBGBCRn\_EL1, bit [0]

Trap MSR writes of [DBGBCR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

DBGBCRn_EL1	Meaning
0b0	MSR writes of <a href="#">DBGBCR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">DBGBCR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of [DBGBCR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

## Accessing the HDFGWTR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, HDFGWTR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x1D8];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then

# HFGITR\_EL2, Hypervisor Fine-Grained Instruction Trap Register

The HFGITR\_EL2 characteristics are:

## Purpose

Provides **instruction controls** **trap for controls** **traps of execution of System instructions**.

## Configuration

This register is present only when FEAT\_FGT is implemented. Otherwise, direct accesses to HFGITR\_EL2 are UNDEFINED.

## Attributes

HFGITR\_EL2 is a 64-bit register.

## Field descriptions

The HFGITR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56
RES0							
TLBIVAAE1IS	TLBIASIDE1IS	TLBIVAE1IS	TLBIVMALLE1IS	TLBIRVAALE1OS	TLBIRVALE1OS	TLBIRVAAE1OS	TLBIRVAE1OST
31	30	29	28	27	26	25	24

### Bits [63:55]

Reserved, RES0.

### DCCVAC, bit [54]

Trap execution of multiple **System** instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 **System** instructions to EL2:

- **DC CVAC**.
- **DC CGVAC****DC CGDVAC**, if FEAT\_MTE is implemented.
- **DC CGDVAC****DC CGVAC**, if FEAT\_MTE is implemented.
- **DC CVAC**.

DCCVAC	Meaning
0b0	Execution of the <b>System</b> instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <b>HCR_EL2</b> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <b>SCR_EL3</b> .FGTEn == 1, execution at EL1 and EL0 using AArch64 of any of the <b>System</b> instructions listed above is trapped to EL2 and reported with EC syndrome value 0b1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, inIn a system where the PE resets into EL2, this field resets to 0.

**SVC\_EL1, bit [53]**

Trap execution of SVC at EL1 using AArch64 to EL2.

SVC_EL1	Meaning
0b0	Execution of SVC is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of SVC at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**SVC\_EL0, bit [52]**

Trap execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 when EL1 is using AArch64 to EL2.

SVC_EL0	Meaning
0b0	Execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2.{E2H,TGE}</a> != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, then, unless the instruction generates a higher priority exception: 0b1, then, unless the instruction generates a higher priority exception: <ul style="list-style-type: none"> <li>Execution of SVC at EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15.</li> <li>Execution of SVC at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x11.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**ERET, bit [51]**

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

Trap execution of ERET\* instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 System instructions to EL2:

- ERET.
- ERETAA, if FEAT\_PAuth is implemented.
- ERETAB, if FEAT\_PAuth is implemented.

ERET	Meaning
0b0	Execution of the instructions listed above is not affected by this bit.
0b1	Execution of the ERET* instructions is not affected by this bit. If EL2 is implemented and enabled in the current Security state and <a href="#">HCR_EL2.API</a> == 0, execution at EL1 using AArch64 of ERETAA or ERETAB instructions is reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the <a href="#">HCR_EL2.API</a> == 0. If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution at EL1 using AArch64 of any of the 0b1 ERET*, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x1A, unless the instruction generates a higher priority exception.

If EL2 is implemented and enabled in the current Security state, [HCR\\_EL2.API](#) == 0b0, and this bit enables a fine-grained trap on the instruction, then execution at EL1 using AArch64 of ERETAA or ERETAB instructions is trapped to

EL2 and reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the trap enabled by [HCR\\_EL2.API == 0](#).

In a system where the PE resets into EL2, this field resets to 0.

#### CPPRCTX, bit [50]

When FEAT\_SPECRES is implemented:

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### CPPRCTX, bit [50]

When FEAT\_SPECRES is implemented:

Trap execution of [CPP RCTX](#) at EL1 and EL0 using AArch64 and execution of [CPPRCTX](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

CPPRCTX	Meaning
0b0	Execution of <a href="#">CPP RCTX</a> at EL1 and EL0 using AArch64 and execution of <a href="#">CPPRCTX</a> at EL0 using AArch32 is not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the instruction generates a higher priority exception: 0b1, then, unless the instruction generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>Execution of <a href="#">CPP RCTX</a> at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>Execution of <a href="#">CPPRCTX</a> at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### DVPRCTX, bit [49]

When FEAT\_SPECRES is implemented:

Trap execution of [DVP RCTX](#) at EL1 and EL0 using AArch64 and execution of [DVPRCTX](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

DVPRCTX	Meaning
0b0	Execution of <a href="#">DVP RCTX</a> at EL1 and EL0 using AArch64 and execution of <a href="#">DVPRCTX</a> at EL0 using AArch32 is not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the instruction generates a higher priority exception: 0b1, then, unless the instruction generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>Execution of <a href="#">DVP RCTX</a> at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>Execution of <a href="#">DVPRCTX</a> at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**CFPRCTX, bit [48]****When FEAT\_SPECRES is implemented:**

Trap execution of [CFP RCTX](#) at EL1 and EL0 using AArch64 and execution of [CFPRCTX](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

CFPRCTX	Meaning
0b0	Execution of <a href="#">CFP RCTX</a> at EL1 and EL0 using AArch64 and execution of <a href="#">CFPRCTX</a> at EL0 using AArch32 is not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, then, unless the instruction generates a higher priority exception: 0b1, then, unless the instruction generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>Execution of <a href="#">CFP RCTX</a> at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>Execution of <a href="#">CFPRCTX</a> at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIVAALE1, bit [47]**

Trap execution of [TLBI VAALE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI VAALE1NXS](#).

TLBIVAALE1	Meaning
0b0	Execution of <a href="#">TLBI VAALE1</a> is not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, execution of 0b1, then execution of <a href="#">TLBI VAALE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.</p>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TLBIVALE1, bit [46]**

Trap execution of [TLBI VALE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI VALE1NXS](#).

TLBIVALE1	Meaning
0b0	Execution of <a href="#">TLBI VALE1</a> is not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 1, execution of 0b1, then execution of <a href="#">TLBI VALE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.</p>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TLBIVAAE1, bit [45]

Trap execution of [TLBI VAAE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VAAE1NXS](#).

TLBIVAAE1	Meaning
0b0	Execution of <a href="#">TLBI VAAE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI VAAE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TLBIASIDE1, bit [44]

Trap execution of [TLBI ASIDE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI ASIDE1NXS](#).

TLBIASIDE1	Meaning
0b0	Execution of <a href="#">TLBI ASIDE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI ASIDE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TLBIVAE1, bit [43]

Trap execution of [TLBI VAE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VAE1NXS](#).

TLBIVAE1	Meaning
0b0	Execution of <a href="#">TLBI VAE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI VAE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TLBIVMALLE1, bit [42]

Trap execution of [TLBI VMALLE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VMALLE1NXS](#).

TLBIVMALE1	Meaning
0b0	Execution of <a href="#">TLBI VMALE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI VMALE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TLBIRVALE1, bit [41]

When FEAT\_TLBIRANGE is implemented:

Trap execution of [TLBI RVALE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI RVALE1NXS](#).

TLBIRVALE1	Meaning
0b0	Execution of <a href="#">TLBI RVALE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI RVALE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### TLBIRVALE1, bit [40]

When FEAT\_TLBIRANGE is implemented:

Trap execution of [TLBI RVALE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI RVALE1NXS](#).

TLBIRVALE1	Meaning
0b0	Execution of <a href="#">TLBI RVALE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI RVALE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### TLBIRVALE1, bit [39]

When FEAT\_TLBIRANGE is implemented:

Trap execution of [TLBI RVALE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and HCRX\_EL2.FGTnXS == 0b0, this field also traps execution of TLBI RVAEE1NXS.

TLBIRVAEE1	Meaning
0b0	Execution of TLBI RVAEE1 is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, execution of 0b1, then execution of TLBI RVAEE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TLBIRVAE1, bit [38]

When FEAT\_TLBIRANGE is implemented:

Trap execution of TLBI RVAE1 at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and HCRX\_EL2.FGTnXS == 0b0, this field also traps execution of TLBI RVAE1NXS.

TLBIRVAE1	Meaning
0b0	Execution of TLBI RVAE1 is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, execution of 0b1, then execution of TLBI RVAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TLBIRVAALE1IS, bit [37]

When FEAT\_TLBIRANGE is implemented:

Trap execution of TLBI RVAALE1IS at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and HCRX\_EL2.FGTnXS == 0b0, this field also traps execution of TLBI RVAALE1ISNXS.

TLBIRVAALE1IS	Meaning
0b0	Execution of TLBI RVAALE1IS is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, execution of 0b1, then execution of TLBI RVAALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**TLBIRVALE1IS, bit [36]****When FEAT\_TLBIRANGE is implemented:**Trap execution of [TLBI RVALE1IS](#) at EL1 using AArch64 to EL2.If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS == 0b0](#), this field also traps execution of [TLBI RVALE1ISNXS](#).

TLBIRVALE1IS	Meaning
0b0	Execution of <a href="#">TLBI RVALE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn == 1</a> , execution of 0b1, then execution of <a href="#">TLBI RVALE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.**Otherwise:**

Reserved, RES0.

**TLBIRVAAE1IS, bit [35]****When FEAT\_TLBIRANGE is implemented:**Trap execution of [TLBI RVAAE1IS](#) at EL1 using AArch64 to EL2.If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS == 0b0](#), this field also traps execution of [TLBI RVAAE1ISNXS](#).

TLBIRVAAE1IS	Meaning
0b0	Execution of <a href="#">TLBI RVAAE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn == 1</a> , execution of 0b1, then execution of <a href="#">TLBI RVAAE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.**Otherwise:**

Reserved, RES0.

**TLBIRVAE1IS, bit [34]****When FEAT\_TLBIRANGE is implemented:**Trap execution of [TLBI RVAE1IS](#) at EL1 using AArch64 to EL2.If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS == 0b0](#), this field also traps execution of [TLBI RVAE1ISNXS](#).

TLBIRVAE1IS	Meaning
0b0	Execution of <a href="#">TLBI RVAE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, execution of 0b1, then execution of TLBI RVAE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TLBIVAALE1IS, bit [33]

Trap execution of [TLBI VAALE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VAALE1ISnXS](#).

TLBIVAALE1IS	Meaning
0b0	Execution of <a href="#">TLBI VAALE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, execution of 0b1, then execution of TLBI VAALE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

### TLBIVALE1IS, bit [32]

Trap execution of [TLBI VALE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VALE1ISnXS](#).

TLBIVALE1IS	Meaning
0b0	Execution of <a href="#">TLBI VALE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, execution of 0b1, then execution of TLBI VALE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

### TLBIVAAE1IS, bit [31]

Trap execution of [TLBI VAAE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VAAE1ISnXS](#).

TLBIVAAE1IS	Meaning
0b0	Execution of <a href="#">TLBI VAAE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI VAAE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### TLBIASIDE1IS, bit [30]

Trap execution of [TLBI ASIDE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI ASIDE1ISNXS](#).

TLBIASIDE1IS	Meaning
0b0	Execution of <a href="#">TLBI ASIDE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI ASIDE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### TLBIVAE1IS, bit [29]

Trap execution of [TLBI VAE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VAE1ISNXS](#).

TLBIVAE1IS	Meaning
0b0	Execution of <a href="#">TLBI VAE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI VAE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### TLBIVMALE1IS, bit [28]

Trap execution of [TLBI VMALLE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VMALLE1ISNXS](#).

TLBIVMALE1IS	Meaning
0b0	Execution of <a href="#">TLBI VMALLE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI VMALLE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### TLBIRVALE1OS, bit [27]

**When FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented:**

Trap execution of [TLBI RVAALE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI RVAALE1OSNXXS](#).

TLBIRVAALE1OS	Meaning
0b0	Execution of <a href="#">TLBI RVAALE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI RVAALE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

#### TLBIRVALE1OS, bit [26]

**When FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented:**

Trap execution of [TLBI RVALE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI RVALE1OSNXXS](#).

TLBIRVALE1OS	Meaning
0b0	Execution of <a href="#">TLBI RVALE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI RVALE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

#### TLBIRVAAE1OS, bit [25]

**When FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented:**

Trap execution of [TLBI RVAAE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI RVAAE1OSNXXS](#).

TLBIRVAAE1OS	Meaning
0b0	Execution of <a href="#">TLBI RVAAE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI RVAAE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TLBIRVAE1OS, bit [24]

When FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented:

Trap execution of [TLBI RVAE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI RVAE1OSNXXS](#).

TLBIRVAE1OS	Meaning
0b0	Execution of <a href="#">TLBI RVAE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI RVAE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TLBIVAAE1OS, bit [23]

When FEAT\_TLBIOS is implemented:

Trap execution of [TLBI VAAE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VAAE1OSNXXS](#).

TLBIVAAE1OS	Meaning
0b0	Execution of <a href="#">TLBI VAAE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI VAAE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIVALE1OS, bit [22]****When FEAT\_TLBIOS is implemented:**

Trap execution of [TLBI VALE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VALE1OSNXS](#).

TLBIVALE1OS	Meaning
0b0	Execution of <a href="#">TLBI VALE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI VALE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIVAAE1OS, bit [21]****When FEAT\_TLBIOS is implemented:**

Trap execution of [TLBI VAAE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VAAE1OSNXS](#).

TLBIVAAE1OS	Meaning
0b0	Execution of <a href="#">TLBI VAAE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI VAAE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIASIDE1OS, bit [20]****When FEAT\_TLBIOS is implemented:**

Trap execution of [TLBI ASIDE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI ASIDE1OSNXS](#).

TLBIASIDE1OS	Meaning
0b0	Execution of <a href="#">TLBI ASIDE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI ASIDE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TLBIVAE1OS, bit [19]

When FEAT\_TLBIOS is implemented:

Trap execution of [TLBI VAE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VAE1OSNXS](#).

TLBIVAE1OS	Meaning
0b0	Execution of <a href="#">TLBI VAE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI VAE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TLBIVMALE1OS, bit [18]

When FEAT\_TLBIOS is implemented:

Trap execution of [TLBI VMALE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VMALE1OSNXS](#).

TLBIVMALE1OS	Meaning
0b0	Execution of <a href="#">TLBI VMALE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">TLBI VMALE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**ATS1E1WP, bit [17]****When FEAT\_PAN2 is implemented:**Trap execution of [AT S1E1WP](#) at EL1 using AArch64 to EL2.

ATS1E1WP	Meaning
0b0	Execution of <a href="#">AT S1E1WP</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">AT S1E1WP</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ATS1E1RP, bit [16]****When FEAT\_PAN2 is implemented:**Trap execution of [AT S1E1RP](#) at EL1 using AArch64 to EL2.

ATS1E1RP	Meaning
0b0	Execution of <a href="#">AT S1E1RP</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">AT S1E1RP</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ATS1E0W, bit [15]**Trap execution of [AT S1E0W](#) at EL1 using AArch64 to EL2.

ATS1E0W	Meaning
0b0	Execution of <a href="#">AT S1E0W</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">AT S1E0W</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**ATS1E0R, bit [14]**Trap execution of [AT S1E0R](#) at EL1 using AArch64 to EL2.

ATS1E0R	Meaning
0b0	Execution of <a href="#">AT S1E0R</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">AT S1E0R</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### ATS1E1W, bit [13]

Trap execution of [AT S1E1W](#) at EL1 using AArch64 to EL2.

ATS1E1W	Meaning
0b0	Execution of <a href="#">AT S1E1W</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">AT S1E1W</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### ATS1E1R, bit [12]

Trap execution of [AT S1E1R](#) at EL1 using AArch64 to EL2.

ATS1E1R	Meaning
0b0	Execution of <a href="#">AT S1E1R</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution of 0b1, then execution of <a href="#">AT S1E1R</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### DCZVA, bit [11]

Trap execution of multiple [System](#) instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 [System](#) instructions to EL2:

- [DC ZVA](#).
- [DC GVA](#), if FEAT\_MTE is implemented.
- [DC GZVA](#), if FEAT\_MTE is implemented.
- [DC ZVA](#).

DCZVA	Meaning
0b0	Execution of the <a href="#">System</a> instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2.{E2H,TGE}</a> != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, execution at EL1 and EL0 using AArch64 of any of the <a href="#">System</a> instructions listed above is trapped to EL2 and reported with EC syndrome value 0b1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DCCIVAC, bit [10]**

Trap execution of multiple **System** instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 **System** instructions to EL2:

- **DC CIVAC.**
- **DC CIGVAC****DC CIGDVAC**, if FEAT\_MTE is implemented.
- **DC CIGDVAC****DC CIGVAC**, if FEAT\_MTE is implemented.
- **DC CIVAC.**

DCCIVAC	Meaning
0b0	Execution of the <b>System</b> instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <b>HCR_EL2</b> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <b>SCR_EL3</b> .FGTEn == 1, execution at EL1 and EL0 using AArch64 of any of the <b>System</b> instructions listed above is trapped to EL2 and reported with EC syndrome value 0b1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DCCVADP, bit [9]**

When FEAT\_DPB2 is implemented:

Trap execution of multiple **System** instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 **System** instructions to EL2:

- **DC CVADP.**
- **DC CGVADP****DC CGDVADP**, if FEAT\_MTE is implemented.
- **DC CGDVADP****DC CGVADP**, if FEAT\_MTE is implemented.
- **DC CVADP.**

DCCVADP	Meaning
0b0	Execution of the <b>System</b> instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <b>HCR_EL2</b> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <b>SCR_EL3</b> .FGTEn == 1, execution at EL1 and EL0 using AArch64 of any of the <b>System</b> instructions listed above is trapped to EL2 and reported with EC syndrome value 0b1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**DCCVAP, bit [8]**

Trap execution of multiple **System** instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 **System** instructions to EL2:

- **DC CVAP.**
- **DC CGVAP****DC CGDVAP**, if FEAT\_MTE is implemented.
- **DC CGDVAP****DC CGVAP**, if FEAT\_MTE is implemented.
- **DC CVAP.**

DCCVAP	Meaning
0b0	Execution of the <b>System</b> instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, execution at EL1 and EL0 using AArch64 of any of the <b>System</b> instructions listed above is trapped to EL2 and reported with EC syndrome value 0b1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DCCVAU, bit [7]

Trap execution of [DC CVAU](#) at EL1 and EL0 using AArch64 to EL2.

DCCVAU	Meaning
0b0	Execution of <a href="#">DC CVAU</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, execution of 0b1, then execution of <a href="#">DC CVAU</a> at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DCCISW, bit [6]

Trap execution of multiple **System** instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 **System** instructions to EL2:

- [DC CISW](#).
- [DC CIGSW](#)/[DC CIGDSW](#), if FEAT\_MTE is implemented.
- [DC CIGDSW](#)/[DC CIGSW](#), if FEAT\_MTE is implemented.
- [DC CISW](#).

DCCISW	Meaning
0b0	Execution of the <b>System</b> instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, execution at EL1 using AArch64 of any of the <b>System</b> instructions listed above is trapped to EL2 and reported with EC syndrome value 0b1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DCCSW, bit [5]

Trap execution of multiple **System** instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 **System** instructions to EL2:

- [DC CSW](#).
- [DC CGSW](#)/[DC CGDSW](#), if FEAT\_MTE is implemented.
- [DC CGDSW](#)/[DC CGSW](#), if FEAT\_MTE is implemented.
- [DC CSW](#).

DCCSW	Meaning
0b0	Execution of the <b>System</b> instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <b>SCR_EL3.FGTEn</b> == 1, execution at EL1 using AArch64 of any of the <b>System</b> instructions listed above is trapped to EL2 and reported with EC syndrome value 0b1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DCISW, bit [4]

Trap execution of multiple **System** instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 **System** instructions to EL2:

- **DC ISW.**
- **DC IGSWDC IGDSW**, if FEAT\_MTE is implemented.
- **DC IGDSWDC IGSW**, if FEAT\_MTE is implemented.
- **DC ISW.**

DCISW	Meaning
0b0	Execution of the <b>System</b> instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <b>SCR_EL3.FGTEn</b> == 1, execution at EL1 using AArch64 of any of the <b>System</b> instructions listed above is trapped to EL2 and reported with EC syndrome value 0b1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DCIVAC, bit [3]

Trap execution of multiple **System** instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 **System** instructions to EL2:

- **DC IVAC.**
- **DC IGVACDC IGDVAC**, if FEAT\_MTE is implemented.
- **DC IGDVACDC IGVAC**, if FEAT\_MTE is implemented.
- **DC IVAC.**

DCIVAC	Meaning
0b0	Execution of the <b>System</b> instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <b>SCR_EL3.FGTEn</b> == 1, execution at EL1 using AArch64 of any of the <b>System</b> instructions listed above is trapped to EL2 and reported with EC syndrome value 0b1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### ICIVAU, bit [2]

Trap execution of **IC IVAU** at EL1 and EL0 using AArch64 to EL2.

ICIVAU	Meaning
0b0	Execution of <a href="#">IC IVAU</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, execution of 0b1, then execution of <a href="#">IC IVAU</a> at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

### ICIALLU, bit [1]

Trap execution of [IC IALLU](#) at EL1 using AArch64 to EL2.

ICIALLU	Meaning
0b0	Execution of <a href="#">IC IALLU</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, execution of 0b1, then execution of <a href="#">IC IALLU</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

### ICIALLUIS, bit [0]

Trap execution of [IC IALLUIS](#) at EL1 using AArch64 to EL2.

ICIALLUIS	Meaning
0b0	Execution of <a href="#">IC IALLUIS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, execution of 0b1, then execution of <a href="#">IC IALLUIS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

## Accessing the HFGITR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, HFGITR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b110

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

# HFGRTR\_EL2, Hypervisor Fine-Grained Read Trap Register

The HFGRTR\_EL2 characteristics are:

## Purpose

Provides controls for traps of MRS and MRC reads of System registers.

## Configuration

This register is present only when FEAT\_FGT is implemented. Otherwise, direct accesses to HFGRTR\_EL2 are UNDEFINED.

## Attributes

HFGRTR\_EL2 is a 64-bit register.

## Field descriptions

The HFGRTR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54
						RES0			
SCXTNUM_EL0	SCXTNUM_EL1	SCTLR_EL1	REVIDR_EL1	PAR_EL1	MPIDR_EL1	MIDR_EL1	MAIR_EL1	LORSA_EL1	LORN_EL1
31	30	29	28	27	26	25	24	23	22

Bits [63:50]

Bits [63:51]

Reserved, RES0.

nACCDATA\_EL1ERXADDR\_EL1, bit [50:49]

When FEAT\_LS64FEAT\_RAS is implemented:

Trap MRS reads of ACCDATA\_EL1ERXADDR\_EL1 at EL1 using AArch64 to EL2.

nACCDATA_EL1	ERXADDR_EL1	Meaning
0b0		If EL2 is implemented and enabled in the current Security state then MRS reads of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1		MRS reads of ACCDATA_EL1 are not affected by this bit. If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MRS reads of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

This bit is ignored by the PE and treated as zero when EL3 is implemented and SCR\_EL3.FGTEn == 0b0.

In a system where the PE resets into EL2, this field resets to 0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### ERXADDR\_EL1, bit [4948]

When FEAT\_RASv1p1 is implemented:

Trap MRS reads of ERXADDR\_EL1 at EL1 using AArch64 to EL2.

ERXADDR_EL1	ERXPFGCDN_EL1	Meaning
0b0		MRS reads of ERXADDR_EL1 are not affected by this bit.
0b1		If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### ERXPFGCDN\_EL1, bit [4847]

When FEAT\_RASv1p1 is implemented:

Trap MRS reads of ERXPFGCDN\_EL1 at EL1 using AArch64 to EL2.

ERXPF_GCDN_EL1	ERXPF_GCTL_EL1	Meaning
0b0		MRS reads of ERXPF_GCDN_EL1 and ERXPF_GCTL_EL1 are not affected by this bit.
0b1		If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, 0b1, then MRS reads of ERXPF_GCDN_EL1 and ERXPF_GCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### ERXPF\_GCTL\_EL1 and ERXPF\_GFE\_EL1, bit [47:46]

When FEAT\_RASv1p1 and FEAT\_RAS is implemented:

Trap MRS reads of ERXPF\_GCTL\_EL1 and ERXPF\_GFE\_EL1 at EL1 using AArch64 to EL2.

ERXPF_GCTL_EL1	ERXPF_GFE_EL1	Meaning
0b0		MRS reads of ERXPF_GCTL_EL1 and ERXPF_GFE_EL1 are not affected by this bit.
0b1		If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, 0b1, then MRS reads of ERXPF_GCTL_EL1 and ERXPF_GFE_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### ERXPF\_GFE\_EL1 and ERXMISCn\_EL1, bit [46:45]

When FEAT\_RAS is implemented:

Trap MRS reads of ERXPF\_GFE\_EL1 at EL1 using AArch64 to EL2.

ERXPF_GFE_EL1	Meaning
0b0	MRS reads of ERXPF_GFE_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then MRS reads of ERXPF_GFE_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### ERXMISCN\_EL1, bit [45]

When FEAT\_RAS is implemented:

Trap MRS reads of ERXMISC<n>\_EL1 at EL1 using AArch64 to EL2.

ERXMISCN_EL1	Meaning
0b0	MRS reads of ERXMISC<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn == 1</a> , 0b1, then MRS reads of ERXMISC<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### ERXSTATUS\_EL1, bit [44]

When FEAT\_RAS is implemented:

Trap MRS reads of [ERXSTATUS\\_EL1](#) at EL1 using AArch64 to EL2.

ERXSTATUS_EL1	Meaning
0b0	MRS reads of <a href="#">ERXSTATUS_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn == 1</a> , 0b1, then MRS reads of <a href="#">ERXSTATUS_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### ERXCTLR\_EL1, bit [43]

When FEAT\_RAS is implemented:

Trap MRS reads of [ERXCTLR\\_EL1](#) at EL1 using AArch64 to EL2.

ERXCTLR_EL1	Meaning
0b0	MRS reads of <a href="#">ERXCTLR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">ERXCTLR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### ERXFR\_EL1, bit [42]

When FEAT\_RAS is implemented:

Trap MRS reads of [ERXFR\\_EL1](#) at EL1 using AArch64 to EL2.

ERXFR_EL1	Meaning
0b0	MRS reads of <a href="#">ERXFR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">ERXFR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### ERRSELR\_EL1, bit [41]

When FEAT\_RAS is implemented:

Trap MRS reads of [ERRSELR\\_EL1](#) at EL1 using AArch64 to EL2.

ERRSELR_EL1	Meaning
0b0	MRS reads of <a href="#">ERRSELR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">ERRSELR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**ERRIDR\_EL1, bit [40]****When FEAT\_RAS is implemented:**Trap MRS reads of [ERRIDR\\_EL1](#) at EL1 using AArch64 to EL2.

ERRIDR_EL1	Meaning
0b0	MRS reads of <a href="#">ERRIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">ERRIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ICC\_IGRPENn\_EL1, bit [39]****When FEAT\_GICv3 is implemented:**

Trap MRS reads of ICC\_IGRPEN&lt;n&gt;\_EL1 at EL1 using AArch64 to EL2.

ICC_IGRPENn_EL1	Meaning
0b0	MRS reads of ICC_IGRPEN<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**VBAR\_EL1, bit [38]**Trap MRS reads of [VBAR\\_EL1](#) at EL1 using AArch64 to EL2.

VBAR_EL1	Meaning
0b0	MRS reads of <a href="#">VBAR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">VBAR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TTBR1\_EL1, bit [37]**Trap MRS reads of [TTBR1\\_EL1](#) at EL1 using AArch64 to EL2.

TTBR1_EL1	Meaning
0b0	MRS reads of <a href="#">TTBR1_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">TTBR1_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TTBR0\_EL1, bit [36]

Trap MRS reads of [TTBR0\\_EL1](#) at EL1 using AArch64 to EL2.

TTBR0_EL1	Meaning
0b0	MRS reads of <a href="#">TTBR0_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">TTBR0_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TPIDR\_EL0, bit [35]

Trap MRS reads of [TPIDR\\_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [TPIDRURW](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDR_EL0	Meaning
0b0	MRS reads of <a href="#">TPIDR_EL0</a> at EL1 and EL0 using AArch64 and MRC reads of <a href="#">TPIDRURW</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2.{E2H,TGE}</a> != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, then, unless the read generates a higher priority exception: 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of <a href="#">TPIDR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of <a href="#">TPIDRURW</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TPIDRRO\_EL0, bit [34]

Trap MRS reads of [TPIDRRO\\_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [TPIDRURO](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDRRO_EL0	Meaning
0b0	MRS reads of <a href="#">TPIDRRO_EL0</a> at EL1 and EL0 using AArch64 and MRC reads of <a href="#">TPIDRURO</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, then, unless the read generates a higher priority exception: 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of <a href="#">TPIDRRO_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of <a href="#">TPIDRURO</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### TPIDR\_EL1, bit [33]

Trap MRS reads of [TPIDR\\_EL1](#) at EL1 using AArch64 to EL2.

TPIDR_EL1	Meaning
0b0	MRS reads of <a href="#">TPIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, 0b1, then MRS reads of <a href="#">TPIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### TCR\_EL1, bit [32]

Trap MRS reads of [TCR\\_EL1](#) at EL1 using AArch64 to EL2.

TCR_EL1	Meaning
0b0	MRS reads of <a href="#">TCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, 0b1, then MRS reads of <a href="#">TCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### SCXTNUM\_EL0, bit [31]

When FEAT\_CSV2 is implemented:

Trap MRS reads of [SCXTNUM\\_EL0](#) at EL1 and EL0 using AArch64 to EL2.

SCXTNUM_EL0	Meaning
0b0	MRS reads of <a href="#">SCXTNUM_EL0</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 1, 0b1, then MRS reads of <a href="#">SCXTNUM_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**SCXTNUM\_EL1, bit [30]****When FEAT\_CSV2 is implemented:**

Trap MRS reads of [SCXTNUM\\_EL1](#) at EL1 using AArch64 to EL2.

SCXTNUM_EL1	Meaning
0b0	MRS reads of <a href="#">SCXTNUM_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">SCXTNUM_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**SCTLR\_EL1, bit [29]**

Trap MRS reads of [SCTLR\\_EL1](#) at EL1 using AArch64 to EL2.

SCTLR_EL1	Meaning
0b0	MRS reads of <a href="#">SCTLR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">SCTLR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**REVIDR\_EL1, bit [28]**

Trap MRS reads of [REVIDR\\_EL1](#) at EL1 using AArch64 to EL2.

REVIDR_EL1	Meaning
0b0	MRS reads of <a href="#">REVIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">REVIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**PAR\_EL1, bit [27]**

Trap MRS reads of [PAR\\_EL1](#) at EL1 using AArch64 to EL2.

PAR_EL1	Meaning
0b0	MRS reads of <a href="#">PAR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MRS reads of <a href="#">PAR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### MPIDR\_EL1, bit [26]

Trap MRS reads of [MPIDR\\_EL1](#) at EL1 using AArch64 to EL2.

MPIDR_EL1	Meaning
0b0	MRS reads of <a href="#">MPIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MRS reads of <a href="#">MPIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### MIDR\_EL1, bit [25]

Trap MRS reads of [MIDR\\_EL1](#) at EL1 using AArch64 to EL2.

MIDR_EL1	Meaning
0b0	MRS reads of <a href="#">MIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MRS reads of <a href="#">MIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### MAIR\_EL1, bit [24]

Trap MRS reads of [MAIR\\_EL1](#) at EL1 using AArch64 to EL2.

MAIR_EL1	Meaning
0b0	MRS reads of <a href="#">MAIR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MRS reads of <a href="#">MAIR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### LORSA\_EL1, bit [23]

When FEAT\_LOR is implemented:

Trap MRS reads of [LORSA\\_EL1](#) at EL1 using AArch64 to EL2.

LORSA_EL1	Meaning
0b0	MRS reads of <a href="#">LORSA_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MRS reads of <a href="#">LORSA_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### LORN\_EL1, bit [22]

When FEAT\_LOR is implemented:

Trap MRS reads of [LORN\\_EL1](#) at EL1 using AArch64 to EL2.

LORN_EL1	Meaning
0b0	MRS reads of <a href="#">LORN_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MRS reads of <a href="#">LORN_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### LORID\_EL1, bit [21]

When FEAT\_LOR is implemented:

Trap MRS reads of [LORID\\_EL1](#) at EL1 using AArch64 to EL2.

LORID_EL1	Meaning
0b0	MRS reads of <a href="#">LORID_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MRS reads of <a href="#">LORID_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

#### LOREA\_EL1, bit [20]

When FEAT\_LOR is implemented:

Trap MRS reads of [LOREA\\_EL1](#) at EL1 using AArch64 to EL2.

LOREA_EL1	Meaning
0b0	MRS reads of <a href="#">LOREA_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">LOREA_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### LORC\_EL1, bit [19]

When FEAT\_LOR is implemented:

Trap MRS reads of [LORC\\_EL1](#) at EL1 using AArch64 to EL2.

LORC_EL1	Meaning
0b0	MRS reads of <a href="#">LORC_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">LORC_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### ISR\_EL1, bit [18]

Trap MRS reads of [ISR\\_EL1](#) at EL1 using AArch64 to EL2.

ISR_EL1	Meaning
0b0	MRS reads of <a href="#">ISR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">ISR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### FAR\_EL1, bit [17]

Trap MRS reads of [FAR\\_EL1](#) at EL1 using AArch64 to EL2.

FAR_EL1	Meaning
0b0	MRS reads of <a href="#">FAR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">FAR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**ESR\_EL1, bit [16]**

Trap MRS reads of [ESR\\_EL1](#) at EL1 using AArch64 to EL2.

ESR_EL1	Meaning
0b0	MRS reads of <a href="#">ESR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">ESR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DCZID\_EL0, bit [15]**

Trap MRS reads of [DCZID\\_EL0](#) at EL1 and EL0 using AArch64 to EL2.

DCZID_EL0	Meaning
0b0	MRS reads of <a href="#">DCZID_EL0</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2.{E2H,TGE}</a> != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">DCZID_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**CTR\_EL0, bit [14]**

Trap MRS reads of [CTR\\_EL0](#) at EL1 and EL0 using AArch64 to EL2.

