### Release Information

For information on the change history and known issues for this release, see the **Release Notes** in the **System Register XML for Armv8.7 (2020-09)**.

### Proprietary Notice

This document is protected by copyright and other related rights and the practice or implementation of the information contained in this document may be protected by one or more patents or pending patent applications. No part of this document may be reproduced in any form by any means without the express prior written permission of Arm. **No license, express or implied, by estoppel or otherwise to any intellectual property rights is granted by this document unless specifically stated.**

Your access to the information in this document is conditional upon your acceptance that you will not use or permit others to use the information for the purposes of determining whether implementations infringe any third party patents.

THIS DOCUMENT IS PROVIDED “AS IS”. ARM PROVIDES NO REPRESENTATIONS AND NO WARRANTIES, EXPRESS, IMPLIED OR STATUTORY, INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY, SATISFACTORY QUALITY, NON-INFRINGEMENT OR FITNESS FOR A PARTICULAR PURPOSE WITH RESPECT TO THE DOCUMENT. For the avoidance of doubt, Arm makes no representation with respect to, and has undertaken no analysis to identify or understand the scope and content of, patents, copyrights, trade secrets, or other rights.

This document may include technical inaccuracies or typographical errors.

TO THE EXTENT NOT PROHIBITED BY LAW, IN NO EVENT WILL ARM BE LIABLE FOR ANY DAMAGES, INCLUDING WITHOUT LIMITATION ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, PUNITIVE, OR CONSEQUENTIAL DAMAGES, HOWEVER CAUSED AND REGARDLESS OF THE THEORY OF LIABILITY, ARISING OUT OF ANY USE OF THIS DOCUMENT, EVEN IF ARM HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

This document consists solely of commercial items. You shall be responsible for ensuring that any use, duplication or disclosure of this document complies fully with any relevant export laws and regulations to assure that this document or any portion thereof is not exported, directly or indirectly, in violation of such export laws. Use of the word “partner” in reference to Arm’s customers is not intended to create or refer to any partnership relationship with any other company. Arm may make changes to this document at any time and without notice.

This document may be translated into other languages for convenience, and you agree that if there is any conflict between the English version of this document and any translation, the terms of the English version of the Agreement shall prevail.

Arm Limited. Company 02557590 registered in England.  
110 Fulbourn Road, Cambridge, England CB1 9NJ.

(LES-PRE-20349 version 21.0)

### Confidentiality Status

This document is Non-Confidential. The right to use, copy and disclose this document may be subject to license restrictions in accordance with the terms of the agreement entered into by Arm and the party that Arm delivered this document to.

### Product Status

The information in this document covers multiple versions of the architecture. The content relating to different versions is given different quality ratings.

The information in this document relating to v8.7 of the architecture and the features introduced in this release is at Alpha quality. Alpha quality means that most major features of the specification are included, features and details might be missing.

The information in this document relating to versions of the architecture before v8.7 and features introduced in previous releases is at Beta quality. Beta quality means that all major features of the specification are included, some details might be missing.

# AArch64 System Registers

[ACCDATA\\_EL1](#): Accelerator Data

[ACTLR\\_EL1](#): Auxiliary Control Register (EL1)

[ACTLR\\_EL2](#): Auxiliary Control Register (EL2)

[ACTLR\\_EL3](#): Auxiliary Control Register (EL3)

[AFSR0\\_EL1](#): Auxiliary Fault Status Register 0 (EL1)

[AFSR0\\_EL2](#): Auxiliary Fault Status Register 0 (EL2)

[AFSR0\\_EL3](#): Auxiliary Fault Status Register 0 (EL3)

[AFSR1\\_EL1](#): Auxiliary Fault Status Register 1 (EL1)

[AFSR1\\_EL2](#): Auxiliary Fault Status Register 1 (EL2)

[AFSR1\\_EL3](#): Auxiliary Fault Status Register 1 (EL3)

[AIDR\\_EL1](#): Auxiliary ID Register

[AMAIR\\_EL1](#): Auxiliary Memory Attribute Indirection Register (EL1)

[AMAIR\\_EL2](#): Auxiliary Memory Attribute Indirection Register (EL2)

[AMAIR\\_EL3](#): Auxiliary Memory Attribute Indirection Register (EL3)

[AMCFGR\\_EL0](#): Activity Monitors Configuration Register

[AMCG1IDR\\_EL0](#): Activity Monitors Counter Group 1 Identification Register

[AMCGCR\\_EL0](#): Activity Monitors Counter Group Configuration Register

[AMCNTENCLR0\\_EL0](#): Activity Monitors Count Enable Clear Register 0

[AMCNTENCLR1\\_EL0](#): Activity Monitors Count Enable Clear Register 1

[AMCNTENSET0\\_EL0](#): Activity Monitors Count Enable Set Register 0

[AMCNTENSET1\\_EL0](#): Activity Monitors Count Enable Set Register 1

[AMCR\\_EL0](#): Activity Monitors Control Register

[AMEVCNTR0<n>\\_EL0](#): Activity Monitors Event Counter Registers 0

[AMEVCNTR1<n>\\_EL0](#): Activity Monitors Event Counter Registers 1

[AMEVCNTVOFF0<n>\\_EL2](#): Activity Monitors Event Counter Virtual Offset Registers 0

[AMEVCNTVOFF1<n>\\_EL2](#): Activity Monitors Event Counter Virtual Offset Registers 1

[AMEVTYPER0<n>\\_EL0](#): Activity Monitors Event Type Registers 0

[AMEVTYPER1<n>\\_EL0](#): Activity Monitors Event Type Registers 1

[AMUSERENR\\_EL0](#): Activity Monitors User Enable Register

[APDAKeyHi\\_EL1](#): Pointer Authentication Key A for Data (bits[127:64])

[APDAKeyLo\\_EL1](#): Pointer Authentication Key A for Data (bits[63:0])

[APDBKeyHi\\_EL1](#): Pointer Authentication Key B for Data (bits[127:64])

[APDBKeyLo\\_EL1](#): Pointer Authentication Key B for Data (bits[63:0])

[APGAKeyHi\\_EL1](#): Pointer Authentication Key A for Code (bits[127:64])

[APGKeyLo\\_EL1](#): Pointer Authentication Key A for Code (bits[63:0])

[APIAKeyHi\\_EL1](#): Pointer Authentication Key A for Instruction (bits[127:64])

[APIAKeyLo\\_EL1](#): Pointer Authentication Key A for Instruction (bits[63:0])

[APIBKeyHi\\_EL1](#): Pointer Authentication Key B for Instruction (bits[127:64])

[APIBKeyLo\\_EL1](#): Pointer Authentication Key B for Instruction (bits[63:0])

[CCSIDR2\\_EL1](#): Current Cache Size ID Register 2

[CCSIDR\\_EL1](#): Current Cache Size ID Register

[CLIDR\\_EL1](#): Cache Level ID Register

[CNTFRQ\\_EL0](#): Counter-timer Frequency register

[CNTHCTL\\_EL2](#): Counter-timer Hypervisor Control register

[CNTHPS\\_CTL\\_EL2](#): Counter-timer Secure Physical Timer Control register (EL2)

[CNTHPS\\_CVAL\\_EL2](#): Counter-timer Secure Physical Timer CompareValue register (EL2)

[CNTHPS\\_TVAL\\_EL2](#): Counter-timer Secure Physical Timer TimerValue register (EL2)

[CNTHP\\_CTL\\_EL2](#): Counter-timer Hypervisor Physical Timer Control register

[CNTHP\\_CVAL\\_EL2](#): Counter-timer Physical Timer CompareValue register (EL2)

[CNTHP\\_TVAL\\_EL2](#): Counter-timer Physical Timer TimerValue register (EL2)

[CNTHVS\\_CTL\\_EL2](#): Counter-timer Secure Virtual Timer Control register (EL2)

[CNTHVS\\_CVAL\\_EL2](#): Counter-timer Secure Virtual Timer CompareValue register (EL2)

[CNTHVS\\_TVAL\\_EL2](#): Counter-timer Secure Virtual Timer TimerValue register (EL2)

[CNTHV\\_CTL\\_EL2](#): Counter-timer Virtual Timer Control register (EL2)

[CNTHV\\_CVAL\\_EL2](#): Counter-timer Virtual Timer CompareValue register (EL2)

[CNTHV\\_TVAL\\_EL2](#): Counter-timer Virtual Timer TimerValue Register (EL2)

[CNTKCTL\\_EL1](#): Counter-timer Kernel Control register

[CNTPCTSS\\_EL0](#): Counter-timer Self-Synchronized Physical Count register

[CNTPCT\\_EL0](#): Counter-timer Physical Count register

[CNTPOFF\\_EL2](#): Counter-timer Physical Offset register

[CNTPS\\_CTL\\_EL1](#): Counter-timer Physical Secure Timer Control register

[CNTPS\\_CVAL\\_EL1](#): Counter-timer Physical Secure Timer CompareValue register

[CNTPS\\_TVAL\\_EL1](#): Counter-timer Physical Secure Timer TimerValue register

[CNTP\\_CTL\\_EL0](#): Counter-timer Physical Timer Control register

[CNTP\\_CVAL\\_EL0](#): Counter-timer Physical Timer CompareValue register

[CNTP\\_TVAL\\_EL0](#): Counter-timer Physical Timer TimerValue register

[CNTVCTSS\\_EL0](#): Counter-timer Self-Synchronized Virtual Count register

[CNTVCT\\_EL0](#): Counter-timer Virtual Count register

[CNTVOFF\\_EL2](#): Counter-timer Virtual Offset register

[CNTV\\_CTL\\_EL0](#): Counter-timer Virtual Timer Control register

[CNTV\\_CVAL\\_EL0](#): Counter-timer Virtual Timer CompareValue register

[CNTV\\_TVAL\\_EL0](#): Counter-timer Virtual Timer TimerValue register

[CONTEXTIDR\\_EL1](#): Context ID Register (EL1)

[CONTEXTIDR\\_EL2](#): Context ID Register (EL2)

[CPACR\\_EL1](#): Architectural Feature Access Control Register

[CPTR\\_EL2](#): Architectural Feature Trap Register (EL2)

[CPTR\\_EL3](#): Architectural Feature Trap Register (EL3)

[CSSELR\\_EL1](#): Cache Size Selection Register

[CTR\\_EL0](#): Cache Type Register

[CurrentEL](#): Current Exception Level

[DACR32\\_EL2](#): Domain Access Control Register

[DAIF](#): Interrupt Mask Bits

[DBGAUTHSTATUS\\_EL1](#): Debug Authentication Status register

[DBGBCR<n>\\_EL1](#): Debug Breakpoint Control Registers

[DBGBVR<n>\\_EL1](#): Debug Breakpoint Value Registers

[DBGCLAIMCLR\\_EL1](#): Debug CLAIM Tag Clear register

[DBGCLAIMSET\\_EL1](#): Debug CLAIM Tag Set register

[DBGDTRRX\\_EL0](#): Debug Data Transfer Register, Receive

[DBGDTRTX\\_EL0](#): Debug Data Transfer Register, Transmit

[DBGDTR\\_EL0](#): Debug Data Transfer Register, half-duplex

[DBGPRCR\\_EL1](#): Debug Power Control Register

[DBGVCR32\\_EL2](#): Debug Vector Catch Register

[DBGWCR<n>\\_EL1](#): Debug Watchpoint Control Registers

[DBGWVR<n>\\_EL1](#): Debug Watchpoint Value Registers

[DCZID\\_EL0](#): Data Cache Zero ID register

[DISR\\_EL1](#): Deferred Interrupt Status Register

[DIT](#): Data Independent Timing

[DLR\\_EL0](#): Debug Link Register

[DSPSR\\_EL0](#): Debug Saved Program Status Register

[ELR\\_EL1](#): Exception Link Register (EL1)

[ELR\\_EL2](#): Exception Link Register (EL2)

[ELR\\_EL3](#): Exception Link Register (EL3)

[ERRIDR\\_EL1](#): Error Record ID Register

[ERRSELR\\_EL1](#): Error Record Select Register

# ACCDATA\_EL1, Accelerator Data

The ACCDATA\_EL1 characteristics are:

## Purpose

Holds the lower 32 bits of the data that is stored by an ST64BV0, Single-copy atomic 64-byte EL0 store instruction.

## Configuration

This register is present only when FEAT\_LS64\_ACCDATA is implemented. Otherwise, direct accesses to ACCDATA\_EL1 are UNDEFINED.

## Attributes

ACCDATA\_EL1 is a 64-bit register.

## Field descriptions

The ACCDATA\_EL1 bit assignments are:

### Bits [63:32]

Reserved, RES0.

### ACCDATA, bits [31:0]

Accelerator Data field. Holds bits[31:0] of the data that is stored by an ST64BV0 instruction.