CTR_EL0	Meaning
0b0	MRS reads of <a href="#">CTR_EL0</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2.{E2H,TGE}</a> != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">CTR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**CSSELR\_EL1, bit [13]**

Trap MRS reads of [CSSELR\\_EL1](#) at EL1 using AArch64 to EL2.

CSSELR_EL1	Meaning
0b0	MRS reads of <a href="#">CSSELR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads of <a href="#">CSSELR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**CPACR\_EL1, bit [12]**

Trap MRS reads of [CPACR\\_EL1](#) at EL1 using AArch64 to EL2.

CPACR_EL1	Meaning
0b0	MRS reads of <a href="#">CPACR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MRS reads of <a href="#">CPACR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### CONTEXTIDR\_EL1, bit [11]

Trap MRS reads of [CONTEXTIDR\\_EL1](#) at EL1 using AArch64 to EL2.

CONTEXTIDR_EL1	Meaning
0b0	MRS reads of <a href="#">CONTEXTIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MRS reads of <a href="#">CONTEXTIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### CLIDR\_EL1, bit [10]

Trap MRS reads of [CLIDR\\_EL1](#) at EL1 using AArch64 to EL2.

CLIDR_EL1	Meaning
0b0	MRS reads of <a href="#">CLIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MRS reads of <a href="#">CLIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### CCSIDR\_EL1, bit [9]

Trap MRS reads of [CCSIDR\\_EL1](#) at EL1 using AArch64 to EL2.

CCSIDR_EL1	Meaning
0b0	MRS reads of <a href="#">CCSIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MRS reads of <a href="#">CCSIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### APIBKey, bit [8]

When FEAT\_PAAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIBKeyHi\\_EL1](#).

- [APIBKeyLo\\_EL1](#).

APIBKey	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### APIAKey, bit [7]

When FEAT\_PAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIAKeyHi\\_EL1](#).
- [APIAKeyLo\\_EL1](#).

APIAKey	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### APGAKey, bit [6]

When FEAT\_PAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APGAKeyHi\\_EL1](#).
- [APGAKeyLo\\_EL1](#).

APGAKey	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**APDBKey, bit [5]****When FEAT\_PAuth is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDBKeyHi\\_EL1](#).
- [APDBKeyLo\\_EL1](#).

APDBKey	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**APDAKey, bit [4]****When FEAT\_PAuth is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDAKeyHi\\_EL1](#).
- [APDAKeyLo\\_EL1](#).

APDAKey	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**AMAIR\_EL1, bit [3]**

Trap MRS reads of [AMAIR\\_EL1](#) at EL1 using AArch64 to EL2.

AMAIR_EL1	Meaning
0b0	MRS reads of <a href="#">AMAIR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1</a> , <a href="#">0b1</a> , then MRS reads of <a href="#">AMAIR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### AIDR\_EL1, bit [2]

Trap MRS reads of [AIDR\\_EL1](#) at EL1 using AArch64 to EL2.

AIDR_EL1	Meaning
0b0	MRS reads of <a href="#">AIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1</a> , <a href="#">0b1</a> , then MRS reads of <a href="#">AIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### AFSR1\_EL1, bit [1]

Trap MRS reads of [AFSR1\\_EL1](#) at EL1 using AArch64 to EL2.

AFSR1_EL1	Meaning
0b0	MRS reads of <a href="#">AFSR1_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1</a> , <a href="#">0b1</a> , then MRS reads of <a href="#">AFSR1_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

#### AFSR0\_EL1, bit [0]

Trap MRS reads of [AFSR0\\_EL1](#) at EL1 using AArch64 to EL2.

AFSR0_EL1	Meaning
0b0	MRS reads of <a href="#">AFSR0_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1</a> , <a href="#">0b1</a> , then MRS reads of <a href="#">AFSR0_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in [In](#) a system where the PE resets into EL2, this field resets to 0.

## Accessing the HFGRTTR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, HFGRTTR\_EL2

op0	op1	CRn	CRm	op2
-----	-----	-----	-----	-----

0b11	0b100	0b0001	0b0001	0b100
------	-------	--------	--------	-------

```

if PSTATE.EL == EL0 then
    UNDEFINED;

The HFGWTR\_EL2 characteristics are:

## Purpose

Provides controls for traps of MSR and MCR writes of System registers.

## Configuration

This register is present only when FEAT\_FGT is implemented. Otherwise, direct accesses to HFGWTR\_EL2 are UNDEFINED.

## Attributes

HFGWTR\_EL2 is a 64-bit register.

## Field descriptions

The HFGWTR\_EL2 bit assignments are:

63		62		61		60		59		58 57		56		55		54		53		52		51	
RES0

**Bits [63:50]**

**Bits [63:51]**

Reserved, RES0.

**nACCDATA\_EL1**~~ERXADDR\_EL1~~, bit [5049]

When **FEAT\_LS64**~~FEAT\_RAS~~ is implemented:

Trap MSR writes of ACCDATA\_EL1, ERXADDR\_EL1 at EL1 using AArch64 to EL2.

nACCDATA_EL1	ERXADDR_EL1	Meaning
0b0		If EL2 is implemented and enabled in the current Security state then MSR writes of ACCDATA_EL1ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, are unless not the affected write by generates this a higher priority exception. bit.
0b1		MSR writes of ACCDATA_EL1 are not affected by this bit. If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, MSR writes of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

This bit is ignored by the PE and treated as zero when EL3 is implemented and SCR\_EL3.FGTEn == 0b0.

In a system where the PE resets into EL2, this field resets to 0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### ERXADDR\_EL1ERXPFPGCDN\_EL1, bit [4948]

When FEAT\_RASFEAT\_RASv1p1 is implemented:

Trap MSR writes of ERXADDR\_EL1ERXPFPGCDN\_EL1 at EL1 using AArch64 to EL2.

ERXADDR_EL1	ERXPFPGCDN_EL1	Meaning
0b0		MSR writes of ERXADDR_EL1ERXPFPGCDN_EL1 are not affected by this bit.
0b1		If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, 0b1, then MSR writes of ERXADDR_EL1ERXPFPGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### ERXPFPGCDN\_EL1ERXPFPGCTL\_EL1, bit [4847]

When FEAT\_RASv1p1 is implemented:

Trap MSR writes of ERXPFPGCDN\_EL1ERXPFPGCTL\_EL1 at EL1 using AArch64 to EL2.

ERXPFPGCDN_EL1	ERXPFPGCTL_EL1	Meaning
0b0		MSR writes of ERXPFPGCDN_EL1 are not affected by this bit.
0b1		If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 1, 0b1, then MSR writes of ERXPFPGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXPFPGCTL\_EL1, bit [47]**

**When FEAT\_RASv1p1 is implemented:**

Trap MSR writes of ERXPFPGCTL\_EL1 at EL1 using AArch64 to EL2.

ERXPFPGCTL_EL1	Meaning
0b0	MSR writes of ERXPFPGCTL_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or SCR_EL3.FGTEn == 0b1, then MSR writes of ERXPFPGCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [46]**

Reserved, RES0.

**ERXMISCN\_EL1, bit [45]**

**When FEAT\_RAS is implemented:**

Trap MSR writes of ERXMISC<n>\_EL1 at EL1 using AArch64 to EL2.

ERXMISCn_EL1	Meaning
0b0	MSR writes of ERXMISC<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn == 1</a> , 0b1, then MSR writes of ERXMISC<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXSTATUS\_EL1, bit [44]**

**When FEAT\_RAS is implemented:**

Trap MSR writes of [ERXSTATUS\\_EL1](#) at EL1 using AArch64 to EL2.

ERXSTATUS_EL1	Meaning
0b0	MSR writes of <a href="#">ERXSTATUS_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn == 1</a> , 0b1, then MSR writes of <a href="#">ERXSTATUS_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXCTLR\_EL1, bit [43]**

**When FEAT\_RAS is implemented:**

Trap MSR writes of [ERXCTLR\\_EL1](#) at EL1 using AArch64 to EL2.

ERXCTLR_EL1	Meaning
0b0	MSR writes of <a href="#">ERXCTLR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn == 1</a> , 0b1, then MSR writes of <a href="#">ERXCTLR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [42]**

Reserved, RES0.

**ERRSELR\_EL1, bit [41]**

When FEAT\_RAS is implemented:

Trap MSR writes of [ERRSELR\\_EL1](#) at EL1 using AArch64 to EL2.

ERRSELR_EL1	Meaning
0b0	MSR writes of <a href="#">ERRSELR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1</a> , <a href="#">0b1</a> , then MSR writes of <a href="#">ERRSELR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**Bit [40]**

Reserved, RES0.

**ICC\_IGRPENn\_EL1, bit [39]**

When FEAT\_GICv3 is implemented:

Trap MSR writes of ICC\_IGRPEN<n>\_EL1 at EL1 using AArch64 to EL2.

ICC_IGRPENn_EL1	Meaning
0b0	MSR writes of ICC_IGRPEN<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1</a> , <a href="#">0b1</a> , then MSR writes of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**VBAR\_EL1, bit [38]**

Trap MSR writes of [VBAR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>VBAR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">VBAR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1, 0b1</b> , then MSR writes of <a href="#">VBAR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### TTBR1\_EL1, bit [37]

Trap MSR writes of [TTBR1\\_EL1](#) at EL1 using AArch64 to EL2.

<b>TTBR1_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">TTBR1_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1, 0b1</b> , then MSR writes of <a href="#">TTBR1_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### TTBR0\_EL1, bit [36]

Trap MSR writes of [TTBR0\\_EL1](#) at EL1 using AArch64 to EL2.

<b>TTBR0_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">TTBR0_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1, 0b1</b> , then MSR writes of <a href="#">TTBR0_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### TPIDR\_ELO, bit [35]

Trap MSR writes of [TPIDR\\_ELO](#) at EL1 and EL0 using AArch64 and MCR writes of [TPIDRURW](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

<b>TPIDR_ELO</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">TPIDR_ELO</a> at EL1 and EL0 using AArch64 and MCR writes of <a href="#">TPIDRURW</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2.{E2H,TGE}</a> != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1</b> , then, unless the write generates a higher priority exception: <b>0b1</b> , then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> <li>MSR writes of <a href="#">TPIDR_ELO</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR writes of <a href="#">TPIDRURW</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TPIDRRO\_EL0, bit [34]**

Trap MSR writes of [TPIDRRO\\_EL0](#) at EL1 using AArch64 to EL2.

TPIDRRO_EL0	Meaning
0b0	MSR writes of <a href="#">TPIDRRO_EL0</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MSR writes of <a href="#">TPIDRRO_EL0</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TPIDR\_EL1, bit [33]**

Trap MSR writes of [TPIDR\\_EL1](#) at EL1 using AArch64 to EL2.

TPIDR_EL1	Meaning
0b0	MSR writes of <a href="#">TPIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MSR writes of <a href="#">TPIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TCR\_EL1, bit [32]**

Trap MSR writes of [TCR\\_EL1](#) at EL1 using AArch64 to EL2.

TCR_EL1	Meaning
0b0	MSR writes of <a href="#">TCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MSR writes of <a href="#">TCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**SCXTNUM\_EL0, bit [31]**

When FEAT\_CSV2 is implemented:

Trap MSR writes of [SCXTNUM\\_EL0](#) at EL1 and EL0 using AArch64 to EL2.

SCXTNUM_EL0	Meaning
0b0	MSR writes of <a href="#">SCXTNUM_EL0</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2.{E2H,TGE}</a> != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <a href="#">1, 0b1</a> , then MSR writes of <a href="#">SCXTNUM_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**SCXTNUM\_EL1, bit [30]****When FEAT\_CSV2 is implemented:**

Trap MSR writes of [SCXTNUM\\_EL1](#) at EL1 using AArch64 to EL2.

SCXTNUM_EL1	Meaning
0b0	MSR writes of <a href="#">SCXTNUM_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">SCXTNUM_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**SCTLR\_EL1, bit [29]**

Trap MSR writes of [SCTLR\\_EL1](#) at EL1 using AArch64 to EL2.

SCTLR_EL1	Meaning
0b0	MSR writes of <a href="#">SCTLR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">SCTLR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Bit [28]**

Reserved, RES0.

**PAR\_EL1, bit [27]**

Trap MSR writes of [PAR\\_EL1](#) at EL1 using AArch64 to EL2.

PAR_EL1	Meaning
0b0	MSR writes of <a href="#">PAR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">PAR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Bits [26:25]**

Reserved, RES0.

**MAIR\_EL1, bit [24]**

Trap MSR writes of [MAIR\\_EL1](#) at EL1 using AArch64 to EL2.

MAIR_EL1	Meaning
0b0	MSR writes of <a href="#">MAIR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">MAIR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**LORSA\_EL1, bit [23]**

When FEAT\_LOR is implemented:

Trap MSR writes of [LORSA\\_EL1](#) at EL1 using AArch64 to EL2.

LORSA_EL1	Meaning
0b0	MSR writes of <a href="#">LORSA_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">LORSA_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**LORN\_EL1, bit [22]**

When FEAT\_LOR is implemented:

Trap MSR writes of [LORN\\_EL1](#) at EL1 using AArch64 to EL2.

LORN_EL1	Meaning
0b0	MSR writes of <a href="#">LORN_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">LORN_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**Bit [21]**

Reserved, RES0.

**LOREA\_EL1, bit [20]**

When FEAT\_LOR is implemented:

Trap MSR writes of [LOREA\\_EL1](#) at EL1 using AArch64 to EL2.

LOREA_EL1	Meaning
0b0	MSR writes of <a href="#">LOREA_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">LOREA_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**LORC\_EL1, bit [19]**

When FEAT\_LOR is implemented:

Trap MSR writes of [LORC\\_EL1](#) at EL1 using AArch64 to EL2.

LORC_EL1	Meaning
0b0	MSR writes of <a href="#">LORC_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">LORC_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**Bit [18]**

Reserved, RES0.

**FAR\_EL1, bit [17]**

Trap MSR writes of [FAR\\_EL1](#) at EL1 using AArch64 to EL2.

FAR_EL1	Meaning
0b0	MSR writes of <a href="#">FAR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">FAR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### ESR\_EL1, bit [16]

Trap MSR writes of [ESR\\_EL1](#) at EL1 using AArch64 to EL2.

ESR_EL1	Meaning
0b0	MSR writes of <a href="#">ESR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">ESR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### Bits [15:14]

Reserved, RES0.

### CSSELR\_EL1, bit [13]

Trap MSR writes of [CSSELR\\_EL1](#) at EL1 using AArch64 to EL2.

CSSELR_EL1	Meaning
0b0	MSR writes of <a href="#">CSSELR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">CSSELR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### CPACR\_EL1, bit [12]

Trap MSR writes of [CPACR\\_EL1](#) at EL1 using AArch64 to EL2.

CPACR_EL1	Meaning
0b0	MSR writes of <a href="#">CPACR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">CPACR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### CONTEXTIDR\_EL1, bit [11]

Trap MSR writes of [CONTEXTIDR\\_EL1](#) at EL1 using AArch64 to EL2.

CONTEXTIDR_EL1	Meaning
0b0	MSR writes of <a href="#">CONTEXTIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes of <a href="#">CONTEXTIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

## Bits [10:9]

Reserved, RES0.

## APIBKey, bit [8]

When FEAT\_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIBKeyHi\\_EL1](#).
- [APIBKeyLo\\_EL1](#).

APIBKey	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

## APIAKey, bit [7]

When FEAT\_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIAKeyHi\\_EL1](#).
- [APIAKeyLo\\_EL1](#).

APIAKey	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

## APGAKey, bit [6]

When FEAT\_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APGAKeyHi\\_EL1](#).
- [APGAKeyLo\\_EL1](#).

APGAKey	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

### APDBKey, bit [5]

#### When FEAT\_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDBKeyHi\\_EL1](#).
- [APDBKeyLo\\_EL1](#).

APDBKey	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

### APDAKey, bit [4]

#### When FEAT\_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDAKeyHi\\_EL1](#).
- [APDAKeyLo\\_EL1](#).

APDAKey	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 1, 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**AMAIR\_EL1, bit [3]**

Trap MSR writes of [AMAIR\\_EL1](#) at EL1 using AArch64 to EL2.

AMAIR_EL1	Meaning
0b0	MSR writes of <a href="#">AMAIR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1, 0b1, then</b> MSR writes of <a href="#">AMAIR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.

**Bit [2]**

Reserved, RES0.

**AFSR1\_EL1, bit [1]**

Trap MSR writes of [AFSR1\\_EL1](#) at EL1 using AArch64 to EL2.

AFSR1_EL1	Meaning
0b0	MSR writes of <a href="#">AFSR1_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1, 0b1, then</b> MSR writes of <a href="#">AFSR1_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.

**AFSR0\_EL1, bit [0]**

Trap MSR writes of [AFSR0\\_EL1](#) at EL1 using AArch64 to EL2.

AFSR0_EL1	Meaning
0b0	MSR writes of <a href="#">AFSR0_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == <b>1, 0b1, then</b> MSR writes of <a href="#">AFSR0_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in **In** a system where the PE resets into EL2, this field resets to 0.

**Accessing the HFGWTR\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, HFGWTR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b101

# HPFAR\_EL2, Hypervisor IPA Fault Address Register

The HPFAR\_EL2 characteristics are:

## Purpose

Holds the faulting IPA for some aborts on a stage 2 translation taken to EL2.

## Configuration

AArch64 System register HPFAR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HPFAR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

The HPFAR\_EL2 is written for:

- Translation or Access faults in the second stage of translation.
- An abort in the second stage of translation performed during the translation table walk of a first stage translation, caused by a Translation fault, an Access flag fault, or a Permission fault.
- A stage 2 Address size fault.

For all other exceptions taken to EL2, this register is UNKNOWN.

### Note

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

## Attributes

HPFAR\_EL2 is a 64-bit register.

## Field descriptions

The HPFAR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NS	RES0										FIPA										RES0										
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NS	RES0										FIPA[51:48]										FIPA[47:12]										
FIPA[47:12]										RES0										RES0											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Execution at EL1 or EL0 makes HPFAR\_EL2 become UNKNOWN.

NS, bit [63]

**When FEAT\_SEL2 is implemented:**

Faulting IPA address space.

NS	Meaning
0b0	Faulting IPA is from the Secure IPA space.
0b1	Faulting IPA is from the Non-secure IPA space.

For **Data** ~~data~~ **Aborts** or **Instruction** ~~instruction~~ **Aborts** ~~aborts~~ taken to Non-secure EL2, this field is RES0.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [62:44]**

Reserved, RES0.

**FIPA, [51:48], bits [43:440]****When FEAT\_LPA is implemented:**

Extension to FIPA[47:12]. See FIPA[47:12] for more details.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FIPA[47:12], bits [39:4]**

Bits [47:12] of the faulting intermediate physical address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

When FEAT\_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use for the stage 1 translation, the FIPA[51:48] bits form the upper part of the address value. For implementations or stage 1 translation granules with fewer than 52 physical address bits the FIPA[51:48] bits are RES0.

The HPFAR\_EL2 is written for:

- Translation or Access faults in the second stage of translation.
- An abort in the second stage of translation performed during the translation table walk of a first stage translation, caused by a Translation fault, an Access flag fault, or a Permission fault.
- A stage 2 Address size fault.

**Note**

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

For all other exceptions taken to EL2, this register is UNKNOWN.

This field resets to an architecturally UNKNOWN value.

**FIPA encoding when FEAT\_LPA is implemented****FIPA, bits [38:0]**

Faulting Intermediate Physical Address.

When 52-bit addresses and a 64KB translation granule are in use for the stage 1 translation, HPFAR\_EL2.FIPA[38:35] forms the upper part of the address value.

For implementations or stage 1 translation granules with fewer than 52 physical address bits the HPFAR\_EL2.FIPA[38:35] is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FIPA encoding when FEAT\_LPA is not implemented****Bits [38:35]**

Reserved, RES0.

**FIPA, bits [34:0]**

Faulting Intermediate Physical Address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [3:0]**

Reserved, RES0.

**Accessing the HPFAR\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, HPFAR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0110	0b0000	0b100

```

if PSTATE.EL == EL0 then

The HSTR\_EL2 characteristics are:

## Purpose

Controls trapping to EL2 of EL1 or lower AArch32 accesses to the System register in the coproc == 0b1111 encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCR or MRRC instruction, this is the CRm value used to access the register.

## Configuration

AArch64 System register HSTR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HSTR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

HSTR\_EL2 is a 64-bit register.

## Field descriptions

The HSTR EL2 bit assignments are:

### When AArch32 is supported at any Exception level:

[illegible]

**Bits [63:16]**

**Bits [63:16, 14, 4]**

Reserved, RES0.

~~Fields T14 and T4 are RES0.~~

**T<n>, bit [n], for n = 15, 13 to 5, 3 to 0**

The remaining fields control whether EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 0b1111 encoding space, are trapped to EL2 as follows:

- MCR or MRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x03, unless the access is UNDEFINED.
- MCRR or MRRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x04, unless the access is UNDEFINED.

T<n>	Meaning
0b0	This control has no effect on EL0 or EL1 accesses to System registers.
0b1	<p>System registers in the coproc == 0b1111 encoding space and CRn == &lt;n&gt; or CRm == &lt;n&gt; where T&lt;n&gt; is the name of this field, are trapped as follows:</p> <ul style="list-style-type: none"> <li>• An EL1 MCR or MRC access is trapped to EL2.</li> <li>• An EL0 MCR or MRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0.</li> <li>• An EL1 MCRR or MRRC access is trapped to EL2.</li> <li>• An EL0 MCRR or MRRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0.</li> </ul> <p>It is IMPLEMENTATION DEFINED whether an EL0 access using AArch32 is trapped to EL2, or is UNDEFINED.</p> <p>If the access is UNDEFINED, and generates an exception that is taken to EL1 or EL2 using AArch64, this is reported with EC syndrome value 0x00.</p>
<p><b>Note</b></p> <p>Arm expects that trapping to EL2 of EL0 accesses to these registers is unusual and used only when the hypervisor must virtualize EL0 operation. Arm recommends that, whenever possible, EL0 accesses to these registers behave as they would if the implementation did not include EL2. This means that, if the architecture does not support the EL0 access, then the register access instruction is treated as UNDEFINED and generates an exception that is taken to EL1.</p>	

For example, when HSTR\_EL2.T7 is 1, for instructions executed at EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to EL2.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to EL2.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

# ICC\_AP0R<n>\_EL1, Interrupt Controller Active Priorities Group 0 Registers, n = 0 - 3

The ICC\_AP0R<n>\_EL1 characteristics are:

## Purpose

Provides information about Group 0 active priorities.

## Configuration

AArch64 System register ICC\_AP0R<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICC\\_AP0R<n>\[31:0\]](#).

## Attributes

ICC\_AP0R<n>\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_AP0R<n>\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

## Accessing the ICC\_AP0R<n>\_EL1

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC\_AP0R1\_EL1 is only implemented in implementations that support 6 or more bits of priority. ICC\_AP0R2\_EL1 and ICC\_AP0R3\_EL1 are only implemented in implementations that support 7 or more bits of priority. Unimplemented registers are UNDEFINED.

---

### Note

---

The number of bits of preemption is indicated by [ICH\\_VTR\\_EL2.PREbits](#).

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICC\_AP0R<n>\_EL1.
- Secure [ICC\\_APIR<n>\\_EL1](#).
- Non-secure [ICC\\_APIR<n>\\_EL1](#).

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_AP0R<n>\_EL1

# ICC\_BPR0\_EL1, Interrupt Controller Binary Point Register 0

The ICC\_BPR0\_EL1 characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

## Configuration

AArch64 System register ICC\_BPR0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICC\\_BPR0\[31:0\]](#).

Virtual accesses to this register update [ICH\\_VMCR\\_EL2.VBPR0](#).

## Attributes

ICC\_BPR0\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_BPR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BinaryPoint																															

### Bits [63:3]

Reserved, RES0.

### BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	ggggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.ssssssss

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the ICC\_BPR0\_EL1

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by [ICC\\_CTLR\\_EL1.PRIBits](#) and [ICC\\_CTLR\\_EL3.PRIBits](#).

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_BPR0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b011

```

if PSTATE.EL == EL0 then

# ICC\_BPR1\_EL1, Interrupt Controller Binary Point Register 1

The ICC\_BPR1\_EL1 characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

## Configuration

AArch64 System register ICC\_BPR1\_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register [ICC\\_BPR1\[31:0\] \(S\)](#).

AArch64 System register ICC\_BPR1\_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register [ICC\\_BPR1\[31:0\] \(NS\)](#).

Virtual accesses to this register update [ICH\\_VMCR\\_EL2.VBPR1](#).

## Attributes

ICC\_BPR1\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_BPR1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:3]

Reserved, RES0.

### BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The minimum value of the Non-secure copy of this register is the minimum value of [ICC\\_BPR0\\_EL1](#) + 1. The minimum value of the Secure copy of this register is the minimum value of [ICC\\_BPR0\\_EL1](#).

If EL3 is implemented and [ICC\\_CTLR\\_EL3.CBPR\\_EL1S](#) is 1:

- When [SCR\\_EL3.EEL2](#) is 1 and [HCR\\_EL2.IMO](#) is 1, Secure accesses to this register at EL1 access the state of [ICV\\_BPR1\\_EL1](#).
- Otherwise, Secure accesses to this register at EL1 access the state of [ICC\\_BPR0\\_EL1](#).

If EL3 is implemented and [ICC\\_CTLR\\_EL3.CBPR\\_EL1NS](#) is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of [HCR\\_EL2.IMO](#) and [SCR\\_EL3.IRQ](#):

HCR_EL2.IMO	SCR_EL3.IRQ	Behavior
0b0	0b0	Non-secure EL1 and EL2 reads return <a href="#">ICC_BPR0_EL1</a> + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b0	0b1	Non-secure EL1 and EL2 accesses trap to EL3.
0b1	0b0	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return <a href="#">ICC_BPR0_EL1</a> + 1 saturated to 0b111. Non-secure EL2 writes are ignored.
0b1	0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 accesses trap to EL3.

If EL3 is not implemented and [ICC\\_CTLR\\_EL1](#).CBPR is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR\_EL2.IMO:

HCR_EL2.IMO	Behavior
0b0	Non-secure EL1 and EL2 reads return <a href="#">ICC_BPR0_EL1</a> + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return <a href="#">ICC_BPR0_EL1</a> + 1 saturated to 0b111. Non-secure EL2 writes are ignored.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ICC\_BPR1\_EL1

On a reset, the binary point field is UNKNOWN.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_BPR1\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b011

# ICC\_CTLR\_EL1, Interrupt Controller Control Register (EL1)

The ICC\_CTLR\_EL1 characteristics are:

## Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

## Configuration

AArch64 System register ICC\_CTLR\_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register [ICC\\_CTLR\[31:0\] \(S\)](#).

AArch64 System register ICC\_CTLR\_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register [ICC\\_CTLR\[31:0\] \(NS\)](#).

## Attributes

ICC\_CTLR\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_CTLR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0												ExtRange		RSS	RES0	A3V	SEIS	IDbits	PRIbits	RES0	PMHE	RES0		EOImode		CBPR					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:20]

Reserved, RES0.

### ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. <ul style="list-style-type: none"> <li>Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</li> </ul>
<b>Note</b> Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.	
0b1	CPU interface supports INTIDs in the range 1024..8191 <ul style="list-style-type: none"> <li>All INTIDs in the range 1024..8191 are treated as requiring deactivation.</li> </ul>

If EL3 is implemented, ICC\_CTLR\_EL1.ExtRange is an alias of [ICC\\_CTLR\\_EL3.ExtRange](#).

**RSS, bit [18]**

Range Selector Support. Possible values are:

<b>RSS</b>	<b>Meaning</b>
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

**Bits [17:16]**

Reserved, RES0.

**A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<b>A3V</b>	<b>Meaning</b>
0b0	The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

If EL3 is implemented, this bit is an alias of [ICC\\_CTLR\\_EL3.A3V](#).

**SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

<b>SEIS</b>	<b>Meaning</b>
0b0	The CPU interface logic does not support local generation of SEIs.
0b1	The CPU interface logic supports local generation of SEIs.

If EL3 is implemented, this bit is an alias of [ICC\\_CTLR\\_EL3.SEIS](#).

**IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

<b>IDbits</b>	<b>Meaning</b>
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is implemented, this field is an alias of [ICC\\_CTLR\\_EL3.IDbits](#).

**PRibits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

**Note**

This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of [GICD\\_CTLR.DS](#).

For physical accesses, this field determines the minimum value of [ICC\\_BPR0\\_EL1](#).

If EL3 is implemented, physical accesses return the value from [ICC\\_CTLR\\_EL3](#).PRIbits.

If EL3 is not implemented, physical accesses return the value from this field.

#### Bit [7]

Reserved, RES0.

#### PMHE, bit [6]

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

PMHE	Meaning
0b0	Disables use of <a href="#">ICC_PMR_EL1</a> as a hint for interrupt distribution.
0b1	Enables use of <a href="#">ICC_PMR_EL1</a> as a hint for interrupt distribution.

If EL3 is implemented, this bit is an alias of [ICC\\_CTLR\\_EL3](#).PMHE. Whether this bit can be written as part of an access to this register depends on the value of [GICD\\_CTLR](#).DS:

- If [GICD\\_CTLR](#).DS == 0, this bit is read-only.
- If [GICD\\_CTLR](#).DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

#### Bits [5:2]

Reserved, RES0.

#### EOImode, bit [1]

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

EOImode	Meaning
0b0	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICC_DIR_EL1</a> are UNPREDICTABLE.
0b1	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide priority drop functionality only. <a href="#">ICC_DIR_EL1</a> provides interrupt deactivation functionality.

The Secure [ICC\\_CTLR\\_EL1](#).EOImode is an alias of [ICC\\_CTLR\\_EL3](#).EOImode\_EL1S.

The Non-secure [ICC\\_CTLR\\_EL1](#).EOImode is an alias of [ICC\\_CTLR\\_EL3](#).EOImode\_EL1NS

#### CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	<a href="#">ICC_BPR0_EL1</a> determines the preemption group for Group 0 interrupts only. <a href="#">ICC_BPR1_EL1</a> determines the preemption group for Group 1 interrupts.
0b1	<a href="#">ICC_BPR0_EL1</a> determines the preemption group for both Group 0 and Group 1 interrupts.

If EL3 is implemented:

- This bit is an alias of [ICC\\_CTLR\\_EL3](#).CBPR\_EL1{S,NS} where S or NS corresponds to the current Security state.
- If [GICD\\_CTLR](#).DS == 0, this bit is read-only.
- If [GICD\\_CTLR](#).DS == 1, this bit is read/write.

If EL3 is not implemented, this bit is read/write.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

## Accessing the ICC\_CTLR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_CTLR\_EL1

# ICC\_CTLR\_EL3, Interrupt Controller Control Register (EL3)

The ICC\_CTLR\_EL3 characteristics are:

## Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

## Configuration

AArch64 System register ICC\_CTLR\_EL3 bits [31:0] can be mapped to AArch32 System register [ICC\\_MCTLR\[31:0\]](#), but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to ICC\_CTLR\_EL3 are UNDEFINED.

## Attributes

ICC\_CTLR\_EL3 is a 64-bit register.

## Field descriptions

The ICC\_CTLR\_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35							
RES0																																			
RES0												ExtRange	RSS	nDS	RES0	A3V	SEIS	IDbits	PRIBits	RES0	PMHE	RM	EOImode_EL1	NS	EOImode_EL2										
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3							

### Bits [63:20]

Reserved, RES0.

### ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. <ul style="list-style-type: none"><li>Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</li></ul>
<b>Note</b> Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.	
0b1	CPU interface supports INTIDs in the range 1024..8191 <ul style="list-style-type: none"><li>All INTIDs in the range 1024..8191 are treated as requiring deactivation.</li></ul>

**RSS, bit [18]**

Range Selector Support.

<b>RSS</b>	<b>Meaning</b>
0b0	Targeted SGIs with affinity level 0 values of 0-15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0-255 are supported.

This bit is read-only.

**nDS, bit [17]**

Disable Security not supported. Read-only and writes are ignored.

<b>nDS</b>	<b>Meaning</b>
0b0	The CPU interface logic supports disabling of security.
0b1	The CPU interface logic does not support disabling of security, and requires that security is not disabled.

**Bit [16]**

Reserved, RES0.

**A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored.

<b>A3V</b>	<b>Meaning</b>
0b0	The CPU interface logic does not support non-zero values of the Aff3 field in SGI generation System registers.
0b1	The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers.

If EL3 is present, [ICC\\_CTLR\\_EL1](#).A3V is an alias of ICC\_CTLR\_EL3.A3V

**SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs:

<b>SEIS</b>	<b>Meaning</b>
0b0	The CPU interface logic does not support generation of SEIs.
0b1	The CPU interface logic supports generation of SEIs.

If EL3 is present, [ICC\\_CTLR\\_EL1](#).SEIS is an alias of ICC\_CTLR\_EL3.SEIS

**IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. Indicates the number of physical interrupt identifier bits supported.

<b>IDbits</b>	<b>Meaning</b>
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is present, [ICC\\_CTLR\\_EL1](#).IDbits is an alias of ICC\_CTLR\_EL3.IDbits

**PRibits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

---

**Note**

This field always returns the number of priority bits implemented, regardless of the value of SCR\_EL3.NS or the value of [GICD\\_CTLR.DS](#).

---

The division between group priority and subpriority is defined in the binary point registers [ICC\\_BPR0\\_EL1](#) and [ICC\\_BPR1\\_EL1](#).

This field determines the minimum value of ICC\_BPR0\_EL1.

**Bit [7]**

Reserved, RES0.

**PMHE, bit [6]**

Priority Mask Hint Enable.

PMHE	Meaning
0b0	Disables use of the priority mask register as a hint for interrupt distribution.
0b1	Enables use of the priority mask register as a hint for interrupt distribution.

Software must write [ICC\\_PMR\\_EL1](#) to 0xFF before clearing this field to 0.

- An implementation might choose to make this field RAO/WI if priority-based routing is always used
- An implementation might choose to make this field RAZ/WI if priority-based routing is never used

If EL3 is present, [ICC\\_CTLR\\_EL1](#).PMHE is an alias of ICC\_CTLR\_EL3.PMHE.

On a Warm reset, this field resets to 0.

**RM, bit [5]**

Routing Modifier. For legacy operation of EL1 software with [GICC\\_CTLR](#).FIQEn set to 1, this bit indicates whether interrupts can be acknowledged or observed as the Highest Priority Pending Interrupt, or whether a special INTID value is returned.

Possible values of this bit are:

RM	Meaning
0b0	Secure Group 0 and Non-secure Group 1 interrupts can be acknowledged and observed as the highest priority interrupt at the Secure Exception level where the interrupt is taken.
0b1	When accessed at EL3 in AArch64 state: <ul style="list-style-type: none"> <li>• Secure Group 0 interrupts return a special INTID value of 1020. This affects accesses to <a href="#">ICC_IAR0_EL1</a> and <a href="#">ICC_HPIR0_EL1</a>.</li> <li>• Non-secure Group 1 interrupts return a special INTID value of 1021. This affects accesses to <a href="#">ICC_IAR1_EL1</a> and <a href="#">ICC_HPIR1_EL1</a>.</li> </ul>

---

**Note**

The Routing Modifier bit is supported in AArch64 only. In systems without EL3 the behavior is as if the value is 0. Software must ensure this bit is 0 when the Secure copy of [ICC\\_SRE\\_EL1](#).SRE is 1, otherwise system behavior is UNPREDICTABLE. In systems without EL3 or where the Secure copy of [ICC\\_SRE\\_EL1](#).SRE is RAO/WI, this bit is RES0.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EOImode\_EL1NS, bit [4]**

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1NS	Meaning
0b0	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICC_DIR_EL1</a> are UNPREDICTABLE.
0b1	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide priority drop functionality only. <a href="#">ICC_DIR_EL1</a> provides interrupt deactivation functionality.

If EL3 is present, [ICC\\_CTLR\\_EL1\(NS\)](#).EOImode is an alias of ICC\_CTLR\_EL3.EOImode\_EL1NS.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EOImode\_EL1S, bit [3]**

EOI mode for interrupts handled at Secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1S	Meaning
0b0	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICC_DIR_EL1</a> are UNPREDICTABLE.
0b1	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide priority drop functionality only. <a href="#">ICC_DIR_EL1</a> provides interrupt deactivation functionality.

If EL3 is present, [ICC\\_CTLR\\_EL1\(S\)](#).EOImode is an alias of ICC\_CTLR\_EL3.EOImode\_EL1S.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EOImode\_EL3, bit [2]**

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL3	Meaning
0b0	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICC_DIR_EL1</a> are UNPREDICTABLE.
0b1	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide priority drop functionality only. <a href="#">ICC_DIR_EL1</a> provides interrupt deactivation functionality.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CBPR\_EL1NS, bit [1]**

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.

CBPR_EL1NS	Meaning
0b0	<a href="#">ICC_BPR0_EL1</a> determines the preemption group for Group 0 interrupts only. <a href="#">ICC_BPR1_EL1</a> determines the preemption group for Non-secure Group 1 interrupts.
0b1	<a href="#">ICC_BPR0_EL1</a> determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to <a href="#">GICC_BPR</a> and <a href="#">ICC_BPR1_EL1</a> access the state of <a href="#">ICC_BPR0_EL1</a> .

If EL3 is present, [ICC\\_CTLR\\_EL1\(NS\)](#).CBPR is an alias of ICC\_CTLR\_EL3.CBPR\_EL1NS.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### CBPR\_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts at EL1 and EL2.

CBPR_EL1S	Meaning
0b0	<a href="#">ICC_BPR0_EL1</a> determines the preemption group for Group 0 interrupts only. <a href="#">ICC_BPR1_EL1</a> determines the preemption group for Secure Group 1 interrupts.
0b1	<a href="#">ICC_BPR0_EL1</a> determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 accesses to <a href="#">ICC_BPR1_EL1</a> access the state of <a href="#">ICC_BPR0_EL1</a> .

If EL3 is present, [ICC\\_CTLR\\_EL1](#)(S).CBPR is an alias of ICC\_CTLR\_EL3.CBPR\_EL1S.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Accessing the ICC\_CTLR\_EL3

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_CTLR\_EL3

op0	op1	CRn	CRm	op2

# ICC\_IGRPEN0\_EL1, Interrupt Controller Interrupt Group 0 Enable register

The ICC\_IGRPEN0\_EL1 characteristics are:

## Purpose

Controls whether Group 0 interrupts are enabled or not.

## Configuration

AArch64 System register ICC\_IGRPEN0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICC\\_IGRPEN0\[31:0\]](#).

## Attributes

ICC\_IGRPEN0\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_IGRPEN0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															Enable
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:1]

Reserved, RES0.

### Enable, bit [0]

Enables Group 0 interrupts.

Enable	Meaning
0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

Virtual accesses to this register update [ICH\\_VMCR\\_EL2.VENG0](#).

If the highest priority pending interrupt for that PE is a Group 0 interrupt using 1 of N model, then the interrupt will be targeted to another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

# ICC\_IGRPEN1\_EL1, Interrupt Controller Interrupt Group 1 Enable register

The ICC\_IGRPEN1\_EL1 characteristics are:

## Purpose

Controls whether Group 1 interrupts are enabled for the current Security state.

## Configuration

AArch64 System register ICC\_IGRPEN1\_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register [ICC\\_IGRPEN1\[31:0\] \(S\)](#).

AArch64 System register ICC\_IGRPEN1\_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register [ICC\\_IGRPEN1\[31:0\] \(NS\)](#).

## Attributes

ICC\_IGRPEN1\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_IGRPEN1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															Enable
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:1]

Reserved, RES0.

### Enable, bit [0]

Enables Group 1 interrupts for the current Security state.

Enable	Meaning
0b0	Group 1 interrupts are disabled for the current Security state.
0b1	Group 1 interrupts are enabled for the current Security state.

Virtual accesses to this register update [ICH\\_VMCR\\_EL2.VENG1](#).

If EL3 is present:

- The Secure [ICC\\_IGRPEN1\\_EL1.Enable](#) bit is a read/write alias of the [ICC\\_IGRPEN1\\_EL3.EnableGrp1S](#) bit.
- The Non-secure [ICC\\_IGRPEN1\\_EL1.Enable](#) bit is a read/write alias of the [ICC\\_IGRPEN1\\_EL3.EnableGrp1NS](#) bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

The ICC\_PMR\_EL1 characteristics are:

## Purpose

Provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Writes to this register must be high performance and must ensure that no interrupt of lower priority than the written value occurs after the write, without requiring an ISB or an exception boundary.

## Configuration

AArch64 System register ICC\_PMR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICC\\_PMR\[31:0\]](#).

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see ‘Observability of the effects of accesses to the GIC registers’ in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Attributes

ICC\_PMR\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_PMR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																RES0																
RES0																Priority																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

**Bits [63:8]**

Reserved, RES0.

### Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	0x00-0xFF (0-255), all values	256
[7:1]	0x00-0xFE (0-254), even values only	128
[7:2]	0x00-0xFC (0-252), in steps of 4	64
[7:3]	0x00-0xF8 (0-248), in steps of 8	32
[7:4]	0x00-0xF0 (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

On a Warm reset, this field resets to 0.

## Accessing the ICC\_PMR\_EL1

**DFB, bit [1]**

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and [GICD\\_CTLR.DS](#) == 0, this field is a read-only alias of [ICC\\_SRE\\_EL3.DFB](#).

If EL3 is implemented and [GICD\\_CTLR.DS](#) == 1, and EL2 is not implemented, this field is a read-write alias of [ICC\\_SRE\\_EL3.DFB](#).

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of [ICC\\_SRE\\_EL2.DFB](#).

If [GICD\\_CTLR.DS](#) == 1 and EL2 is implemented, this field is a read-only alias of [ICC\\_SRE\\_EL2.DFB](#).

In systems that do not support FIQ bypass, this field is RAO/WI.

On a Warm reset, this field resets to 0.

**SRE, bit [0]**

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL1 to any ICC_* System register other than ICC_SRE_EL1 is trapped to EL1.
0b1	The System register interface for the current Security state is enabled.

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and [ICC\\_SRE\\_EL3.SRE](#) == 0 the Secure copy of this bit is RAZ/WI. If [ICC\\_SRE\\_EL3.SRE](#) is changed from zero to one, the Secure copy of this bit becomes UNKNOWN.

If EL2 is implemented and [ICC\\_SRE\\_EL2.SRE](#) == 0 the Non-secure copy of this bit is RAZ/WI. If [ICC\\_SRE\\_EL2.SRE](#) is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

If EL3 is implemented and [ICC\\_SRE\\_EL3.SRE](#) == 0 the Non-secure copy of this bit is RAZ/WI. If [ICC\\_SRE\\_EL3.SRE](#) is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI. The following options are supported:

- The Non-secure copy of [ICC\\_SRE\\_EL1.SRE](#) can be RAO/WI if [ICC\\_SRE\\_EL2.SRE](#) is also RAO/WI. This means all Non-secure software, including VMs using only virtual interrupts, must access the GIC using System registers.
- The Secure copy of [ICC\\_SRE\\_EL1.SRE](#) can be RAO/WI if [ICC\\_SRE\\_EL3.SRE](#) and [ICC\\_SRE\\_EL2.SRE](#) are also RAO/WI. This means that all Secure software must access the GIC using System registers and all Non-secure accesses to registers for physical interrupts must use System registers.

**Note**

A VM using only virtual interrupts might still use memory-mapped access if the Non-secure copy of [ICC\\_SRE\\_EL1.SRE](#) is not RAO/WI.

On a Warm reset, this field resets to 0.

**Accessing the ICC\_SRE\_EL1**

Execution with [ICC\\_SRE\\_EL1.SRE](#) set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, ICC\_SRE\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b101

```

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

If EL3 is implemented and [GICD\\_CTLR.DS](#) is 0, this field is a read-only alias of [ICC\\_SRE\\_EL3.DIB](#).

If EL3 is implemented and [GICD\\_CTLR.DS](#) is 1, this field is a read-write alias of [ICC\\_SRE\\_EL3.DIB](#).

In systems that do not support IRQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

## DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and [GICD\\_CTLR.DS](#) is 0, this field is a read-only alias of [ICC\\_SRE\\_EL3.DFB](#).

If EL3 is implemented and [GICD\\_CTLR.DS](#) is 1, this field is a read-write alias of [ICC\\_SRE\\_EL3.DFB](#).

In systems that do not support FIQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

## SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL2 to any ICH_* or ICC_* register other than <a href="#">ICC_SRE_EL1</a> or <a href="#">ICC_SRE_EL2</a> , is trapped to EL2.
0b1	The System register interface to the ICH_* registers and the EL1 and EL2 ICC_* registers is enabled for EL2.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and [ICC\\_SRE\\_EL3.SRE](#)==0 this bit is RAZ/WI. If [ICC\\_SRE\\_EL3.SRE](#) is changed from zero to one, this bit becomes UNKNOWN.

FEAT\_GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI, but this is only allowed if [ICC\\_SRE\\_EL3.SRE](#) is also RAO/WI.

On a Warm reset, this field resets to 0.

## Accessing the ICC\_SRE\_EL2

Execution with [ICC\\_SRE\\_EL2.SRE](#) set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_SRE\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1001	0b101

The ICC\_SRE\_EL3 characteristics are:

## Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

## Configuration

AArch64 System register ICC\_SRE\_EL3 bits [31:0] can be mapped to AArch32 System register [ICC\\_MSRE\[31:0\]](#), but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to ICC\_SRE\_EL3 are UNDEFINED.

## Attributes

ICC\_SRE\_EL3 is a 64-bit register.

## Field descriptions

The ICC SRE EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
																RES0																					
RES0																		Enable																	DIB	DFB	SRE
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

**Bits [63:4]**

Reserved, RES0.

### Enable, bit [3]

Enable. Enables lower Exception level access to [ICC\\_SRE\\_EL1](#) and [ICC\\_SRE\\_EL2](#).

Enable	Meaning
0b0	EL1 accesses to <a href="#">ICC_SRE_EL1</a> trap to EL3, unless these accesses are trapped to EL2 as a result of ICC_SRE_EL2.Enable == 0. EL2 accesses to <a href="#">ICC_SRE_EL1</a> and <a href="#">ICC_SRE_EL2</a> trap to EL3.
0b1	EL1 accesses to <a href="#">ICC_SRE_EL1</a> do not trap to EL3. EL2 accesses to <a href="#">ICC_SRE_EL1</a> and <a href="#">ICC_SRE_EL2</a> do not trap to EL3.

If ICC\_SRE\_EL3.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC\_SRE\_EL3.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DIB, bit [2]**

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

In systems that do not support IRQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**DFB, bit [1]**

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

In systems that do not support FIQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**SRE, bit [0]**

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL3 to any ICH_* or ICC_* register other than <a href="#">ICC_SRE_EL1</a> , <a href="#">ICC_SRE_EL2</a> , or ICC_SRE_EL3 is trapped to EL3
0b1	The System register interface to the ICH_* registers and the EL1, EL2, and EL3 ICC_* registers is enabled for EL3.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

FEAT\_GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI.

On a Warm reset, this field resets to 0.

**Accessing the ICC\_SRE\_EL3**

This register is always System register accessible.

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_SRE\_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b101

## htmldiff from-

**(new)**

The ICH\_AP0R<n>\_EL2 characteristics are:

## Purpose

Provides information about Group 0 virtual active priorities for EL2.

## Configuration

AArch64 System register ICH\_AP0R<n>\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_AP0R<n>\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_AP0R<n>>\_EL2 is a 64-bit register.

## Field descriptions

The ICH AP0R<n> EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:32]**

Reserved, RES0.

**P<x>, bit [x], for x = 310 to 031**

Provides the access to the virtual active priorities for Group 0 interrupts. Possible values of each bit are:

<b>P&lt;x&gt;</b>	<b>Meaning</b>
0b0	There is no Group 0 interrupt active with this priority level, or all active Group 0 interrupts with this priority level have undergone priority-drop.
0b1	There is a Group 0 interrupt active with this priority level which has not undergone priority drop.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH AP0R0\_EL2 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH\_AP0R0\_EL2 in the bits corresponding to 0:Priority[6:2].

- The active state of preemption levels 128 - 252 are held in ICH\_AP0R1\_EL2 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH\_AP0R0\_EL2 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH\_AP0R1\_EL2 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH\_AP0R2\_EL2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH\_AP0R3\_EL2 in the bits corresponding to 11:Priority[5:1].

#### Note

Having the bit corresponding to a priority set to 1 in both ICH\_AP0R<n>\_EL2 and [ICH\\_AP1R<n>\\_EL2](#) might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

On a Warm reset, this ~~This~~ field resets to 0.

Software must ensure that ICH\_AP0R<n>\_EL2 is 0 for legacy VMs otherwise behaviour is UNPREDICTABLE. For more information about support for legacy VMs, see 'Support for legacy operation of VMs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The active priorities for Group 0 and Group 1 interrupts for legacy VMs are held in [ICH\\_AP1R<n>\\_EL2](#) and reads and writes to GICV\_APR access [ICH\\_AP1R<n>\\_EL2](#). This means that ICH\_AP0R<n>\_EL2 is inaccessible to legacy VMs.

## Accessing the ICH\_AP0R<n>\_EL2

ICH\_AP0R1\_EL2 is only implemented in implementations that support 6 or more bits of preemption. ICH\_AP0R2\_EL2 and ICH\_AP0R3\_EL2 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

#### Note

The number of bits of preemption is indicated by [ICH\\_VTR\\_EL2](#).PREbits

Writing to these registers with any value other than the last read value of the register (or 0x00000000 for a newly set up virtual machine) can result in UNPREDICTABLE behavior of the virtual interrupt prioritization system allowing either:

- Virtual interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution at EL1 or EL0.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICH\_AP0R<n>\_EL2.
- [ICH\\_AP1R<n>\\_EL2](#).

Having the bit corresponding to a priority set in both ICH\_AP0R<n>\_EL2 and [ICH\\_AP1R<n>\\_EL2](#) can result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_AP0R<n>\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1000	0b0:n[1:0]

# ICH\_AP1R<n>\_EL2, Interrupt Controller Hyp Active Priorities Group 1 Registers, n = 0 - 3

The ICH\_AP1R<n>\_EL2 characteristics are:

## Purpose

Provides information about Group 1 virtual active priorities for EL2.

## Configuration

AArch64 System register ICH\_AP1R<n>\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_AP1R<n>\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_AP1R<n>\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_AP1R<n>\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### P<x>, bit [x], for x = 310 to 031

Group 1 interrupt active priorities. Possible values of each bit are:

P<x>	Meaning
0b0	There is no Group 1 interrupt active with this priority level, or all active Group 1 interrupts with this priority level have undergone priority-drop.
0b1	There is a Group 1 interrupt active with this priority level which has not undergone priority drop.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH\_AP1R0\_EL2 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH\_AP1R0\_EL2 in the bits corresponding to 0:Priority[6:2].

- The active state of preemption levels 128 - 252 are held in ICH\_AP1R1\_EL2 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH\_AP1R0\_EL2 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH\_AP1R1\_EL2 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH\_AP1R2\_EL2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH\_AP1R3\_EL2 in the bits corresponding to 11:Priority[5:1].

#### Note

Having the bit corresponding to a priority set to 1 in both [ICH\\_AP0R<n>\\_EL2](#) and ICH\_AP1R<n>\_EL2 might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

On a Warm reset, this **This** field resets to 0.

This register is always used for legacy VMs, regardless of the group of the virtual interrupt. Reads and writes to [GICV\\_APR<n>](#) access [ICH\\_AP1R<n>\\_EL2](#). For more information about support for legacy VMs, see 'Support for legacy operation of VMs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Accessing the ICH\_AP1R<n>\_EL2

ICH\_AP1R1\_EL2 is only implemented in implementations that support 6 or more bits of preemption. ICH\_AP1R2\_EL2 and ICH\_AP1R3\_EL2 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

#### Note

The number of bits of preemption is indicated by [ICH\\_VTR\\_EL2](#).PREbits

Writing to these registers with any value other than the last read value of the register (or 0x00000000 for a newly set up virtual machine) can result in UNPREDICTABLE behavior of the virtual interrupt prioritization system allowing either:

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_AP1R<n>\_EL2

# ICH\_EISR\_EL2, Interrupt Controller End of Interrupt Status Register

The ICH\_EISR\_EL2 characteristics are:

## Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

## Configuration

AArch64 System register ICH\_EISR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_EISR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_EISR\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_EISR\_EL2 bit assignments are:

### Bits [63:16]

Reserved, RES0.

### Status<n>, bit [n], for n = 15 to 0

EOI maintenance interrupt status bit for List register <n>:

Status<n>	Meaning
0b0	List register <n>, <a href="#">ICH_LR&lt;n&gt;_EL2</a> , does not have an EOI maintenance interrupt.
0b1	List register <n>, <a href="#">ICH_LR&lt;n&gt;_EL2</a> , has an EOI maintenance interrupt that has not been handled.

For any [ICH\\_LR<n>\\_EL2](#), the corresponding status bit is set to 1 if all of the following are true:

- [ICH\\_LR<n>\\_EL2](#).State is 0b00.
- [ICH\\_LR<n>\\_EL2](#).HW is 0.
- [ICH\\_LR<n>\\_EL2](#).EOI (bit [41]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

Otherwise the status bit takes the value 0.

## Accessing the ICH\_EISR\_EL2

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, ICH\_EISR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b011

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_EISR_EL2;
elseif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_EISR_EL2;

```

# ICH\_ELRSR\_EL2, Interrupt Controller Empty List Register Status Register

The ICH\_ELRSR\_EL2 characteristics are:

## Purpose

These registers can be used to locate a usable List register when the hypervisor is delivering an interrupt to a VM.

## Configuration

AArch64 System register ICH\_ELRSR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_ELRSR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_ELRSR\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_ELRSR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40
RES0																RES0							
																Status15	Status14	Status13	Status12	Status11	Status10	Status9	Status8
																bit [n], for n = 0 to 15							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8

### Bits [63:16]

Reserved, RES0.

### Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>, [ICH\\_LR<n>\\_EL2](#):

Status<n>	Meaning
0b0	List register <a href="#">ICH_LR&lt;n&gt;_EL2</a> , if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.
0b1	List register <a href="#">ICH_LR&lt;n&gt;_EL2</a> does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.

For any List register <n>, the corresponding status bit is set to 1 if [ICH\\_LR<n>\\_EL2](#).State is 0b00 and either [ICH\\_LR<n>\\_EL2](#).HW is 1 or [ICH\\_LR<n>\\_EL2](#).EOI (bit [41]) is 0.

Otherwise the status bit takes the value 0.

## Accessing the ICH\_ELRSR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_ELRSR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b101

# ICH\_HCR\_EL2, Interrupt Controller Hyp Control Register

The ICH\_HCR\_EL2 characteristics are:

## Purpose

Controls the environment for VMs.

## Configuration

AArch64 System register ICH\_HCR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_HCR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_HCR\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_HCR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37
RES0																										
EOIcount		RES0					DVIM	TDIR	TSEI	TALL1	TALL0	TCR	RES0	vSGIEOICount	VGrp1DIE	VGrp1EIE	VGrp0DIE	VGrp0EIE								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5

## Bits [26:16]

Reserved, RES0.

## DVIM, bit [15]

When ICH\_VTR\_EL2.DVIM == 1:

Directly-injected Virtual Interrupt Mask.

DVIM	Meaning
0b0	This control has no effect on the signalling of virtual interrupts.
0b1	Virtual interrupts received via direct-injection are not presented to the virtual CPU interface and not considered when determining the highest priority pending virtual interrupt.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

## TDIR, bit [14]

Trap EL1 writes to [ICC\\_DIR\\_EL1](#) and [ICV\\_DIR\\_EL1](#).

TDIR	Meaning
0b0	EL1 writes of <a href="#">ICC_DIR_EL1</a> and <a href="#">ICV_DIR_EL1</a> are not trapped to EL2, unless trapped by other mechanisms.
0b1	EL1 writes of <a href="#">ICV_DIR_EL1</a> are trapped to EL2. It is IMPLEMENTATION DEFINED whether writes of <a href="#">ICC_DIR_EL1</a> are trapped. Not trapping <a href="#">ICC_DIR_EL1</a> writes is DEPRECATED.

Support for this bit is OPTIONAL, with support indicated by [ICH\\_VTR\\_EL2](#).

If the implementation does not support this trap, this bit is RES0.

Arm deprecates not including this trap bit.

On a Warm reset, this field resets to 0.

## TSEI, bit [13]

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at EL1.

TSEI	Meaning
0b0	Locally generated SEIs do not cause a trap to EL2.
0b1	Locally generated SEIs trap to EL2.

If [ICH\\_VTR\\_EL2](#).SEIS is 0, this bit is RES0.

On a Warm reset, this field resets to 0.

## TALL1, bit [12]

Trap all EL1 accesses to ICC\_\* and ICV\_\* System registers for Group 1 interrupts to EL2.

TALL1	Meaning
0b0	EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal.
0b1	EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2.

On a Warm reset, this **This** field resets to 0.

### TALLO, bit [11]

Trap all EL1 accesses to ICC\_\* and ICV\_\* System registers for Group 0 interrupts to EL2.

TALLO	Meaning
0b0	EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal.
0b1	EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2.

On a Warm reset, this **This** field resets to 0.

### TC, bit [10]

Trap all EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.

TC	Meaning
0b0	EL1 accesses to common registers proceed as normal.
0b1	EL1 accesses to common registers trap to EL2.

This affects accesses to [ICC\\_SGI0R\\_EL1](#), [ICC\\_SGI1R\\_EL1](#), [ICC\\_ASGI1R\\_EL1](#), [ICC\\_CTLR\\_EL1](#), [ICC\\_DIR\\_EL1](#), [ICC\\_PMR\\_EL1](#), [ICC\\_RPR\\_EL1](#), [ICV\\_CTLR\\_EL1](#), [ICV\\_DIR\\_EL1](#), [ICV\\_PMR\\_EL1](#), and [ICV\\_RPR\\_EL1](#).

On a Warm reset, this **This** field resets to 0.

### Bit [9]

Reserved, RES0.

### vSGIEOICount, bit [8]

When FEAT\_GICv4p1 is implemented:

Controls whether deactivation of virtual SGIs can increment ICH\_HCR\_EL2.EOICount

vSGIEOICount	Meaning
0b0	Deactivation of virtual SGIs can increment ICH_HCR_EL2.EOICount.
0b1	Deactivation of virtual SGIs does not increment ICH_HCR_EL2.EOICount.

On a Warm reset, this **This** field resets to 0.

Otherwise:

Reserved, RES0.

### VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp1DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">ICH_VMCR_EL2.VENG1</a> is 0.

On a Warm reset, this **This** field resets to 0.

**VGrp1EIE, bit [6]**

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp1EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">ICH_VMCR_EL2.VENG1</a> is 1.

On a Warm reset, this **This** field resets to 0.

**VGrp0DIE, bit [5]**

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp0DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">ICH_VMCR_EL2.VENG0</a> is 0.

On a Warm reset, this **This** field resets to 0.

**VGrp0EIE, bit [4]**

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp0EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">ICH_VMCR_EL2.VENG0</a> is 1.

On a Warm reset, this **This** field resets to 0.

**NPIE, bit [3]**

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to 0b01 (pending):

NPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

On a Warm reset, this **This** field resets to 0.

**LRENPIE, bit [2]**

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

LRENPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted while the EOICount field is not 0.

On a Warm reset, this **This** field resets to 0.

**UIE, bit [1]**

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

UIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.

On a Warm reset, this **This** field resets to 0.

## En, bit [0]

Enable. Global enable bit for the virtual CPU interface:

En	Meaning
0b0	Virtual CPU interface operation disabled.
0b1	Virtual CPU interface operation enabled.

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of [ICV\\_IAR0\\_EL1](#), [ICV\\_IAR1\\_EL1](#), [GICV\\_IAR](#) or [GICV\\_AIAR](#) returns a spurious interrupt ID.

## Note

This field is RES0 when SCR\_EL3.{NS,EEL2}=={0,0}

On a Warm reset, this **This** field resets to 0.

# ICH\_LR<n>\_EL2, Interrupt Controller List Registers, n = 0 - 15

The ICH\_LR<n>\_EL2 characteristics are:

## Purpose

Provides interrupt context information for the virtual CPU interface.

## Configuration

AArch64 System register ICH\_LR<n>\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_LR<n>\[31:0\]](#).

AArch64 System register ICH\_LR<n>\_EL2 bits [63:32] are architecturally mapped to AArch32 System register [ICH\\_LRC<n>\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_LR<n>\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_LR<n>\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
State	HW	Group	RES0						Priority								RES0				pINTID												
vINTID																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### State, bits [63:62]

The state of the interrupt:

State	Meaning
0b00	Invalid (Inactive).
0b01	Pending.
0b10	Active.
0b11	Pending and active.

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the invalid state are ignored, except for the purpose of generating virtual maintenance interrupts.

For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## HW, bit [61]

Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the ID that the pINTID field indicates.

HW	Meaning
0b0	The interrupt is triggered entirely by software. No notification is sent to the Distributor when the virtual interrupt is deactivated.
0b1	The interrupt maps directly to a hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using the pINTID field from this register to indicate the physical interrupt ID. If <a href="#">ICH_VMCR_EL2.VEOIM</a> is 0, this request corresponds to a write to <a href="#">ICC_FOIR0_EL1</a> or <a href="#">ICC_FOIR1_EL1</a> . Otherwise, it corresponds to a write to <a href="#">ICC_DIR_EL1</a> .

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Group, bit [60]

Indicates the group for this virtual interrupt.

Group	Meaning
0b0	This is a Group 0 virtual interrupt. <a href="#">ICH_VMCR_EL2.VFIQEn</a> determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and <a href="#">ICH_VMCR_EL2.VENG0</a> enables signaling of this interrupt to the virtual machine.
0b1	This is a Group 1 virtual interrupt, signaled as a virtual IRQ. <a href="#">ICH_VMCR_EL2.VENG1</a> enables the signalling of this interrupt to the virtual machine. If <a href="#">ICH_VMCR_EL2.VCBPR</a> is 0, then <a href="#">ICC_BPR1_EL1</a> determines if a pending Group 1 interrupt has sufficient priority to preempt current execution. Otherwise, <a href="#">ICH_LR&lt;n&gt;_EL2</a> determines preemption.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bits [59:56]

Reserved, RES0.

## Priority, bits [55:48]

The priority of this interrupt.

It is IMPLEMENTATION DEFINED how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit[48] up to bit[50]. The number of implemented bits can be discovered from [ICH\\_VTR\\_EL2.PRIBits](#).

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bits [47:45]

Reserved, RES0.

## pINTID, bits [44:32]

Physical INTID, for hardware interrupts.

When ICH\_LR<n>\_EL2.HW is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[44:42] : RES0.
- Bit[41] : EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, a maintenance interrupt is asserted.

- Bits[40:32] : RES0.

When ICH\_LR<n>\_EL2.HW is 1 (there is a corresponding physical interrupt):

- This field indicates the physical INTID. This field is only required to implement enough bits to hold a valid value for the implemented INTID size. Any unused higher order bits are RES0.
- When [ICC\\_CTLR\\_EL1.ExtRange](#) is 0, then bits[44:42] of this field are RES0.
- If the value of pINTID is not a valid INTID, behavior is UNPREDICTABLE. If the value of pINTID indicates a PPI, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 13 bits of Physical INTID are required, regardless of the number specified by [ICC\\_CTLR\\_EL1.IDbits](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**vINTID, bits [31:0]**

Virtual INTID of the interrupt.

If the value of vINTID is 1020-1023 and ICH\_LR<n>\_EL2.State!=0b00 (Inactive), behavior is UNPREDICTABLE.

Behavior is UNPREDICTABLE if two or more List Registers specify the same vINTID when:

- ICH\_LR<n>\_EL2.State == 0b01.
- ICH\_LR<n>\_EL2.State == 0b10.
- ICH\_LR<n>\_EL2.State == 0b11.

It is IMPLEMENTATION DEFINED how many bits are implemented, though at least 16 bits must be implemented. Unimplemented bits are RES0. The number of implemented bits can be discovered from [ICH\\_VTR\\_EL2.IDbits](#).

When [ICC\\_SRE\\_EL1.SRE](#) == 0, specifying a vINTID in the LPI range is UNPREDICTABLE

**Note**

When a VM is using memory-mapped access to the GIC, software must ensure that the correct source PE ID is provided in bits[12:10].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ICH\_LR<n>\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_LR<n>\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b110:n[3]	n[2:0]

# ICH\_MISR\_EL2, Interrupt Controller Maintenance Interrupt State Register

The ICH\_MISR\_EL2 characteristics are:

## Purpose

Indicates which maintenance interrupts are asserted.

## Configuration

AArch64 System register ICH\_MISR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_MISR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_MISR\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_MISR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																VGrp1D		VGrp1E		VGrp0D		VGrp0E		NPL		REN		U		EOI	

### Bits [63:8]

Reserved, RES0.

### VGrp1D, bit [7]

vPE Group 1 Disabled.

VGrp1D	Meaning
0b0	vPE Group 1 Disabled maintenance interrupt not asserted.
0b1	vPE Group 1 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR\\_EL2.VGrp1DIE](#)==1 and [ICH\\_VMCR\\_EL2.VENG1](#)==is 0.

On a Warm reset, this field resets to 0.

### VGrp1E, bit [6]

vPE Group 1 Enabled.

VGrp1E	Meaning
0b0	vPE Group 1 Enabled maintenance interrupt not asserted.
0b1	vPE Group 1 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR\\_EL2.VGrp1EIE==1](#) and [ICH\\_VMCR\\_EL2.VENG1==1](#).

On a Warm reset, this **This** field resets to 0.

### VGrp0D, bit [5]

vPE Group 0 Disabled.

VGrp0D	Meaning
0b0	vPE Group 0 Disabled maintenance interrupt not asserted.
0b1	vPE Group 0 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR\\_EL2.VGrp0DIE==1](#) and [ICH\\_VMCR\\_EL2.VENG0==0](#).

On a Warm reset, this **This** field resets to 0.

### VGrp0E, bit [4]

vPE Group 0 Enabled.

VGrp0E	Meaning
0b0	vPE Group 0 Enabled maintenance interrupt not asserted.
0b1	vPE Group 0 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR\\_EL2.VGrp0EIE==1](#) and [ICH\\_VMCR\\_EL2.VENG0==1](#).

On a Warm reset, this **This** field resets to 0.

### NP, bit [3]

No Pending.

NP	Meaning
0b0	No Pending maintenance interrupt not asserted.
0b1	No Pending maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR\\_EL2.NPIE==1](#) and no List register is in pending state.

On a Warm reset, this **This** field resets to 0.

### LREN, bit [2]

List Register Entry Not Present.

LREN	Meaning
0b0	List Register Entry Not Present maintenance interrupt not asserted.
0b1	List Register Entry Not Present maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR\\_EL2.LRENPIE==1](#) and [ICH\\_HCR\\_EL2.EOIcount](#) is non-zero.

On a Warm reset, this **This** field resets to 0.

### U, bit [1]

Underflow.

U	Meaning
0b0	Underflow maintenance interrupt not asserted.
0b1	Underflow maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR\\_EL2.UIE==1](#) and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding [ICH\\_LR<n>\\_EL2.State](#) bits do not equal 0x0.

On a Warm reset, this **This** field resets to 0.

## EOI, bit [0]

End Of Interrupt.

EOI	Meaning
0b0	End Of Interrupt maintenance interrupt not asserted.
0b1	End Of Interrupt maintenance interrupt asserted.

This maintenance interrupt is asserted when at least one bit in [ICH\\_EISR\\_EL2](#) is 1.

On a Warm reset, this **This** field resets to 0.

The U and NP bits do not include the status of any pending/active 'VSet (IRI)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069) packets because these bits control generation of interrupts that allow software management of the contents of the List Registers (which are not affected by 'VSet (IRI)' packets).

## Accessing the ICH\_MISR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_MISR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_MISR_EL2;
elseif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_MISR_EL2;

```

# ICH\_VTR\_EL2, Interrupt Controller VGIC Type Register

The ICH\_VTR\_EL2 characteristics are:

## Purpose

Reports supported GIC ~~virtualisation~~ **virtualization** features.