## Accessing the ACCDATA\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ACCDATA\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1101	0b0000	0b101

```

if PSTATE.EL == EL0 then

# ACTLR\_EL1, Auxiliary Control Register (EL1)

The ACTLR\_EL1 characteristics are:

## Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

**Note**

Arm recommends the contents of this register have no effect on the PE when [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, and instead the configuration and control fields are provided by the [ACTLR\\_EL2](#) register. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

## Configuration

AArch64 System register ACTLR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ACTLR\[31:0\]](#).

AArch64 System register ACTLR\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [ACTLR2\[31:0\]](#).

## Attributes

ACTLR\_EL1 is a 64-bit register.

## Field descriptions

The ACTLR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																															
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**IMPLEMENTATION DEFINED, bits [63:0]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ACTLR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ACTLR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TACR == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '1x1' then
        return NVMem[0x118];
    else
        return ACTLR_EL1;
elsif PSTATE.EL == EL2 then
    return ACTLR_EL1;
elsif PSTATE.EL == EL3 then
    return ACTLR_EL1;

```

MSR ACTLR\_EL1, <Xt>

# ACTLR\_EL2, Auxiliary Control Register (EL2)

The ACTLR\_EL2 characteristics are:

## Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for EL2.

### Note

Arm recommends the contents of this register are updated to apply to EL0 when [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, gaining configuration and control fields from the [ACTLR\\_EL1](#). This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

## Configuration

AArch64 System register ACTLR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HACTLR\[31:0\]](#).

AArch64 System register ACTLR\_EL2 bits [63:32] are architecturally mapped to AArch32 System register [HACTLR2\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ACTLR\_EL2 is a 64-bit register.

## Field descriptions

The ACTLR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# AMCFGR\_EL0, Activity Monitors Configuration Register

The AMCFGR\_EL0 characteristics are:

## Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR\_EL0 is applicable to both the architected and the auxiliary counter groups.

## Configuration

AArch64 System register AMCFGR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMCFGR\[31:0\]](#).

AArch64 System register AMCFGR\_EL0 bits [31:0] are architecturally mapped to External register [AMCFGR\[31:0\]](#).

This register is present only when FEAT\_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR\_EL0 are UNDEFINED.

## Attributes

AMCFGR\_EL0 is a 64-bit register.

## Field descriptions

The AMCFGR\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
NCG				RES0				HDBG				RAZ								SIZE								N			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### NCG, bits [31:28]

Defines the number of counter groups.

The number of implemented counter groups is defined as  $[AMCFGR\_EL0.NCG + 1]$ .

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

### Bits [27:25]

Reserved, RES0.

### HDBG, bit [24]

Halt-on-debug supported.

From Armv8, this feature must be supported, and so this bit is 0b1.

HDBG	Meaning
0b0	<a href="#">AMCR_EL0</a> .HDBG is RES0.
0b1	<a href="#">AMCR_EL0</a> .HDBG is read/write.

**Bits [23:14]**

Reserved, RAZ.

**SIZE, bits [13:8]**

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the activity monitors Extension is defined as [AMCFGR\_EL0.SIZE + 1].

From Armv8, the counters are 64-bit, and so this field is 0b111111.

**Note**

Software also uses this field to determine the spacing of counters in the memory-map. From Armv8, the counters are at doubleword-aligned addresses.

**N, bits [7:0]**

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is defined as [AMCFGR\_EL0.N + 1].

**Accessing the AMCFGR\_EL0**

Accesses to this register use the following encodings:

MRS <Xt>, AMCFGR\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0010	0b001

```

# AMCG1IDR\_EL0, Activity Monitors Counter Group 1 Identification Register

The AMCG1IDR\_EL0 characteristics are:

## Purpose

Defines which auxiliary counters are implemented, and which of them have a corresponding virtual offset register, [AMEVCNTVOFF1<n>\\_EL2](#) implemented.

## Configuration

This register is present only when FEAT\_AMUv1p1 is implemented. Otherwise, direct accesses to AMCG1IDR\_EL0 are UNDEFINED.

## Attributes

AMCG1IDR\_EL0 is a 64-bit register.

## Field descriptions

The AMCG1IDR\_EL0 bit assignments are:

63	62	61	60	59	
<a href="#">AMEVCNTVOFF115_EL2</a>	<a href="#">AMEVCNTVOFF114_EL2</a>	<a href="#">AMEVCNTVOFF113_EL2</a>	<a href="#">AMEVCNTVOFF112_EL2</a>	<a href="#">AMEVCNTVOFF111_EL2</a>	<a href="#">AMEVCNTVOFF110_EL2</a>
31	30	29	28	27	

### Bits [63:32]

Reserved, RES0.

### AMEVCNTVOFF1<n>\_EL2, bit [n+16], for n = 15 to 0

Indicates which implemented auxiliary counters have a corresponding virtual offset register, [AMEVCNTVOFF1<n>\\_EL2](#) implemented.

AMEVCNTVOFF1<n>_EL2	Meaning
0b0	When read, mean that <a href="#">AMEVCNTR1&lt;n&gt;_EL0</a> does not have an offset, or is not implemented.
0b1	When read, means the offset <a href="#">AMEVCNTVOFF1&lt;n&gt;_EL2</a> is implemented for <a href="#">AMEVCNTR1&lt;n&gt;_EL0</a> .

### AMEVCNTR1<n>\_EL0, bit [n], for n = 15 to 0

Indicates which auxiliary counters [AMEVCNTR1<n>\\_EL0](#) are implemented.

AMEVCNTR1<n>_EL0	Meaning
0b0	When read, means that <a href="#">AMEVCNTR1&lt;n&gt;_EL0</a> is not implemented.
0b1	When read, means that <a href="#">AMEVCNTR1&lt;n&gt;_EL0</a> is implemented.

## Accessing the AMCG1IDR\_EL0

Accesses to this register use the following encodings:

# AMCGCR\_EL0, Activity Monitors Counter Group Configuration Register

The AMCGCR\_EL0 characteristics are:

## Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

## Configuration

AArch64 System register AMCGCR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMCGCR\[31:0\]](#).

AArch64 System register AMCGCR\_EL0 bits [31:0] are architecturally mapped to External register [AMCGCR\[31:0\]](#).

This register is present only when FEAT\_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR\_EL0 are UNDEFINED.

## Attributes

AMCGCR\_EL0 is a 64-bit register.

## Field descriptions

The AMCGCR\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

### Bits [63:16]

Reserved, RES0.

### CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT\_AMUv1, the permitted range of values is 0x0 to 0x10.

### CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

In an implementation that includes FEAT\_AMUv1, the value of this field is 0x4.

## Accessing the AMCGCR\_EL0

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, AMCGCR\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0010	0b010

# AMCR\_EL0, Activity Monitors Control Register

The AMCR\_EL0 characteristics are:

## Purpose

Global control register for the activity monitors implementation. AMCR\_EL0 is applicable to both the architected and the auxiliary counter groups.

## Configuration

AArch64 System register AMCR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMCR\[31:0\]](#).

AArch64 System register AMCR\_EL0 bits [31:0] are architecturally mapped to External register [AMCR\[31:0\]](#).

This register is present only when FEAT\_AMUv1 is implemented. Otherwise, direct accesses to AMCR\_EL0 are UNDEFINED.

## Attributes

AMCR\_EL0 is a 64-bit register.

## Field descriptions

The AMCR\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0														CG1RZ	RES0						HDBG	RES0									
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:18]

Reserved, RES0.

### CG1RZ, bit [17]

When FEAT\_AMUv1p1 is implemented:

Counter Group 1 Read Zero.

CG1RZ	Meaning
0b0	System register reads of <a href="#">AMEVCNTR1&lt;n&gt;_EL0</a> return the event count at all implemented and enabled Exception levels.
0b1	If the current Exception level is the highest implemented Exception level, system register reads of <a href="#">AMEVCNTR1&lt;n&gt;_EL0</a> return the event count. Otherwise, reads of <a href="#">AMEVCNTR1&lt;n&gt;_EL0</a> return a zero value.

### Note

Reads from the memory-mapped view are unaffected by this field.

### Otherwise:

Reserved, RES0.

**Bits [16:11]**

Reserved, RES0.

**HDBG, bit [10]**

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

<b>HDBG</b>	<b>Meaning</b>
0b0	Activity monitors do not halt counting when the PE is halted in Debug state.
0b1	Activity monitors halt counting when the PE is halted in Debug state.

**Bits [9:0]**

Reserved, RES0.

**Accessing the AMCR\_EL0**

Accesses to this register use the following encodings:

MRS <Xt>, AMCR\_EL0

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b11	0b011	0b1101	0b0010	0b000

# AMEVCNTR0<n>\_EL0, Activity Monitors Event Counter Registers 0, n = 0 - 15

The AMEVCNTR0<n>\_EL0 characteristics are:

## Purpose

Provides access to the architected activity monitor event counters.

## Configuration

AArch64 System register AMEVCNTR0<n>\_EL0 bits [63:0] are architecturally mapped to AArch32 System register [AMEVCNTR0<n>\[63:0\]](#).

AArch64 System register AMEVCNTR0<n>\_EL0 bits [63:0] are architecturally mapped to External register [AMEVCNTR0<n>\[63:0\]](#).

This register is present only when FEAT\_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n>\_EL0 are UNDEFINED.

## Attributes

AMEVCNTR0<n>\_EL0 is a 64-bit register.

## Field descriptions

The AMEVCNTR0<n>\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# AMEVTYPER0<n>\_EL0, Activity Monitors Event Type Registers 0, n = 0 - 15

The AMEVTYPER0<n>\_EL0 characteristics are:

## Purpose

Provides information on the events that an architected activity monitor event counter [AMEVCNTR0<n>\\_EL0](#) counts.

## Configuration

AArch64 System register AMEVTYPER0<n>\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMEVTYPER0<n>\[31:0\]](#).

AArch64 System register AMEVTYPER0<n>\_EL0 bits [31:0] are architecturally mapped to External register [AMEVTYPER0<n>\[31:0\]](#).

This register is present only when FEAT\_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n>\_EL0 are UNDEFINED.

## Attributes

AMEVTYPER0<n>\_EL0 is a 64-bit register.

## Field descriptions

The AMEVTYPER0<n>\_EL0 bit assignments are:

### Bits [63:16]

Reserved, RES0.

### evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter [AMEVCNTR0<n>\\_EL0](#). The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

evtCount	Meaning	Applies when
0x0011	Processor frequency cycles	When n == 0
0x4004	Constant frequency cycles	When n == 1
0x0008	Instructions retired	When n == 2
0x4005	Memory stall cycles	When n == 3

## Accessing the AMEVTYPER0<n>\_EL0

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPER0<n>\_EL0 are UNDEFINED.

### Note

[AMCGCR\\_EL0](#).CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings:

MRS <Xt>, AMEVTYPER0<n>\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b011:n[3]	n[2:0]

# AMEVTYPER1<n>\_EL0, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n>\_EL0 characteristics are:

## Purpose

Provides information on the events that an auxiliary activity monitor event counter [AMEVCNTR1<n>\\_EL0](#) counts.

## Configuration

AArch64 System register AMEVTYPER1<n>\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMEVTYPER1<n>\[31:0\]](#).

AArch64 System register AMEVTYPER1<n>\_EL0 bits [31:0] are architecturally mapped to External register [AMEVTYPER1<n>\[31:0\]](#).

This register is present only when FEAT\_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n>\_EL0 are UNDEFINED.

## Attributes

AMEVTYPER1<n>\_EL0 is a 64-bit register.

## Field descriptions

The AMEVTYPER1<n>\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																evtCount															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:16]

Reserved, RES0.

### evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter [AMEVCNTR1<n>\\_EL0](#).

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter [AMEVCNTR1<n>\\_EL0](#), then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by [AMEVCNTR1<n>\\_EL0](#) might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter [AMEVCNTR1<n>\\_EL0](#) is enabled, writes to this register have UNPREDICTABLE results.

## Accessing the AMEVTYPER1<n>\_EL0

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n>\_EL0 are UNDEFINED.

**Note**

[AMCGCR\\_EL0](#).CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings:

MRS <Xt>, AMEVTYPER1<n>\_EL0

# AMUSERENR\_EL0, Activity Monitors User Enable Register

The AMUSERENR\_EL0 characteristics are:

## Purpose

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR\_EL0 is applicable to both the architected and the auxiliary counter groups.

## Configuration

AArch64 System register AMUSERENR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMUSERENR\[31:0\]](#).

This register is present only when FEAT\_AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR\_EL0 are UNDEFINED.

## Attributes

AMUSERENR\_EL0 is a 64-bit register.

## Field descriptions

The AMUSERENR\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															EN
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:1]

Reserved, RES0.

### EN, bit [0]

Traps EL0 accesses to the activity monitors registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2.TGE](#) is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value 0x18:
  - [AMCFGR\\_EL0](#), [AMCGCR\\_EL0](#), [AMCNTENCLR0\\_EL0](#), [AMCNTENCLR1\\_EL0](#), [AMCNTENSET0\\_EL0](#), [AMCNTENSET1\\_EL0](#), [AMCR\\_EL0](#), [AMEVCNTR0<n>\\_EL0](#), [AMEVCNTR1<n>\\_EL0](#), [AMEVTYPER0<n>\\_EL0](#), and [AMEVTYPER1<n>\\_EL0](#).
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped and reported using EC syndrome value 0x04:
  - [AMCFGR](#), [AMCGCR](#), [AMCNTENCLR0](#), [AMCNTENCLR1](#), [AMCNTENSET0](#), [AMCNTENSET1](#), [AMCR](#), [AMEVCNTR0<n>](#), [AMEVCNTR1<n>](#), [AMEVTYPER0<n>](#), and [AMEVTYPER1<n>](#).

EN	Meaning
0b0	EL0 accesses to the activity monitors registers are trapped.
0b1	This control does not cause any instructions to be trapped. Software can access all activity monitor registers at EL0.

### Note

- AMUSERENR\_EL0 can always be read at EL0 and is not governed by this bit.

## Accessing the AMUSERENR\_EL0

# APDAKeyHi\_EL1, Pointer Authentication Key A for Data (bits[127:64])

The APDAKeyHi\_EL1 characteristics are:

## Purpose

Holds bits[127:64] of key A used for authentication of data pointer values.

### Note

The term APDAKey\_EL1 is used to describe the concatenation of [APDAKeyHi\\_EL1](#): [APDAKeyLo\\_EL1](#).

## Configuration

This register is present only when FEAT\_PAuth is implemented. Otherwise, direct accesses to APDAKeyHi\_EL1 are UNDEFINED.

## Attributes

APDAKeyHi\_EL1 is a 64-bit register.

## Field descriptions

The APDAKeyHi\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
64 bit value, bits[127:64] of the 128 bit pointer authentication key value																															
64 bit value, bits[127:64] of the 128 bit pointer authentication key value																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

64 bit value, bits[127:64] of the 128 bit pointer authentication key value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the APDAKeyHi\_EL1

Accesses to this register use the following encodings:

# APDAKeyLo\_EL1, Pointer Authentication Key A for Data (bits[63:0])

The APDAKeyLo\_EL1 characteristics are:

## Purpose

Holds bits[63:0] of key A used for authentication of data pointer values.

**Note**

The term APDAKey\_EL1 is used to describe the concatenation of [APDAKeyHi\\_EL1](#): [APDAKeyLo\\_EL1](#).

## Configuration

This register is present only when FEAT\_PAuth is implemented. Otherwise, direct accesses to APDAKeyLo\_EL1 are UNDEFINED.

## Attributes

APDAKeyLo\_EL1 is a 64-bit register.

## Field descriptions

The APDAKeyLo\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:0]**

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the APDAKeyLo\_EL1

Accesses to this register use the following encodings:

# APGAKeyLo\_EL1, Pointer Authentication Key A for Code (bits[63:0])

The APGAKeyLo\_EL1 characteristics are:

## Purpose

Holds bits[63:0] of key used for generic pointer authentication code.

**Note**

The term APGAKey\_EL1 is used to describe the concatenation of [APGAKeyHi\\_EL1](#): [APGAKeyLo\\_EL1](#).

## Configuration

This register is present only when FEAT\_PAuth is implemented. Otherwise, direct accesses to APGAKeyLo\_EL1 are UNDEFINED.

## Attributes

APGAKeyLo\_EL1 is a 64-bit register.

## Field descriptions

The APGAKeyLo\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:0]**

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the APGAKeyLo\_EL1

Accesses to this register use the following encodings:

# APIBKeyLo\_EL1, Pointer Authentication Key B for Instruction (bits[63:0])

The APIBKeyLo\_EL1 characteristics are:

## Purpose

Holds bits[63:0] of key B used for authentication of instruction pointer values.

### Note

The term APIBKey\_EL1 is used to describe the concatenation of [APIBKeyHi\\_EL1](#): [APIBKeyLo\\_EL1](#).

## Configuration

This register is present only when FEAT\_PAuth is implemented. Otherwise, direct accesses to APIBKeyLo\_EL1 are UNDEFINED.

## Attributes

APIBKeyLo\_EL1 is a 64-bit register.

## Field descriptions

The APIBKeyLo\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
64 bit value, bits[63:0] of the 128 bit pointer authentication key value																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the APIBKeyLo\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, APIBKeyLo\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0001	0b010

# AT S12E0R, Address Translate Stages 1 and 2 EL0 Read

The AT S12E0R characteristics are:

## Purpose

Performs stage 1 and 2 address translations from EL0, with permissions as if reading from the given virtual address from EL0, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the EL1&0 translation regime.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the EL2&0 translation regime.
- Otherwise, the EL1&0 translation regime.

## Configuration

There are no configuration notes.

## Attributes

AT S12E0R is a 64-bit System instruction.

## Field descriptions

The AT S12E0R input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Input address for translation																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Input address for translation. The resulting address can be read from the [PAR\\_EL1](#).

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

## Executing the AT S12E0R instruction

Accesses to this instruction use the following encodings:

AT S12E0R, <Xt>

# AT S1E1R, Address Translate Stage 1 EL1 Read

The AT S1E1R characteristics are:

## Purpose

Performs stage 1 address translation, with permissions as if reading from the given virtual address from EL1, or from EL2 if the Effective value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3](#).NS:
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the EL1&0 translation regime, accessed from EL1.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the EL2&0 translation regime, accessed from EL2.
- Otherwise, the EL1&0 translation regime, accessed from EL1.

## Configuration

There are no configuration notes.

## Attributes

AT S1E1R is a 64-bit System instruction.

## Field descriptions

The AT S1E1R input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Input address for translation																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Input address for translation. The resulting address can be read from the [PAR\\_EL1](#).

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

## Executing the AT S1E1R instruction

Accesses to this instruction use the following encodings:

AT S1E1R, <Xt>

# AT S1E1RP, Address Translate Stage 1 EL1 Read PAN

The AT S1E1RP characteristics are:

## Purpose

Performs a stage 1 address translation, where the value of PSTATE.PAN determines if a read from a location will generate a permission fault for a privileged access, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of [SCR\\_EL3.NS](#):
  - If [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, the EL1&0 translation regime, accessed from EL1.
  - If [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the EL2&0 translation regime, accessed from EL2.
- Otherwise, the EL1&0 translation regime, accessed from EL1.

## Configuration

This instruction is present only when FEAT\_PAN2 is implemented. Otherwise, direct accesses to AT S1E1RP are UNDEFINED.

## Attributes

AT S1E1RP is a 64-bit System instruction.

## Field descriptions

The AT S1E1RP input value bit assignments are:

# CCSIDR2\_EL1, Current Cache Size ID Register 2

The CCSIDR2\_EL1 characteristics are:

## Purpose

When FEAT\_CCIDX is implemented, provides the information about the architecture of the currently selected cache from bits[63:32] of [CCSIDR\\_EL1](#).

When FEAT\_CCIDX is not implemented, this register is not implemented.

## Configuration

AArch64 System register CCSIDR2\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CCSIDR2\[31:0\]](#).

This register is present only when FEAT\_CCIDX is implemented. Otherwise, direct accesses to CCSIDR2\_EL1 are UNDEFINED.

In an AArch64 only implementation, it is IMPLEMENTATION DEFINED whether reading this register gives an UNKNOWN value or is UNDEFINED.

The implementation includes one CCSIDR2\_EL1 for each cache that it can access. [CSSELR\\_EL1](#) selects which Cache Size ID Register is accessible.

## Attributes

CCSIDR2\_EL1 is a 64-bit register.

## Field descriptions

The CCSIDR2\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
RES0																NumSets															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:24]

Reserved, RES0.

### NumSets, bits [23:0]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

## Accessing the CCSIDR2\_EL1

If [CSSELR\\_EL1](#).Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR2\_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR2\_EL1 read is treated as NOP.
- The CCSIDR2\_EL1 read is UNDEFINED.
- The CCSIDR2\_EL1 read returns an UNKNOWN value.

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, CCSIDR2\_EL1

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID2 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && HCR_EL2.TID4 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else

## Purpose

Provides information about the architecture of the currently selected cache.

## Configuration

AArch64 System register CCSIDR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CCSIDR\[31:0\]](#).

AArch64 System register CCSIDR\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [CCSIDR2\[31:0\]](#).

The implementation includes one CCSIDR\_EL1 for each cache that it can access. [CSSELR\\_EL1](#) selects which Cache Size ID Register is accessible.

## Attributes

CCSIDR\_EL1 is a 64-bit register.

## Field descriptions

The CCSIDR\_EL1 bit assignments are:

### When FEAT\_CCIDX is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								NumSets																							
RES0								Associativity																							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

### Bits [63:56]

Reserved, RES0.

### NumSets, bits [55:32]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

### Bits [31:24]

Reserved, RES0.

**Associativity, bits [23:3]**

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

**LineSize, bits [2:0]**

( $\log_2(\text{Number of bytes in cache line})$ ) - 4. For example:

- For a line length of 16 bytes:  $\log_2(16) = 4$ , LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes:  $\log_2(32) = 5$ , LineSize entry = 1.

When FEAT\_MTE is implemented and enabled, where a cache only holds Allocation tags, this field is RES0.

**Otherwise:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
UNKNOWN				NumSets												Associativity								LineSize							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Note**

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

**Bits [63:32]**

Reserved, RES0.

**Bits [31:28]**

Reserved, UNKNOWN.

**NumSets, bits [27:13]**

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

**Associativity, bits [12:3]**

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

**LineSize, bits [2:0]**

( $\log_2(\text{Number of bytes in cache line})$ ) - 4. For example:

- For a line length of 16 bytes:  $\log_2(16) = 4$ , LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes:  $\log_2(32) = 5$ , LineSize entry = 1.

**Accessing the CCSIDR\_EL1**

If [CSSELR\\_EL1](#).Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR\_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR\_EL1 read is treated as NOP.

- The CCSIDR\_EL1 read is UNDEFINED.
- The CCSIDR\_EL1 read returns an UNKNOWN value.

Accesses to this register use the following encodings:

MRS <Xt>, CCSIDR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID2 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elseif EL2Enabled() && HCR_EL2.TID4 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elseif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.CCSIDR_EL1 == '1'
then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return CCSIDR_EL1;
    elseif PSTATE.EL == EL2 then
        return CCSIDR_EL1;
    elseif PSTATE.EL == EL3 then
        return CCSIDR_EL1;