## Configuration

AArch64 System register ICH\_VTR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_VTR\[31:0\]](#).

If EL2 is not implemented, all bits in this register are RES0 from EL3, except for nV4, which is RES1 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_VTR\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_VTR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																																
PRibits				PREbits				IDbits				SEIS	A3V	nV4	TDS	DVIM	RES0												ListRegs			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### Bits [63:32]

Reserved, RES0.

### PRibits, bits [31:29]

Priority bits. The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

This field is an alias of [ICV\\_CTLR\\_EL1](#).PRibits.

### PREbits, bits [28:26]

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH\_VTR\_EL2.PRibits.

The maximum value of this field is 6, indicating 7 bits of preemption.

This field determines the minimum value of [ICH\\_VMCR\\_EL2](#).VBPR0.

**IDbits, bits [25:23]**

The number of virtual interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

This field is an alias of [ICV\\_CTLR\\_EL1](#).IDbits.

**SEIS, bit [22]**

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support generation of SEIs.
0b1	The virtual CPU interface logic supports generation of SEIs.

This bit is an alias of [ICV\\_CTLR\\_EL1](#).SEIS.

**A3V, bit [21]**

Affinity 3 Valid. Possible values are:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

This bit is an alias of [ICV\\_CTLR\\_EL1](#).A3V.

**nV4, bit [20]**

Direct injection of virtual interrupts not supported. Possible values are:

nV4	Meaning
0b0	The CPU interface logic supports direct injection of virtual interrupts.
0b1	The CPU interface logic does not support direct injection of virtual interrupts.

If [FEAT\\_GICv4](#) [FEAT\\_GICv3](#) is **not** implemented, this bit is RES1.

**TDS, bit [19]**

Separate trapping of EL1 writes to [ICV\\_DIR\\_EL1](#) supported.

TDS	Meaning
0b0	Implementation does not support <a href="#">ICH_HCR_EL2</a> .TDIR.
0b1	Implementation supports <a href="#">ICH_HCR_EL2</a> .TDIR.

**DVIM, bit [18]**

Masking of directly-injected virtual interrupts.

DVIM	Meaning
0b0	Masking of Directly-injected Virtual Interrupts not supported.
0b1	Masking of Directly-injected Virtual Interrupts is supported.

Bits [17:5]

Reserved, RES0.

ListRegs, bits [4:0]

The number of implemented List registers, minus one. For example, a value of 0b01111 indicates that the maximum of 16 List registers are implemented.

Accessing the ICH\_VTR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_VTR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_VTR_EL2;
elseif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_VTR_EL2;
```

-------	----------------	-------

The ICV\_AP0R<n>\_EL1 characteristics are:

## Purpose

Provides information about virtual Group 0 active priorities.

## Configuration

AArch64 System register ICV\_AP0R<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV\\_AP0R<n>\[31:0\]](#).

## Attributes

ICV\_AP0R<n>\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_AP0R<n>\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																RES0																
IMPLEMENTATION DEFINED																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

**Bits [63:32]**

Reserved, RES0.

### IMPLEMENTATION DEFINED, bits [31:0]

## IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

## Accessing the ICV AP0R<n> EL1

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV\_AP0R1\_EL1 is only implemented in implementations that support 6 or more bits of priority. ICV\_AP0R2\_EL1 and ICV\_AP0R3\_EL1 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV\_AP0R<n>\_EL1.
- [ICV\\_AP1R<n>\\_EL1](#).

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_AP0R<n>\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b1:n[1:0]

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap

# ICV\_AP1R<n>\_EL1, Interrupt Controller Virtual Active Priorities Group 1 Registers, n = 0 - 3

The ICV\_AP1R<n>\_EL1 characteristics are:

## Purpose

Provides information about virtual Group 1 active priorities.

## Configuration

AArch64 System register ICV\_AP1R<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV\\_AP1R<n>\[31:0\]](#).

## Attributes

ICV\_AP1R<n>\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_AP1R<n>\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

## Accessing the ICV\_AP1R<n>\_EL1

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV\_AP1R1\_EL1 is only implemented in implementations that support 6 or more bits of priority. ICV\_AP1R2\_EL1 and ICV\_AP1R3\_EL1 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- [ICV\\_AP0R<n>\\_EL1](#).
- [ICV\\_AP1R<n>\\_EL1](#).

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_AP1R<n>\_EL1

op0	op1	CRn	CRm	op2

# ICV\_BPR0\_EL1, Interrupt Controller Virtual Binary Point Register 0

The ICV\_BPR0\_EL1 characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 0 interrupt preemption.

## Configuration

AArch64 System register ICV\_BPR0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV\\_BPR0\[31:0\]](#).

## Attributes

ICV\_BPR0\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_BPR0\_EL1 bit assignments are:

### Bits [63:3]

Reserved, RES0.

### BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	gggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.ssssssss

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ICV\_BPR0\_EL1

The minimum binary point value is derived from the number of implemented preemption bits, as shown in the following table:

Number of implemented preemption bits	Minimum value of BPR0
7	0
6	1
5	2

The number of implemented preemption bits is indicated by [ICH\\_VTR\\_EL2.PREbits](#).

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_BPR0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b011

# ICV\_BPR1\_EL1, Interrupt Controller Virtual Binary Point Register 1

The ICV\_BPR1\_EL1 characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 1 interrupt preemption.

## Configuration

AArch64 System register ICV\_BPR1\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV\\_BPR1\[31:0\]](#).

## Attributes

ICV\_BPR1\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_BPR1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																BinaryPoint															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:3]

Reserved, RES0.

### BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for virtual Group 0 and virtual Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	-	-	-
1	[7:1]	[0]	ggggggg.s
2	[7:2]	[1:0]	ggggggg.ss
3	[7:3]	[2:0]	ggggg.sss
4	[7:4]	[3:0]	gggg.ssss
5	[7:5]	[4:0]	ggg.sssss
6	[7:6]	[5:0]	gg.ssssss
7	[7]	[6:0]	g.sssssss

Writing 0 to this field will set this field to its reset value.

If [ICV\\_CTLR\\_EL1](#).CBPR is set to 1, Non-secure EL1 reads return [ICV\\_BPR0\\_EL1](#) + 1 saturated to 0b111. Non-secure EL1 writes are ignored.

If [ICV\\_CTLR\\_EL1](#).CBPR is set to 1, Secure EL1 reads return [ICV\\_BPR0\\_EL1](#). Secure EL1 writes modify [ICV\\_BPR0\\_EL1](#).

## Accessing the ICV\_BPR1\_EL1

The reset value is IMPLEMENTATION DEFINED, but is equal to the minimum value of [ICV\\_BPR0\\_EL1](#) plus one.

An attempt to program the binary point field to a value less than the reset value sets the field to the reset value.

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_BPR1\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b011

```

OnThis a Warm reset, this field resets to an architecturally UNKNOWNIMPLEMENTATION\_DEFINED non-zero value.

## Accessing the ICV\_BPR1\_EL1

For Non-secure writes, the minimum value of this field is the minimum value of ICH\_VMCR\_EL2.VBPR0 plus one.

For Secure writes, the minimum value of this field is the minimum value of ICH\_VMCR\_EL2.VBPR0.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings:

The ICV\_CTLR\_EL1 characteristics are:

## Purpose

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

## Configuration

AArch64 System register ICV\_CTLR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV\\_CTLR\[31:0\]](#).

## Attributes

ICV\_CTLR\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_CTLR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0												ExtRange		RSS	RES0		A3V	SEIS	IDbits		PRibits		RES0						EOImode	CBPR	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:20]**

Reserved, RES0.

### ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	<p>CPU interface does not support INTIDs in the range 1024..8191.</p> <ul style="list-style-type: none"> <li>Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</li> </ul> <hr/> <p><b>Note</b></p> <p>Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.</p> <hr/>
0b1	<p>CPU interface supports INTIDs in the range 1024..8191</p> <ul style="list-style-type: none"> <li>All INTIDs in the range 1024..8191 are treated as requiring deactivation.</li> </ul>

ICV CTLR EL1.ExtRange is an alias of [ICC CTLR EL1.ExtRange](#).

**RSS, bit [18]**

Range Selector Support. Possible values are:

<b>RSS</b>	<b>Meaning</b>
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

**Bits [17:16]**

Reserved, RES0.

**A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<b>A3V</b>	<b>Meaning</b>
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

**SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

<b>SEIS</b>	<b>Meaning</b>
0b0	The virtual CPU interface logic does not support local generation of SEIs.
0b1	The virtual CPU interface logic supports local generation of SEIs.

**IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

<b>IDbits</b>	<b>Meaning</b>
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

**PRIbits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation must implement at least 32 levels of physical priority (5 priority bits).

**Note**

This field always returns the number of priority bits implemented.

The division between group priority and subpriority is defined in the binary point registers [ICV\\_BPR0\\_EL1](#) and [ICV\\_BPR1\\_EL1](#).

**Bits [7:2]**

Reserved, RES0.

**EOImode, bit [1]**

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

EOImode	Meaning
0b0	<a href="#">ICV_EOIR0_EL1</a> and <a href="#">ICV_EOIR1_EL1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICV_DIR_EL1</a> are UNPREDICTABLE.
0b1	<a href="#">ICV_EOIR0_EL1</a> and <a href="#">ICV_EOIR1_EL1</a> provide priority drop functionality only. <a href="#">ICV_DIR_EL1</a> provides interrupt deactivation functionality.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**CBPR, bit [0]**

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

CBPR	Meaning
0b0	<a href="#">ICV_BPR1_EL1</a> determines the preemption group for virtual Group 1 interrupts.
0b1	Reads of <a href="#">ICV_BPR1_EL1</a> return <a href="#">ICV_BPR0_EL1</a> plus one, saturated to 0b111. Writes to <a href="#">ICV_BPR1_EL1</a> are ignored.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

The ICV\_IGRPEN1\_EL1 characteristics are:

## Purpose

Controls whether virtual Group 1 interrupts are enabled for the current Security state.

## Configuration

AArch64 System register ICV\_IGRPEN1\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV\\_IGRPEN1\[31:0\]](#).

## Attributes

ICV\_IGRPEN1\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_IGRPEN1\_EL1 bit assignments are:

Register map for the 32-bit register:

- Bits 63 to 32: RES0
- Bits 31 to 1: RES0
- Bit 0: Enable

**Bits [63:1]**

Reserved, RES0.

### Enable, bit [0]

Enables virtual Group 1 interrupts.

Enable	Meaning
0b0	Virtual Group 1 interrupts are disabled.
0b1	Virtual Group 1 interrupts are enabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ICV\_IGRPEN1\_EL1

Accesses to this register use the following encodings:

# ICV\_PMR\_EL1, Interrupt Controller Virtual Interrupt Priority Mask Register

The ICV\_PMR\_EL1 characteristics are:

## Purpose

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

## Configuration

AArch64 System register ICV\_PMR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV\\_PMR\[31:0\]](#).

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Attributes

ICV\_PMR\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_PMR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																																			
RES0																								Priority											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

### Bits [63:8]

Reserved, RES0.

### Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	0x00-0xFF (0-255), all values	256
[7:1]	0x00-0xFE (0-254), even values only	128
[7:2]	0x00-0xFC (0-252), in steps of 4	64
[7:3]	0x00-0xF8 (0-248), in steps of 8	32
[7:4]	0x00-0xF0 (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ICV\_PMR\_EL1

Accesses to this register use the following encodings:

# ID\_AA64DFR0\_EL1, AArch64 Debug Feature Register 0

The ID\_AA64DFR0\_EL1 characteristics are:

## Purpose

Provides top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers, see Principles of the ID scheme for fields in ID registers.

## Configuration

The external register [EDDFR](#) gives information from this register.

## Attributes

ID\_AA64DFR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64DFR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CTX_CMPs				RES0				WRPs				RES0				BRPs				PMUVer				TraceVer				DebugVer			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:52]

Reserved, RES0.

### MTPMU, bits [51:48]

Multi-threaded PMU extension. Defined values are:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether <a href="#">PMEVTYPER&lt;n&gt;_EL0.MT</a> are read/write or RES0.
0b0001	FEAT_MTPMU implemented and FEAT_PMUv3 implemented. <a href="#">PMEVTYPER&lt;n&gt;_EL0.MT</a> are read/write. When FEAT_MTPMU is disabled, the Effective values of <a href="#">PMEVTYPER&lt;n&gt;_EL0.MT</a> and <a href="#">PMEVTYPER&lt;n&gt;_EL0.MT</a> are 0.
0b1111	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, <a href="#">PMEVTYPER&lt;n&gt;_EL0.MT</a> are RES0.

All other values are reserved.

FEAT\_MTPMU implements the functionality identified by the value 0b0001.

From [Armv8.6](#), an implementation that includes FEAT\_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include **FEAT\_PMUv3**, the value 0b0001 is not permitted.

#### Bits [47:44]

Reserved, RES0.

#### TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT\_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if an Embedded Trace Macrocell Architecture PE Trace Unit is implemented, the value 0b0000 is not permitted.

#### DoubleLock, bits [39:36]

OS Double Lock implemented. Defined values are:

DoubleLock	Meaning
0b0000	OS Double Lock implemented. <a href="#">OSDLR_EL1</a> is RW.
0b1111	OS Double Lock not implemented. <a href="#">OSDLR_EL1</a> is RAZ/WI.

All other values are reserved.

FEAT\_DoubleLock implements the functionality identified by the value 0b0000.

In Armv8.0, the only permitted value is 0b0000.

If FEAT\_Debugv8p2 is implemented and FEAT\_DoPD is not implemented, the permitted values are 0b0000 and 0b1111.

If FEAT\_DoPD is implemented, the only permitted value is 0b1111.

#### PMSVer, bits [35:32]

Statistical Profiling Extension version. Defined values are:

PMSVer	Meaning
0b0000	Statistical Profiling Extension not implemented.
0b0001	Statistical Profiling Extension implemented.
0b0010	As 0b0001, and adds: <ul style="list-style-type: none"> <li>Support for the Event packet Alignment flag.</li> <li>If FEAT_SVE is implemented, support for the Scalable Vector extensions to Statistical Profiling.</li> </ul>
0b0011	As 0b0010, and adds: <ul style="list-style-type: none"> <li>The last branch target Address packet.</li> <li>Discard mode.</li> <li>Extended event filtering, including the <a href="#">PMSNEVFR_EL1</a> System register.</li> <li>If FEAT_PMUv3 is implemented, controls to freeze the PMU event counters after an SPE buffer management event occurs.</li> <li>If FEAT_PMUv3 is implemented, the <a href="#">SAMPLE_FEED_BR</a>, <a href="#">SAMPLE_FEED_EVENT</a>, <a href="#">SAMPLE_FEED_LAT</a>, <a href="#">SAMPLE_FEED_LD</a>, <a href="#">SAMPLE_FEED_OP</a>, and <a href="#">SAMPLE_FEED ST</a> PMU events.</li> </ul>

All other values are reserved.

FEAT\_SPE implements the functionality identified by the value 0b0001.

FEAT\_SPEv1p1 implements the functionality identified by the value 0b0010.

FEAT\_SPEv1p2 implements the functionality identified by the value 0b0011.

~~From Armv8.5, if FEAT\_SPE is implemented, the value 0b0001 is not permitted.~~

In Armv8.5, if FEAT\_SPE is implemented, the value 0b0001 is not permitted.

From Armv8.7, if FEAT\_SPE is implemented, the value 0b0010 is not permitted.

## CTX\_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

## Bits [27:24]

Reserved, RES0.

## WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

## Bits [19:16]

Reserved, RES0.

## BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

## PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and also includes support for: <ul style="list-style-type: none"> <li>Extended 16-bit <a href="#">PMEVTYPER&lt;n&gt;_EL0</a>.evtCount field.</li> <li>If EL2 is implemented, the <a href="#">MDCR_EL2</a>.HPMD control bit.</li> </ul>
0b0101	PMUv3 for Armv8.4. As 0b0100, and also includes support for the <a href="#">PMMIR_EL1</a> register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and also includes support for: <ul style="list-style-type: none"> <li>64-bit event counters.</li> <li>If EL2 is implemented, the <a href="#">MDCR_EL2</a>.HCCD control bit.</li> <li>If EL3 is implemented, the <a href="#">MDCR_EL3</a>.SCCD control bit.</li> </ul>
0b0111	PMUv3 for Armv8.7. As 0b0110, and also includes support for: <ul style="list-style-type: none"> <li>The <a href="#">PMCR_EL0</a>.FZO and, if EL2 is implemented, <a href="#">MDCR_EL2</a>.HPMFZO control bits.</li> <li>If EL3 is implemented, the <a href="#">MDCR_EL3</a>.{MPMX,MCCD} control bits.</li> </ul>
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT\_PMUv3 implements the functionality identified by the value 0b0001.

FEAT\_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT\_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT\_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT\_PMUv3p7 implements Armv8.1, the if functionality FEAT\_PMUv3 is implemented, the value 0b0111 0b0001 is not permitted.

In From Armv8.1 Armv8.4, if FEAT\_PMUv3 is implemented, the value 0b0001 0b0100 is not permitted.

In From Armv8.4 Armv8.5, if FEAT\_PMUv3 is implemented, the value 0b0100 0b0101 is not permitted.

In Armv8.5, if FEAT\_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT\_PMUv3 is implemented, the value 0b0110 is not permitted.

### TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

TraceVer	Meaning
0b0000	PE trace unit System registers not implemented.
0b0001	PE trace unit System registers implemented.

All other values are reserved.

See the ETM Architecture Specification for more information.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.

### DebugVer, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

DebugVer	Meaning
0b0110	Armv8 debug architecture.
0b0111	Armv8 debug architecture with Virtualization Host Extensions.
0b1000	Armv8.2 debug architecture.
0b1001	Armv8.4 debug architecture.

All other values are reserved.

FEAT\_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT\_Debugv8p4 adds the functionality identified by the value 0b1001.

In Armv8.1, the value 0b0110 is not permitted.

In Armv8.2, the value 0b0111 is not permitted.

From Armv8.4, the value 0b1000 is not permitted.

## Accessing the ID\_AA64DFR0\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_AA64DFR0\_EL1

op0	op1	CRn	CRm	op2

# ID\_AA64ISAR0\_EL1, AArch64 Instruction Set Attribute Register 0

The ID\_AA64ISAR0\_EL1 characteristics are:

## Purpose

Provides information about the instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

There are no configuration notes.

## Attributes

ID\_AA64ISAR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64ISAR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### RNDR, bits [63:60]

Indicates support for Random Number instructions in AArch64 state. Defined values are:

RNDR	Meaning
0b0000	No Random Number instructions are implemented.
0b0001	<a href="#">RNDR</a> and <a href="#">RNDRRS</a> registers are implemented.

All other values are reserved.

FEAT\_RNG implements the functionality identified by the value 0b0001.

From Armv8.5, the permitted values are 0b0000 and 0b0001.

### TLB, bits [59:56]

Indicates support for Outer shareable and TLB range maintenance instructions. Defined values are:

TLB	Meaning
0b0000	Outer shareable and TLB range maintenance instructions are not implemented.
0b0001	Outer shareable TLB maintenance instructions are implemented.
0b0010	Outer shareable and TLB range maintenance instructions are implemented.

All other values are reserved.

FEAT\_TLBIOS implements the functionality identified by the values 0b0001 and 0b0010.

FEAT\_TLBIRANGE implements the functionality identified by the value 0b0010.

From Armv8.4, the only permitted value is 0b0010.

### TS, bits [55:52]

Indicates support for flag manipulation instructions. Defined values are:

TS	Meaning
0b0000	No flag manipulation instructions are implemented.
0b0001	CFINV, RMIF, SETF16, and SETF8 instructions are implemented.
0b0010	CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented.

All other values are reserved.

FEAT\_FlagM implements the functionality identified by the value 0b0001.

FEAT\_FlagM2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

In Armv8.4, the only permitted value is 0b0001.

From Armv8.5, the only permitted value is 0b0010.

### FHM, bits [51:48]

Indicates support for FMLAL and FMLSL instructions. Defined values are:

FHM	Meaning
0b0000	FMLAL and FMLSL instructions are not implemented.
0b0001	FMLAL and FMLSL instructions are implemented.

All other values are reserved.

FEAT\_FHM implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

### DP, bits [47:44]

Indicates support for Dot Product instructions in AArch64 state. Defined values are:

DP	Meaning
0b0000	No Dot Product instructions implemented.
0b0001	UDOT and SDOT instructions implemented.

All other values are reserved.

FEAT\_DotProd implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

### SM4, bits [43:40]

Indicates support for SM4 instructions in AArch64 state. Defined values are:

SM4	Meaning
0b0000	No SM4 instructions implemented.
0b0001	SM4E and SM4EKEY instructions implemented.

All other values are reserved.

If FEAT\_SM4 is not implemented, the value 0b0001 is reserved.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID\_AA64ISAR0\_EL1.SM3.

### SM3, bits [39:36]

Indicates support for SM3 instructions in AArch64 state. Defined values are:

SM3	Meaning
0b0000	No SM3 instructions implemented.
0b0001	SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 instructions implemented.

All other values are reserved.

If FEAT\_SM3 is not implemented, the value 0b0001 is reserved.

FEAT\_SM3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID\_AA64ISAR0\_EL1.SM4.

### SHA3, bits [35:32]

Indicates support for SHA3 instructions in AArch64 state. Defined values are:

SHA3	Meaning
0b0000	No SHA3 instructions implemented.
0b0001	EOR3, RAX1, XAR, and BCAX instructions implemented.

All other values are reserved.

If FEAT\_SHA3 is not implemented, the value 0b0001 is reserved.

FEAT\_SHA3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

If the value of ID\_AA64ISAR0\_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0001, ID\_AA64ISAR0\_EL1.SHA2 must have the value 0b0010.

### RDM, bits [31:28]

Indicates support for SQRDMLAH and SQRDMLSH instructions in AArch64 state. Defined values are:

RDM	Meaning
0b0000	No RDMA instructions implemented.
0b0001	SQRDMLAH and SQRDMLSH instructions implemented.

All other values are reserved.

FEAT\_RDM implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

### Bits [27:24]

Reserved, RES0.

### Atomic, bits [23:20]

Indicates support for Atomic instructions in AArch64 state. Defined values are:

Atomic	Meaning
0b0000	No Atomic instructions implemented.
0b0010	LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.

All other values are reserved.

FEAT\_LSE implements the functionality identified by the value 0b0010.

From Armv8.1, the only permitted value is 0b0010.

### CRC32, bits [19:16]

Indicates support for CRC32 instructions in AArch64 state. Defined values are:

CRC32	Meaning
0b0000	No CRC32 instructions implemented.
0b0001	CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

### SHA2, bits [15:12]

Indicates support for SHA2 instructions in AArch64 state. Defined values are:

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	Implements instructions: SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.
0b0010	Implements instructions: <ul style="list-style-type: none"> <li>SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.</li> <li>SHA512H, SHA512H2, SHA512SU0, and SHA512SU1.</li> </ul>

All other values are reserved.

FEAT\_SHA256 implements the functionality identified by the value 0b0001.

FEAT\_SHA512 implements the functionality identified by the value 0b0010.

In Armv8, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

If the value of ID\_AA64ISAR0\_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0010, ID\_AA64ISAR0\_EL1.SHA3 must have the value 0b0001.

### SHA1, bits [11:8]

Indicates support for SHA1 instructions in AArch64 state. Defined values are:

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented.

All other values are reserved.

FEAT\_SHA1 implements the functionality identified by the value 0b0001.

From Armv8, the permitted values are 0b0000 and 0b0001.

If the value of ID\_AA64ISAR0\_EL1.SHA2 is 0b0000, this field must have the value 0b0000.

### AES, bits [7:4]

Indicates support for AES instructions in AArch64 state. Defined values are:

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC instructions implemented.
0b0010	As for 0b0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.

FEAT\_AES implements the functionality identified by the value 0b0001.

FEAT\_PMULL implements the functionality identified by the value 0b0010.

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0010.

### Bits [3:0]

Reserved, RES0.

## Accessing the ID\_AA64ISAR0\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_AA64ISAR0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented("FEAT_IDST") then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then

# ID\_AA64ISAR1\_EL1, AArch64 Instruction Set Attribute Register 1

The ID\_AA64ISAR1\_EL1 characteristics are:

## Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

If ID\_AA64ISAR1\_EL1.{API, APA} == {0000, 0000}, then:

- The [TCR\\_EL1](#).{TBID,TBID0}, [TCR\\_EL2](#).{TBID0,TBID1}, [TCR\\_EL2](#).TBID and [TCR\\_EL3](#).TBID bits are RES0.
- [APIAKeyHi\\_EL1](#), [APIAKeyLo\\_EL1](#), [APIBKeyHi\\_EL1](#), [APIBKeyLo\\_EL1](#), [APDAKeyHi\\_EL1](#), [APDAKeyLo\\_EL1](#), [APDBKeyHi\\_EL1](#), [APDBKeyLo\\_EL1](#) are not allocated.
- SCTLR\_ELx.EnIA, SCTLR\_ELx.EnIB, SCTLR\_ELx.EnDA, SCTLR\_ELx.EnDB are all RES0.

If ID\_AA64ISAR1\_EL1.{GPI, GPA, API, APA} == {0000, 0000, 0000, 0000}, then:

- [HCR\\_EL2](#).APK and [HCR\\_EL2](#).API are RES0.
- [SCR\\_EL3](#).APK and [SCR\\_EL3](#).API are RES0.

## Attributes

ID\_AA64ISAR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64ISAR1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
LS64RES0				XSI8MM				I8MMDGH				DGHBF16				BF16SPECRES				SPECRESSB				SBFRINTTS							FRINTTS
GPI				GPA				LRCPC				FCMA				JSCVT				API				APA							DPB
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:56]

Reserved, RES0.

### LS64, bits [63:60]

Indicates support for LD64B and ST64B\* instructions, and the [ACCDATA\\_EL1](#) register. Defined values of this field are:

LS64	Meaning
0b0000	The LD64B and ST64B* instructions, the <a href="#">ACCDATA_EL1</a> register, and associated traps are not supported.
0b0001	The LD64B and ST64B instructions are supported.
0b0010	The LD64B, ST64B, and ST64BV instructions, and their associated traps are supported.
0b0011	The LD64 and ST64B* instructions, the <a href="#">ACCDATA_EL1</a> register, and their associated traps are supported.

All other values are reserved.

FEAT\_LS64 implements the functionality identified by 0b0001.

FEAT\_LS64\_V implements the functionality identified by 0b0010.

FEAT\_LS64\_ACCDATA implements the functionality identified by 0b0011.

From Armv8.7, the permitted values are 0b0001, 0b0010, and 0b0011.

### XS, bits [59:56]

Indicates support for the XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX\_EL2.{FGTnXS, FnXS} fields in AArch64 state. Defined values are:

XS	Meaning
0b0000	The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields are not supported.
0b0001	The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields are supported.

All other values are reserved.

FEAT\_XS implements the functionality identified by 0b0001.

From Armv8.7, the only permitted value is 0b0001.

### I8MM, bits [55:52]

Indicates support for Advanced SIMD and Floating-point Int8 matrix multiplication instructions in AArch64 state. Defined values of this field are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.

All other values are reserved.

FEAT\_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID\_AA64ZFR0\_EL1.I8MM.

From Armv8.6, the only permitted value is 0b0001.

### DGH, bits [51:48]

Indicates support for the Data Gathering Hint instruction. Defined values are:

DGH	Meaning
0b0000	Data Gathering Hint is not implemented.
0b0001	Data Gathering Hint is implemented.

All other values are reserved.

FEAT\_DGH implements the functionality identified by 0b0001.

From ARMv8.0, the permitted values are 0b0000 and 0b0001.

If the DGH instruction has no effect in preventing the merging of memory accesses, the value of this field is 0b0000.

### BF16, bits [47:44]

Indicates support for Advanced SIMD and Floating-point BFloat16 instructions in AArch64 state. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	BFCVTBFDOT, BFCVTNBFMLAL, BFCVTN2BFMLAL2, BFDOTBFMMLA, BFMLALBBFCVT, BFMLALT, and BFMMLABFCVT2 instructions are implemented.

All other values are reserved.

FEAT\_BF16 implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID\\_AA64ZFR0\\_EL1](#).BF16.

From [Armv8.6](#)ARMv8.6, the only permitted value is 0b0001.

## SPECRES, bits [43:40]

Indicates support for prediction invalidation instructions in AArch64 state. Defined values are:

SPECRES	Meaning
0b0000	CFP RCTX, DVP RCTX, and CPP RCTX instructions are not implemented.
0b0001	CFP RCTX, DVP RCTX, and CPP RCTX instructions are implemented.

All other values are reserved.

FEAT\_SPECRES implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

## SB, bits [39:36]

Indicates support for SB instruction in AArch64 state. Defined values are:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

FEAT\_SB implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

## FRINTTS, bits [35:32]

Indicates support for the FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented. Defined values are:

FRINTTS	Meaning
0b0000	FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are not implemented.
0b0001	FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented.

All other values are reserved.

FEAT\_FRINTTS implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

**GPI, bits [31:28]**

Indicates support for an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

<b>GPI</b>	<b>Meaning</b>
0b0000	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID\_AA64ISAR1\_EL1.GPA is non-zero, this field must have the value 0b0000.

**GPA, bits [27:24]**

Indicates whether QARMA or Architected algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

<b>GPA</b>	<b>Meaning</b>
0b0000	Generic Authentication using an Architected algorithm is not implemented.
0b0001	Generic Authentication using the QARMA algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID\_AA64ISAR1\_EL1.GPI is non-zero, this field must have the value 0b0000.

**LRCPC, bits [23:20]**

Indicates support for weaker release consistency, RCpc, based model. Defined values are:

<b>LRCPC</b>	<b>Meaning</b>
0b0000	The LDAPR*, LDAPUR*, and STLUR* instructions are not implemented.
0b0001	The LDAPR* instructions are implemented. The LDAPUR*, and STLUR* instructions are not implemented.
0b0010	The LDAPR*, LDAPUR*, and STLUR* instructions are implemented.

All other values are reserved.

FEAT\_LRCPC implements the functionality identified by the value 0b0001.

FEAT\_LRCPC2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

In Armv8.3, the permitted values are 0b0001 and 0b0010.

From Armv8.4, the only permitted value is 0b0010.

**FCMA, bits [19:16]**

Indicates support for complex number addition and multiplication, where numbers are stored in vectors. Defined values are:

<b>FCMA</b>	<b>Meaning</b>
0b0000	The FCMLA and FCADD instructions are not implemented.
0b0001	The FCMLA and FCADD instructions are implemented.

All other values are reserved.

FEAT\_FCMA implements the functionality identified by the value 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

### JSCVT, bits [15:12]

Indicates support for JavaScript conversion from double precision floating point values to integers in AArch64 state. Defined values are:

JSCVT	Meaning
0b0000	The FJCVTZS instruction is not implemented.
0b0001	The FJCVTZS instruction is implemented.

All other values are reserved.

FEAT\_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

### API, bits [11:8]

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

API	Meaning
0b0000	Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE, and the HaveEnhancedPAC2() function returning FALSE.
0b0011	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.
0b0100	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT\_PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

FEAT\_PAuth2 implements the functionality added by the value 0b0011.

FEAT\_FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID\_AA64ISAR1\_EL1.APA is non-zero, this field must have the value 0b0000.

#### APA, bits [7:4]

Indicates whether QARMA or Architected algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

APA	Meaning
0b0000	Address Authentication using an Architected algorithm is not implemented.
0b0001	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE.
0b0011	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0100	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT\_PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

FEAT\_PAuth2 implements the functionality added by the value 0b0011.

FEAT\_FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of the ID\_AA64ISAR1\_EL1.API is non-zero, this field must have the value 0b0000.

#### DPB, bits [3:0]

Data Persistence writeback. Indicates support for the [DC CVAP](#) and [DC CVADP](#) instructions in AArch64 state. Defined values are:

DPB	Meaning
0b0000	<a href="#">DC CVAP</a> not supported.
0b0001	<a href="#">DC CVAP</a> supported.
0b0010	<a href="#">DC CVAP</a> and <a href="#">DC CVADP</a> supported.

All other values are reserved.

FEAT\_DPB implements the functionality identified by the value 0b0001.

FEAT\_DPB2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0001 and 0b0010.

## Accessing the ID\_AA64ISAR1\_EL1

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, ID\_AA64ISAR1\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented("FEAT_IDST") then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64ISAR1_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_AA64ISAR1_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_AA64ISAR1_EL1;

```

From Armv8.5, the only permitted value is 0b0010.

## Accessing the ID\_AA64ISAR1\_EL1

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, ID\_AA64ISAR1\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64ISAR1_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_AA64ISAR1_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_AA64ISAR1_EL1;

```

# ID\_AA64ISAR2\_EL1, AArch64 Instruction Set Attribute Register 2

The ID\_AA64ISAR2\_EL1 characteristics are:

## Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see Principles of the ID scheme for fields in ID registers.

## Configuration

This register is present only from Armv8.7. Otherwise, direct accesses to ID\_AA64ISAR2\_EL1 are UNDEFINED.

## Attributes

ID\_AA64ISAR2\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64ISAR2\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																RES0								RPRES				WFxT			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:8]

Reserved, RES0.

### RPRES, bits [7:4]

When [FPCR.AH](#) is 1, indicates support for 12 bits of mantissa in reciprocal and reciprocal square root instructions in AArch64 state. Defined values are:

RPRES	Meaning
0b0000	Reciprocal and reciprocal square root estimates give 8 bits of mantissa.
0b0001	Reciprocal and reciprocal square root estimates give 12 bits of mantissa.

All other values are reserved.