```

# CFP RCTX, Control Flow Prediction Restriction by Context

The CFP RCTX characteristics are:

## Purpose

Control Flow Prediction Restriction by Context applies to all Control Flow Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, control flow prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

### Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

## Configuration

This instruction is present only when FEAT\_SPECRES is implemented. Otherwise, direct accesses to CFP RCTX are UNDEFINED.

## Attributes

CFP RCTX is a 64-bit System instruction.

## Field descriptions

The CFP RCTX input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0															GVMID	VMID															
RES0					NS	EL		RES0							GASID	ASID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:49]

Reserved, RES0.

### GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

<b>GVMID</b>	<b>Meaning</b>
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

#### **VMID, bits [47:32]**

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR\\_EL2.E2H==0](#) or [HCR\\_EL2.TGE==0](#)).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR\\_EL2.E2H==0](#) or [HCR\\_EL2.TGE==0](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR\\_EL2.E2H==1](#) and [HCR\\_EL2.TGE==1](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

#### **Bits [31:27]**

Reserved, RES0.

#### **NS, bit [26]**

Security State. Defined values are:

<b>NS</b>	<b>Meaning</b>
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

#### **EL, bits [25:24]**

Exception Level. Indicates the Exception level of the target execution context.

<b>EL</b>	<b>Meaning</b>
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

#### **Bits [23:17]**

Reserved, RES0.

#### **GASID, bit [16]**

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASID for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

### ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

## Executing the CFP RCTX instruction

Accesses to this instruction use the following encodings:

CFP RCTX, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b100

```

if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLR_EL1.EnRCTX == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGITR_EL2.CFPRCTX == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> == '11' && SCTLR_EL2.EnRCTX == '0' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            CFP_RCTX(X[t]);
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.NV == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.CFPRCTX == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            CFP_RCTX(X[t]);
    elsif PSTATE.EL == EL2 then
        CFP_RCTX(X[t]);
    elsif PSTATE.EL == EL3 then
        CFP_RCTX(X[t]);

```

# CLIDR\_EL1, Cache Level ID Register

The CLIDR\_EL1 characteristics are:

## Purpose

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

## Configuration

AArch64 System register CLIDR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CLIDR\[31:0\]](#).

## Attributes

CLIDR\_EL1 is a 64-bit register.

## Field descriptions

The CLIDR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32			
RES0																	Ttype7	Ttype6	Ttype5	Ttype4	Ttype3	Ttype2	Ttype1	ICB										
ICB		LoUU		LoC		LoUIS		Ctype7		Ctype6		Ctype5		Ctype4		Ctype3		Ctype2		Ctype1														
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			

### Bits [63:47]

Reserved, RES0.

### Ttype<n>, bits [2(n-1)+34:2(n-1)+33], for n = 7 to 1

When FEAT\_MTE is implemented:

Tag cache type. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy.

Ttype<n>	Meaning
0b00	No Tag Cache.
0b01	Separate Allocation Tag Cache.
0b10	Unified Allocation Tag and Data cache, Allocation Tags and Data in unified lines.
0b11	Unified Allocation Tag and Data cache, Allocation Tags and Data in separate lines.

### Otherwise:

Reserved, RES0.

### ICB, bits [32:30]

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

The possible values are:

ICB	Meaning
0b000	Not disclosed by this mechanism.
0b001	L1 cache is the highest Inner Cacheable level.
0b010	L2 cache is the highest Inner Cacheable level.
0b011	L3 cache is the highest Inner Cacheable level.
0b100	L4 cache is the highest Inner Cacheable level.
0b101	L5 cache is the highest Inner Cacheable level.
0b110	L6 cache is the highest Inner Cacheable level.
0b111	L7 cache is the highest Inner Cacheable level.

**LoUU, bits [29:27]**

Level of Unification Uniprocessor for the cache hierarchy.

**Note**

When FEAT\_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

**LoC, bits [26:24]**

Level of Coherence for the cache hierarchy.

**LoUIS, bits [23:21]**

Level of Unification Inner Shareable for the cache hierarchy.

**Note**

When FEAT\_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

**Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 7 to 1**

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

Ctype<n>	Meaning
0b000	No cache.
0b001	Instruction cache only.
0b010	Data cache only.
0b011	Separate instruction and data caches.
0b100	Unified cache.

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

**Accessing the CLIDR\_EL1**

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, CLIDR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then

# CNTFRQ\_EL0, Counter-timer Frequency register

The CNTFRQ\_EL0 characteristics are:

## Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

## Configuration

AArch64 System register CNTFRQ\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [CNTFRQ\[31:0\]](#).

## Attributes

CNTFRQ\_EL0 is a 64-bit register.

## Field descriptions

The CNTFRQ\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# CNTHCTL\_EL2, Counter-timer Hypervisor Control register

The CNTHCTL\_EL2 characteristics are:

## Purpose

Controls the generation of an event stream from the physical counter, and access from EL1 to the physical counter and the EL1 physical timer.

## Configuration

AArch64 System register CNTHCTL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHCTL\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

CNTHCTL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHCTL\_EL2 bit assignments are:

### When FEAT\_VHE is implemented and HCR\_EL2.E2H == 1:

6362616059585756555453525150	49	48	47	46	45	44	43	42	41	40
RES0										
RES0	EVNTIS	EL1NVVCT	EL1NVPCT	EL1TVCT	EL1TVT	ECV	EL1PTEN	EL1PCTEN	ELOPTEN	ELOVTE
3130292827262524232221201918	17	16	15	14	13	12	11	10	9	8

### Bits [63:18]

Reserved, RES0.

### EVNTIS, bit [17]

#### When FEAT\_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTHCTL_EL2.EVNTI field applies to <a href="#">CNTPCT_ELO[15:0]</a> .
0b1	The CNTHCTL_EL2.EVNTI field applies to <a href="#">CNTPCT_ELO[23:8]</a> .

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EL1NVVCT, bit [16]****When FEAT\_ECV is implemented:**

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If (( <a href="#">HCR_EL2.E2H==1</a> && <a href="#">HCR_EL2.TGE==1</a> )    <a href="#">HCR_EL2.NV2==0</a>    <a href="#">HCR_EL2.NV1==1</a>    <a href="#">HCR_EL2.NV==0</a> ), this control does not cause any instructions to be trapped. If (( <a href="#">HCR_EL2.E2H==0</a>    <a href="#">HCR_EL2.TGE==0</a> ) && <a href="#">HCR_EL2.NV2==1</a> && <a href="#">HCR_EL2.NV1==0</a> && <a href="#">HCR_EL2.NV==1</a> ), then EL1 accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EL1NVPCT, bit [15]****When FEAT\_ECV is implemented:**

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVPCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If (( <a href="#">HCR_EL2.E2H==1</a> && <a href="#">HCR_EL2.TGE==1</a> )    <a href="#">HCR_EL2.NV2==0</a>    <a href="#">HCR_EL2.NV1==1</a>    <a href="#">HCR_EL2.NV==0</a> ), this control does not cause any instructions to be trapped. If ( <a href="#">HCR_EL2.E2H==0</a>    <a href="#">HCR_EL2.TGE==0</a> ) && <a href="#">HCR_EL2.NV2==1</a> && <a href="#">HCR_EL2.NV1==0</a> && <a href="#">HCR_EL2.NV==1</a> , then EL1 accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02, are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EL1TVCT, bit [14]**

**When FEAT\_ECV is implemented:**

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

EL1TVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If <a href="#">HCR_EL2</a> .{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If <a href="#">HCR_EL2</a> .E2H is 0 or <a href="#">HCR_EL2</a> .TGE is 0, then: <ul style="list-style-type: none"> <li>In AArch64 state, traps EL0 and EL1 accesses to <a href="#">CNTVCT_EL0</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.EL0VCTEN.</li> <li>In AArch32 state, traps EL0 and EL1 accesses to <a href="#">CNTVCT</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.EL0VCTEN or <a href="#">CNTKCTL</a>.PL0VCTEN.</li> </ul>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EL1TVT, bit [13]****When FEAT\_ECV is implemented:**

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

EL1TVT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If <a href="#">HCR_EL2</a> .{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If <a href="#">HCR_EL2</a> .E2H is 0 or <a href="#">HCR_EL2</a> .TGE is 0, then: <ul style="list-style-type: none"> <li>In AArch64 state, traps EL0 and EL1 accesses to <a href="#">CNTV_CTL_EL0</a>, <a href="#">CNTV_CVAL_EL0</a>, and <a href="#">CNTV_TVAL_EL0</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.EL0VTEN.</li> <li>In AArch32 state, traps EL0 and EL1 accesses to <a href="#">CNTV_CTL</a>, <a href="#">CNTV_CVAL</a>, and <a href="#">CNTV_TVAL</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.EL0VTEN or <a href="#">CNTKCTL</a>.PL0VTEN.</li> </ul>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**ECV, bit [12]****When FEAT\_ECV is implemented:**

Enables the Enhanced Counter Virtualization functionality registers.

ECV	Meaning
0b0	Enhanced Counter Virtualization functionality is disabled.
0b1	<p>When <a href="#">HCR_EL2</a>.{E2H, TGE} == {1, 1} or <a href="#">SCR_EL3</a>.{NS, EEL2} == {0, 0}, then Enhanced Counter Virtualization functionality is disabled.</p> <p>When <a href="#">SCR_EL3</a>.NS or <a href="#">SCR_EL3</a>.EEL2 are 1, and <a href="#">HCR_EL2</a>.E2H or <a href="#">HCR_EL2</a>.TGE are 0, then Enhanced Counter Virtualization functionality is enabled when EL2 is enabled for the current Security state. This means that:</p> <ul style="list-style-type: none"> <li>An MRS to <a href="#">CNTPCT_EL0</a> from either EL0 or EL1 that is not trapped will return the value (PCount&lt;63:0&gt; - <a href="#">CNTPOFF_EL2</a>&lt;63:0&gt;).</li> <li>The EL1 physical timer interrupt is triggered when ((PCount&lt;63:0&gt; - <a href="#">CNTPOFF_EL2</a>&lt;63:0&gt;) - PCVal&lt;63:0&gt;) is greater than or equal to 0. PCount&lt;63:0&gt; is the physical count returned when <a href="#">CNTPCT_EL0</a> is read from EL2 or EL3. PCVal&lt;63:0&gt; is the EL1 physical timer compare value for this timer.</li> </ul>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EL1PTEN, bit [11]**

When [HCR\\_EL2](#).TGE is 0, traps EL0 and EL1 accesses to the E1 physical timer registers to EL2 when EL2 is enabled in the current Security state.

EL1PTEN	Meaning
0b0	<p>From AArch64 state: EL0 and EL1 accesses to the <a href="#">CNTP_CTL_EL0</a>, <a href="#">CNTP_CVAL_EL0</a>, and <a href="#">CNTP_TVAL_EL0</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.ELOPTEN.</p> <p>From AArch32 state: EL0 and EL1 accesses to the <a href="#">CNTP_CTL</a>, <a href="#">CNTP_CVAL</a>, and <a href="#">CNTP_TVAL</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.ELOPTEN or <a href="#">CNTKCTL</a>.PLOPTEN.</p>
0b1	This control does not cause any instructions to be trapped.

When [HCR\\_EL2](#).TGE is 1, this control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EL1PCTEN, bit [10]**

When [HCR\\_EL2](#).TGE is 0, traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [CNTPCT\\_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRRC or MCRR accesses to [CNTPCT](#) are trapped to EL2, reported using EC syndrome value 0x04.

EL1PCTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the <a href="#">CNTPCT_EL0</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1.EL0PCTEN</a> . From AArch32 state: EL0 and EL1 accesses to the <a href="#">CNTPCT</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1.EL0PCTEN</a> or <a href="#">CNTKCTL.PL0PCTEN</a> .
0b1	This control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### ELOPTEN, bit [9]

When [HCR\\_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, traps EL0 accesses to the physical timer registers to EL2.

ELOPTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the <a href="#">CNTP_CTL_EL0</a> , <a href="#">CNTP_CVAL_EL0</a> , and <a href="#">CNTP_TVAL_EL0</a> registers are trapped to EL2. EL0 using AArch32: EL0 accesses to the <a href="#">CNTP_CTL</a> , <a href="#">CNTP_CVAL</a> and <a href="#">CNTP_TVAL</a> registers are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### ELOVTEN, bit [8]

When [HCR\\_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, traps EL0 accesses to the virtual timer registers to EL2.

ELOVTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the <a href="#">CNTV_CTL_EL0</a> , <a href="#">CNTV_CVAL_EL0</a> , and <a href="#">CNTV_TVAL_EL0</a> registers are trapped to EL2. EL0 using AArch32: EL0 accesses to the <a href="#">CNTV_CTL</a> , <a href="#">CNTV_CVAL</a> , and <a href="#">CNTV_TVAL</a> registers are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### EVNTI, bits [7:4]

Selects which bit of the counter register [CNTPCT\\_EL0](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT\_ECV is implemented, and CNTHCTL\_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register [CNTPCT\\_EL0](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### EVNTDIR, bit [3]

Controls which transition of the counter register [CNTPCT\\_EL0](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EVNTEN, bit [2]

Enables the generation of an event stream from the counter register [CNTPCT\\_EL0](#).

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EL0VCTEN, bit [1]

When [HCR\\_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, traps EL0 accesses to the frequency register and virtual counter register to EL2.

EL0VCTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the <a href="#">CNTVCT_EL0</a> are trapped to EL2. EL0 using AArch64: EL0 accesses to the <a href="#">CNTERQ_EL0</a> register are trapped to EL2, if <a href="#">CNTHCTL_EL2.EL0PCTEN</a> is also 0. EL0 using AArch32: EL0 accesses to the <a href="#">CNTVCT</a> are trapped to EL2. EL0 using AArch32: EL0 accesses to the <a href="#">CNTERQ</a> register are trapped to EL2, if <a href="#">CNTHCTL_EL2.EL0PCTEN</a> is also 0.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EL0PCTEN, bit [0]

When [HCR\\_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR\\_EL2.TGE](#) is 1, traps EL0 accesses to the frequency register and physical counter register to EL2.

EL0PCTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the <a href="#">CNTPCT_EL0</a> are trapped to EL2. EL0 using AArch64: EL0 accesses to the <a href="#">CNTERQ_EL0</a> register are trapped to EL2, if <a href="#">CNTHCTL_EL2.EL0VCTEN</a> is also 0. EL0 using AArch32: EL0 accesses to the <a href="#">CNTPCT</a> are trapped to EL2. EL0 using AArch32: EL0 accesses to the <a href="#">CNTERQ</a> and register are trapped to EL2, if <a href="#">CNTHCTL_EL2.EL0VCTEN</a> is also 0.
0b1	This control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Otherwise:

This format applies in all Armv8.0 implementations, and it also contains a description of the behavior when EL3 is implemented and EL2 is not implemented.

**Bits [63:18]**

Reserved, RES0.

**EVNTIS, bit [17]**

When FEAT\_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTHCTL_EL2.EVNTI field applies to <a href="#">CNTPCT_ELO</a> [15:0].
0b1	The CNTHCTL_EL2.EVNTI field applies to <a href="#">CNTPCT_ELO</a> [23:8].

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**EL1NVVCT, bit [16]**

When FEAT\_ECV is implemented:

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If (( <a href="#">HCR_EL2.E2H</a> ==1 && <a href="#">HCR_EL2.TGE</a> ==1)    <a href="#">HCR_EL2.NV2</a> ==0    <a href="#">HCR_EL2.NV1</a> ==1    <a href="#">HCR_EL2.NV</a> ==0), this control does not cause any instructions to be trapped. If (( <a href="#">HCR_EL2.E2H</a> ==0    <a href="#">HCR_EL2.TGE</a> ==0) && <a href="#">HCR_EL2.NV2</a> ==1 && <a href="#">HCR_EL2.NV1</a> ==0 && <a href="#">HCR_EL2.NV</a> ==1), then EL1 accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**EL1NVPCT, bit [15]**

When FEAT\_ECV is implemented:

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVPCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If (( <a href="#">HCR_EL2.E2H</a> ==1 && <a href="#">HCR_EL2.TGE</a> ==1)    <a href="#">HCR_EL2.NV2</a> ==0    <a href="#">HCR_EL2.NV1</a> ==1    <a href="#">HCR_EL2.NV</a> ==0), this control does not cause any instructions to be trapped. If ( <a href="#">HCR_EL2.E2H</a> ==0    <a href="#">HCR_EL2.TGE</a> ==0) && <a href="#">HCR_EL2.NV2</a> ==1 && <a href="#">HCR_EL2.NV1</a> ==0 && <a href="#">HCR_EL2.NV</a> ==1, then EL1 accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02, are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### EL1TVCT, bit [14]

#### When FEAT\_ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

EL1TVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If <a href="#">HCR_EL2</a> .{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If <a href="#">HCR_EL2.E2H</a> is 0 or <a href="#">HCR_EL2.TGE</a> is 0, then: In AArch64 state, traps EL0 and EL1 accesses to <a href="#">CNTVCT_EL0</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1.EL0VCTEN</a> . In AArch32 state, traps EL0 and EL1 accesses to <a href="#">CNTVCT</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1.EL0VCTEN</a> or <a href="#">CNTKCTL.PL0VCTEN</a> .