FEAT\_RPRES implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

### WFxT, bits [3:0]

Indicates support for the WFET and WFIT instructions in AArch64 state. Defined values are:

Wfxt	Meaning
0b0000	WFET and WFIT are not supported.
0b0001	WFET and WFIT are supported.

All other values are reserved.

FEAT\_Wfxt implements the functionality identified by the value 0b0001.

From Armv8.7, the only permitted value is 0b0001.

## Accessing the ID\_AA64ISAR2\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_AA64ISAR2\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64ISAR2_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_AA64ISAR2_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_AA64ISAR2_EL1;

```

The ID\_AA64MMFR0\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

There are no configuration notes.

## Attributes

ID\_AA64MMFR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64MMFR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ECV				FGT				RES0								ExS				TGran4_2				TGran64_2				TGran16_2			
TGran4				TGran64				TGran16				BigEndEL0				SNSMem				BigEnd				ASIDBits				PARange			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ECV, bits [63:60]

Indicates presence of Enhanced Counter Virtualization. Defined values are:

ECV	Meaning
0b0000	Enhanced Counter Virtualization is not implemented.
0b0001	Enhanced Counter Virtualization is implemented. Supports <a href="#">CINTHCTL_EL2</a> .{EL1TVT, EL1TVCT, EL1NVPCT, EL1NVVCT, EVNTIS}, <a href="#">CINTKCTL_EL1</a> .EVNTIS, <a href="#">CINTPCTSS_EL0</a> counter views, and <a href="#">CINTVCTSS_EL0</a> counter views. Extends the <a href="#">PMSCR_EL1</a> .PCT, <a href="#">PMSCR_EL2</a> .PCT, <a href="#">TRFCR_EL1</a> .TS, and <a href="#">TRFCR_EL2</a> .TS fields.
0b0010	As 0b0001, and also includes support for <a href="#">CINTHCTL_EL2</a> .ECV and <a href="#">CINTPOFF_EL2</a> .

All other values are reserved.

FEAT\_ECV implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.6, the only permitted values are 0b0001 and 0b0010.

**FGT, bits [59:56]**

Indicates presence of the Fine-Grained Trap controls:

- If EL2 is implemented, the [HAFGRTR\\_EL2](#), [HDFGRTR\\_EL2](#), [HDFGWTR\\_EL2](#), [HFGRTR\\_EL2](#), [HFGITR\\_EL2](#) and [HFGWTR\\_EL2](#) registers, and their associated traps.

- **MDCR\_EL2**.If **TDCC** EL2 is implemented, and **MDCR\_EL2**.**MDCR\_EL3**.TDCC.
- **SCR\_EL3**.If EL3 is implemented, **MDCR\_EL3**.TDCC.**FGTE**n.
- If both EL2 and EL3 are implemented, **SCR\_EL3**.FGTEn.

Defined values are:

FGT	Meaning
0b0000	The fine-grained trap controls are not implemented.
0b0001	The fine-grained trap controls are <b>implemented</b> . <b>implemented</b> and can generate fine-grained traps of EL1 and EL0 functionality.

All other values are reserved.

FEAT\_FGT implements the functionality identified by the value 0b0001.

From Armv8.6, the only permitted value is 0b0001.

## Bits [55:48]

Reserved, RES0.

## ExS, bits [47:44]

Indicates support for disabling context synchronizing exception entry and exit. Defined values are:

ExS	Meaning
0b0000	All exception entries and exits are context synchronization events.
0b0001	Non-context synchronizing exception entry and exit are supported.

All other values are reserved.

FEAT\_ExS implements the functionality identified by the value 0b0001.

## TGran4\_2, bits [43:40]

Indicates support for 4KB memory granule size at stage 2. Defined values are:

TGran4_2	Meaning	Applies when
0b0000	Support for 4KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran4 field.	
0b0001	4KB granule not supported at stage 2.	
0b0010	4KB granule supported at stage 2.	
<b>0b0011</b>	<b>4KB granule at stage 2 supports 52-bit input and output addresses.</b>	<b>When FEAT_LPA2 is implemented</b>

All other values are reserved.

The 0b0000 value is deprecated.

## TGran64\_2, bits [39:36]

Indicates support for 64KB memory granule size at stage 2. Defined values are:

TGran64_2	Meaning
0b0000	Support for 64KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran64 field.
0b0001	64KB granule not supported at stage 2.
0b0010	64KB granule supported at stage 2.

All other values are reserved.

The 0b0000 value is deprecated.

### TGran16\_2, bits [35:32]

Indicates support for 16KB memory granule size at stage 2. Defined values are:

TGran16_2	Meaning	Applies when
0b0000	Support for 16KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran16 field.	
0b0001	16KB granule not supported at stage 2.	
0b0010	16KB granule supported at stage 2.	
0b0011	16KB granule at stage 2 supports 52-bit input and output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

The 0b0000 value is deprecated.

### TGran4, bits [31:28]

Indicates support for 4KB memory translation granule size. Defined values are:

TGran4	Meaning	Applies when
0b0000	4KB granule supported.	
0b0001	4KB granule supports 52-bit input and output addresses.	When FEAT_LPA2 is implemented
0b1111	4KB granule not supported.	

All other values are reserved.

### TGran64, bits [27:24]

Indicates support for 64KB memory translation granule size. Defined values are:

TGran64	Meaning
0b0000	64KB granule supported.
0b1111	64KB granule not supported.

All other values are reserved.

### TGran16, bits [23:20]

Indicates support for 16KB memory translation granule size. Defined values are:

TGran16	Meaning	Applies when
0b0000	16KB granule not supported.	
0b0001	16KB granule supported.	
0b0010	16KB granule supports 52-bit input and output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

### BigEndEL0, bits [19:16]

Indicates support for mixed-endian at EL0 only. Defined values are:

BigEndEL0	Meaning
0b0000	No mixed-endian support at EL0. The <a href="#">SCTLR_EL1.E0E</a> bit has a fixed value.
0b0001	Mixed-endian support at EL0. The <a href="#">SCTLR_EL1.E0E</a> bit can be configured.

All other values are reserved.

This field is invalid and is RES0 if ID\_AA64MMFR0\_EL1.BigEnd is not 0b0000.

### SNSMem, bits [15:12]

Indicates support for a distinction between Secure and Non-secure Memory. Defined values are:

SNSMem	Meaning
0b0000	Does not support a distinction between Secure and Non-secure Memory.
0b0001	Does support a distinction between Secure and Non-secure Memory.

#### Note

If EL3 is implemented, the value 0b0000 is not permitted.

All other values are reserved.

### BigEnd, bits [11:8]

Indicates support for mixed-endian configuration. Defined values are:

BigEnd	Meaning
0b0000	No mixed-endian support. The 'SCTLR_ELx'.EE bits have a fixed value. See the BigEndEL0 field, bits[19:16], for whether EL0 supports mixed-endian.
0b0001	Mixed-endian support. The 'SCTLR_ELx'.EE and <a href="#">SCTLR_EL1.E0E</a> bits can be configured.

All other values are reserved.

### ASIDBits, bits [7:4]

Number of ASID bits. Defined values are:

ASIDBits	Meaning
0b0000	8 bits.
0b0010	16 bits.

All other values are reserved.

### PARange, bits [3:0]

Physical Address range supported. Defined values are:

PARange	Meaning
0b0000	32 bits, 4GB.
0b0001	36 bits, 64GB.
0b0010	40 bits, 1TB.
0b0011	42 bits, 4TB.
0b0100	44 bits, 16TB.
0b0101	48 bits, 256TB.
0b0110	52 bits, 4PB.

All other values are reserved.

The value 0b0110 is permitted only if the implementation includes FEAT\_LPA, otherwise it is reserved.

## Accessing the ID\_AA64MMFR0\_EL1

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, ID\_AA64MMFR0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented("FEAT_IDST") then
        if EL2Enabled() && HCR_EL2.TGE == '1' then

# ID\_AA64MMFR1\_EL1, AArch64 Memory Model Feature Register 1

The ID\_AA64MMFR1\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

There are no configuration notes.

## Attributes

ID\_AA64MMFR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64MMFR1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																AFPETS				HCXTWED				ETS				TWED			
XNX				SpecSEI				PAN				LO				HPDS				VH				VMIDBits				HAFDBS			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:40]

### Bits [63:48]

Reserved, RES0.

### AFP, bits [47:44]

Indicates support for FPCR.{AH, FIZ, NEP}. Defined values are:

AFP	Meaning
0b0000	The FPCR.{AH, FIZ, NEP} fields are not supported.
0b0001	The FPCR.{AH, FIZ, NEP} fields are supported.

All other values are reserved.

FEAT\_AFP implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

### HCX, bits [43:40]

Indicates support for HCRX\_EL2 and its associated EL3 trap. Defined values are:

HCX	Meaning
0b0000	HCRX_EL2 and its associated EL3 trap are not supported.
0b0001	HCRX_EL2 and its associated EL3 trap are supported.

All other values are reserved.

FEAT\_HCX implements the functionality identified by the value 0b0001.

From Armv8.7, if EL2 is implemented, the only permitted value is 0b0001.

### ETS, bits [39:36]

Indicates support for Enhanced Translation Synchronization. Defined values are:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is supported.

All other values are reserved.

FEAT\_ETS implements the functionality identified by the value 0b0001.

In From Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

### TWED, bits [35:32]

Indicates support for the configurable delayed trapping of WFE. Defined values are:

TWED	Meaning
0b0000	Configurable delayed trapping of WFE is not supported.
0b0001	Configurable delayed trapping of WFE is supported.

All other values are reserved.

FEAT\_TWED implements the functionality identified by the value 0b0001.

From Armv8.6, the permitted values are 0b0000 and 0b0001.

### XNX, bits [31:28]

Indicates support for execute-never control distinction by Exception level at stage 2. Defined values are:

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT\_XNX implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

### SpecSEI, bits [27:24]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

SpecSEI	Meaning
0b0000	The PE never generates an SError interrupt due to an External abort on a speculative read.
0b0001	The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

## PAN, bits [23:20]

Privileged Access Never. Indicates support for the PAN bit in PSTATE, [SPSR\\_EL1](#), [SPSR\\_EL2](#), [SPSR\\_EL3](#), and [DPSR\\_EL0](#). Defined values are:

PAN	Meaning
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and <a href="#">AT S1E1RP</a> and <a href="#">AT S1E1WP</a> instructions supported.
0b0011	PAN supported, <a href="#">AT S1E1RP</a> and <a href="#">AT S1E1WP</a> instructions supported, and <a href="#">SCTLR_EL1.EPAN</a> and <a href="#">SCTLR_EL2.EPAN</a> bits supported.

All other values are reserved.

FEAT\_PAN implements the functionality identified by the value 0b0001.

FEAT\_PAN2 implements the functionality added by the value 0b0010.

FEAT\_PAN3 implements the functionality added by the value 0b0011.

In Armv8.1, the permitted values are 0b0001 and 0b0011.

From Armv8.2, the permitted values are 0b0010 and 0b0011.

From Armv8.7, the only permitted value is 0b0011.

## LO, bits [19:16]

LORegions. Indicates support for LORegions. Defined values are:

LO	Meaning
0b0000	LORegions not supported.
0b0001	LORegions supported.

All other values are reserved.

FEAT\_LOR implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

## HPDS, bits [15:12]

Hierarchical Permission Disables. Indicates support for disabling hierarchical controls in translation tables. Defined values are:

HPDS	Meaning
0b0000	Disabling of hierarchical controls not supported.
0b0001	Disabling of hierarchical controls supported with the <a href="#">TCR_EL1</a> .{HPD1, HPD0}, <a href="#">TCR_EL2</a> .HPD or <a href="#">TCR_EL2</a> .{HPD1, HPD0}, and <a href="#">TCR_EL3</a> .HPD bits.
0b0010	As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

FEAT\_HPDS implements the functionality identified by the value 0b0001.

FEAT\_HPDS2 implements the functionality identified by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

**VH, bits [11:8]**

Virtualization Host Extensions. Defined values are:

<b>VH</b>	<b>Meaning</b>
0b0000	Virtualization Host Extensions not supported.
0b0001	Virtualization Host Extensions supported.

All other values are reserved.

FEAT\_VHE implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

**VMIDBits, bits [7:4]**

Number of VMID bits. Defined values are:

<b>VMIDBits</b>	<b>Meaning</b>
0b0000	8 bits
0b0010	16 bits

All other values are reserved.

FEAT\_VMID16 implements the functionality identified by the value 0b0010.

From Armv8.1, the permitted values are 0b0000 and 0b0010.

**HAFDBS, bits [3:0]**

Hardware updates to Access flag and Dirty state in translation tables. Defined values are:

<b>HAFDBS</b>	<b>Meaning</b>
0b0000	Hardware update of the Access flag and dirty state are not supported.
0b0001	Hardware update of the Access flag is supported.
0b0010	Hardware update of both the Access flag and dirty state is supported.

All other values are reserved.

FEAT\_HAFDBS implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.1, the permitted values are 0b0000, 0b0001, and 0b0010.

**Accessing the ID\_AA64MMFR1\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, ID\_AA64MMFR1\_EL1

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b11	0b000	0b0000	0b0111	0b001

# ID\_AA64MMFR2\_EL1, AArch64 Memory Model Feature Register 2

The ID\_AA64MMFR2\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

### Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

## Attributes

ID\_AA64MMFR2\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64MMFR2\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
EOPD				EVT				BBM				TTL				RES0				FWB				IDS				AT			
ST				NV				CCIDX				VARange				IESB				LSM				UAO				CnP			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### EOPD, bits [63:60]

Indicates support for the EOPD mechanism. Defined values are:

EOPD	Meaning
0b0000	EOPDx mechanism is not implemented.
0b0001	EOPDx mechanism is implemented.

All other values are reserved.

FEAT\_EOPD implements the functionality identified by the value 0b0001.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT\_EOPD is implemented, FEAT\_CSV3 must be implemented.

### EVT, bits [59:56]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the [HCR\\_EL2](#).{TTLBOS, TLBIS, TOCU, TICAB, TID4} traps. Defined values are:

<b>EVT</b>	<b>Meaning</b>
0b0000	<a href="#">HCR_EL2</a> .{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	<a href="#">HCR_EL2</a> .{TOCU, TICAB, TID4} traps are supported.
0b0010	<a href="#">HCR_EL2</a> .{TTLBOS, TTLBIS} traps are not supported.
0b0010	<a href="#">HCR_EL2</a> .{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

FEAT\_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

## BBM, bits [55:52]

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block size for a translation.

<b>BBM</b>	<b>Meaning</b>
0b0000	Level 0 support for changing block size is supported.
0b0001	Level 1 support for changing block size is supported.
0b0010	Level 2 support for changing block size is supported.

All other values are reserved.

FEAT\_BBM implements the functionality identified by the values 0b0000, 0b0001, and 0b0010.

From Armv8.4, the permitted values are 0b0000, 0b0001, and 0b0010.

## TTL, bits [51:48]

Indicates support for TTL field in address operations. Defined values are:

<b>TTL</b>	<b>Meaning</b>
0b0000	TLB maintenance instructions by address have bits[47:44] as RES0.
0b0001	TLB maintenance instructions by address have bits[47:44] holding the TTL field.

All other values are reserved.

FEAT\_TTL implements the functionality identified by the value 0b0001.

This field affects [TLBI IPAS2E1](#), [TLBI IPAS2E1IS](#), [TLBI IPAS2E1OS](#), [TLBI IPAS2LE1](#), [TLBI IPAS2LE1IS](#), [TLBI IPAS2LE1OS](#), [TLBI VAAE1](#), [TLBI VAAE1IS](#), [TLBI VAAE1OS](#), [TLBI VAAE1IS](#), [TLBI VAAE1OS](#), [TLBI VAE1](#), [TLBI VAE1IS](#), [TLBI VAE1OS](#), [TLBI VAE2](#), [TLBI VAE2IS](#), [TLBI VAE2OS](#), [TLBI VAE3](#), [TLBI VAE3IS](#), [TLBI VAE3OS](#), [TLBI VALE1](#), [TLBI VALE1IS](#), [TLBI VALE1OS](#), [TLBI VALE2](#), [TLBI VALE2IS](#), [TLBI VALE2OS](#), [TLBI VALE3](#), [TLBI VALE3IS](#), [TLBI VALE3OS](#).

From Armv8.4, the only permitted value is 0b0001.

## Bits [47:44]

Reserved, RES0.

## FWB, bits [43:40]

Indicates support for [HCR\\_EL2](#).FWB. Defined values are:

<b>FWB</b>	<b>Meaning</b>
0b0000	<a href="#">HCR_EL2</a> .FWB bit is not supported.
0b0001	<a href="#">HCR_EL2</a> .FWB is supported.

All other values reserved.

FEAT\_S2FWB implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

## IDS, bits [39:36]

Indicates the value of ESR\_ELx.EC that reports an exception generated by a read access to the feature ID space. Defined values are:

<b>IDS</b>	<b>Meaning</b>
0b0000	An exception which is generated by a read access to the feature ID space, other than a trap caused by <a href="#">HCR_EL2</a> .TIDx, <a href="#">SCTLR_EL1</a> .UCT, or <a href="#">SCTLR_EL2</a> .UCT, is reported by ESR_ELx.EC == 0x0.
0b0001	All exceptions generated by an AArch64 read access to the feature ID space are reported by ESR_ELx.EC == 0x18.

All other values are reserved.

The Feature ID space is defined as the System register space in AArch64 with op0==3, op1=={0, 1, 3}, CRn==0, CRm=={0-7}, op2=={0-7}.

FEAT\_IDST implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

## AT, bits [35:32]

Identifies support for unaligned single-copy atomicity and atomic functions. Defined values are:

<b>AT</b>	<b>Meaning</b>
0b0000	Unaligned single-copy atomicity and atomic functions are not supported.
0b0001	Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.

All other values are reserved.

FEAT\_LSE2 implements the functionality identified by the value 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

## ST, bits [31:28]

Identifies support for small translation tables. Defined values are:

<b>ST</b>	<b>Meaning</b>
0b0000	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 39.
0b0001	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.

All other values are reserved.

FEAT\_TTST implements the functionality identified by the value 0b0001.

If FEAT\_SEL2 is implemented, the only permitted value is 0b0001.

In an implementation which does not support FEAT\_SEL2, the permitted values are 0b0000 and 0b0001.

**NV, bits [27:24]**

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are:

NV	Meaning
0b0000	Nested virtualization is not supported.
0b0001	The HCR_EL2.NV, HCR_EL2.NV1, HCR_EL2.AT bits are implemented.
0b0010	The <a href="#">VNCR_EL2</a> register and the HCR_EL2.{AT, NV, NV1, NV2} bits are implemented.

All other values are reserved.

If EL2 is not implemented, the only permitted value is 0b0000.

FEAT\_NV implements the functionality identified by the value 0b0001.

FEAT\_NV2 implements the functionality identified by the value 0b0010.

In Armv8.3, if EL2 is implemented, the permitted values are 0b0000 and 0b0001.

From Armv8.4, if EL2 is implemented, the permitted values are 0b0000, 0b0001, and 0b0010.

**CCIDX, bits [23:20]**

Support for the use of revised [CCSIDR\\_EL1](#) register format. Defined values are:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR_EL1.
0b0001	64-bit format implemented for all levels of the CCSIDR_EL1.

All other values are reserved.

FEAT\_CCIDX implements the functionality identified by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

**VARange, bits [19:16]**

Indicates support for a larger virtual address. Defined values are:

VARange	Meaning
0b0000	VMSAv8-64 supports 48-bit VAs.
0b0001	VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The other translation granules support 48-bit VAs.

All other values are reserved.

FEAT\_LVA implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**IESB, bits [15:12]**

Indicates support for the IESB bit in the SCTLR\_ELx registers. Defined values are:

IESB	Meaning
0b0000	IESB bit in the SCTLR_ELx registers is not supported.
0b0001	IESB bit in the SCTLR_ELx registers is supported.

All other values are reserved.

FEAT\_IESB implements the functionality identified by the value 0b0001.

LSM, bits [11:8]

Indicates support for LSMAOE and nTLSMD bits in [SCTLR\\_EL1](#) and [SCTLR\\_EL2](#). Defined values are:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT\_LSMAOC implements the functionality identified by the value 0b0001.

UAO, bits [7:4]

User Access Override. Defined values are:

UAO	Meaning
0b0000	UAO not supported.
0b0001	UAO supported.

All other values are reserved.

FEAT\_UAO implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

CnP, bits [3:0]

Indicates support for Common not Private translations. Defined values are:

CnP	Meaning
0b0000	Common not Private translations not supported.
0b0001	Common not Private translations supported.

All other values are reserved.

FEAT\_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Accessing the ID\_AA64MMFR2\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_AA64MMFR2\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented("FEAT_IDST") then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then

**CSV2, bits [59:56]**

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	This Device does not disclose whether branch targets trained in one hardware described context can affect speculative execution in a different hardware described context.
0b0001	Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way. Contexts do not include the SCXTNUM_ELx register contexts, and these registers are not supported.
0b0010	Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way. Contexts include the SCXTNUM_ELx register contexts, and these registers are supported.

From Armv8.5, the only permitted values are 0b0001 or 0b0010.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

**Bits [55:52]**

Reserved, RES0.

**DIT, bits [51:48]**

Data Independent Timing. Defined values are:

DIT	Meaning
0b0000	AArch64 does not guarantee constant execution time of any instructions.
0b0001	AArch64 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT\_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

**AMU, bits [47:44]**

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT\_AMUv1 implements the functionality identified by the value 0b0001.

FEAT\_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

### MPAM, bits [43:40]

Indicates support for MPAM Extension. Defined values are:

MPAM	Meaning
0b0000	If <a href="#">ID_AA64PFR1_EL1</a> .MPAM_frac == 0b0000, MPAM Extension is not implemented.
	If <a href="#">ID_AA64PFR1_EL1</a> .MPAM_frac == 0b0001, MPAM Extension version 0.1 is implemented.
0b0001	If <a href="#">ID_AA64PFR1_EL1</a> .MPAM_frac == 0b0000, MPAM Extension version 1.0 is implemented.
	If <a href="#">ID_AA64PFR1_EL1</a> .MPAM_frac == 0b0001, MPAM Extension version 1.1 is implemented.

All other values are reserved.

### SEL2, bits [39:36]

Secure EL2. Defined values are:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

All other values are reserved.

FEAT\_SEL2 implements the functionality identified by the value 0b0001.

### SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

SVE	Meaning
0b0000	SVE architectural state and programmers' model are not implemented.
0b0001	SVE architectural state and programmers' model are implemented.

All other values are reserved.

If implemented, refer to [ID\\_AA64ZFR0\\_EL1](#) for information about which SVE instructions are available.

### RAS, bits [31:28]

RAS Extension version. Defined values are:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	RAS Extension present.
0b0010	FEAT_RASv1p1 present. As 0b0001, and adds support for: <ul style="list-style-type: none"> <li>If EL3 is implemented, FEAT_DoubleFault.</li> <li>Additional ERXMISC&lt;m&gt;_EL1 System registers.</li> <li>Additional System registers <a href="#">ERXPFGCDN_EL1</a>, <a href="#">ERXPFGCTL_EL1</a>, and <a href="#">ERXPFGF_EL1</a>, and the <a href="#">SCR_EL3</a>.FIEN and <a href="#">HCR_EL2</a>.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension.</li> </ul> Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to <a href="#">ERR&lt;n&gt;STATUS</a> and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

FEAT\_RAS implements the functionality identified by the value 0b0001.

FEAT\_RASv1p1 and FEAT\_DoubleFault implement the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT\_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT\_DoubleFault is not implemented, and [ERRIDR\\_EL1.NUM](#) is zero, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010. Otherwise from Armv8.4, the only permitted value is 0b0010.

From Armv8.4, when FEAT\_DoubleFault is not implemented, and [ERRIDR\\_EL1](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

#### Note

When the value of this field is 0b0001, [ID\\_AA64PFR1\\_EL1.RAS\\_frac](#) indicates whether FEAT\_RASv1p1 is implemented.

### GIC, bits [27:24]

System register GIC CPU interface. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

### AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following Sisd and SIMD operations: <ul style="list-style-type: none"> <li>Integer byte, halfword, word and doubleword element operations.</li> <li>Single-precision and double-precision floating-point arithmetic.</li> <li>Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.</li> </ul>
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support that does not include the FEAT\_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support that includes the FEAT\_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

### FP, bits [19:16]

Floating-point. Defined values are:

FP	Meaning
0b0000	Floating-point is implemented, and includes support for: <ul style="list-style-type: none"> <li>Single-precision and double-precision floating-point types.</li> <li>Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.</li> </ul>
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support that does not include the FEAT\_FP16 extension.
- 0b0001 in an implementation with floating-point support that includes the FEAT\_FP16 extension.
- 0b1111 in an implementation without floating-point support.

### EL3, bits [15:12]

EL3 Exception level handling. Defined values are:

EL3	Meaning
0b0000	EL3 is not implemented.
0b0001	EL3 can be executed in AArch64 state only.
0b0010	EL3 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

### EL2, bits [11:8]

EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

### EL1, bits [7:4]

EL1 Exception level handling. Defined values are:

EL1	Meaning
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

### EL0, bits [3:0]

EL0 Exception level handling. Defined values are:

EL0	Meaning
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

## Accessing the ID\_AA64PFR0\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_AA64PFR0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented("FEAT_IDST") then

# ID\_AA64PFR1\_EL1, AArch64 Processor Feature Register 1

The ID\_AA64PFR1\_EL1 characteristics are:

## Purpose

Reserved for future expansion of information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

There are no configuration notes.

## Attributes

ID\_AA64PFR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64PFR1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0												MPAM_frac				RAS_frac				MTE				SSBS				BT			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:20]

Reserved, RES0.

### MPAM\_frac, bits [19:16]

MPAM Extension fractional field. Defined values are:

MPAM_frac	Meaning
0b0000	If <a href="#">ID_AA64PFR0_EL1</a> .MPAM == 0b0000, MPAM Extension not implemented. If <a href="#">ID_AA64PFR0_EL1</a> .MPAM == 0b0001, MPAM Extension v1.0 is implemented.
0b0001	If <a href="#">ID_AA64PFR0_EL1</a> .MPAM == 0b0000, implements MPAM v0.1, which is like v1.1 but reduces support for Secure PARTIDs. If <a href="#">ID_AA64PFR0_EL1</a> .MPAM == 0b0001, implements MPAM v1.1 and adds support for <a href="#">MPAM2_EL2</a> .TIDR to provide trapping of <a href="#">MPAMIDR_EL1</a> when <a href="#">MPAMHCR_EL2</a> is not present.

All other values are reserved.

### RAS\_frac, bits [15:12]

RAS Extension fractional field. Defined values are:

RAS_frac	Meaning
0b0000	If <a href="#">ID_AA64PFR0_EL1</a> .RAS == 0b0001, RAS Extension implemented.
0b0001	If <a href="#">ID_AA64PFR0_EL1</a> .RAS == 0b0001, as 0b0000 and adds support for: <ul style="list-style-type: none"> <li>Additional ERXMISC&lt;m&gt;_EL1 System registers.</li> <li>Additional System registers <a href="#">ERXPFPCDN_EL1</a>, <a href="#">ERXPFPCCTL_EL1</a>, and <a href="#">ERXPFPCF_EL1</a>, and the <a href="#">SCR_EL3</a>.FIEN and <a href="#">HCR_EL2</a>.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension.</li> </ul> <p>Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to <a href="#">ERR&lt;n&gt;STATUS</a>, and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.</p>

All other values are reserved.

FEAT\_RASv1p1 implements the functionality identified by the value 0b0001.

This field is valid only if [ID\\_AA64PFR0\\_EL1](#).RAS == 0b0001.

### MTE, bits [11:8]

Support for the Memory Tagging Extension. Defined values are:

MTE	Meaning
0b0000	Memory Tagging Extension is not implemented.
0b0001	Instruction-only Memory Tagging Extension is implemented. Memory Tagging Extension instructions accessible at EL0 are implemented. Instructions and System Registers defined by the extension not configurably accessible at EL0 are Unallocated and other System Register fields defined by the extension are RES0.
0b0010	Full Memory Tagging Extension is implemented.
0b0011	Memory Tagging Extension is implemented with support for asymmetric Tag Check Fault handling.

All other values are reserved.

FEAT\_MTE implements the functionality identified by the value 0b0001.

FEAT\_MTE2 implements When the [ID\\_AA64PFR1\\_EL1](#).MTE functionality identified by the value < 0b0010:

- All register fields added to existing System registers and Special-purpose registers as part of the extension are RES0, and treated as 0.
- The following System registers are UNDEFINED:
  - [GMID\\_EL1](#), [GCR\\_EL1](#), [RGSRR\\_EL1](#), [TFSRE0\\_EL1](#), and [TFSRR\\_ELx](#).
- The following System instructions are UNDEFINED:
  - [DC\\_CGSW](#), [DC\\_CIGSW](#), [DC\\_IGSW](#), [DC\\_CGDSW](#), [DC\\_CIGDSW](#), [DC\\_IGDSW](#), [DC\\_IGVAC](#), and [DC\\_IGDVAC](#).
- The following instructions are UNDEFINED:
  - [LDGM](#), [STGM](#), and [STZGM](#).
- The Tagged memory type encoding in [MAIR\\_ELx](#) is UNPREDICTABLE.

FEAT\_MTE3 implements the functionality identified by the value 0b0011.

In Armv8.5, the permitted values are 0b0000, 0b0001 and 0b0010.

From Armv8.7, the value 0b0001 is not permitted

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

SSBS	Meaning
0b0000	AArch64 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.
0b0010	AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypassing Safe, and the MSR and MRS instructions to directly read and write the PSTATE.SSBS field.

All other values are reserved.

FEAT\_SSBS implements the functionality identified by the value 0b0001.

FEAT\_SSBS2 implements the functionality identified by the value 0b0010.

BT, bits [3:0]

Branch Target Identification mechanism support in AArch64 state. Defined values are:

BT	Meaning
0b0000	The Branch Target Identification mechanism is not implemented.
0b0001	The Branch Target Identification mechanism is implemented.

All other values are reserved.

FEAT\_BTI implements the functionality identified by the value 0b0001.

From Armv8.5, the only permitted value is 0b0001.

Accessing the ID\_AA64PFR1\_EL1

Accesses to this register use the following encodings:

# ID\_AA64ZFR0\_EL1, SVE Feature ID register 0

The ID\_AA64ZFR0\_EL1 characteristics are:

## Purpose

Provides additional information about the implemented features of the AArch64 Scalable Vector Extension, when the [ID\\_AA64PFR0\\_EL1](#).SVE field is not zero.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

### Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

## Attributes

ID\_AA64ZFR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64ZFR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32			
RES0				F64MM				F32MM				RES0				I8MM				RES0														
RES0								BF16				RES0																			SVEver			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			

### Bits [63:60]

Reserved, RES0.

### F64MM, bits [59:56]

Indicates support for SVE FP64 double-precision floating-point matrix multiplication instructions. Defined values are:

F64MM	Meaning
0b0000	FP64 matrix multiplication and related instructions are not implemented.
0b0001	FP64 variant of the FMMLA instruction, and LD1RO* instructions are implemented. The 128-bit element variations of TRN1, TRN2, UZP1, UZP2, ZIP1, and ZIP2 are also implemented.

All other values are reserved.

FEAT\_F64MM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**F32MM, bits [55:52]**

Indicates support for the SVE FP32 single-precision floating-point matrix multiplication instruction. Defined values are:

<b>F32MM</b>	<b>Meaning</b>
0b0000	FP32 matrix multiplication instruction is not implemented.
0b0001	FP32 variant of the FMMLA instruction is implemented.

All other values are reserved.

FEAT\_F32MM implements the functionality identified by 0b0001.

From Arm v8.2, the permitted values are 0b0000 and 0b0001.

**Bits [51:48]**

Reserved, RES0.

**I8MM, bits [47:44]**

Indicates support for SVE Int8 matrix multiplication instructions. Defined values are:

<b>I8MM</b>	<b>Meaning</b>
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.

All other values are reserved.

FEAT\_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID\\_AA64ISAR1\\_EL1](#).I8MM.

From Armv8.6, the only permitted value is 0b0001.

**Bits [43:24]**

Reserved, RES0.

**BF16, bits [23:20]**

Indicates support for SVE BFloat16 instructions. Defined values are:

<b>BF16</b>	<b>Meaning</b>
0b0000	BFloat16 instructions are not implemented.
0b0001	BFCVT, BFCVTNT, BFDOT, BFMLALB, BFMLALT, and BFMMLA instructions are implemented.

All other values are reserved.

FEAT\_BF16 implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID\\_AA64ISAR1\\_EL1](#).BF16.

From **Armv8.6**~~ARMv8.6~~, the only permitted value is 0b0001.

**Bits [19:4]**

Reserved, RES0.

SVEver, bits [3:0]

Indicates Scalable support Vector for Extension SVE instruction version set 2. version. Defined values are:

SVEver	Meaning
0b0000	SVE instructions are implemented.

Accessing the ID\_AA64ZFR0\_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, ID_AA64ZFR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b100

# ID\_AFR0\_EL1, AArch32 Auxiliary Feature Register 0

The ID\_AFR0\_EL1 characteristics are:

## Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_AFR0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_AFR0\[31:0\]](#).

## Attributes

ID\_AFR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AFR0\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

# ID\_DFR0\_EL1, AArch32 Debug Feature Register 0

The ID\_DFR0\_EL1 characteristics are:

## Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_DFR0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_DFR0\[31:0\]](#).

## Attributes

ID\_DFR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_DFR0\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TraceFilt				PerfMon				MProfDbg				MMapTrc				CopTrc				MMapDbg				CopSDBG				CopDbg			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT\_TRF implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

### PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PerfMon	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv1 implemented.
0b0010	Performance Monitors Extension, PMUv2 implemented.
0b0011	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0011, and also includes support for: <ul style="list-style-type: none"> <li>Extended 16-bit <a href="#">PMEVTYPER&lt;n&gt;.evtCount</a> field.</li> <li>If EL2 is implemented, the <a href="#">HDCR.HPMD</a> control bit.</li> </ul>
0b0101	PMUv3 for Armv8.4. As 0b0100, and also includes support for the <a href="#">PMMIR</a> register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and also includes support for: <ul style="list-style-type: none"> <li>64-bit event counters.</li> <li>If EL2 is implemented, the <a href="#">HDCR.HCCD</a> control bit.</li> <li>If EL3 is implemented, the <a href="#">MDCR_EL3.SCCD</a> control bit.</li> </ul>
0b0111	PMUv3 for Armv8.7. As 0b0110, and also includes support for: <ul style="list-style-type: none"> <li>The <a href="#">PMCR.FZO</a> and, if EL2 is implemented, <a href="#">HDCR.HPMFZO</a> control bits.</li> <li>If EL3 is implemented, the <a href="#">MDCR_EL3.{MPMX,MCCD}</a> control bits.</li> </ul>
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT\_PMUv3 implements the functionality identified by the value 0b0011.

FEAT\_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT\_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT\_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT\_PMUv3p7 implements the functionality identified by the value 0b0111.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT\_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT\_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT\_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT\_PMUv3 is implemented, the value 0b0110 is not permitted.

#### Note

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

## MProfDbg, bits [23:20]

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

MProfDbg	Meaning
0b0000	Not supported.
0b0001	Support for M profile Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### MMapTrc, bits [19:16]

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

MMapTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

### CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

CopTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with System registers access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

### MMapDbg, bits [11:8]

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In Armv8-A, this field is RES0.

The optional memory map defined by Armv8 is not compatible with Armv7.

### CopSDBG, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

### CopDbg, bits [3:0]

Support for System registers-based debug model, using registers in the coproc == 0b1110 encoding space, for A and R profile processors. Defined values are:

CopDbg	Meaning
0b0000	Not supported.
0b0010	Support for Armv6, v6 Debug architecture, with System registers access.
0b0011	Support for Armv6, v6.1 Debug architecture, with System registers access.
0b0100	Support for Armv7, v7 Debug architecture, with System registers access.
0b0101	Support for Armv7, v7.1 Debug architecture, with System registers access.
0b0110	Support for Armv8 debug architecture, with System registers access.
0b0111	Support for Armv8 debug architecture, with System registers access, and Virtualization Host Extensions.
0b1000	Support for Armv8.2 debug architecture.
0b1001	Support for Armv8.4 debug architecture.

All other values are reserved.

FEAT\_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT\_Debugv8p4 adds the functionality identified by the value 0b1001.

In Armv8.0, the only permitted value is 0b0110.

In Armv8.1, the only permitted value is 0b0111.

In Armv8.2, the only permitted value is 0b1000.

From Armv8.4, the only permitted value is 0b1001.

## Otherwise:

# ID\_DFR1\_EL1, Debug Feature Register 1

The ID\_DFR1\_EL1 characteristics are:

## Purpose

Provides top level information about the debug system in AArch32.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_DFR1\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_DFR1\[31:0\]](#).

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

## Attributes

ID\_DFR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_DFR1\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32																
																RES0																															
RES0																																MTPMU															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																

#### Bits [63:4]

Reserved, RES0.

#### MTPMU, bits [3:0]

Multi-threaded PMU extension. Defined values are:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION_DEFINED whether PMUv3 is read/write or RES0.
0b0001	FEAT_MTPMU implemented and FEAT_PMUv3 implemented. PMUv3 is read/write. When FEAT_MTPMU is disabled, the Effective values of PMUv3 are 0.
0b1111	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMUv3 are RES0.

All other values are reserved.

FEAT\_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, an implementation that includes FEAT\_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT\_PMUv3, the value 0b0001 is not permitted.

## Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN

# ID\_ISAR0\_EL1, AArch32 Instruction Set Attribute Register 0

The ID\_ISAR0\_EL1 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), [ID\\_ISAR4\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_ISAR0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_ISAR0\[31:0\]](#).

## Attributes

ID\_ISAR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_ISAR0\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0				Divide				Debug				Coprocc				CmpBranch				BitField				BitCount				Swap			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:28]

Reserved, RES0.

### Divide, bits [27:24]

Indicates the implemented Divide instructions. Defined values are:

Divide	Meaning
0b0000	None implemented.
0b0001	Adds SDIV and UDIV in the T32 instruction set.
0b0010	As for 0b0001, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**Debug, bits [23:20]**

Indicates the implemented Debug instructions. Defined values are:

Debug	Meaning
0b0000	None implemented.
0b0001	Adds BKPT.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Coproc, bits [19:16]**

Indicates the implemented System register access instructions. Defined values are:

Coproc	Meaning
0b0000	None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.
0b0001	Adds generic CDP, LDC, MCR, MRC, and STC.
0b0010	As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.
0b0011	As for 0b0010, and adds generic MCRR and MRRC.
0b0100	As for 0b0011, and adds generic MCRR2 and MRRC2.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**CmpBranch, bits [15:12]**

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

CmpBranch	Meaning
0b0000	None implemented.
0b0001	Adds CBNZ and CBZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**BitField, bits [11:8]**

Indicates the implemented BitField instructions. Defined values are:

BitField	Meaning
0b0000	None implemented.
0b0001	Adds BFC, BFI, SBFX, and UBFX.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**BitCount, bits [7:4]**

Indicates the implemented Bit Counting instructions. Defined values are:

BitCount	Meaning
0b0000	None implemented.
0b0001	Adds CLZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Swap, bits [3:0]**

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

Swap	Meaning
0b0000	None implemented.
0b0001	Adds SWP and SWPB.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**Otherwise:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:0]**

Reserved, UNKNOWN.

**Accessing the ID\_ISAR0\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, ID\_ISAR0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b000

```

if PSTATE.EL == EL0 then

# ID\_ISAR1\_EL1, AArch32 Instruction Set Attribute Register 1

The ID\_ISAR1\_EL1 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), [ID\\_ISAR4\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_ISAR1\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_ISAR1\[31:0\]](#).

## Attributes

ID\_ISAR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_ISAR1\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
<a href="#">Jazelle</a>				<a href="#">Interwork</a>				<a href="#">Immediate</a>				<a href="#">IfThen</a>				<a href="#">Extend</a>				<a href="#">Except_AR</a>				<a href="#">Except</a>				<a href="#">Endian</a>			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions. Defined values are:

Jazelle	Meaning
0b0000	No support for Jazelle.
0b0001	Adds the BXJ instruction and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Interwork, bits [27:24]

Indicates the implemented Interworking instructions. Defined values are:

Interwork	Meaning
0b0000	None implemented.
0b0001	Adds the BX instruction, and the T bit in the PSR.
0b0010	As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.
0b0011	As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

#### Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

Immediate	Meaning
0b0000	None implemented.
0b0001	Adds: <ul style="list-style-type: none"> <li>The MOVT instruction.</li> <li>The MOV instruction encodings with zero-extended 16-bit immediates.</li> <li>The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

#### IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

IfThen	Meaning
0b0000	None implemented.
0b0001	Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

#### Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

Extend	Meaning
0b0000	No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.
0b0001	Adds the SXTB, SXTH, UXTB, and UXTH instructions.
0b0010	As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

#### Except\_AR, bits [11:8]

Indicates the implemented A and R profile exception-handling instructions. Defined values are:

Except_AR	Meaning
0b0000	None implemented.
0b0001	Adds the SRS and RFE instructions, and the A and R profile forms of the CPS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:

Except	Meaning
0b0000	Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.
0b0001	Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Endian, bits [3:0]

Indicates the implemented Endian instructions. Defined values are:

Endian	Meaning
0b0000	None implemented.
0b0001	Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

### Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# ID\_ISAR2\_EL1, AArch32 Instruction Set Attribute Register 2

The ID\_ISAR2\_EL1 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR3\\_EL1](#), [ID\\_ISAR4\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_ISAR2\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_ISAR2\[31:0\]](#).

## Attributes

ID\_ISAR2\_EL1 is a 64-bit register.

## Field descriptions

The ID\_ISAR2\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Reversal				PSR_AR				MultU				MultS				Mult				MultiAccessInt				MemHint				LoadStore			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### Reversal, bits [31:28]

Indicates the implemented Reversal instructions. Defined values are:

Reversal	Meaning
0b0000	None implemented.
0b0001	Adds the REV, REV16, and REVSH instructions.
0b0010	As for 0b0001, and adds the RBIT instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

### PSR\_AR, bits [27:24]

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:

PSR_AR	Meaning
0b0000	None implemented.
0b0001	Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

### MultiU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

MultiU	Meaning
0b0000	None implemented.
0b0001	Adds the UMULL and UMLAL instructions.
0b0010	As for 0b0001, and adds the UMAAL instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

### MultiS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions. Defined values are:

MultiS	Meaning
0b0000	None implemented.
0b0001	Adds the SMULL and SMLAL instructions.
0b0010	As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
0b0011	As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLS LD, SMLS LD, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSD X instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

### Multi, bits [15:12]

Indicates the implemented additional Multiply instructions. Defined values are:

Multi	Meaning
0b0000	No additional instructions implemented. This means only MUL is implemented.
0b0001	Adds the MLA instruction.
0b0010	As for 0b0001, and adds the MLS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

### MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions. Defined values are:

MultiAccessInt	Meaning
0b0000	No support. This means the LDM and STM instructions are not interruptible.
0b0001	LDM and STM instructions are restartable.
0b0010	LDM and STM instructions are continuable.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:

MemHint	Meaning
0b0000	None implemented.
0b0001	Adds the PLD instruction.
0b0010	Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)
0b0011	As for 0b0001 (or 0b0010), and adds the PLI instruction.
0b0100	As for 0b0011, and adds the PLDW instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

### LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

LoadStore	Meaning
0b0000	No additional load/store instructions implemented.
0b0001	Adds the LDRD and STRD instructions.
0b0010	As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

## Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
UNKNOWN																															

### Bits [63:0]

Reserved, UNKNOWN.

# ID\_ISAR3\_EL1, AArch32 Instruction Set Attribute Register 3

The ID\_ISAR3\_EL1 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR4\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_ISAR3\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_ISAR3\[31:0\]](#).

## Attributes

ID\_ISAR3\_EL1 is a 64-bit register.

## Field descriptions

The ID\_ISAR3\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
T32EE				TrueNOP				T32Copy				TabBranch				SynchPrim				SVC				SIMD				Saturate			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### T32EE, bits [31:28]

Indicates the implemented T32EE instructions. Defined values are:

T32EE	Meaning
0b0000	None implemented.
0b0001	Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions. Defined values are:

TrueNOP	Meaning
0b0000	None implemented. This means there are no NOP instructions that do not have any register dependencies.
0b0001	Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

T32Copy	Meaning
0b0000	Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.
0b0001	Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

TabBranch	Meaning
0b0000	None implemented.
0b0001	Adds the TBB and TBH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### SynchPrim, bits [15:12]

Used in conjunction with ID\_ISAR4.SynchPrim\_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

SynchPrim	Meaning
0b0000	If SynchPrim_frac == 0b0000, no Synchronization Primitives implemented.
0b0001	If SynchPrim_frac == 0b0000, adds the LDREX and STREX instructions.
	If SynchPrim_frac == 0b0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.
0b0010	If SynchPrim_frac == 0b0000, as for [0b0001, 0b0011] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim\_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

### SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

SVC	Meaning
0b0000	Not implemented.
0b0001	Adds the SVC instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:

SIMD	Meaning
0b0000	None implemented.
0b0001	Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
0b0011	As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, [MVFR0](#), [MVFR1](#), and [MVFR2](#) give information about the implemented Advanced SIMD instructions.

### Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

Saturate	Meaning
0b0000	None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
0b0001	Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
														UNKNOWN																							
														UNKNOWN																							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

### Bits [63:0]

Reserved, UNKNOWN.

## Accessing the ID\_ISAR3\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_ISAR3\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b011

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented("FEAT_IDST") then
        if EL2Enabled() && HCR_EL2.TGE == '1' then

# ID\_ISAR4\_EL1, AArch32 Instruction Set Attribute Register 4

The ID\_ISAR4\_EL1 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_ISAR4\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_ISAR4\[31:0\]](#).

## Attributes

ID\_ISAR4\_EL1 is a 64-bit register.

## Field descriptions

The ID\_ISAR4\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
<a href="#">SWP_frac</a>				<a href="#">PSR_M</a>				<a href="#">SynchPrim_frac</a>				<a href="#">Barrier</a>				<a href="#">SMC</a>				<a href="#">Writeback</a>				<a href="#">WithShifts</a>				<a href="#">Unpriv</a>			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### SWP\_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

SWP_frac	Meaning
0b0000	SWP or SWPB instructions not implemented.
0b0001	SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if [ID\\_ISAR0](#).Swap is 0b0000.

In Armv8-A, the only permitted value is 0b0000.

**PSR\_M, bits [27:24]**

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

PSR_M	Meaning
0b0000	None implemented.
0b0001	Adds the M profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**SynchPrim\_frac, bits [23:20]**

Used in conjunction with [ID\\_ISAR3.SynchPrim](#) to indicate the implemented Synchronization Primitive instructions. Possible values are:

SynchPrim_frac	Meaning
0b0000	If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.
0b0011	If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim\_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

**Barrier, bits [19:16]**

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

Barrier	Meaning
0b0000	None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.
0b0001	Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**SMC, bits [15:12]**

Indicates the implemented SMC instructions. Defined values are:

SMC	Meaning
0b0000	None implemented.
0b0001	Adds the SMC instruction.

All other values are reserved.

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32, then this field has the value 0b0000.

**Writeback, bits [11:8]**

Indicates the support for Writeback addressing modes. Defined values are:

Writeback	Meaning
0b0000	Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.
0b0001	Adds support for all of the writeback addressing modes.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

WithShifts	Meaning
0b0000	Nonzero shifts supported only in MOV and shift instructions.
0b0001	Adds support for shifts of loads and stores over the range LSL 0-3.
0b0011	As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.
0b0100	As for 0b0011, and adds support for register-controlled shift options.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

### Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

Unpriv	Meaning
0b0000	None implemented. No T variant instructions are implemented.
0b0001	Adds the LDRBT, LDRT, STRBT, and STRT instructions.
0b0010	As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

### Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
UNKNOWN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Reserved, UNKNOWN.

## Accessing the ID\_ISAR4\_EL1

# ID\_ISAR5\_EL1, AArch32 Instruction Set Attribute Register 5

The ID\_ISAR5\_EL1 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), and [ID\\_ISAR4\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_ISAR5\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_ISAR5\[31:0\]](#).

## Attributes

ID\_ISAR5\_EL1 is a 64-bit register.

## Field descriptions

The ID\_ISAR5\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
VCMA				RDM				RES0				CRC32				SHA2				SHA1				AES				SEVL			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### VCMA, bits [31:28]

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

VCMA	Meaning
0b0000	The VCMLA and VCADD instructions are not implemented in AArch32.
0b0001	The VCMLA and VCADD instructions are implemented in AArch32.

All other values are reserved.

FEAT\_FCMA implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, the only permitted value is 0b0001.

### RDM, bits [27:24]

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

RDM	Meaning
0b0000	No VQRDMLAH and VQRDMLSH instructions implemented.
0b0001	VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

FEAT\_RDM implements the functionality identified by the value 0b0001.

In Armv8.0, the only permitted value is 0b0000.

From Armv8.1, the only permitted value is 0b0001.

### Bits [23:20]

Reserved, RES0.

### CRC32, bits [19:16]

Indicates whether the CRC32 instructions are implemented in AArch32 state.

CRC32	Meaning
0b0000	No CRC32 instructions implemented.
0b0001	CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

### SHA2, bits [15:12]

Indicates whether the SHA2 instructions are implemented in AArch32 state.

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

### SHA1, bits [11:8]

Indicates whether the SHA1 instructions are implemented in AArch32 state.

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**AES, bits [7:4]**

Indicates whether the AES instructions are implemented in AArch32 state.

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC implemented.
0b0010	As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

**SEVL, bits [3:0]**

Indicates whether the SEVL instruction is implemented in AArch32 state.

SEVL	Meaning
0b0000	SEVL is implemented as a NOP.
0b0001	SEVL is implemented as Send Event Local.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Otherwise:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
														UNKNOWN																							
														UNKNOWN

# ID\_ISAR6\_EL1, AArch32 Instruction Set Attribute Register 6

The ID\_ISAR6\_EL1 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), [ID\\_ISAR4\\_EL1](#) and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_ISAR6\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_ISAR6\[31:0\]](#).

### Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

## Attributes

ID\_ISAR6\_EL1 is a 64-bit register.

## Field descriptions

The ID\_ISAR6\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0				I8MM				BF16				SPECRES				SB				FHM				DP				JSCVT			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:28]

Reserved, RES0.

### I8MM, bits [27:24]

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values of this field are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.

All other values are reserved.

FEAT\_AA32I8MM implements the functionality identified by 0b0001.

### BF16, bits [23:20]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	VCVT, VCVTB, VCVTT, VDOT, VFMA, VFMA, VFMA, and VMMLA instructions with BF16 operand or result types are implemented.

All other values are reserved.

FEAT\_AA32BF16 implements the functionality identified by 0b0001.

### SPECRES, bits [19:16]

Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:

SPECRES	Meaning
0b0000	Prediction invalidation instructions are not implemented.
0b0001	CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.

All other values are reserved.

FEAT\_SPECRES implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

### SB, bits [15:12]

Indicates support for the SB instruction in AArch32 state. Defined values are:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

FEAT\_SB implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

### FHM, bits [11:8]

Indicates support for Advanced SIMD and floating-point VFMA and VFMSL instructions in AArch32 state. Defined values are:

FHM	Meaning
0b0000	VFMA and VFMSL instructions are not implemented.
0b0001	VFMA and VFMSL instructions are implemented.

All other values are reserved.

FEAT\_FHM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**DP, bits [7:4]**

Indicates support for Advanced SIMD and floating-point VFMA and VFMSL instructions in AArch32 state. Defined values are:

DP	Meaning
0b0000	Dot product instructions are not implemented.
0b0001	UDOT and VSDOT instructions are implemented.

All other values are reserved.

FEAT\_DotProd implements the functionality identified by 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

**JSCVT, bits [3:0]**

Indicates support for the VJCVT instruction in AArch32 state. Defined values are:

JSCVT	Meaning
0b0000	The VJCVT instruction is not implemented.
0b0001	The VJCVT instruction is implemented.

All other values are reserved.

FEAT\_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

**Otherwise:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN

**FCSE, bits [27:24]**

Indicates whether the implementation includes the FCSE. Defined values are:

FCSE	Meaning
0b0000	Not supported.
0b0001	Support for FCSE.

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

**AuxReg, bits [23:20]**

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

AuxReg	Meaning
0b0000	None supported.
0b0001	Support for Auxiliary Control Register only.
0b0010	Support for Auxiliary Fault Status Registers ( <a href="#">AIFSR</a> and <a href="#">ADFSR</a> ) and Auxiliary Control Register.

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

**Note**

Accesses to unimplemented Auxiliary registers are UNDEFINED.

**TCM, bits [19:16]**

Indicates support for TCMs and associated DMAs. Defined values are:

TCM	Meaning
0b0000	Not supported.
0b0001	Support is IMPLEMENTATION DEFINED. Armv7 requires this setting.
0b0010	Support for TCM only, Armv6 implementation.
0b0011	Support for TCM and DMA, Armv6 implementation.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

**ShareLvl, bits [15:12]**

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

ShareLvl	Meaning
0b0000	One level of shareability implemented.
0b0001	Two levels of shareability implemented.

All other values are reserved.

From Armv8 the only permitted value is 0b0001.

**OuterShr, bits [11:8]**

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

OuterShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

#### PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

PMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED PMSA.
0b0010	Support for PMSAv6, with a Cache Type Register implemented.
0b0011	Support for PMSAv7, with support for memory subsections. Armv7-R profile.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

#### VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

VMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED VMSA.
0b0010	Support for VMSAv6, with Cache and TLB Type Registers implemented.
0b0011	Support for VMSAv7, with support for remapping and the Access flag. Armv7-A profile.
0b0100	As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
0b0101	As for 0b0100, and adds support for the Long-descriptor translation table format.

All other values are reserved.

In Armv8-A the only permitted value is 0b0101.

### Otherwise:

# ID\_MMFR1\_EL1, AArch32 Memory Model Feature Register 1

The ID\_MMFR1\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0\\_EL1](#), [ID\\_MMFR2\\_EL1](#), [ID\\_MMFR3\\_EL1](#), and [ID\\_MMFR4\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_MMFR1\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_MMFR1\[31:0\]](#).

## Attributes

ID\_MMFR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_MMFR1\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
BPred				L1TstCln				L1Uni				L1Hvd				L1UniSW				L1HvdSW				L1UniVA				L1HvdVA			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

<b>BPred</b>	<b>Meaning</b>
0b0000	No branch predictor, or no MMU present. Implies a fixed MPU configuration.
0b0001	Branch predictor requires flushing on: <ul style="list-style-type: none"> <li>• Enabling or disabling a stage of address translation.</li> <li>• Writing new data to instruction locations.</li> <li>• Writing new mappings to the translation tables.</li> <li>• Changes to the <a href="#">TTBR0</a>, <a href="#">TTBR1</a>, or <a href="#">TTBCR</a> registers.</li> <li>• Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.</li> </ul>
0b0010	Branch predictor requires flushing on: <ul style="list-style-type: none"> <li>• Enabling or disabling a stage of address translation.</li> <li>• Writing new data to instruction locations.</li> <li>• Writing new mappings to the translation tables.</li> <li>• Any change to the <a href="#">TTBR0</a>, <a href="#">TTBR1</a>, or <a href="#">TTBCR</a> registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.</li> </ul>
0b0011	Branch predictor requires flushing only on writing new data to instruction locations.
0b0100	For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In Armv8-A, the permitted values are 0b0010, 0b0011, and 0b0100. For values other than 0b0000 and 0b0100 the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

#### **L1TstCln, bits [27:24]**

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

<b>L1TstCln</b>	<b>Meaning</b>
0b0000	None supported.
0b0001	Supported Level 1 data cache test and clean operations are: <ul style="list-style-type: none"> <li>• Test and clean data cache.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Test, clean, and invalidate data cache.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

#### **L1Uni, bits [23:20]**

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

<b>L1Uni</b>	<b>Meaning</b>
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: <ul style="list-style-type: none"> <li>• Invalidate cache, including branch predictor if appropriate.</li> <li>• Invalidate branch predictor, if appropriate.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Clean cache, using a recursive model that uses the cache dirty status bit.</li> <li>• Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1Hvd, bits [19:16]**

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

<b>L1Hvd</b>	<b>Meaning</b>
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: <ul style="list-style-type: none"> <li>• Invalidate instruction cache, including branch predictor if appropriate.</li> <li>• Invalidate branch predictor, if appropriate.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Invalidate data cache.</li> <li>• Invalidate data cache and instruction cache, including branch predictor if appropriate.</li> </ul>
0b0011	As for 0b0010, and adds: <ul style="list-style-type: none"> <li>• Clean data cache, using a recursive model that uses the cache dirty status bit.</li> <li>• Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1UniSW, bits [15:12]**

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

<b>L1UniSW</b>	<b>Meaning</b>
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by set/way are: <ul style="list-style-type: none"> <li>• Clean cache line by set/way.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Clean and invalidate cache line by set/way.</li> </ul>
0b0011	As for 0b0010, and adds: <ul style="list-style-type: none"> <li>• Invalidate cache line by set/way.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1HvdSW, bits [11:8]**

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

<b>L1HvdSW</b>	<b>Meaning</b>
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by set/way are: <ul style="list-style-type: none"> <li>• Clean data cache line by set/way.</li> <li>• Clean and invalidate data cache line by set/way.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Invalidate data cache line by set/way.</li> </ul>
0b0011	As for 0b0010, and adds: <ul style="list-style-type: none"> <li>• Invalidate instruction cache line by set/way.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1UniVA, bits [7:4]**

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

<b>L1UniVA</b>	<b>Meaning</b>
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by VA are: <ul style="list-style-type: none"> <li>• Clean cache line by VA.</li> <li>• Invalidate cache line by VA.</li> <li>• Clean and invalidate cache line by VA.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Invalidate branch predictor by VA, if branch predictor is implemented.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1HvdVA, bits [3:0]**

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

<b>L1HvdVA</b>	<b>Meaning</b>
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by VA are: <ul style="list-style-type: none"> <li>• Clean data cache line by VA.</li> <li>• Invalidate data cache line by VA.</li> <li>• Clean and invalidate data cache line by VA.</li> <li>• Clean instruction cache line by VA.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Invalidate branch predictor by VA, if branch predictor is implemented.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**Otherwise:**

# ID\_MMFR2\_EL1, AArch32 Memory Model Feature Register 2

The ID\_MMFR2\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0\\_EL1](#), [ID\\_MMFR1\\_EL1](#), [ID\\_MMFR3\\_EL1](#), and [ID\\_MMFR4\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_MMFR2\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_MMFR2\[31:0\]](#).

## Attributes

ID\_MMFR2\_EL1 is a 64-bit register.

## Field descriptions

The ID\_MMFR2\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
<a href="#">HWAaccFlg</a>				<a href="#">WFIStall</a>				<a href="#">MemBarr</a>				<a href="#">UniTLB</a>				<a href="#">HvdTLB</a>				<a href="#">L1HvdRng</a>				<a href="#">L1HvdBG</a>				<a href="#">L1HvdFG</a>			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### HWAaccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

HWAaccFlg	Meaning
0b0000	Not supported.
0b0001	Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

### WFIStall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

WFIStall	Meaning
0b0000	Not supported.
0b0001	Support for WFI stalling.

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0001.

### MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==0b1111) encoding space:

MemBarr	Meaning
0b0000	None supported.
0b0001	Supported memory barrier System instructions are: <ul style="list-style-type: none"> <li>Data Synchronization Barrier (DSB).</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>Instruction Synchronization Barrier (ISB).</li> <li>Data Memory Barrier (DMB).</li> </ul>

All other values are reserved.

From Armv8, the only permitted value is 0b0010.

Arm deprecates the use of these operations. ID\_ISAR4.Barrier\_instrs indicates the level of support for the preferred barrier instructions.

### UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

UniTLB	Meaning
0b0000	Not supported.
0b0001	Supported unified TLB maintenance operations are: <ul style="list-style-type: none"> <li>Invalidate all entries in the TLB.</li> <li>Invalidate TLB entry by VA.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>Invalidate TLB entries by ASID match.</li> </ul>
0b0011	As for 0b0010, and adds: <ul style="list-style-type: none"> <li>Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.</li> </ul>
0b0100	As for 0b0011, and adds: <ul style="list-style-type: none"> <li>Invalidate Hyp mode unified TLB entry by VA.</li> <li>Invalidate entire Non-secure PL1&amp;0 unified TLB.</li> <li>Invalidate entire Hyp mode unified TLB.</li> </ul>
0b0101	As for 0b0100, and adds the following operations: <a href="#">TLBIMVALIS</a> , <a href="#">TLBIMVAALIS</a> , <a href="#">TLBIMVALHIS</a> , <a href="#">TLBIMVAL</a> , <a href="#">TLBIMVAAL</a> , <a href="#">TLBIMVALH</a> .
0b0110	As for 0b0101, and adds the following operations: <a href="#">TLBIIPAS2IS</a> , <a href="#">TLBIIPAS2LIS</a> , <a href="#">TLBIIPAS2</a> , <a href="#">TLBIIPAS2L</a> .

All other values are reserved.

In Armv8-A, the only permitted value is 0b0110.

### HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

### L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

L1HvdRng	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache maintenance range operations are: <ul style="list-style-type: none"> <li>• Invalidate data cache range by VA.</li> <li>• Invalidate instruction cache range by VA.</li> <li>• Clean data cache range by VA.</li> <li>• Clean and invalidate data cache range by VA.</li> </ul>

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

#### L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

L1HvdBG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache background fetch operations are: <ul style="list-style-type: none"> <li>• Fetch instruction cache range by VA.</li> <li>• Fetch data cache range by VA.</li> </ul>

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

#### L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

L1HvdFG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache foreground fetch operations are: <ul style="list-style-type: none"> <li>• Fetch instruction cache range by VA.</li> <li>• Fetch data cache range by VA.</li> </ul>

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

### Otherwise:

# ID\_MMFR3\_EL1, AArch32 Memory Model Feature Register 3

The ID\_MMFR3\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0\\_EL1](#), [ID\\_MMFR1\\_EL1](#), [ID\\_MMFR2\\_EL1](#), and [ID\\_MMFR4\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_MMFR3\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_MMFR3\[31:0\]](#).

## Attributes

ID\_MMFR3\_EL1 is a 64-bit register.

## Field descriptions

The ID\_MMFR3\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Supersec				CMemSz				CohWalk				PAN				MaintBcst				BPMaint				CMaintSW				CMaintVA			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

Supersec	Meaning
0b0000	Supersections supported.
0b1111	Supersections not supported.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b1111.

### CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

<b>CMemSz</b>	<b>Meaning</b>
0b0000	4GB, corresponding to a 32-bit physical address range.
0b0001	64GB, corresponding to a 36-bit physical address range.
0b0010	1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b0010.

### **CohWalk, bits [23:20]**

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

<b>CohWalk</b>	<b>Meaning</b>
0b0000	Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.
0b0001	Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### **PAN, bits [19:16]**

Privileged Access Never. Indicates support for the PAN bit in [CPSR](#), [SPSR](#), and [DPSR](#) in AArch32 state. Defined values are:

<b>PAN</b>	<b>Meaning</b>
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and <a href="#">ATS1CPRP</a> and <a href="#">ATS1CPWP</a> instructions supported.

All other values are reserved.

FEAT\_PAN implements the functionality identified by the value 0b0001.

FEAT\_PAN2 implements the functionality added by the value 0b0010.

In Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the only permitted value is 0b0010.

### **MaintBcst, bits [15:12]**

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

<b>MaintBcst</b>	<b>Meaning</b>
0b0000	Cache, TLB, and branch predictor operations only affect local structures.
0b0001	Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.
0b0010	Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**BPMaint, bits [11:8]**

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

BPMaint	Meaning
0b0000	None supported.
0b0001	Supported branch predictor maintenance operations are: <ul style="list-style-type: none"> <li>• Invalidate all branch predictors.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Invalidate branch predictors by VA.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**CMaintSW, bits [7:4]**

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

CMaintSW	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance instructions by set/way are: <ul style="list-style-type: none"> <li>• Invalidate data cache by set/way.</li> <li>• Clean data cache by set/way.</li> <li>• Clean and invalidate data cache by set/way.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

**CMaintVA, bits [3:0]**

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

CMaintVA	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance operations by VA are: <ul style="list-style-type: none"> <li>• Invalidate data cache by VA.</li> <li>• Clean data cache by VA.</li> <li>• Clean and invalidate data cache by VA.</li> <li>• Invalidate instruction cache by VA.</li> <li>• Invalidate all instruction cache entries.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

**Otherwise:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:0]**

Reserved, UNKNOWN.

**Accessing the ID\_MMFR3\_EL1**

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, ID\_MMFR3\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b111

# ID\_MMFR4\_EL1, AArch32 Memory Model Feature Register 4

The ID\_MMFR4\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0\\_EL1](#), [ID\\_MMFR1\\_EL1](#), [ID\\_MMFR2\\_EL1](#), and [ID\\_MMFR3\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_MMFR4\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_MMFR4\[31:0\]](#).

## Attributes

ID\_MMFR4\_EL1 is a 64-bit register.

## Field descriptions

The ID\_MMFR4\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
EVT				CCIDX				LSM				HPDS				CnP				XNX				AC2				SpecSEI			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### EVT, bits [31:28]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the [HCR2](#).{TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

EVT	Meaning
0b0000	<a href="#">HCR2</a> .{TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	<a href="#">HCR2</a> .{TOCU, TICAB, TID4} traps are supported.
	<a href="#">HCR2</a> .TTLBIS trap is not supported.
0b0010	<a href="#">HCR2</a> .{TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

FEAT\_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented supporting AArch32, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

### CCIDX, bits [27:24]

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.
0b0001	64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.

All other values are reserved.

FEAT\_CCIDX implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

### LSM, bits [23:20]

Indicates support for LSMAOE and nTLSMD bits in [HSCTLR](#) and [SCTLR](#). Defined values are:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT\_LSMAOC implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

### HPDS, bits [19:16]

Hierarchical permission disables bits in translation tables. Defined values are:

HPDS	Meaning
0b0000	Disabling of hierarchical controls not supported.
0b0001	Supports disabling of hierarchical controls using the <a href="#">TTBCR2</a> .HPD0, <a href="#">TTBCR2</a> .HPD1, and <a href="#">HTCR</a> .HPD bits.
0b0010	As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

FEAT\_AA32HPD implements the functionality identified by the value 0b0001.

FEAT\_HPDS2 implements the functionality added by the value 0b0010.

#### Note

The value 0b0000 implies that the encoding for [TTBCR2](#) is UNDEFINED.

### CnP, bits [15:12]

Common not Private translations. Defined values are:

CnP	Meaning
0b0000	Common not Private translations not supported.
0b0001	Common not Private translations supported.

All other values are reserved.

FEAT\_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2 the only permitted value is 0b0001.

### XNX, bits [11:8]

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT\_XNX implements the functionality identified by the value 0b0001.

When FEAT\_XNX is implemented:

- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of ID\_MMFR4\_EL1.XNX is 0b0000 or 0b0001:
  - [ID\\_AA64MMFR1\\_EL1.XNX](#) == 1.
  - EL2 cannot use AArch32.
  - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0b0001.

### AC2, bits [7:4]

Indicates the extension of the [ACTLR](#) and [HACTLR](#) registers using [ACTLR2](#) and [HACTLR2](#). Defined values are:

AC2	Meaning
0b0000	<a href="#">ACTLR2</a> and <a href="#">HACTLR2</a> are not implemented.
0b0001	<a href="#">ACTLR2</a> and <a href="#">HACTLR2</a> are implemented.

All other values are reserved.

In Armv8.0 and Armv8.1 the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

### SpecSEI, bits [3:0]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

SpecSEI	Meaning
0b0000	The PE never generates an SError interrupt due to an External abort on a speculative read.
0b0001	The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

### Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
UNKNOWN																															

**Bits [63:0]**

Reserved, UNKNOWN.