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### EL1TVT, bit [13]

#### When FEAT\_ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

EL1TVT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If <a href="#">HCR_EL2</a> .{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If <a href="#">HCR_EL2</a> .E2H is 0 or <a href="#">HCR_EL2</a> .TGE is 0, then: <ul style="list-style-type: none"> <li>In AArch64 state, traps EL0 and EL1 accesses to <a href="#">CNTV_CTL_EL0</a>, <a href="#">CNTV_CVAL_EL0</a>, and <a href="#">CNTV_TVAL_EL0</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.EL0VTEN.</li> <li>In AArch32 state, traps EL0 and EL1 accesses to <a href="#">CNTV_CTL</a>, <a href="#">CNTV_CVAL</a>, and <a href="#">CNTV_TVAL</a> to EL2, unless they are trapped by <a href="#">CNTKCTL_EL1</a>.EL0VTEN or <a href="#">CNTKCTL</a>.PL0VTEN.</li> </ul>

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL\_EL2.ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### ECV, bit [12]

##### When FEAT\_ECV is implemented:

Enables the Enhanced Counter Virtualization functionality registers.

ECV	Meaning
0b0	Enhanced Counter Virtualization functionality is disabled.
0b1	When <a href="#">HCR_EL2</a> .{E2H, TGE} == {1, 1} or <a href="#">SCR_EL3</a> .{NS, EEL2} == {0, 0}, then Enhanced Counter Virtualization functionality is disabled. When <a href="#">SCR_EL3</a> .NS or <a href="#">SCR_EL3</a> .EEL2 are 1, and <a href="#">HCR_EL2</a> .E2H or <a href="#">HCR_EL2</a> .TGE are 0, then Enhanced Counter Virtualization functionality is enabled when EL2 is enabled for the current Security state. This means that: <ul style="list-style-type: none"> <li>An MRS to <a href="#">CNTPCT_EL0</a> from either EL0 or EL1 that is not trapped will return the value (PCount&lt;63:0&gt; - <a href="#">CNTPOFF_EL2</a>&lt;63:0&gt;).</li> <li>The EL1 physical timer interrupt is triggered when ((PCount&lt;63:0&gt; - <a href="#">CNTPOFF_EL2</a>&lt;63:0&gt;) - PCVal&lt;63:0&gt;) is greater than or equal to 0. PCount is the physical count returned when <a href="#">CNTPCT_EL0</a> is read from EL2 or EL3. PCVal&lt;63:0&gt; is the EL1 physical timer compare value for this timer.</li> </ul>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bits [11:8]

Reserved, RES0.

#### EVNTI, bits [7:4]

Selects which bit of the counter register [CNTPCT\\_EL0](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT\_ECV is implemented, and CNTHCTL\_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register [CNTPCT\\_EL0](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EVNTDIR, bit [3]

Controls which transition of the counter register [CNTPCT\\_EL0](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EVNTEN, bit [2]

Enables the generation of an event stream from the counter register [CNTPCT\\_EL0](#).

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

On a Warm reset, this field resets to 0.

### EL1PCEN, bit [1]

Traps EL0 and EL1 accesses to the EL1 physical timer registers to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [CNTP\\_CTL\\_EL0](#), [CNTP\\_CVAL\\_EL0](#), [CNTP\\_TVAL\\_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCRR accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x3 and MRRC and MCRR accesses are trapped to EL2, reported using EC syndrome value 0x04:
  - [CNTP\\_CTL](#), [CNTP\\_CVAL](#), [CNTP\\_TVAL](#).

EL1PCEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the <a href="#">CNTP_CTL_EL0</a> , <a href="#">CNTP_CVAL_EL0</a> , and <a href="#">CNTP_TVAL_EL0</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1.ELOPTEN</a> . From AArch32 state: EL0 and EL1 accesses to the <a href="#">CNTP_CTL</a> , <a href="#">CNTP_CVAL</a> , and <a href="#">CNTP_TVAL</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1.ELOPTEN</a> or <a href="#">CNTKCTL.PLOPTEN</a> .
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EL1PCTEN, bit [0]

Traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [CNTPCT\\_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRRC or MCRR accesses to [CNTPCT](#) are trapped to EL2, reported using EC syndrome value 0x04.

EL1PCTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the <a href="#">CNTPCT_EL0</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1.EL0PCTEN</a> . From AArch32 state: EL0 and EL1 accesses to the <a href="#">CNTPCT</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by <a href="#">CNTKCTL_EL1.EL0PCTEN</a> or <a href="#">CNTKCTL.PL0PCTEN</a> .
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTHCTL\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHCTL\_EL2 or CNTKCTL\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTHCTL\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return CNTHCTL_EL2;
elsif PSTATE.EL == EL3 then
    return CNTHCTL_EL2;

```

MSR CNTHCTL\_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    CNTHCTL_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    CNTHCTL_EL2 = X[t];

# CNTHP\_CTL\_EL2, Counter-timer Hypervisor Physical Timer Control register

The CNTHP\_CTL\_EL2 characteristics are:

## Purpose

Control register for the EL2 physical timer.

## Configuration

AArch64 System register CNTHP\_CTL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHP\\_CTL\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHP\_CTL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHP\_CTL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																																	
RES0																														ISTATUS		IMASK	ENABLE
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### Bits [63:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHP\\_TVAL\\_EL2](#) continues to count down.

#### Note

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTHP\_CTL\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP\_CTL\_EL2 or CNTP\_CTL\_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# CNTHP\_CVAL\_EL2, Counter-timer Physical Timer CompareValue register (EL2)

The CNTHP\_CVAL\_EL2 characteristics are:

## Purpose

Holds the compare value for the EL2 physical timer.

## Configuration

AArch64 System register CNTHP\_CVAL\_EL2 bits [63:0] are architecturally mapped to AArch32 System register [CNTHP\\_CVAL\[63:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHP\_CVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHP\_CVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
														CompareValue																	
														CompareValue																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When [CNTHP\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHP\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHP\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHP\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTHP\_CVAL\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP\_CVAL\_EL2 or CNTP\_CVAL\_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# CNTHP\_TVAL\_EL2, Counter-timer Physical Timer TimerValue register (EL2)

The CNTHP\_TVAL\_EL2 characteristics are:

## Purpose

Holds the timer value for the EL2 physical timer.

## Configuration

AArch64 System register CNTHP\_TVAL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHP\\_TVAL\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHP\_TVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHP\_TVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																TimerValue															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHP\\_CTL\\_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHP\\_CTL\\_EL2.ENABLE](#) is 1, the value returned is ([CNTHP\\_CVAL\\_EL2](#) - [CNTPCT\\_EL0](#)).

On a write of this register, [CNTHP\\_CVAL\\_EL2](#) is set to ([CNTPCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHP\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - [CNTHP\\_CVAL\\_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHP\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHP\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHP\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTHP\_TVAL\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP\_TVAL\_EL2 or CNTP\_TVAL\_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTHP\_TVAL\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0010	0b000

```

# CNTHPS\_CTL\_EL2, Counter-timer Secure Physical Timer Control register (EL2)

The CNTHPS\_CTL\_EL2 characteristics are:

## Purpose

Control register for the Secure EL2 physical timer.

## Configuration

AArch64 System register CNTHPS\_CTL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHPS\\_CTL\[31:0\]](#).

This register is present only when FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHPS\_CTL\_EL2 are UNDEFINED.

## Attributes

CNTHPS\_CTL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHPS\_CTL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the CNTHPS\_CTL\_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS\_CTL\_EL2.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHPS\\_TVAL\\_EL2](#) continues to count down.

---

#### Note

Disabling the output signal might be a power-saving option.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# CNTHPS\_CVAL\_EL2, Counter-timer Secure Physical Timer CompareValue register (EL2)

The CNTHPS\_CVAL\_EL2 characteristics are:

## Purpose

Holds the compare value for the Secure EL2 physical timer.

## Configuration

AArch64 System register CNTHPS\_CVAL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHPS\\_CVAL\[31:0\]](#).

This register is present only when EL2 is implemented and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHPS\_CVAL\_EL2 are UNDEFINED.

## Attributes

CNTHPS\_CVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHPS\_CVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CompareValue																															

### CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When [CNTHPS\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHPS\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHPS\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHPS\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# CNTHPS\_TVAL\_EL2, Counter-timer Secure Physical Timer TimerValue register (EL2)

The CNTHPS\_TVAL\_EL2 characteristics are:

## Purpose

Holds the timer value for the Secure EL2 physical timer.

## Configuration

AArch64 System register CNTHPS\_TVAL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHPS\\_TVAL\[31:0\]](#).

This register is present only when EL2 is implemented and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHPS\_TVAL\_EL2 are UNDEFINED.

## Attributes

CNTHPS\_TVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHPS\_TVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TimerValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHPS\\_CTL\\_EL2](#).ENABLE is 0, the value returned is UNKNOWN.
- If [CNTHPS\\_CTL\\_EL2](#).ENABLE is 1, the value returned is ([CNTHPS\\_CVAL\\_EL2](#) - [CNTPTCT\\_EL0](#)).

On a write of this register, [CNTHPS\\_CVAL\\_EL2](#) is set to ([CNTPTCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHPS\\_CTL\\_EL2](#).ENABLE is 1, the timer condition is met when ([CNTPTCT\\_EL0](#) - [CNTHPS\\_CVAL\\_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHPS\\_CTL\\_EL2](#).ISTATUS is set to 1.
- If [CNTHPS\\_CTL\\_EL2](#).IMASK is 0, an interrupt is generated.

When [CNTHPS\\_CTL\\_EL2](#).ENABLE is 0, the timer condition is not met, but [CNTPTCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTHPS\_TVAL\_EL2

## CNTHV\_CTL\_EL2, Counter-timer Virtual Timer Control register (EL2)

The CNTHV\_CTL\_EL2 characteristics are:

## Purpose

Control register for the EL2 virtual timer.

## Configuration

AArch64 System register CNTHV\_CTL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHV\\_CTL\[31:0\]](#).

This register is present only when FEAT\_VHE is implemented. Otherwise, direct accesses to CNTHV\_CTL\_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHV\_CTL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHV\_CTL\_EL2 bit assignments are:

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

<b>ISTATUS</b>	<b>Meaning</b>
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHV\\_TVAL\\_EL2](#) continues to count down.

#### Note

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTHV\_CTL\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV\_CTL\_EL2 or CNTV\_CTL\_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTHV\_CTL\_EL2

## Field descriptions

The CNTHV\_CVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When [CNTHV\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTVCT\\_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHV\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHV\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHV\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT\\_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTHV\_CVAL\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV\_CVAL\_EL2 or CNTV\_CVAL\_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, CNTHV\_CVAL\_EL2

op0	op1	CRn	CRm	op2

# CNTHV\_TVAL\_EL2, Counter-timer Virtual Timer TimerValue Register (EL2)

The CNTHV\_TVAL\_EL2 characteristics are:

## Purpose

Holds the timer value for the EL2 virtual timer.

## Configuration

AArch64 System register CNTHV\_TVAL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHV\\_TVAL\[31:0\]](#).

This register is present only when FEAT\_VHE is implemented. Otherwise, direct accesses to CNTHV\_TVAL\_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

CNTHV\_TVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHV\_TVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																TimerValue															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHV\\_CTL\\_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHV\\_CTL\\_EL2.ENABLE](#) is 1, the value returned is ([CNTHV\\_CVAL\\_EL2](#) - [CNTVCT\\_EL0](#)).

On a write of this register, [CNTHV\\_CVAL\\_EL2](#) is set to ([CNTVCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHV\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTVCT\\_EL0](#) - [CNTHV\\_CVAL\\_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHV\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHV\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHV\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTHV\_TVAL\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV\_TVAL\_EL2 or CNTV\_TVAL\_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# CNTHVS\_CTL\_EL2, Counter-timer Secure Virtual Timer Control register (EL2)

The CNTHVS\_CTL\_EL2 characteristics are:

## Purpose

Control register for the Secure EL2 virtual timer.

## Configuration

AArch64 System register CNTHVS\_CTL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHVS\\_CTL\[31:0\]](#).

This register is present only when EL2 is implemented and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHVS\_CTL\_EL2 are UNDEFINED.

## Attributes

CNTHVS\_CTL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHVS\_CTL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the CNTHVS\_CTL\_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the CNTHVS\_CTL\_EL2.ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHVS\\_TVAL\\_EL2](#) continues to count down.

---

#### Note

Disabling the output signal might be a power-saving option.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTHVS\_CTL\_EL2

Accesses to this register use the following encodings:

# CNTHVS\_CVAL\_EL2, Counter-timer Secure Virtual Timer CompareValue register (EL2)

The CNTHVS\_CVAL\_EL2 characteristics are:

## Purpose

Holds the compare value for the Secure EL2 virtual timer.

## Configuration

AArch64 System register CNTHVS\_CVAL\_EL2 bits [63:0] are architecturally mapped to AArch32 System register [CNTHVS\\_CVAL\[63:0\]](#).

This register is present only when EL2 is implemented and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHVS\_CVAL\_EL2 are UNDEFINED.

## Attributes

CNTHVS\_CVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHVS\_CVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CompareValue, bits [63:0]

Holds the Secure EL2 virtual timer CompareValue.

When [CNTHVS\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTVCT\\_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHVS\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHVS\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHVS\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT\\_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTHVS\_CVAL\_EL2

Accesses to this register use the following encodings:

# CNTHVS\_TVAL\_EL2, Counter-timer Secure Virtual Timer TimerValue register (EL2)

The CNTHVS\_TVAL\_EL2 characteristics are:

## Purpose

Holds the timer value for the Secure EL2 virtual timer.

## Configuration

AArch64 System register CNTHVS\_TVAL\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHVS\\_TVAL\[31:0\]](#).

This register is present only when EL2 is implemented and FEAT\_SEL2 is implemented. Otherwise, direct accesses to CNTHVS\_TVAL\_EL2 are UNDEFINED.

## Attributes

CNTHVS\_TVAL\_EL2 is a 64-bit register.

## Field descriptions

The CNTHVS\_TVAL\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TimerValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHVS\\_CTL\\_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHVS\\_CTL\\_EL2.ENABLE](#) is 1, the value returned is ([CNTHVS\\_CVAL\\_EL2](#) - [CNTVCT\\_EL0](#)).

On a write of this register, [CNTHVS\\_CVAL\\_EL2](#) is set to ([CNTVCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHVS\\_CTL\\_EL2.ENABLE](#) is 1, the timer condition is met when (([CNTVCT\\_EL0](#) - [CNTHVS\\_CVAL\\_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHVS\\_CTL\\_EL2.ISTATUS](#) is set to 1.
- If [CNTHVS\\_CTL\\_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHVS\\_CTL\\_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# CNTKCTL\_EL1, Counter-timer Kernel Control register

The CNTKCTL\_EL1 characteristics are:

## Purpose

When FEAT\_VHE is not implemented, or when [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, this register controls the generation of an event stream from the virtual counter, and access from EL0 to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

When FEAT\_VHE is implemented and [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this register does not cause any event stream from the virtual counter to be generated, and does not control access to the counters and timers. The access to counters and timers at EL0 is controlled by [CNTHCTL\\_EL2](#).

## Configuration

AArch64 System register CNTKCTL\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CNTKCTL\[31:0\]](#).

## Attributes

CNTKCTL\_EL1 is a 64-bit register.

## Field descriptions

The CNTKCTL\_EL1 bit assignments are:

Reserved, RES0.

### EVNTIS, bit [17]

When FEAT\_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTKCTL_EL1.EVNTI field applies to <a href="#">CNTVCT_EL0</a> [15:0].
0b1	The CNTKCTL_EL1.EVNTI field applies to <a href="#">CNTVCT_EL0</a> [23:8].

This control applies regardless of the value of the [CNTHCTL\\_EL2](#).ECV bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

**Bits [16:10]**

Reserved, RES0.

**ELOPTEN, bit [9]**

Traps EL0 accesses to the physical timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2.TGE](#) is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value 0x18:
  - [CNTP\\_CTL\\_EL0](#), [CNTP\\_CVAL\\_EL0](#), and [CNTP\\_TVAL\\_EL0](#).
- In AArch32 state, MRC and MCR accesses to the following registers are trapped, reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped, reported using EC syndrome value 0x04:
  - [CNTP\\_CTL](#), [CNTP\\_CVAL](#), [CNTP\\_TVAL](#).

ELOPTEN	Meaning
0b0	EL0 accesses to the physical timer registers are trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

When FEAT\_VHE is implemented and [HCR\\_EL2.{E2H, TGE}](#) is {1, 1}, this control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ELOVTEN, bit [8]**

Traps EL0 accesses to the virtual timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2.TGE](#) is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value 0x18:
  - [CNTV\\_CTL\\_EL0](#), [CNTV\\_CVAL\\_EL0](#), and [CNTV\\_TVAL\\_EL0](#).
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped using EC syndrome value 0x04:
  - [CNTV\\_CTL](#), [CNTV\\_CVAL](#), and [CNTV\\_TVAL](#).

ELOVTEN	Meaning
0b0	EL0 accesses to the virtual timer registers are trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT\_VHE is implemented and [HCR\\_EL2.{E2H, TGE}](#) is {1, 1}, this control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EVNTI, bits [7:4]**

Selects which bit of the counter register [CNTVCT\\_EL0](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT\_ECV is implemented, and CNTKCTL\_EL1.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register [CNTVCT\\_EL0](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EVNTDIR, bit [3]**

Controls which transition of the counter register [CNTVCT\\_EL0](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## EVNTEN, bit [2]

When FEAT\_VHE is not implemented, or when [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}, enables the generation of an event stream from the counter register [CNTVCT\\_EL0](#).

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

When FEAT\_VHE is implemented and [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this control does not enable the event stream.

On a Warm reset, this field resets to 0.

## ELOVCTEN, bit [1]

Traps EL0 accesses to the frequency register and virtual counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2](#).TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped and reported using EC syndrome value 0x18:
  - [CNTVCT\\_EL0](#) and if [CNTKCTL\\_EL1](#).ELOPCTEN is 0, [CNTFRQ\\_EL0](#).
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped and reported using EC syndrome value 0x04:
  - [CNTVCT](#) and if [CNTKCTL\\_EL1](#).ELOPCTEN is 0, [CNTFRQ](#).

ELOVCTEN	Meaning
0b0	EL0 accesses to the frequency register and virtual counter registers are trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT\_VHE is implemented and [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ELOPCTEN, bit [0]

Traps EL0 accesses to the frequency register and physical counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2](#).TGE is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value 0x18:
  - [CNTPCT\\_EL0](#) and if [CNTKCTL\\_EL1](#).ELOVCTEN is 0, [CNTFRQ\\_EL0](#).
- In AArch32 state, MCR or MRC accesses the following registers are trapped, reported using EC syndrome value 0x03, MCRR or MRRC accesses are trapped and reported using EC syndrome value 0x04:
  - [CNTPCT](#) and if [CNTKCTL\\_EL1](#).ELOVCTEN is 0, [CNTFRQ](#).

ELOPCTEN	Meaning
0b0	EL0 accesses to the frequency register and physical counter register are trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT\_VHE is implemented and [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTKCTL\_EL1

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTKCTL\_EL1 or CNTKCTL\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTKCTL\_EL1

## CNTP\_CTL\_EL0, Counter-timer Physical Timer Control register

The CNTP\_CTL\_EL0 characteristics are:

## Purpose

Control register for the EL1 physical timer.

## Configuration

AArch64 System register CNTP\_CTL\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [CNTP\\_CTL\[31:0\]](#).

## Attributes

CNTP\_CTL\_EL0 is a 64-bit register.

## Field descriptions

The CNTP\_CTL\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
																RES0																			
RES0																														ISTATUS		IMASK		ENABLE	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

**Bits [63:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP\\_TVAL\\_EL0](#) continues to count down.

---

#### Note

Disabling the output signal might be a power-saving option.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTP\_CTL\_EL0

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP\_CTL\_EL0 or CNTP\_CTL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTP\_CTL\_EL0

op0	op1	CRn	CRm	op2

# CNTP\_CVAL\_EL0, Counter-timer Physical Timer CompareValue register

The CNTP\_CVAL\_EL0 characteristics are:

## Purpose

Holds the compare value for the EL1 physical timer.

## Configuration

AArch64 System register CNTP\_CVAL\_EL0 bits [63:0] are architecturally mapped to AArch32 System register [CNTP\\_CVAL\[63:0\]](#).

## Attributes

CNTP\_CVAL\_EL0 is a 64-bit register.

## Field descriptions

The CNTP\_CVAL\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When [CNTP\\_CTL\\_EL0.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTP\\_CTL\\_EL0.ISTATUS](#) is set to 1.
- If [CNTP\\_CTL\\_EL0.IMASK](#) is 0, an interrupt is generated.

When [CNTP\\_CTL\\_EL0.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTP\_CVAL\_EL0

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP\_CVAL\_EL0 or CNTP\_CVAL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTP\_CVAL\_EL0