**Accessing the ID\_MMFR4\_EL1**

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, ID\_MMFR4\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b110

# ID\_PFR0\_EL1, AArch32 Processor Feature Register 0

The ID\_PFR0\_EL1 characteristics are:

## Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with [ID\\_PFR1\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_PFR0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_PFR0\[31:0\]](#).

## Attributes

ID\_PFR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_PFR0\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RAS				DIT				AMU				CSV2				State3				State2				State1				State0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### RAS, bits [31:28]

RAS Extension version. Defined values are:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	RAS Extension present.
0b0010	FEAT_RASv1p1 present. As 0b0001, and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to <a href="#">ERR&lt;n&gt;STATUS</a> and support for the optional RAS Timestamp Extension.

All other values are reserved.

[FEAT\\_RAS](#)~~FEAT\_RASv1p1~~ implements the functionality identified by the value [0b0001](#)~~0b0010~~.

[FEAT\\_RASv1p1](#) implements the functionality identified by the value [0b0010](#).

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT\_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT\_DoubleFault is not implemented, and [ERRIDR.NUM](#) is zero, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010. Otherwise, from Armv8.4, the only permitted value is 0b0010.

From Armv8.4, when FEAT\_DoubleFault is not implemented, and [ERRIDR\\_EL1.NUM](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

### Note

When the value of this field is 0b0001, [ID\\_PFR2\\_EL1.RAS\\_frac](#) indicates whether FEAT\_RASv1p1 is implemented.

## DIT, bits [27:24]

Data Independent Timing. Defined values are:

DIT	Meaning
0b0000	AArch32 does not guarantee constant execution time of any instructions.
0b0001	AArch32 provides the <a href="#">PSTATE.DIT</a> <a href="#">CPSR.DIT</a> mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT\_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

## AMU, bits [23:20]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT\_AMUv1 implements the functionality identified by the value 0b0001.

FEAT\_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

## CSV2, bits [19:16]

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	This Device does not disclose whether branch targets trained in one hardware described context can affect speculative execution in a different hardware described context.
0b0001	Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way.

All other values are reserved.

FEAT\_CSV2 implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

### State3, bits [15:12]

T32EE instruction set support. Defined values are:

State3	Meaning
0b0000	Not implemented.
0b0001	T32EE instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### State2, bits [11:8]

Jazelle extension support. Defined values are:

State2	Meaning
0b0000	Not implemented.
0b0001	Jazelle extension implemented, without clearing of <a href="#">JOSCR.CV</a> on exception entry.
0b0010	Jazelle extension implemented, with clearing of <a href="#">JOSCR.CV</a> on exception entry.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### State1, bits [7:4]

T32 instruction set support. Defined values are:

State1	Meaning
0b0000	T32 instruction set not implemented.
0b0001	T32 encodings before the introduction of Thumb-2 technology implemented: <ul style="list-style-type: none"> <li>All instructions are 16-bit.</li> <li>A BL or BLX is a pair of 16-bit instructions.</li> <li>32-bit instructions other than BL and BLX cannot be encoded.</li> </ul>
0b0011	T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

### State0, bits [3:0]

A32 instruction set support. Defined values are:

State0	Meaning
0b0000	A32 instruction set not implemented.
0b0001	A32 instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing the ID\_PFR0\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_PFR0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b000

```

if PSTATE.EL == EL0 then

# ID\_PFR1\_EL1, AArch32 Processor Feature Register 1

The ID\_PFR1\_EL1 characteristics are:

## Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with [ID\\_PFR0\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_PFR1\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_PFR1\[31:0\]](#).

## Attributes

ID\_PFR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_PFR1\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
GIC				Virt_frac				Sec_frac				GenTimer				Virtualization				MProgMod				Security				ProgMod			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

### Virt\_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:

<b>Virt_frac</b>	<b>Meaning</b>
0b0000	No features from the ARMv7 Virtualization Extensions are implemented.
0b0001	The following features of the ARMv7 Virtualization Extensions are implemented: <ul style="list-style-type: none"> <li>• The <a href="#">SCR.SIF</a> bit, if EL3 is implemented.</li> <li>• The modifications to the <a href="#">SCR.AW</a> and <a href="#">SCR.FW</a> bits described in the Virtualization Extensions, if EL3 is implemented.</li> <li>• The MSR (banked register) and MRS (banked register) instructions.</li> <li>• The ERET instruction.</li> </ul>

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is only valid when the value of ID\_PFR1\_EL1.Virtualization is 0, otherwise it holds the value 0b0000.

#### Note

The ID\_ISAR registers do not identify whether the instructions added by the ARMv7 Virtualization Extensions are implemented.

### Sec\_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

<b>Sec_frac</b>	<b>Meaning</b>
0b0000	No features from the ARMv7 Security Extensions are implemented.
0b0001	The following features from the ARMv7 Security Extensions are implemented: <ul style="list-style-type: none"> <li>• The VBAR register.</li> <li>• The <a href="#">TTBCR.PD0</a> and <a href="#">TTBCR.PD1</a> bits.</li> </ul>
0b0010	As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is only valid when the value of ID\_PFR1\_EL1.Security is 0, otherwise it holds the value 0b0000.

### GenTimer, bits [19:16]

Generic Timer support. Defined values are:

<b>GenTimer</b>	<b>Meaning</b>
0b0000	Generic Timer is not implemented.
0b0001	Generic Timer is implemented.
0b0010	Generic Timer is implemented, and also includes support for <a href="#">CNTHCTL.EVNTIS</a> and <a href="#">CNTKCTL.EVNTIS</a> fields, and <a href="#">CNTPTCSS</a> and <a href="#">CNTVCTSS</a> counter views.

All other values are reserved.

FEAT\_ECV implements the functionality identified by the value 0b0010.

In Armv8.0, Armv8.1, Armv8.2, Armv8.3, Armv8.4, and Armv8.5, the only permitted value is 0b0001.

From Armv8.6, the only permitted value is 0b0010.

## Virtualization, bits [15:12]

Virtualization support. Defined values are:

Virtualization	Meaning
0b0000	EL2, Hyp mode, and the HVC instruction not implemented.
0b0001	EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

### Note

The ID\_ISARs do not identify whether the HVC instruction is implemented.

## MProgMod, bits [11:8]

M profile programmers' model support. Defined values are:

MProgMod	Meaning
0b0000	Not supported.
0b0010	Support for two-stack programmers' model.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

## Security, bits [7:4]

Security support. Defined values are:

Security	Meaning
0b0000	EL3, Monitor mode, and the SMC instruction not implemented.
0b0001	EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.
0b0010	As for 0b0001, and adds the ability to set the <a href="#">NSACR</a> .RFR bit. Not permitted in Armv8 as the <a href="#">NSACR</a> .RFR bit is RES0.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

**ProgMod, bits [3:0]**

Support for the standard programmers' model for Armv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

ProgMod	Meaning
0b0000	Not supported.
0b0001	Supported.

All other values are reserved.

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32 then this field has the value 0b0000.

**Otherwise:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
UNKNOWN																															

**Bits [63:0]**

Reserved, UNKNOWN.

**Accessing the ID\_PFR1\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, ID\_PFR1\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented("FEAT_IDST") then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else

Reserved, RES0.

### RAS\_frac, bits [11:8]

RAS Extension fractional field. Defined values are:

RAS_frac	Meaning
0b0000	If <a href="#">ID_PFR0_EL1</a> .RAS == 0b0001, RAS Extension implemented.
0b0001	If <a href="#">ID_PFR0_EL1</a> .RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to <a href="#">ERR&lt;n&gt;STATUS</a> and support for the optional RAS Timestamp Extension.

All other values are reserved.

This field is valid only if [ID\\_PFR0\\_EL1](#).RAS == 0b0001.

**SSBS, bits [7:4]**

Speculative Store Bypassing controls in AArch64 state. Defined values are:

SSBS	Meaning
0b0000	AArch32 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

**CSV3, bits [3:0]**

Speculative use of faulting data. Defined values are:

CSV3	Meaning
0b0000	This Device does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence
0b0001	Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence

All other values are reserved.

FEAT\_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT\_EOPD is implemented, FEAT\_CSV3 must be implemented.

**Otherwise:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
UNKNOWN

# IFSR32\_EL2, Instruction Fault Status Register (EL2)

The IFSR32\_EL2 characteristics are:

## Purpose

Allows access to the AArch32 [IFSR](#) register from AArch64 state only. Its value has no effect on execution in AArch64 state.

## Configuration

AArch64 System register IFSR32\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [IFSR\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to IFSR32\_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

## Attributes

IFSR32\_EL2 is a 64-bit register.

## Field descriptions

The IFSR32\_EL2 bit assignments are:

### When TTBCR.EAE == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																																			
RES0																FnV	RES0				ExT	RES0		FS[4]	LPAAE	RES0						FS[3:0]			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

### Bits [63:17]

Reserved, RES0.

### FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	<a href="#">IFAR</a> is valid.
0b1	<a href="#">IFAR</a> is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [15:13]

Reserved, RES0.

**ExT, bit [12]**

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [11]**

Reserved, RES0.

This field is bit[4] of FS[4:0].

**FS, [4], bits [10, 3:0]**

Fault Status bits. Bits [10] and [3:0] are interpreted together.

FS	Meaning	Applies when
0b00001	PC alignment fault.	
0b00010	Debug exception.	
0b00011	Access flag fault, level 1.	
0b00101	Translation fault, level 1.	
0b00110	Access flag fault, level 2.	
0b00111	Translation fault, level 2.	
0b01000	Synchronous External abort, not on translation table walk.	
0b01001	Domain fault, level 1.	
0b01011	Domain fault, level 2.	
0b01100	Synchronous External abort, on translation table walk, level 1.	
0b01101	Permission fault, level 1.	
0b01110	Synchronous External abort, on translation table walk, level 2.	
0b01111	Permission fault, level 2.	
0b10000	TLB conflict abort.	
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault).	
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b11100	Synchronous parity or ECC error on translation table walk, level 1.	When FEAT_RAS is not implemented
0b11110	Synchronous parity or ECC error on translation table walk, level 2.	When FEAT_RAS is not implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is IFSR32\_EL2[10].
- FS[3:0] is IFSR32\_EL2[3:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Bits [8:4]

Reserved, RES0.

#### FS[3:0], bits [3:0]

This field is bits[3:0] of FS[4:0].

See FS[4] for the field description.

### When TTBCR.EAE == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																FnV	RES0			ExT	RES0			LPAE	RES0			STATUS			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### Bits [63:17]

Reserved, RES0.

#### FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	<b>IFAR</b> is valid.
0b1	<b>IFAR</b> is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Bits [15:13]

Reserved, RES0.

#### ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Bits [11:10]

Reserved, RES0.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [8:6]**

Reserved, RES0.

**STATUS, bits [5:0]**

Fault status bits. Possible values of this field are:

STATUS	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100001	PC alignment fault.	
0b100010	Debug exception.	
0b110000	TLB conflict abort.	

All other values are reserved.

When **FEAT\_RAS**the RAS Extension is implemented, 0b011000, 0b011101, 0b011110, and 0b011111 are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Accessing the IFSR32\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, IFSR32\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0000	0b001

```

# LORC\_EL1, LORegion Control (EL1)

The LORC\_EL1 characteristics are:

## Purpose

Enables and disables LORegions, and selects the current LORegion descriptor.

## Configuration

This register is present only when FEAT\_LOR is implemented. Otherwise, direct accesses to LORC\_EL1 are UNDEFINED.

If no LORegion descriptors are supported by the PE, then this register is RES0.

## Attributes

LORC\_EL1 is a 64-bit register.

## Field descriptions

The LORC\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0										DS										RES0		EN									
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:10]

Reserved, RES0.

### DS, bits [9:2]

Descriptor Select. Selects the current LORegion descriptor accessed by [LORSA\\_EL1](#), [LOREA\\_EL1](#), and [LORN\\_EL1](#).

The number of LORegion descriptors in IMPLEMENTATION DEFINED. The maximum number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are RES0, where M is Log<sub>2</sub>(Number of LORegion descriptors supported by the implementation).

If this field points to an LORegion descriptor that is not supported by an implementation, then the registers [LORN\\_EL1](#), [LOREA\\_EL1](#), and [LORSA\\_EL1](#) are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [1]

Reserved, RES0.

### EN, bit [0]

Enable. Indicates whether LORegions are enabled.

EN	Meaning
0b0	Disabled. Memory accesses do not match any LORegions.
0b1	Enabled. Memory accesses may match a LORegion.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to 0.

## Accessing the LORC\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, LORC\_EL1

op0	op1	CRn	CRm	op2

# LOREA\_EL1, LORegion End Address (EL1)

The LOREA\_EL1 characteristics are:

## Purpose

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1](#).DS.

## Configuration

This register is present only when FEAT\_LOR is implemented. Otherwise, direct accesses to LOREA\_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC\\_EL1](#).DS points to a LORegion that is not supported by the PE.

## Attributes

LOREA\_EL1 is a 64-bit register.

## Field descriptions

The LOREA\_EL1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Any of the fields in this register are permitted to be cached in a TLB.

### Bits [63:52]

Reserved, RES0.

### EA[51:48], bits [51:48]

When FEAT\_LPA is implemented:

Extension to EA[47:16]. See EA[47:16] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### EA[47:16], bits [47:16]

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by [LORC\\_EL1](#).DS. Bits[15:0] of this address are defined to be 0xFFFF. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT\_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, EA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, EA[51:48] are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bits [15:0]

Reserved, RES0.

## Accessing the LOREA\_EL1

Accesses to this register use the following encodings:

# LORN\_EL1, LORegion Number (EL1)

The LORN\_EL1 characteristics are:

## Purpose

Holds the number of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1](#).DS.

## Configuration

This register is present only when FEAT\_LOR is implemented. Otherwise, direct accesses to LORN\_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC\\_EL1](#).DS points to a LORegion that is not supported by the PE.

## Attributes

LORN\_EL1 is a 64-bit register.

## Field descriptions

The LORN\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																RES0															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Any of the fields in this register are permitted to be cached in a TLB.

### Bits [63:8]

Reserved, RES0.

### Num, bits [7:0]

Number of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1](#).DS.

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are RES0, where N is (Log<sub>2</sub>(Number of LORegions supported by the PE)).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the LORN\_EL1

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, LORN\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b010

# LORSA\_EL1, LORegion Start Address (EL1)

The LORSA\_EL1 characteristics are:

## Purpose

Indicates whether the current LORegion descriptor selected by [LORC\\_EL1](#).DS is enabled, and holds the physical address of the start of the LORegion.

## Configuration

This register is present only when FEAT\_LOR is implemented. Otherwise, direct accesses to LORSA\_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC\\_EL1](#).DS points to a LORegion that is not supported by the PE.

## Attributes

LORSA\_EL1 is a 64-bit register.

## Field descriptions

The LORSA\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0												SA																			
SA												RES0																		Valid	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

SA[47:16]																RES0															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Any of the fields in this register are permitted to be cached in a TLB.

### Bits [63:52]

Reserved, RES0.

### SA, [51:48], bits [51:1648]

#### When FEAT\_LPA is implemented:

Extension to SA[47:16]. See SA[47:16] for more details.

This field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

**SA[47:16], bits [47:16]**

Bits [47:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1.DS](#). Bits[15:0] of this address are defined to be 0x0000. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT\_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, SA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, SA[51:48] are RES0.

This field resets to an architecturally UNKNOWN value.

**SA encoding when FEAT\_LPA is implemented****SA, bits [35:0]**

The start physical address of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1.DS](#).

Bits[15:0] of this address are defined to be 0x0000.

When 52-bit addresses and a 64KB translation granule are in use, LORSA\_EL1.SA[35:32] forms the upper part of the address value.

For implementations with fewer than 52 physical address bits, LORSA\_EL1.SA[35:32] is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SA encoding when FEAT\_LPA is not implemented****Bits [35:32]**

Reserved, RES0.

**SA, bits [31:0]**

The start physical address of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1.DS](#).

Bits[15:0] of this address are defined to be 0x0000.

For implementations with fewer than 48 bits, the upper bits of this field are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [15:1]**

Reserved, RES0.

**Valid, bit [0]**

Indicates whether the current LORegion Descriptor is enabled.

Valid	Meaning
0b0	Disabled
0b1	Enabled

On a Warm reset, this **This** field resets to 0.

# MAIR\_EL1, Memory Attribute Indirection Register (EL1)

The MAIR\_EL1 characteristics are:

## Purpose

Provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

## Configuration

AArch64 System register MAIR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PRRR\[31:0\]](#) when TTBCR.EAE == 0.

AArch64 System register MAIR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MAIR0\[31:0\]](#) when TTBCR.EAE == 1.

AArch64 System register MAIR\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [NMRR\[31:0\]](#) when TTBCR.EAE == 0.

AArch64 System register MAIR\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [MAIR1\[31:0\]](#) when TTBCR.EAE == 1.

## Attributes

MAIR\_EL1 is a 64-bit register.

## Field descriptions

The MAIR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">Attr7</a>								<a href="#">Attr6</a>								<a href="#">Attr5</a>								<a href="#">Attr4</a>							
<a href="#">Attr3</a>								<a href="#">Attr2</a>								<a href="#">Attr1</a>								<a href="#">Attr0</a>							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MAIR\_EL1 is permitted to be cached in a TLB.

**Attr<n>, bits [8n+7:8n], for n = 70 to 07**

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where AttrIdx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01 (xx != 00)	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0b0000iiii, (oooo != 0000 and iii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b010000000b11110000	If FEAT_XSFEAT_MTE is implemented, then: Tagged Normal Memory. Inner+Outer Non-cacheable Write-Back Non-transient memory, Inner+Outer Non-cacheable memory with Read-Allocate, the Inner+Outer XS Write-Allocate, attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0bxxxx0000, (xxxx != 0000 and xxxx != 1111)	UNPREDICTABLE
0b11110000	If FEAT_MTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111)	UNPREDICTABLE.