op0	op1	CRn	CRm	op2
-----	-----	-----	-----	-----

0b11	0b011	0b1110	0b0010	0b010
------	-------	--------	--------	-------

```

if PSTATE.EL == EL0 then

# CNTP\_TVAL\_ELO, Counter-timer Physical Timer TimerValue register

The CNTP\_TVAL\_ELO characteristics are:

## Purpose

Holds the timer value for the EL1 physical timer.

## Configuration

AArch64 System register CNTP\_TVAL\_ELO bits [31:0] are architecturally mapped to AArch32 System register [CNTP\\_TVAL\[31:0\]](#).

## Attributes

CNTP\_TVAL\_ELO is a 64-bit register.

## Field descriptions

The CNTP\_TVAL\_ELO bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TimerValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If [CNTP\\_CTL\\_ELO.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTP\\_CTL\\_ELO.ENABLE](#) is 1, the value returned is ([CNTP\\_CVAL\\_ELO](#) - [CNTPCT\\_ELO](#)).

On a write of this register, [CNTP\\_CVAL\\_ELO](#) is set to ([CNTPCT\\_ELO](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP\\_CTL\\_ELO.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_ELO](#) - [CNTP\\_CVAL\\_ELO](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTP\\_CTL\\_ELO.ISTATUS](#) is set to 1.
- If [CNTP\\_CTL\\_ELO.IMASK](#) is 0, an interrupt is generated.

When [CNTP\\_CTL\\_ELO.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_ELO](#) continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTP\_TVAL\_EL0

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP\_TVAL\_EL0 or CNTP\_TVAL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTP\_TVAL\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b11110	0b0010	0b000

# CNPCT\_EL0, Counter-timer Physical Count register

The CNTPCT\_EL0 characteristics are:

## Purpose

Holds the 64-bit physical count value.

## Configuration

AArch64 System register CNTPCT\_EL0 bits [63:0] are architecturally mapped to AArch32 System register [CNPCTI63:01](#).

All reads to the CNTPCT\_EL0 occur in program order relative to reads to [CNPCTSS\\_EL0](#) or CNTPCT\_EL0.

## Attributes

CNPCT\_EL0 is a 64-bit register.

## Field descriptions

The CNTPCT\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Physical count value																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Physical count value.

Reads of CNTPCT\_EL0 from EL0 or EL1 return (PCount<63:0> - [CNTPOFF\\_EL2](#)<63:0>) if the access is not trapped, and all of the following are true:

- [CNTHCTL\\_EL2](#).ECV is 1.
- [HCR\\_EL2](#).{E2H, TGE} is not {1, 1}.

Where PCount<63:0> is the physical count returned when CNTPCT\_EL0 is read from EL2 or EL3.

## Accessing the CNTPCT\_EL0

Accesses to this register use the following encodings:

MRS <Xt>, CNTPCT\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0000	0b001

# CNTPCTSS\_EL0, Counter-timer Self-Synchronized Physical Count register

The CNTPCTSS\_EL0 characteristics are:

## Purpose

Holds the self-synchronized view of the 64-bit physical count value.

## Configuration

AArch64 System register CNTPCTSS\_EL0 bits [63:0] are architecturally mapped to AArch32 System register [CNTPCTSS\[63:0\]](#).

This register is present only when FEAT\_ECV is implemented. Otherwise, direct accesses to CNTPCTSS\_EL0 are UNDEFINED.

All reads to the CNTPCTSS\_EL0 occur in program order relative to reads to [CNTPCT\\_EL0](#) or CNTPCTSS\_EL0.

This register is a self-synchronised view of the [CNTPCT\\_EL0](#) counter, and cannot be read speculatively.

## Attributes

CNTPCTSS\_EL0 is a 64-bit register.

## Field descriptions

The CNTPCTSS\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# CNTPOFF\_EL2, Counter-timer Physical Offset register

The CNTPOFF\_EL2 characteristics are:

## Purpose

Holds the 64-bit physical offset. This is the offset for the AArch64 physical timers and counters when Enhanced Counter Virtualization is enabled.

## Configuration

This register is present only when FEAT\_ECV is implemented. Otherwise, direct accesses to CNTPOFF\_EL2 are UNDEFINED.

The offsetting of the timers and counters based on EL2 using AArch64 apply at:

- EL1 when EL1 is using AArch64 or AArch32.
- EL0 when EL0 is using AArch64 or AArch32.

When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if either of the following are true:

- [CNTHCTL\\_EL2](#).ECV is 0.
- [SCR\\_EL3](#).ECVEn is 0.
- [HCR\\_EL2](#).{E2H, TGE} is {1, 1}.

## Attributes

CNTPOFF\_EL2 is a 64-bit register.

## Field descriptions

The CNTPOFF\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

### ISTATUS, bit [2]

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

This bit is read-only.

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

Page 248

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTPS\\_TVAL\\_EL1](#) continues to count down.

---

#### Note

Disabling the output signal might be a power-saving option.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# CNTPS\_CVAL\_EL1, Counter-timer Physical Secure Timer CompareValue register

The CNTPS\_CVAL\_EL1 characteristics are:

## Purpose

Holds the compare value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

## Configuration

There are no configuration notes.

## Attributes

CNTPS\_CVAL\_EL1 is a 64-bit register.

## Field descriptions

The CNTPS\_CVAL\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CompareValue, bits [63:0]

Holds the secure physical timer CompareValue.

When [CNTPS\\_CTL\\_EL1](#).ENABLE is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTPS\\_CTL\\_EL1](#).ISTATUS is set to 1.
- If [CNTPS\\_CTL\\_EL1](#).IMASK is 0, an interrupt is generated.

When [CNTPS\\_CTL\\_EL1](#).ENABLE is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTPS\_CVAL\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, CNTPS\_CVAL\_EL1

op0	op1	CRn	CRm	op2

# CNTPS\_TVAL\_EL1, Counter-timer Physical Secure Timer TimerValue register

The CNTPS\_TVAL\_EL1 characteristics are:

## Purpose

Holds the timer value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

## Configuration

There are no configuration notes.

## Attributes

CNTPS\_TVAL\_EL1 is a 64-bit register.

## Field descriptions

The CNTPS\_TVAL\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TimerValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TimerValue, bits [31:0]

The TimerValue view of the secure physical timer.

On a read of this register:

- If [CNTPS\\_CTL\\_EL1.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTPS\\_CTL\\_EL1.ENABLE](#) is 1, the value returned is ([CNTPS\\_CVAL\\_EL1](#) - [CNTPCT\\_EL0](#)).

On a write of this register, [CNTPS\\_CVAL\\_EL1](#) is set to ([CNTPCT\\_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTPS\\_CTL\\_EL1.ENABLE](#) is 1, the timer condition is met when ([CNTPCT\\_EL0](#) - [CNTPS\\_CVAL\\_EL1](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTPS\\_CTL\\_EL1.ISTATUS](#) is set to 1.
- If [CNTPS\\_CTL\\_EL1.IMASK](#) is 0, an interrupt is generated.

When [CNTPS\\_CTL\\_EL1.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT\\_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTPS\_TVAL\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, CNTPS\_TVAL\_EL1

## CNTV\_CTL\_EL0, Counter-timer Virtual Timer Control register

The CNTV\_CTL\_EL0 characteristics are:

## Purpose

Control register for the virtual timer.

## Configuration

AArch64 System register CNTV\_CTL\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [CNTV\\_CTL\[31:0\]](#).

## Attributes

CNTV\_CTL\_EL0 is a 64-bit register.

## Field descriptions

The CNTV\_CTL\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32							
RES0																																						
RES0																														ISTATUS			IMASK			ENABLE		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0							

**Bits [63:3]**

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTV\\_TVAL\\_EL0](#) continues to count down.

---

#### Note

Disabling the output signal might be a power-saving option.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTV\_CTL\_EL0

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV\_CTL\_EL0 or CNTV\_CTL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTV\_CTL\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0011	0b001

# CNTV\_CVAL\_EL0, Counter-timer Virtual Timer CompareValue register

The CNTV\_CVAL\_EL0 characteristics are:

## Purpose

Holds the compare value for the virtual timer.

## Configuration

AArch64 System register CNTV\_CVAL\_EL0 bits [63:0] are architecturally mapped to AArch32 System register [CNTV\\_CVAL\[63:0\]](#).

## Attributes

CNTV\_CVAL\_EL0 is a 64-bit register.

## Field descriptions

The CNTV\_CVAL\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CompareValue, bits [63:0]

Holds the EL1 virtual timer CompareValue.

When [CNTV\\_CTL\\_EL0](#).ENABLE is 1, the timer condition is met when ([CNTVCT\\_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTV\\_CTL\\_EL0](#).ISTATUS is set to 1.
- If [CNTV\\_CTL\\_EL0](#).IMASK is 0, an interrupt is generated.

When [CNTV\\_CTL\\_EL0](#).ENABLE is 0, the timer condition is not met, but [CNTVCT\\_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTV\_CVAL\_EL0

When [HCR\\_EL2](#).E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV\_CVAL\_EL0 or CNTV\_CVAL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CNTV\_CVAL\_EL0

op0	op1	CRn	CRm	op2
-----	-----	-----	-----	-----

0b11	0b011	0b1110	0b0011	0b010

# CNTV\_TVAL\_ELO, Counter-timer Virtual Timer TimerValue register

The CNTV\_TVAL\_ELO characteristics are:

## Purpose

Holds the timer value for the EL1 virtual timer.

## Configuration

AArch64 System register CNTV\_TVAL\_ELO bits [31:0] are architecturally mapped to AArch32 System register [CNTV\\_TVAL\[31:0\]](#).

## Attributes

CNTV\_TVAL\_ELO is a 64-bit register.

## Field descriptions

The CNTV\_TVAL\_ELO bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TimerValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TimerValue, bits [31:0]

The TimerValue view of the EL1 virtual timer.

On a read of this register:

- If [CNTV\\_CTL\\_ELO.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTV\\_CTL\\_ELO.ENABLE](#) is 1, the value returned is ([CNTV\\_CVAL\\_ELO](#) - [CNTVCT\\_ELO](#)).

On a write of this register, [CNTV\\_CVAL\\_ELO](#) is set to ([CNTVCT\\_ELO](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTV\\_CTL\\_ELO.ENABLE](#) is 1, the timer condition is met when ([CNTVCT\\_ELO](#) - [CNTV\\_CVAL\\_ELO](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTV\\_CTL\\_ELO.ISTATUS](#) is set to 1.
- If [CNTV\\_CTL\\_ELO.IMASK](#) is 0, an interrupt is generated.

When [CNTV\\_CTL\\_ELO.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT\\_ELO](#) continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTV\_TVAL\_EL0

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV\_TVAL\_EL0 or CNTV\_TVAL\_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# CNTVCT\_EL0, Counter-timer Virtual Count register

The CNTVCT\_EL0 characteristics are:

## Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value minus the virtual offset visible in [CNTVOFF\\_EL2](#).

## Configuration

AArch64 System register CNTVCT\_EL0 bits [63:0] are architecturally mapped to AArch32 System register [CNTVCTI\[63:0\]](#).

The value of this register is the same as the value of [CNTPCT\\_EL0](#) in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented, [HCR\\_EL2](#).E2H is 1, and this register is read from EL2.
- When EL2 is implemented and enabled in the current Security state, [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, and this register is read from EL0 or EL2.

All reads to the CNTVCT\_EL0 occur in program order relative to reads to [CNTVCTSS\\_EL0](#) or CNTVCT\_EL0.

## Attributes

CNTVCT\_EL0 is a 64-bit register.

## Field descriptions

The CNTVCT\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# CNTVCTSS\_EL0, Counter-timer Self-Synchronized Virtual Count register

The CNTVCTSS\_EL0 characteristics are:

## Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in [CNTPCT\\_EL0](#) minus the virtual offset visible in [CNTVOFF\\_EL2](#).

## Configuration

AArch64 System register CNTVCTSS\_EL0 bits [63:0] are architecturally mapped to AArch32 System register [CNTVCTSS\[63:0\]](#).

This register is present only when FEAT\_ECV is implemented. Otherwise, direct accesses to CNTVCTSS\_EL0 are UNDEFINED.

All reads to the CNTVCTSS\_EL0 occur in program order relative to reads to [CNTVCT\\_EL0](#) or CNTVCTSS\_EL0.

This register is a self-synchronised view of the [CNTVCT\\_EL0](#) counter, and cannot be read speculatively.

## Attributes

CNTVCTSS\_EL0 is a 64-bit register.

## Field descriptions

The CNTVCTSS\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Self-synchronized virtual count value																															
Self-synchronized virtual count value

# CNTVOFF\_EL2, Counter-timer Virtual Offset register

The CNTVOFF\_EL2 characteristics are:

## Purpose

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in [CNTPCT\\_ELO](#) and the virtual count value visible in [CNTVCT\\_ELO](#).

## Configuration

AArch64 System register CNTVOFF\_EL2 bits [63:0] are architecturally mapped to AArch32 System register [CNTVOFF\[63:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

### Note

When EL2 is implemented and enabled in the current Security state, and is using AArch64, the virtual counter uses a fixed virtual offset of zero in the following situations:

- [HCR\\_EL2.E2H](#) is 1, and [CNTVCT\\_ELO](#) is read from EL2.
- [HCR\\_EL2.{E2H, TGE}](#) is {1, 1}, and either:
  - [CNTVCT\\_ELO](#) is read from EL0 or EL2.
  - [CNTVCT](#) is read from EL0.

## Attributes

CNTVOFF\_EL2 is a 64-bit register.

## Field descriptions

The CNTVOFF\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual offset																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Virtual offset																															

### Bits [63:0]

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTVOFF\_EL2

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, CNTVOFF\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0000	0b011

# CONTEXTIDR\_EL1, Context ID Register (EL1)

The CONTEXTIDR\_EL1 characteristics are:

## Purpose

Identifies the current Process Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

## Configuration

AArch64 System register CONTEXTIDR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CONTEXTIDR\[31:0\]](#).

## Attributes

CONTEXTIDR\_EL1 is a 64-bit register.

## Field descriptions

The CONTEXTIDR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																PROCID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

#### Note

In AArch32 state, when [TTBCR](#).EAE is set to 0, [CONTEXTIDR](#).ASID holds the ASID.

In AArch64 state, CONTEXTIDR\_EL1 is independent of the ASID, and for the EL1&0 translation regime either [TTBR0\\_EL1](#) or [TTBR1\\_EL1](#) holds the ASID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CONTEXTIDR\_EL1

When [HCR\\_EL2](#).E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CONTEXTIDR\_EL1 or CONTEXTIDR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# CONTEXTIDR\_EL2, Context ID Register (EL2)

The CONTEXTIDR\_EL2 characteristics are:

## Purpose

Identifies the current Process Identifier for EL2.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

## Configuration

This register is present only when FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented. Otherwise, direct accesses to CONTEXTIDR\_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

CONTEXTIDR\_EL2 is a 64-bit register.

## Field descriptions

The CONTEXTIDR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# CPACR\_EL1, Architectural Feature Access Control Register

The CPACR\_EL1 characteristics are:

## Purpose

Controls access to trace, SVE, Advanced SIMD and floating-point functionality.

## Configuration

AArch64 System register CPACR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CPACR\[31:0\]](#).

When [HCR\\_EL2](#).{E2H, TGE} == {1, 1}, the fields in this register have no effect on execution at EL0 and EL1. In this case, the controls provided by [CPTR\\_EL2](#) are used.

## Attributes

CPACR\_EL1 is a 64-bit register.

## Field descriptions

The CPACR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0	TTA	RES0				FPEN		RES0	ZEN	RES0																					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:29]

Reserved, RES0.

### TTA, bit [28]

Traps EL0 and EL1 System register accesses to all implemented trace registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2](#).{E2H, TGE} is {0,1}, from both Execution states as follows:

- In AArch64 state, accesses to trace registers are trapped, reported using ESR\_ELx.EC value 0x18.
- In AArch32 state, MRC and MCR accesses to trace registers are trapped, reported using ESR\_ELx.EC value 0x05.
- In AArch32 state, MRRC and MCRR accesses to trace registers are trapped, reported using ESR\_ELx.EC value 0x0C.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	This control causes EL0 and EL1 System register accesses to all implemented trace registers to be trapped.

### Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT\_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher

---

priority than an exception that would be generated because the value of [CPACR\\_EL1](#).TTA is 1.

- The Armv8-A architecture does not provide traps on trace register accesses through the optional memory-mapped interface.
- 

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not implemented, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bits [27:22]

Reserved, RES0.

## FPEN, bits [21:20]

Traps EL0 and EL1 accesses to SVE, Advanced SIMD and floating-point registers to EL1, reported using ESR\_ELx.EC value 0x07, or to EL2 reported using ESR\_ELx.EC value 0x00, when EL2 is implemented and enabled for the current Security state and [HCR\\_EL2](#).{E2H, TGE} is {0,1}, from both Execution states as follows:

- In AArch64 state, accesses to [FPCR](#), [FPSR](#), any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
- In AArch32 state, [FPSCR](#), and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPACR\_EL1.ZEN has precedence over the value of CPACR\_EL1.FPEN.

FPEN	Meaning
0b00	This control causes any instructions at EL0 or EL1 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped.
0b01	This control causes any instructions at EL0 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, but does not cause any instruction at EL1 to be trapped.
0b10	This control causes any instructions at EL0 or EL1 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped.
0b11	This control does not cause any instructions to be trapped.

Writes to [MVFR0](#), [MVFR1](#) and [MVFR2](#) from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

### Note

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
  - Accesses from EL0 to [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), and [FPEXC](#) are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR\_EL1.FPEN is not 0b11.
- 

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bits [19:18]

Reserved, RES0.

**ZEN, bits [17:16]****When FEAT\_SVE is implemented:**

Traps EL0 and EL1 execution of SVE instructions and instructions that directly access [ZCR\\_EL1](#) System register to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and [HCR\\_EL2](#).{E2H, TGE} is {0,1}.

The exception is reported using ESR\_ELx.EC value 0x19.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPACR\_EL1.ZEN has precedence over the value of CPACR\_EL1.FPEN.

ZEN	Meaning
0b00	This control causes these instructions executed at EL0 or EL1 to be trapped.
0b01	This control causes these instructions executed at EL0 to be trapped, but does not cause any instruction at EL1 to be trapped.
0b10	This control causes these instructions executed at EL0 or EL1 to be trapped.
0b11	This control does not cause any instruction to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [15:0]**

Reserved, RES0.

**Accessing the CPACR\_EL1**

When [HCR\\_EL2](#).E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CPACR\_EL1 or CPACR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, CPACR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b010

# CPP RCTX, Cache Prefetch Prediction Restriction by Context

The CPP RCTX characteristics are:

## Purpose

Cache Prefetch Prediction Restriction by Context applies to all Cache Allocation Resources that predict cache allocations based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, cache prefetch prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction applies to all:

- Instruction caches.
- Data caches.
- TLB prefetching hardware used by the executing PE that applies to the supplied context or contexts.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

---

### Note

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

---

## Configuration

This instruction is present only when FEAT\_SPECRES is implemented. Otherwise, direct accesses to CPP RCTX are UNDEFINED.

## Attributes

CPP RCTX is a 64-bit System instruction.

## Field descriptions

The CPP RCTX input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0															GVMID	VMID															
RES0					NS	EL	RES0								GASID	ASID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:49]

Reserved, RES0.

**GVMID, bit [48]**

Execution of this instruction applies to all VMIDs or a specified VMID.

<b>GVMID</b>	<b>Meaning</b>
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 and EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**VMID, bits [47:32]**

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR\\_EL2.E2H==0](#) or [HCR\\_EL2.TGE==0](#)).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR\\_EL2.E2H==0](#) or [HCR\\_EL2.TGE==0](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR\\_EL2.E2H==1](#) and [HCR\\_EL2.TGE==1](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

**Bits [31:27]**

Reserved, RES0.

**NS, bit [26]**

Security State. Defined values are:

<b>NS</b>	<b>Meaning</b>
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

**EL, bits [25:24]**

Exception Level. Indicates the Exception level of the target execution context.

<b>EL</b>	<b>Meaning</b>
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

**Bits [23:17]**

Reserved, RES0.

**GASID, bit [16]**

Execution of this instruction applies to all ASIDs or a specified ASID.

<b>GASID</b>	<b>Meaning</b>
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASID for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

**ASID, bits [15:0]**

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

**Executing the CPP RCTX instruction**

Accesses to this instruction use the following encodings:

CPP RCTX, <Xt>

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b01	0b011	0b0111	0b0011	0b111