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the MAIR\_EL1

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic MAIR\_EL1 or MAIR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, MAIR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0010	0b000

```

# MAIR\_EL2, Memory Attribute Indirection Register (EL2)

The MAIR\_EL2 characteristics are:

## Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

## Configuration

AArch64 System register MAIR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HMAIR0\[31:0\]](#).

AArch64 System register MAIR\_EL2 bits [63:32] are architecturally mapped to AArch32 System register [HMAIR1\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MAIR\_EL2 is a 64-bit register.

## Field descriptions

The MAIR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Attr7								Attr6								Attr5								Attr4							
Attr3								Attr2								Attr1								Attr0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MAIR\_EL2 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 70 to 07

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where AttrIndx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01 (xx != 00)	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0b0000iiii, (oooo != 0000 and iii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b010000000b11110000	If FEAT_XSFEAT_MTE is implemented, then: Tagged Normal Memory. Inner+Outer Non-cacheable Write-Back Non-transient memory, Inner+Outer Non-cacheable memory with Read-Allocate, the Inner+Outer XS Write-Allocate, attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0bxxxx0000, (xxxx != 0000 and xxxx != 1111)	UNPREDICTABLE
0b11110000	If FEAT_MTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111)	UNPREDICTABLE.

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the MAIR\_EL2

# MDCR\_EL2, Monitor Debug Configuration Register (EL2)

The MDCR\_EL2 characteristics are:

## Purpose

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

## Configuration

AArch64 System register MDCR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HDCR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MDCR\_EL2 is a 64-bit register.

## Field descriptions

The MDCR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	RES0
RES0	HPMFZ	OMPME	MTPME	TDCCT	TDCCHLP	HLPRES0	RES0	HCCD	HCCDRES0	RES0	TTRF	TTRFRES0	RES0	HPMD	HPMDRES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	

### Bits [63:29]

### Bits [63:37]

Reserved, RES0.

### HPMFZSOMPME, bit [36:28]

When **FEAT\_SPEv1p2FEAT\_MTPMU** is implemented and EL3 is not implemented:

Hyp Performance Monitors Freeze-on-SPE event. Stop counters when [PMBLIMTR\\_EL1](#).{PMFZ, E} == {1, 1} and [PMBSR\\_EL1](#).S == 0b1.

HPMFZS	Meaning
0b0	Do not freeze on Statistical Profiling Buffer Management event.
0b1	Event counters do not count following a Statistical Profiling Buffer Management event.

If MDCR\_EL2.HPMN is less than [PMCR\\_EL0](#).N, this bit affects the operation of event counters in the range [MDCR\_EL2.HPMN .. ([PMCR\\_EL0](#).N-1)].

If MDCR\_EL2.HPMN is equal to [PMCR\\_EL0](#).N, this bit has no effect.

This bit does not affect the operation of event counters in the range [0 .. (MDCR\_EL2.HPMN-1)] and [PMCCNTR\\_EL0](#).

The operation of this bit applies even when EL2 is disabled in the current Security state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bits [35:30]

Reserved, RES0.

#### HPMFZO, bit [29]

##### When FEAT\_PMUv3p7 is implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

HPMFZO	Meaning
0b0	Do not freeze on overflow.
0b1	Event counters do not count when <a href="#">PMOVSLR_EL0</a> [( <a href="#">PMCR_EL0</a> .N-1):MDCR_EL2.HPMN] is nonzero.

If MDCR\_EL2.HPMN is less than [PMCR\\_EL0](#).N, this bit affects the operation of event counters in the range [MDCR\_EL2.HPMN .. ([PMCR\\_EL0](#).N-1)].

If MDCR\_EL2.HPMN is equal to [PMCR\\_EL0](#).N, this bit has no effect.

This bit does not affect the operation of event counters in the range [0 .. (MDCR\_EL2.HPMN-1)] and [PMCCNTR\\_EL0](#).

The operation of this bit ignores the values of [PMOVSLR\\_EL0](#)[(MDCR\_EL2.HPMN-1):0].

The operation of this bit applies even when EL2 is disabled in the current Security state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### MTPME, bit [28]

##### When FEAT\_MTPMU is implemented and EL3 is not implemented:

Multi-threaded PMU Enable. Enables use of the [PMEVTYPER<n>\\_EL0](#).MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of <a href="#">PMEVTYPER&lt;n&gt;_EL0</a> .MT is zero.
0b1	<a href="#">PMEVTYPER&lt;n&gt;_EL0</a> .MT bits not affected by this bit.

If FEAT\_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is [0](#), [0b0](#).

On a Cold reset, this field resets to 1.

#### Otherwise:

Reserved, RES0.

#### TDCC, bit [27]

**When FEAT\_FGT is implemented:**

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Trap exception to EL2, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: [OSDTRRX\\_EL1](#), [OSDTRTX\\_EL1](#), [MDCCSR\\_EL0](#), [MDCCINT\\_EL1](#), and, when the PE is in Non-debug state, [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#).

AArch32: [DBGDTRRXint](#), [DBGDTRTXint](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- ~~0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.~~
- 0x06 for trapped AArch32 LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).
- ~~0x06 for trapped AArch32 LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).~~
- 0x18 for trapped AArch64 MRS and MSR accesses.
- ~~0x18 for trapped AArch64 MRS and MSR accesses.~~

When the PE is in Debug state, MDCR\_EL2.TDCC does not trap any accesses to:

AArch64: [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#).

AArch32: [DBGDTRRXint](#) and [DBGDTRTXint](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HLP, bit [26]****When FEAT\_PMUv3p5 is implemented:**

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

HLP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> [31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> [63:0].

If MDCR\_EL2.HPMN is less than [PMCR\\_EL0.N](#) or [PMCR.N](#), this bit affects the operation of event counters in the range [MDCR\_EL2.HPMN..([PMCR\\_EL0.N](#)-1)] or [MDCR\_EL2.HPMN..([PMCR.N](#)-1)]. Otherwise this bit has no effect on the operation of the event counters.

**Note**

---

The effect of MDCR\_EL2.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state.

---

For more information see the description of the MDCR\_EL2.HPMN field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [25:24]**

Reserved, RES0.

**HCCD, bit [23]**

**When FEAT\_PMUv3p5 is implemented:**

Hypervisor Cycle Counter Disable. Prohibits [PMCCNTR\\_EL0](#) from counting at EL2.

HCCD	Meaning
0b0	Cycle counting by <a href="#">PMCCNTR_EL0</a> is not affected by this bit.
0b1	Cycle counting by <a href="#">PMCCNTR_EL0</a> is prohibited at EL2.

This bit does not affect the CPU\_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [22:20]**

Reserved, RES0.

**TTRF, bit [19]**

**When FEAT\_TRF is implemented:**

Traps use of the Trace Filter Control registers at EL1 to EL2, as follows:

- Access to [TRFCR\\_EL1](#) is trapped to EL2, reported using EC syndrome value 0x18.
- Access to [TRFCR](#) is trapped to EL2, reported using EC syndrome value 0x03.

TTRF	Meaning
0b0	Accesses to <a href="#">TRFCR_EL1</a> and <a href="#">TRFCR</a> at EL1 are not affected by this control.
0b1	Accesses to <a href="#">TRFCR_EL1</a> and <a href="#">TRFCR</a> at EL1 generate a trap exception to EL2 when EL2 is enabled in the current Security state.

**Otherwise:**

Reserved, RES0.

**Bit [18]**

Reserved, RES0.

**HPMD, bit [17]**

When FEAT\_PMUv3p1 is implemented:

Guest Performance Monitors Disable. This control prohibits event counting at EL2.

HPMD	Meaning
0b0	Event counting allowed at EL2.
0b1	Event counting prohibited at EL2. If FEAT_Debugv8p2 is not implemented, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().

This control applies only to:

- The event counters in the range [0..(MDCR\_EL2.HPMN-1)].
- If [PMCR\\_EL0.DP](#) is set to 1, [PMCCNTR\\_EL0](#).

The other event counters are unaffected, and when [PMCR\\_EL0.DP](#) is set to 0, [PMCCNTR\\_EL0](#) is unaffected.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**Bits [16:15]**

Reserved, RES0.

**TPMS, bit [14]**

When FEAT\_SPE is implemented:

Trap Performance Monitor Sampling. If [When EL2 is implemented and enabled in the current Security state, this field controls access to Statistical Profiling control registers from EL1.](#)

TPMS	Meaning
0b0	Do not trap Statistical Profiling controls to EL2.
0b1	If <a href="#">Accesses EL2 to is Statistical implemented Profiling and controls enabled at in EL1 the generate current a Security Trap state, exception accesses to Statistical EL2 Profiling when control EL2 registers is at enabled EL1 in generate the a current Trap Security exception to EL2 state.</a>

The Statistical Profiling control registers trapped by this control are: [PMSCR\\_EL1](#), [PMSEVFR\\_EL1](#), [PMSFCR\\_EL1](#), [PMSICR\\_EL1](#), [PMSIDR\\_EL1](#), [PMSIRR\\_EL1](#), and [PMSLATFR\\_EL1](#).

- [PMSCR\\_EL1](#), [PMSEVFR\\_EL1](#), [PMSFCR\\_EL1](#), [PMSICR\\_EL1](#), [PMSIDR\\_EL1](#), [PMSIRR\\_EL1](#), and [PMSLATFR\\_EL1](#).
- If FEAT\_SPEv1p2 is implemented, [PMSNEVFR\\_EL1](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**E2PB, bits [13:12]**

**When FEAT\_SPE is implemented:**

EL2 Profiling Buffer. If EL2 is implemented and enabled in the Profiling Buffer owning Security state, this field controls the owning translation regime. If EL2 is implemented and enabled in the current Security state, this field controls access to Profiling Buffer control registers from EL1.

E2PB	Meaning
0b00	If EL2 is implemented and enabled in the Profiling Buffer owning Security state, the Profiling Buffer uses the EL2 or EL2&0 stage 1 translation regime. Otherwise the Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.
0b10	Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.
0b11	Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer control registers at EL1 are not trapped to EL2.

All other values are reserved.

The Profiling Buffer control registers trapped by this control are: [PMBLIMITR\\_EL1](#), [PMBPTR\\_EL1](#), and [PMBSR\\_EL1](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TDRA, bit [11]**

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to [MDRAR\\_EL1](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 or EL1 is using AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05 and MRRC or MCRR accesses are trapped to EL2, reported using EC syndrome value 0x0C:
  - [DBGDRAR](#), [DBGDSAR](#).

TDRA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by <a href="#">DBGDSCRext</a> .UDCCdis or <a href="#">MDSCR_EL1</a> .TDCC.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR\\_EL2](#).TDE == 1.
- [HCR\\_EL2](#).TGE == 1.

**Note**

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDOSA, bit [10]****When FEAT\_DoubleLock is implemented:**

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - [OSLAR\\_EL1](#), [OSLSR\\_EL1](#), [OSDLR\\_EL1](#), and [DBGPRCR\\_EL1](#).
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
  - [DBGOSLSR](#), [DBGOSLAR](#), [DBGOSDLR](#), and [DBGPRCR](#).
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

**Note**

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR\\_EL2](#).TDE == 1.
- [HCR\\_EL2](#).TGE == 1.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - [OSLAR\\_EL1](#), [OSLSR\\_EL1](#), and [DBGPRCR\\_EL1](#).
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
  - [DBGOSLSR](#), [DBGOSLAR](#), and [DBGPRCR](#).
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to [OSDLR\\_EL1](#) are trapped.

It is IMPLEMENTATION DEFINED whether accesses to [DBGOSDLR](#) are trapped.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

**Note**

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR\\_EL2.TDE](#) == 1.
- [HCR\\_EL2.TGE](#) == 1.

**Note**

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDA, bit [9]**

Trap Debug Access. Traps EL0 and EL1 System register accesses to debug System registers that are not trapped by MDCR\_EL2.TDRA or MDCR\_EL2.TDOSA, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x18:
  - [MDCCSR\\_EL0](#), [MDCCINT\\_EL1](#), [OSDTRRX\\_EL1](#), [MDSCR\\_EL1](#), [OSDTRTX\\_EL1](#), [OSECCR\\_EL1](#), [DBGBVR<n>\\_EL1](#), [DBGBCR<n>\\_EL1](#), [DBGWVR<n>\\_EL1](#), [DBGWCR<n>\\_EL1](#), [DBGCLAIMSET\\_EL1](#), [DBGCLAIMCLR\\_EL1](#), [DBGAUTHSTATUS\\_EL1](#).
  - When not in Debug state, [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), [DBGDTRTX\\_EL0](#).
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05.
  - [DBGDIDR](#), [DBGDSCRint](#), [DBGDCCINT](#), [DBGWFAR](#), [DBGVCR](#), [DBGDSCRext](#), [DBGDTRTXext](#), [DBGDTRRXext](#), [DBGBVR<n>](#), [DBGBCR<n>](#), [DBGBXR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#), [DBGCLAIMSET](#), [DBGCLAIMCLR](#), [DBGAUTHSTATUS](#), [DBGDEVID](#), [DBGDEVID1](#), [DBGDEVID2](#), [DBGOSECCR](#).
  - When not in Debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).
- In AArch32 state, STC accesses to [DBGDTRRXint](#) and LDC accesses to [DBGDTRTXint](#) are trapped to EL2, reported using EC syndrome value 0x06.

TDA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 or EL1 System register accesses to the debug registers are trapped from both Execution states to EL2 when EL2 is enabled in the current Security state, unless the access generates a higher priority exception.

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

Traps of AArch64 accesses to [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#) are ignored in Debug state.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR\\_EL2.TDE](#) == 1
- [HCR\\_EL2.TGE](#) == 1

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDE, bit [8]**

Trap Debug Exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL<sub>D</sub>.

TDE	Meaning
0b0	The debug target Exception level is EL1.
0b1	If EL2 is enabled for the current Effective value of <a href="#">SCR_EL3.NS</a> , the debug target Exception level is EL2, otherwise the debug target Exception level is EL1. The MDCR_EL2.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

For more information, see 'Routing debug exceptions'.

This field is treated as being 1 for all purposes other than a direct read when [HCR\\_EL2.TGE](#) == 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## HPME, bit [7]

When FEAT\_PMUv3 is implemented:

[MDCR\_EL2.HPMN..(N-1)] event counters enable.

HPME	Meaning
0b0	Event counters in the range [MDCR_EL2.HPMN..( <a href="#">PMCR_ELO.N-1</a> )] are disabled.
0b1	Event counters in the range [MDCR_EL2.HPMN..( <a href="#">PMCR_ELO.N-1</a> )] are enabled by <a href="#">PMCNTENSET_ELO</a> .

If MDCR\_EL2.HPMN is less than [PMCR\\_ELO.N](#) or [PMCR.N](#), the event counters in the range [MDCR\_EL2.HPMN..([PMCR\\_ELO.N-1](#))] or [HDCR.HPMN..([PMCR.N-1](#))], are enabled and disabled by this bit. Otherwise this bit has no effect on the operation of the event counters.

### Note

The effect of MDCR\_EL2.HPMN on the operation of this bit applies regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HPMN field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

## TPM, bit [6]

When FEAT\_PMUv3 is implemented:

Trap Performance Monitors accesses. Traps EL0 and EL1 accesses to all Performance Monitor registers to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - [PMCR\\_ELO](#), [PMCNTENSET\\_ELO](#), [PMCNTENCLR\\_ELO](#), [PMOVSCCLR\\_ELO](#), [PMSWINC\\_ELO](#), [PMSELR\\_ELO](#), [PMCEID0\\_ELO](#), [PMCEID1\\_ELO](#), [PMCCNTR\\_ELO](#), [PMXEVTYPERR\\_ELO](#), [PMXEVCNTR\\_ELO](#), [PMUSERENR\\_ELO](#), [PMINTENSET\\_EL1](#), [PMINTENCLR\\_EL1](#), [PMOVSSET\\_ELO](#), [PMEVCNTR<n>\\_ELO](#), [PMEVTYPERR<n>\\_ELO](#), [PMCCFILTR\\_ELO](#).
  - If FEAT\_PMUv3p4 is implemented, [PMMIR\\_EL1](#)
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, MRRC or MCRR accesses are trapped to EL2 and reported using EC syndrome value 0x04:

- [PMCR](#), [PMCNTENSET](#), [PMCNTENCLR](#), [PMOVSr](#), [PMSWINC](#), [PMSELR](#), [PMCEID0](#), [PMCEID1](#), [PMCCNTR](#), [PMXEVTYPER](#), [PMXEVCNTR](#), [PMUSERENR](#), [PMINTENSET](#), [PMINTENCLR](#), [PMOVSSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMCCFILTR](#).
- If FEAT\_PMUv3p4 is implemented, [PMMIR](#).
- If FEAT\_PMUv3p1 is implemented, [PMCEID2](#), and [PMCEID3](#).

TPM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 accesses to all Performance Monitor registers are trapped to EL2 when EL2 is enabled in the current Security state.

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TPMCR, bit [5]****When FEAT\_PMUv3 is implemented:**

Trap [PMCR\\_EL0](#) or [PMCR](#) accesses. Traps EL0 and EL1 accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [PMCR\\_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, accesses to [PMCR](#) are trapped to EL2, reported using EC syndrome value 0x03.

TPMCR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 accesses to the <a href="#">PMCR_EL0</a> or <a href="#">PMCR</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by <a href="#">PMUSERENR</a> .EN or <a href="#">PMUSERENR_EL0</a> .EN.

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HPMN, bits [4:0]****When FEAT\_PMUv3 is implemented:**

Defines the number of event counters that are accessible from EL3, EL2, EL1, and from EL0 if permitted.

If HPMN is less than [PMCR\\_EL0](#).N, HPMN divides the Performance Monitors into two ranges: [0..(HPMN-1)] and [HPMN..([PMCR\\_EL0](#).N-1)].

For an event counter in the range [0..(HPMN-1)]:

- The counter is accessible from EL3, EL2, and EL1, and from EL0 if permitted by [PMUSERENR\\_EL0](#) or [PMUSERENR](#).
- If FEAT\_PMUv3p5 is implemented, [PMCR\\_EL0.LP](#) or [PMCR.LP](#) determines whether the counter overflow flag is set on unsigned overflow of [PMEVCNTR<n>\\_EL0\[31:0\]](#) or [PMEVCNTR<n>\\_EL0\[63:0\]](#).
- The counter is enabled by [PMCR\\_EL0.E](#) or [PMCR.E](#) and bit <n> of [PMCNTENSET\\_EL0](#).

#### Note

If HPMN is equal to [PMCR\\_EL0.N](#), this applies to all event counters.

If HPMN is less than [PMCR\\_EL0.N](#), for an event counter in the range [HPMN..([PMCR\\_EL0.N](#)-1)]:

- The counter is accessible from EL2 and EL3.
- If FEAT\_SEL2 is disabled or is not implemented, the counter is also accessible from Secure EL1, and from Secure EL0 if permitted by [PMUSERENR\\_EL0](#).
- If FEAT\_PMUv3p5 is implemented, [MDCR\\_EL2.HLP](#) or [HDCR.HLP](#) determines whether the counter overflow flag is set on unsigned overflow of [PMEVCNTR<n>\\_EL0\[31:0\]](#) or [PMEVCNTR<n>\\_EL0\[63:0\]](#).
- The counter is enabled by [MDCR\\_EL2.HPME](#) or [HDCR.HPME](#) and bit <n> of [PMCNTENSET\\_EL0](#).

If this field is set to 0, or to a value larger than [PMCR\\_EL0.N](#), then the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of [MDCR\\_EL2.HPMN](#) is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 and EL3 use. That is, the PE behaves as if [MDCR\\_EL2.HPMN](#) is set to an UNKNOWN non-zero value less than or equal to [PMCR\\_EL0.N](#).
  - All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.

On a Warm reset, this field resets to the value in [PMCR\\_EL0.N](#).

#### Otherwise:

Reserved, RES0.

## Accessing the MDCR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, MDCR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then

The MDCR\_EL3 characteristics are:

## Purpose

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

## Configuration

AArch64 System register MDCR\_EL3 bits [31:0] can be mapped to AArch32 System register [SDCR\[31:0\]](#), but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to MDCR\_EL3 are UNDEFINED.

## Attributes

MDCR\_EL3 is a 64-bit register.

## Field descriptions

The MDCR\_EL3 bit assignments are:

636261	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36
RES0																							EnPM

313029	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4

**Bits [63:29]**

**Bits [63:37]**

Reserved, RES0.

**EnPMSNMTPME, bit [3628]**

**When ~~FEAT\_SPEv1p2~~FEAT\_MTPMU is implemented:**

Trap accesses to [PMSNEVFR\\_EL1](#). Controls access to Statistical Profiling [PMSNEVFR\\_EL1](#) System register from EL2 and EL1.

EnPMSN	Meaning
0b0	Accesses to <a href="#">PMSNEVER_EL1</a> at EL2 and EL1 generate a Trap exception to EL3.
0b1	Do not trap <a href="#">PMSNEVER_EL1</a> to EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**MPMX, bit [35]**

**When FEAT\_PMUv3p7 is implemented:**

Monitor Performance Monitors Extended control. In conjunction with MDCR\_EL3.SPME, controls when event counters are disabled at EL3 and in other Secure Exception levels.

MPMX	Meaning
0b0	Event counting is not affected by this bit.
0b1	Event counting by some or all event counters is prohibited at EL3.

If EL2 is implemented, MDCR\_EL3.SPME == 0b1, and MDCR\_EL2.HPMN is less than PMCR\_EL0.N then all the following are true:

- This bit affects the operation of event counters in the range [0 .. (MDCR\_EL2.HPMN-1)].
- This bit does not affect the operation of event counters in the range [MDCR\_EL2.HPMN .. (PMCR\_EL0.N-1)].
- This applies even when EL2 is disabled in Secure state.

If EL2 is not implemented, MDCR\_EL3.SPME == 0b0, or MDCR\_EL2.HPMN is equal to PMCR\_EL0.N then this bit affects the operation of all event counters.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**MCCD, bit [34]****When FEAT\_PMUv3p7 is implemented:**

Monitor Cycle Counter Disable. Prohibits the Cycle Counter, PMCCNTR\_EL0, from counting at EL3.

MCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this bit.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited at EL3.

This bit does not affect the CPU\_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [33:29]**

Reserved, RES0.

**MTPME, bit [28]****When FEAT\_MTPMU is implemented:**

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>\_EL0.MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>_EL0.MT is zero.
0b1	PMEVTYPER<n>_EL0.MT bits not affected by this bit.

If FEAT\_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0, 0b0.

On a Cold reset, this field resets to 1.

**Otherwise:**

Reserved, RES0.

**TDCC, bit [27]****When FEAT\_FGT is implemented:**

Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: [OSDTRRX\\_EL1](#), [OSDTRTX\\_EL1](#), [MDCCSR\\_EL0](#), [MDCCINT\\_EL1](#), and, when the PE is in Non-debug state, [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#).

AArch32: [DBGDTRRXint](#), [DBGDTRTXint](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).
- 0x06 for trapped AArch32 LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).
- 0x18 for trapped AArch64 MRS and MSR accesses.
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR\_EL3.TDCC does not trap any accesses to:

AArch64: [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#).

AArch32: [DBGDTRRXint](#) and [DBGDTRTXint](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [26:24]**

Reserved, RES0.

**SCCD, bit [23]****When FEAT\_PMUv3p5 is implemented:**

Secure Cycle Counter Disable. Prohibits [PMCCNTR\\_EL0](#) from counting in Secure state.

SCCD	Meaning
0b0	Cycle counting by <a href="#">PMCCNTR_EL0</a> is not affected by this bit.
0b1	Cycle counting by <a href="#">PMCCNTR_EL0</a> is prohibited in Secure state.

This bit does not affect the CPU\_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [22]**

Reserved, RES0.

**EPMAD, bit [21]**

**When FEAT\_Debugv8p4 is implemented and FEAT\_PMUv3 is implemented:**

External Performance Monitors Non-secure Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

EPMAD	Meaning
0b0	Non-secure access to Performance Monitor registers from external debugger is permitted.
0b1	Non-secure access to Performance Monitor registers from external debugger is not permitted.

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

**When FEAT\_PMUv3 is implemented:**

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

EPMAD	Meaning
0b0	Access to Performance Monitor registers from external debugger is permitted.
0b1	Access to Performance Monitor registers from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**EDAD, bit [20]**

**When FEAT\_Debugv8p4 is implemented:**

External Debug Non-secure Access Disable. Controls Non-secure access to breakpoint, watchpoint, and [OSLAR\\_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Non-secure access to debug registers from external debugger is permitted.
0b1	Non-secure access to breakpoint and watchpoint registers, and <a href="#">OSLAR_EL1</a> from external debugger is not permitted.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, this field resets to 0.

**When FEAT\_Debugv8p2 is implemented:**

External Debug Access Disable. Controls access to breakpoint, watchpoint, and [OSLAR\\_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers, and to <a href="#">OSLAR_EL1</a> from external debugger is permitted.
0b1	Access to breakpoint and watchpoint registers, and to <a href="#">OSLAR_EL1</a> from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, this field resets to 0.

**Otherwise:**

External Debug Access disable. Controls access to breakpoint, watchpoint, and optionally [OSLAR\\_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers from external debugger is permitted.
0b1	Access to breakpoint and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the <a href="#">OSLAR_EL1</a> register from an external debugger is permitted or not permitted.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, this field resets to 0.

**TTRF, bit [19]**

**When FEAT\_TRF is implemented:**

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

The Trace Filter registers trapped by this control are:

- [TRFCR\\_EL2](#), TRFCR\_EL12, [TRFCR\\_EL1](#), reported using EC syndrome value 0x18.
- [HTRFCR](#) and [TRFCR](#), reported using EC syndrome value 0x03.

TTRF	Meaning
0b0	Accesses to Trace Filter registers at EL2 and EL1 are not affected by this bit.
0b1	Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception.

**Otherwise:**

Reserved, RES0.

**STE, bit [18]****When FEAT\_TRF is implemented:**

Secure Trace enable. Enables tracing in Secure state.

STE	Meaning
0b0	Trace prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Secure state is not affected by this bit.

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented **and** the Effective value of [SCR\\_EL3.NS](#) is 0b0, the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**SPME, bit [17]****When FEAT\_PMUv3 is implemented and ~~FEAT\_PMUv3p7~~FEAT\_Debugv8p2 is implemented:**

Secure Performance Monitors Enable.

Controls event counting in Secure state and EL3.

When MDCR\_EL3.MPMX == 0b1, this bit affects the operation of event counters at EL3 only. See MDCR\_EL3.MPMX for more information.

SPME	Meaning
0b0	When MDCR_EL3.MPMX == 0b0: Event counting prohibited in Secure state.
0b1	When MDCR_EL3.MPMX == 0b0: Event counting in Secure state not affected by this bit.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

**When FEAT\_PMUv3 is implemented and FEAT\_Debugv8p2 is implemented:**

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
0b0	Event counting prohibited in Secure state.
0b1	Event counting in Secure state not affected by this bit.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

**When FEAT\_PMUv3 is implemented:**

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
0b0	Event counting prohibited in Secure state, unless ExternalSecureNoninvasiveDebugEnabled() is TRUE.
0b1	Event counting in Secure state not affected by this bit.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### SDD, bit [16]

AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

SDD	Meaning
0b0	Debug exceptions in Secure state are not affected by this bit.
0b1	Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of [SCR\\_EL3.RW](#) is 0b1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### SPD32, bits [15:14]

##### When EL1 is capable of using AArch32:

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

SPD32	Meaning
0b00	Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.
0b10	Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.
0b11	Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored if the PE is either:

- In Non-secure state.
- In Secure state and Secure EL1 is using AArch64.

If Secure EL1 is using AArch32 then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of [SDER32\\_EL3.SUIDEN](#) is 0b1.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this field is 0b11.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NSPB, bits [13:12]****When FEAT\_SPE is implemented:**

Non-secure Profiling Buffer. ~~Controls~~~~This field controls~~ the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

NSPB	Meaning
0b00	Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in both <del>Security</del> <del>security</del> states generate Trap exceptions to EL3.
0b01	Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.
0b10	Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in both <del>Security</del> <del>security</del> states generate Trap exceptions to EL3.
0b11	Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.

The Statistical Profiling and Profiling Buffer control registers trapped by this control are: ~~PMBLIMITR\_EL1~~, ~~PMBPTR\_EL1~~, ~~PMBSR\_EL1~~, ~~PMSCR\_EL1~~, ~~PMSCR\_EL2~~, ~~PMSEVFR\_EL1~~, ~~PMSEVFR\_EL1~~, ~~PMSICR\_EL1~~, ~~PMSIDR\_EL1~~, ~~PMSIRR\_EL1~~, and ~~PMSLATFR\_EL1~~.

- ~~PMBLIMITR\_EL1~~, ~~PMBPTR\_EL1~~, ~~PMBSR\_EL1~~, ~~PMSCR\_EL1~~, ~~PMSCR\_EL2~~, ~~PMSEVFR\_EL1~~, ~~PMSEVFR\_EL1~~, ~~PMSICR\_EL1~~, ~~PMSIDR\_EL1~~, ~~PMSIRR\_EL1~~, and ~~PMSLATFR\_EL1~~.
- If FEAT\_SPEv1p2 is implemented, ~~PMSNEVER\_EL1~~.

If EL3 is not implemented and the Effective value of ~~SCR\_EL3~~.NS is 0b1, the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of ~~SCR\_EL3~~.NS is 0b0, the Effective value of this field is 0b01.

On a Warm reset, this field resets to an ~~architecturally~~ UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [11]**

Reserved, RES0.

**TDOSA, bit [10]****When FEAT\_DoubleLock is implemented:**

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:

- Accesses from AArch64 state, [OSLAR\\_EL1](#), [OSLSR\\_EL1](#), [OSDLR\\_EL1](#), [DBGPRCR\\_EL1](#) and any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit, are trapped to EL3 and reported using EC syndrome value 0x18.
- Accesses using MCR or MRC to [DBGOSLAR](#), [DBGOSLSR](#), [DBGOSDLR](#), and [DBGPRCR](#), are trapped to EL3 and reported using EC syndrome value 0x05.
- Accesses to any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by <a href="#">HDCR.TDOSA</a> or <a href="#">MDCR_EL2.TDOSA</a> .

**Note**

The powerdown debug registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:

- AArch64: [OSLAR\\_EL1](#), [OSLSR\\_EL1](#), and [DBGPRCR\\_EL1](#).
- AArch32: [DBGOSLAR](#), [DBGOSLSR](#), and [DBGPRCR](#).
- AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- It is IMPLEMENTATION DEFINED whether accesses to [OSDLR\\_EL1](#) and [DBGOSDLR](#) are trapped.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by <a href="#">HDCR.TDOSA</a> or <a href="#">MDCR_EL2.TDOSA</a> .

**Note**

The powerdown debug registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDA, bit [9]**

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the MDCR\_EL3.TDOSA field.

Accesses to the debug registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported using EC syndrome value 0x18:
  - [DBGBVR<n>\\_EL1](#), [DBGBCR<n>\\_EL1](#), [DBGWVR<n>\\_EL1](#), [DBGWCR<n>\\_EL1](#), [DBGCLAIMSET\\_EL1](#), [DBGCLAIMCLR\\_EL1](#), [DBGAUTHSTATUS\\_EL1](#), [DBGVCR32\\_EL2](#).
  - AArch64: [MDCR\\_EL2](#), [MDRAR\\_EL1](#), [MDCCSR\\_EL0](#), [MDCCINT\\_EL1](#), [MDSCR\\_EL1](#), [OSDTRRX\\_EL1](#), [OSDTRTX\\_EL1](#), [OSECCR\\_EL1](#).
- In AArch32 state, [SDER](#) is trapped to EL3 and reported using EC syndrome value 0x03.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x05, accesses using MCRR or MRRC are reported using EC syndrome value 0x0C:
  - [HDCR](#), [DBGDRAR](#), [DBGDSAR](#), [BGDIDR](#), [BGDCCINT](#), [DBGWFAR](#), [DBGVCR](#), [DBGBVR<n>](#), [DBGBCR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#).
  - [DBGCLAIMSET](#), [DBGCLAIMCLR](#), [DBGAUTHSTATUS](#), [DBGDEVID](#), [DBGDEVID1](#), [DBGDEVID2](#), [DBGOSECCR](#).
- In AArch32 state, STC accesses to [DBGDTRRXint](#) and LDC accesses to [DBGDTRTXint](#) are reported using EC syndrome value 0x06.
- When not in Debug state, the following registers are also trapped to EL3:

- AArch64 accesses to [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#), reported using EC syndrome value 0x18.
- AArch32 accesses using MCR or MRC to [DBGDTRRXint](#) and [DBGDTRTXint](#), reported using EC syndrome value 0x05.

TDA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by MDCR_EL3.TDOSA, are trapped to EL3, from both Security states and both Execution states, unless it is trapped by <a href="#">DBGDSCRext.UDCCdis</a> , <a href="#">MDCR_EL1.TDCC</a> , <a href="#">HDCR.TDA</a> or <a href="#">MDCR_EL2.TDA</a> .

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [8:7]

Reserved, RES0.

#### TPM, bit [6]

When FEAT\_PMUv3 is implemented:

Trap Performance Monitor register accesses. Accesses to all Performance Monitor registers from EL0, EL1 and EL2 to EL3, from both Security states and both Execution states are trapped as follows:

- In AArch64 state, accesses to the following registers are trapped to EL3 and are reported using EC syndrome value 0x18:
  - [PMCR\\_EL0](#), [PMCNTENSET\\_EL0](#), [PMCNTENCLR\\_EL0](#), [PMOVSLR\\_EL0](#), [PMSWINC\\_EL0](#), [PMSELR\\_EL0](#), [PMCEID0\\_EL0](#), [PMCEID1\\_EL0](#), [PMCCNTR\\_EL0](#), [PMXEVTYPER\\_EL0](#), [PMXVCNTR\\_EL0](#), [PMUSERENR\\_EL0](#), [PMINTENSET\\_EL1](#), [PMINTENCLR\\_EL1](#), [PMOVSSET\\_EL0](#), [PMEVCNTR<n>\\_EL0](#), [PMEVTYPER<n>\\_EL0](#), [PMCCFILTR\\_EL0](#).
  - If FEAT\_PMUv3p4 is implemented, [PMMIR\\_EL1](#)
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses using MCRR or MRRC are reported using EC syndrome value 0x04:
  - [PMCR](#), [PMCNTENSET](#), [PMCNTENCLR](#), [PMOVSr](#), [PMSWINC](#), [PMSELR](#), [PMCEID0](#), [PMCEID1](#), [PMCCNTR](#), [PMXEVTYPER](#), [PMXVCNTR](#), [PMUSERENR](#), [PMINTENSET](#), [PMINTENCLR](#), [PMOVSSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMCCFILTR](#).
  - If FEAT\_PMUv3p1 is implemented, [PMCEID2](#), and [PMCEID3](#).
  - If FEAT\_PMUv3p4 is implemented, [PMMIR](#).

TPM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2, EL1, and EL0 System register accesses to all Performance Monitor registers are trapped to EL3, unless it is trapped by <a href="#">HDCR.TPM</a> or <a href="#">MDCR_EL2.TPM</a> .

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

#### Bits [5:0]

# MDRAR\_EL1, Monitor Debug ROM Address Register

The MDRAR\_EL1 characteristics are:

## Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

## Configuration

AArch64 System register MDRAR\_EL1 bits [63:0] are architecturally mapped to AArch32 System register [DBGDRAR\[63:0\]](#).

## Attributes

MDRAR\_EL1 is a 64-bit register.

## Field descriptions

The MDRAR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0												ROMADDR																			
ROMADDR												RES0																Valid			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0												ROMADDR[51:48]									ROMADDR[47:12]										
ROMADDR[47:12]												RES0																Valid			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:52]

Reserved, RES0.

### ROMADDR[51:48], bits [51:1248]

#### When FEAT\_LPA is implemented:

Extension to ROMADDR[47:12]. See ROMADDR[47:12] for more details.

If MDRAR\_EL1.Valid == 0b00, then this field is UNKNOWN.

#### Otherwise:

Reserved, RES0.

### ROMADDR[47:12], bits [47:12]

Bits[47:12] of the ROM table physical address.

When FEAT\_LPA is implemented, ROMADDR[51:48] forms the upper part of the address value. Otherwise, ROMADDR[51:48] is RES0.

If the physical address size in bits (PAsize) is less than 52, then the register bits corresponding to ROMADDR [51:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

If MDRAR\_EL1.Valid == 0b00, then this field is UNKNOWN.

## ROMADDR encoding when FEAT\_LPA is implemented

### ROMADDR, bits [39:0]

The ROM table physical address.

Bits [11:0] of the ROM table physical address are defined to be zero.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

If MDRAR\_EL1.Valid == 0b00, then this field is UNKNOWN.

The upper part of the address value.

If the physical address size in bits (PAsize) is less than 52, then the register bits corresponding to ROMADDR [39:PAsize] are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ROMADDR encoding when FEAT\_LPA is not implemented or AArch32 is supported at any Exception level

### Bits [39:36]

Reserved, RES0.

### ROMADDR, bits [35:0]

The ROM table physical address.

Bits [11:0] of the ROM table physical address are defined to be zero.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

If MDRAR\_EL1.Valid == 0b00, then this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:2]**

Reserved, RES0.

**Valid, bits [1:0]**

This field indicates whether the ROM Table address is valid.

Valid	Meaning
0b00	ROM Table address is not valid. Software must ignore ROMADDR.
0b11	ROM Table address is valid.

Other values are reserved.

**Accessing the MDRAR\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, MDRAR\_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TDA == '1' then

# MIDR\_EL1, Main ID Register

The MIDR\_EL1 characteristics are:

## Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

## Configuration

AArch64 System register MIDR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MIDR\[31:0\]](#).

AArch64 System register MIDR\_EL1 bits [31:0] are architecturally mapped to External register [MIDR\\_EL1\[31:0\]](#).

## Attributes

MIDR\_EL1 is a 64-bit register.

## Field descriptions

The MIDR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																																	
Implementer								Variant				Architecture				PartNum														Revision			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### Bits [63:32]

Reserved, RES0.

### Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

Hex representation	Implementer
0x00	Reserved for software use
0xC0	Ampere Computing
0x41	Arm Limited
0x42	Broadcom Corporation
0x43	Cavium Inc.
0x44	Digital Equipment Corporation
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation
0x50	Applied Micro Circuits Corporation
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

**Architecture, bits [19:16]**

Architecture version. For A-profile, the defined values are:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers, see 'ID registers'.

All other values are reserved.

**PartNum, bits [15:4]**

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the device.

**Accessing the MIDR\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, MIDR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented("FEAT_IDST") then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGRTTR_EL2.MIDR_EL1 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elseif EL2Enabled() then
            return VPIDR_EL2;
        else
            return MIDR_EL1;
    elseif PSTATE.EL == EL2 then
        return MIDR_EL1;
    elseif PSTATE.EL == EL3 then
        return MIDR_EL1;

```

## Accessing the MIDR\_EL1

Accesses to this register use the following encodings:

```
MRS <Xt>, MIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.MIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() then
        return VPIDR_EL2;
    else
        return MIDR_EL1;
elseif PSTATE.EL == EL2 then
    return MIDR_EL1;
elseif PSTATE.EL == EL3 then
    return MIDR_EL1;

```

# MPAM0\_EL1, MPAM0 Register (EL1)

The MPAM0\_EL1 characteristics are:

## Purpose

Holds information to generate MPAM labels for memory requests when executing at EL0. When EL2 is present and enabled, the MPAM virtualization option is present, [MPAMHCR\\_EL2.GSTAPP\\_PLK == 1](#) and [HCR\\_EL2.TGE == 0](#), [MPAM1\\_EL1](#) is used instead of MPAM0\_EL1 to generate MPAM information to label memory requests.

If EL2 is present and enabled, and [HCR\\_EL2.E2H == 0](#) or [HCR\\_EL2.TGE == 0](#), the MPAM virtualization option is present and [MPAMHCR\\_EL2.EL0\\_VPMEN == 1](#), then MPAM PARTIDs in MPAM0\_EL1 are virtual and mapped into physical PARTIDs for the current Security state.

## Configuration

This register is present only when FEAT\_MPAM is implemented. Otherwise, direct accesses to MPAM0\_EL1 are UNDEFINED.

## Attributes

MPAM0\_EL1 is a 64-bit register.

## Field descriptions

The MPAM0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																PMG_D								PMG_I							
PARTID_D																PARTID_I															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:48]

Reserved, RES0.

### PMG\_D, bits [47:40]

Performance monitoring group property for PARTID\_D.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PMG\_I, bits [39:32]

Performance monitoring group property for PARTID\_I.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PARTID\_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PARTID\_I, bits [15:0]**

Partition ID for instruction accesses made from EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the MPAM0\_EL1**

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

MRS <Xt>, MPAM0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0101	0b001

```

# MPAM1\_EL1, MPAM1 Register (EL1)

The MPAM1\_EL1 characteristics are:

## Purpose

Holds information to generate MPAM labels for memory requests when executing at EL1.

When EL2 is present and enabled, the MPAM virtualization option is present, [MPAMHCR\\_EL2.GSTAPP\\_PLK](#) == 1 and [HCR\\_EL2.TGE](#) == 0, MPAM1\_EL1 is used instead of [MPAM0\\_EL1](#) to generate MPAM labels for memory requests when executing at EL0.

MPAM1\_EL1 is an alias for [MPAM2\\_EL2](#) when executing at EL2 with [HCR\\_EL2.E2H](#) == 1.

MPAM1\_EL12 is an alias for MPAM1\_EL1 when executing at EL2 or EL3 with [HCR\\_EL2.E2H](#) == 1.

If EL2 is present and enabled, the MPAM virtualization option is present and [MPAMHCR\\_EL2.EL1\\_VPMEN](#) == 1, MPAM PARTIDs in MPAM1\_EL1 are virtual and mapped into physical PARTIDs for the current Security state. This mapping of MPAM1\_EL1 virtual PARTIDs to physical PARTIDs when EL1\_VPMEN is 1 also applies when MPAM1\_EL1 is used at EL0 due to [MPAMHCR\\_EL2.GSTAPP\\_PLK](#).

## Configuration

AArch64 System register MPAM1\_EL1 bit [63] is architecturally mapped to AArch64 System register [MPAM3\\_EL3\[63\]](#) when EL3 is implemented.

AArch64 System register MPAM1\_EL1 bit [63] is architecturally mapped to AArch64 System register [MPAM2\\_EL2\[63\]](#) when EL3 is not implemented and EL2 is implemented.

This register is present only when FEAT\_MPAM is implemented. Otherwise, direct accesses to MPAM1\_EL1 are UNDEFINED.

## Attributes

MPAM1\_EL1 is a 64-bit register.

## Field descriptions

The MPAM1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
MPAMEN	RES0	FORCED_NS	RES0										PMG_D							PMG_I											
PARTID_D															PARTID_I																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

If neither EL3 nor EL2 is implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write bit [MPAM3\\_EL3.MPAMEN](#).

If EL3 is not implemented and EL2 is implemented, this field is read-only and reads the current value of the read/write bit [MPAM2\\_EL2.MPAMEN](#).

On a Warm reset, this **This** field resets to 0.

Accessing this field has the following behavior:

- When EL3 is not implemented and EL2 is not implemented, access to this field is **RW**.
- Otherwise, access to this field is **RO**.

## Bits [62:61]

Reserved, RES0.

## FORCED\_NS, bit [60]

When FEAT\_MPAMv0p1 is implemented:

In the Secure state, FORCED\_NS indicates the state of [MPAM3\\_EL3.FORCE\\_NS](#).

FORCED_NS	Meaning
0b0	In the Non-secure state, always reads as 0. In the Secure state, indicates that <a href="#">MPAM3_EL3.FORCE_NS</a> == 0.
0b1	In the Secure state, indicates that <a href="#">MPAM3_EL3.FORCE_NS</a> == 1.

Always reads as 0 in the Non-secure state.

Writes are ignored.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

## Bits [59:48]

Reserved, RES0.

## PMG\_D, bits [47:40]

Performance monitoring group property for PARTID\_D.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## PMG\_I, bits [39:32]

Performance monitoring group property for PARTID\_I.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## PARTID\_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**PARTID\_I, bits [15:0]**

Partition ID for instruction accesses made from EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the MPAM1\_EL1**

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, accesses from EL3 using the mnemonic MPAM1\_EL1 or MPAM1\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

MRS <Xt>, MPAM1\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0101	0b000

```

# MPAM2\_EL2, MPAM2 Register (EL2)

The MPAM2\_EL2 characteristics are:

## Purpose

Holds information to generate MPAM labels for memory requests when executing at EL2.

## Configuration

AArch64 System register MPAM2\_EL2 bit [63] is architecturally mapped to AArch64 System register [MPAM3\\_EL3\[63\]](#) when EL3 is implemented.

AArch64 System register MPAM2\_EL2 bit [63] is architecturally mapped to AArch64 System register [MPAM1\\_EL1\[63\]](#).

This register is present only when FEAT\_MPAM is implemented. Otherwise, direct accesses to MPAM2\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MPAM2\_EL2 is a 64-bit register.

## Field descriptions

The MPAM2\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
MPAMEN	RES0	TIDR		RES0		TRAPMPAM0EL1		TRAPMPAM1EL1		PMG_D		PMG_I																			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information from all Exception levels.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

If EL3 is not implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write [MPAM3\\_EL3](#).MPAMEN bit.

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When EL3 is not implemented, access to this field is **RW**.
- Otherwise, access to this field is **RO**.

**Bits [62:59]**

Reserved, RES0.

**TIDR, bit [58]**

When (FEAT\_MPAMvOp1 is implemented or FEAT\_MPAMv1p1 is implemented) and MPAMIDR\_EL1.HAS\_TIDR == 1:

TIDR traps accesses to [MPAMIDR\\_EL1](#) from EL1 to EL2.

TIDR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Trap accesses to <a href="#">MPAMIDR_EL1</a> from EL1 to EL2.

[MPAMHCR\\_EL2](#).TRAP\_MPAMIDR\_EL1 == 1 also traps [MPAMIDR\\_EL1](#) accesses from EL1 to EL2. If either TIDR or TRAP\_MPAMIDR\_EL1 are 1, accesses are trapped.

**Otherwise:**

Reserved, RES0.

**Bits [57:50]**

Reserved, RES0.

**TRAPMPAM0EL1, bit [49]**

TRAPMPAM0EL1: Trap accesses from EL1 to the [MPAM0\\_EL1](#) register trap to EL2.

TRAPMPAM0EL1	Meaning
0b0	Accesses to <a href="#">MPAM0_EL1</a> from EL1 are not trapped.
0b1	Accesses to <a href="#">MPAM0_EL1</a> from EL1 are trapped to EL2.

On a Warm reset, when ~~When~~ EL3 is not implemented, this field resets to 1.

On a Warm reset, when ~~When~~ EL3 is implemented, this field resets to an architecturally UNKNOWN value.

**TRAPMPAM1EL1, bit [48]**

TRAPMPAM1EL1: Trap accesses from EL1 to the [MPAM1\\_EL1](#) register trap to EL2.

TRAPMPAM1EL1	Meaning
0b0	Accesses to <a href="#">MPAM1_EL1</a> from EL1 are not trapped.
0b1	Accesses to <a href="#">MPAM1_EL1</a> from EL1 are trapped to EL2.

On a Warm reset, when ~~When~~ EL3 is not implemented, this field resets to 1.

On a Warm reset, when ~~When~~ EL3 is implemented, this field resets to an architecturally UNKNOWN value.

**PMG\_D, bits [47:40]**

Performance monitoring group for data accesses.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**PMG\_I, bits [39:32]**

Performance monitoring group for instruction accesses.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**PARTID\_D, bits [31:16]**

Partition ID for data accesses, including load and store accesses, made from EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PARTID\_I, bits [15:0]**

Partition ID for instruction accesses made from EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the MPAM2\_EL2**

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

MRS <Xt>, MPAM2\_EL2

# MPAM3\_EL3, MPAM3 Register (EL3)

The MPAM3\_EL3 characteristics are:

## Purpose

Holds information to generate MPAM labels for memory requests when executing at EL3.

## Configuration

AArch64 System register MPAM3\_EL3 bit [63] is architecturally mapped to AArch64 System register [MPAM2\\_EL2\[63\]](#) when EL2 is implemented.

AArch64 System register MPAM3\_EL3 bit [63] is architecturally mapped to AArch64 System register [MPAM1\\_EL1\[63\]](#).

This register is present only when FEAT\_MPAM is implemented. Otherwise, direct accesses to MPAM3\_EL3 are UNDEFINED.

## Attributes

MPAM3\_EL3 is a 64-bit register.

## Field descriptions

The MPAM3\_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
MPAMEN	TRAPLOWER	SDEFLT	FORCE_NS	RES0											PMG_D						PMG_I										
PARTID_D																PARTID_I															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

Values of this field are:

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information when executing at any ELn.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

This field is always read/write in MPAM3\_EL3.

On a Warm reset, this field resets to 0.

### TRAPLOWER, bit [62]

Trap direct accesses to any MPAM system registers that are not UNDEFINED from all ELn lower than EL3.

TRAPLOWER	Meaning
0b0	Do not force trapping of direct accesses of MPAM system registers to EL3.
0b1	Force all direct accesses of MPAM system registers to trap to EL3.

On a Cold reset, this field resets to 1.

### SDEFLT, bit [61]

When (FEAT\_MPAMv0p1 is implemented or FEAT\_MPAMv1p1 is implemented) and MPAMIDR\_EL1.HAS\_SDEFLT == 1:

SDEFLT overrides the PARTID with the default PARTID when executing in the Secure state.

SDEFLT	Meaning
0b0	The PARTID is determined normally in the Secure state.
0b1	The PARTID is always PARTID 0 when executing in the Secure state.

On a Warm reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

### FORCE\_NS, bit [60]

When FEAT\_MPAMv0p1 is implemented and MPAMIDR\_EL1.HAS\_FORCE\_NS == 1:

FORCE\_NS forces MPAM\_NS to always be 1 in the Secure state.

FORCE_NS	Meaning
0b0	MPAM_NS is 0 when executing in the Secure state.
0b1	MPAM_NS is 1 when executing in the Secure state.

An implementation is permitted to have this field as RAO if the implementation does not support generating MPAM\_NS as 0.