```

        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        CPP_RCTX(X[t]);
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.CPPRCTX == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        CPP_RCTX(X[t]);
elseif PSTATE.EL == EL2 then
    CPP_RCTX(X[t]);
elseif PSTATE.EL == EL3 then
    CPP_RCTX(X[t]);

```

# CPTR\_EL2, Architectural Feature Trap Register (EL2)

The CPTR\_EL2 characteristics are:

## Purpose

Controls trapping to EL2 of accesses to [CPACR](#), [CPACR\\_EL1](#), trace, Activity Monitor, SVE, Advanced SIMD and floating-point functionality.

## Configuration

AArch64 System register CPTR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HCPTR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

CPTR\_EL2 is a 64-bit register.

## Field descriptions

The CPTR\_EL2 bit assignments are:

### When FEAT\_VHE is implemented and HCR\_EL2.E2H == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TCPAC	TAM	RES0	TTA	RES0								FPEN	RES0	ZEN	RES0

### Bits [63:32]

Reserved, RES0.

### TCPAC, bit [31]

When [HCR\\_EL2.TGE](#) is 0, traps EL1 accesses to [CPACR\\_EL1](#) reported using ESR\_ELx.EC value 0x18, and accesses to [CPACR](#) reported using ESR\_ELx.EC value 0x03, to EL2 when EL2 is enabled in the current Security state.

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to <a href="#">CPACR_EL1</a> and <a href="#">CPACR</a> are trapped to EL2 when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

### Note

[CPACR\\_EL1](#) and [CPACR](#) are not accessible at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TAM, bit [30]****When FEAT\_AMUv1 is implemented:**

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using ESR\_ELx.EC value 0x18:
  - [AMUSERENR\\_EL0](#), [AMCFGR\\_EL0](#), [AMCGCR\\_EL0](#), [AMCNTENCLR0\\_EL0](#), [AMCNTENCLR1\\_EL0](#), [AMCNTENSET0\\_EL0](#), [AMCNTENSET1\\_EL0](#), [AMCR\\_EL0](#), [AMEVCNTR0<n>\\_EL0](#), [AMEVCNTR1<n>\\_EL0](#), [AMEVTYPE0<n>\\_EL0](#), and [AMEVTYPE1<n>\\_EL0](#).
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using ESR\_ELx.EC value 0x03:
  - [AMUSERENR](#), [AMCFGR](#), [AMCGCR](#), [AMCNTENCLR0](#), [AMCNTENCLR1](#), [AMCNTENSET0](#), [AMCNTENSET1](#), [AMCR](#), [AMEVTYPE0<n>](#), and [AMEVTYPE1<n>](#).
- In AArch32 state, MRRC or MCRR accesses to [AMEVCNTR0<n>](#) and [AMEVCNTR1<n>](#), are trapped to EL2, reported using ESR\_ELx.EC value 0x04.

TAM	Meaning
0b0	Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.
0b1	Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [29]**

Reserved, RES0.

**TTA, bit [28]**

Traps System register accesses to all implemented trace registers to EL2 when EL2 is enabled in the current Security state, from both Execution states as follows:

- In AArch64 state, accesses to trace registers with op0=2, op1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCR accesses to trace registers with cpnum=14, opc1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x05.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at EL0, EL1 or EL2, to execute a System register access to an implemented trace register is trapped to EL2 when EL2 is enabled in the current Security state, unless <a href="#">HCR_EL2.TGE</a> is 0 and it is trapped by <a href="#">CPACR.NSTRCDIS</a> or <a href="#">CPACR_EL1.TTA</a> . When <a href="#">HCR_EL2.TGE</a> is 1, any attempt at EL0 or EL2 to execute a System register access to an implemented trace register is trapped to EL2 when EL2 is enabled in the current Security state.

**Note**

The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT\_ETMv4, EL0 access to the trace registers are UNDEFINED, and any resulting exception is higher priority than this trap exception that would be generated because the value of CPTR\_EL2.TTA is 1.

---

EL2 does not provide traps on trace register accesses through the optional Memory-mapped interface.

---

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [27:22]

Reserved, RES0.

#### FPEN, bits [21:20]

Traps execution at EL2, EL1, and EL0 of instructions that directly access the SVE, Advanced SIMD and floating-point registers to EL2 when EL2 is enabled in the current Security state, from both Execution states.

The exception is reported using ESR\_ELx.EC value 0x07.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR\_EL2.ZEN has precedence over the value of CPTR\_EL2.FPEN.

FPEN	Meaning
0b00	This control causes any instructions at EL0, EL1, or EL2 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, subject to the exception prioritization rules.
0b01	When <a href="#">HCR_EL2.TGE</a> is 0, this control does not cause any instructions to be trapped. When <a href="#">HCR_EL2.TGE</a> is 1, this control causes instructions at EL0 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, but does not cause any instruction at EL2 to be trapped.
0b10	This control causes any instructions at EL0, EL1, or EL2 that use the registers associated with SVE, Advanced SIMD and floating-point execution to be trapped, subject to the exception prioritization rules.
0b11	This control does not cause any instructions to be trapped.

Writes to [MVFR0](#), [MVFR1](#), and [MVFR2](#) from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

#### Note

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), and [FPEXC](#) are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR\_EL2.FPEN is not 0b11.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [19:18]

Reserved, RES0.

#### ZEN, bits [17:16]

##### When FEAT\_SVE is implemented:

Traps execution at EL2, EL1, and EL0 of SVE instructions, and instructions that directly access the [ZCR\\_EL1](#) and [ZCR\\_EL2](#) System registers to EL2 when EL2 is enabled in the current Security state.

The exception is reported using ESR\_ELx.EC value 0x19.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR\_EL2.ZEN has precedence over the value of CPTR\_EL2.FPEN.

ZEN	Meaning
0b00	This control causes execution at EL2, EL1, and EL0 of these instructions to be trapped, subject to the exception prioritization rules.
0b01	When <a href="#">HCR_EL2.TGE</a> is 0, this control does not cause any instruction to be trapped. When <a href="#">HCR_EL2.TGE</a> is 1, this control causes these instructions executed at EL0 to be trapped, but does not cause any instruction at EL2 to be trapped.
0b10	This control causes execution at EL2, EL1, and EL0 of these instructions to be trapped, subject to the exception prioritization rules.
0b11	This control does not cause any instruction to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

This format applies in all Armv8.0 implementations.

#### Bits [63:32]

Reserved, RES0.

#### TCPAC, bit [31]

Traps EL1 accesses to [CPACR\\_EL1](#), reported using ESR\_ELx.EC value 0x18 and accesses to [CPACR](#), reported using ESR\_ELx.EC value 0x03, to EL2 when EL2 is enabled in the current Security state.

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to <a href="#">CPACR_EL1</a> and <a href="#">CPACR</a> are trapped to EL2 when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

#### Note

[CPACR\\_EL1](#) and [CPACR](#) are not accessible at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TAM, bit [30]****When FEAT\_AMUv1 is implemented:**

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using ESR\_ELx.EC value 0x18:
  - [AMUSERENR\\_EL0](#), [AMCFGR\\_EL0](#), [AMCGCR\\_EL0](#), [AMCNTENCLR0\\_EL0](#), [AMCNTENCLR1\\_EL0](#), [AMCNTENSET0\\_EL0](#), [AMCNTENSET1\\_EL0](#), [AMCR\\_EL0](#), [AMEVCNTR0<n>\\_EL0](#), [AMEVCNTR1<n>\\_EL0](#), [AMEVTYPER0<n>\\_EL0](#), and [AMEVTYPER1<n>\\_EL0](#).
- In AArch32 state, MCR or MRC accesses to the following registers are trapped to EL2 and reported using ESR\_ELx.EC value 0x03:
  - [AMUSERENR](#), [AMCFGR](#), [AMCGCR](#), [AMCNTENCLR0](#), [AMCNTENCLR1](#), [AMCNTENSET0](#), [AMCNTENSET1](#), [AMCR](#), [AMEVTYPER0<n>](#), and [AMEVTYPER1<n>](#).
- In AArch32 state, MCRR or MRRC accesses to [AMEVCNTR0<n>](#) and [AMEVCNTR1<n>](#), are trapped to EL2, reported using ESR\_ELx.EC value 0x04.

TAM	Meaning
0b0	Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.
0b1	Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [29:21]**

Reserved, RES0.

**TTA, bit [20]**

Traps System register accesses to all implemented trace registers to EL2 when EL2 is enabled in the current Security state, from both Execution states as follows:

- In AArch64 state, accesses to trace registers with op0=2, op1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCR accesses to trace registers with cpnum=14, opc1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x05.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at EL0, EL1, or EL2, to execute a System register access to an implemented trace register is trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by <a href="#">CPACR.TRCDIS</a> or <a href="#">CPACR_EL1.TTA</a> .

**Note**

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT\_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of [CPTR\\_EL2.TTA](#) is 1.
- EL2 does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [19:14]

Reserved, RES0.

#### Bits [13:12]

Reserved, RES1.

#### Bit [11]

Reserved, RES0.

#### TFP, bit [10]

Traps accesses to SVE, Advanced SIMD and floating-point functionality to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using ESR\_ELx.EC value 0x07:
  - [FPCR](#), [FPSR](#), [FPEXC32\\_EL2](#), any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using ESR\_ELx.EC value 0x07:
  - [MVFR0](#), [MVFR1](#), [MVFR2](#), [FPSCR](#), [FPEXC](#), and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers. For the purposes of this trap, the architecture defines a VMSR access to [FPSID](#) from EL1 or higher as an access to a SIMD and floating point register. Otherwise, permitted VMSR accesses to [FPSID](#) are ignored.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR\_EL2.TZ has precedence over the value of CPTR\_EL2.TFP.

TFP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at EL0, EL1 or EL2, to execute an instruction that uses the registers associated with SVE, Advanced SIMD and floating-point execution is trapped to EL2 when EL2 is enabled in the current Security state, subject to the exception prioritization rules.

#### Note

[FPEXC32\\_EL2](#) is not accessible from EL0 using AArch64.

[FPSID](#), [MVFR0](#), [MVFR1](#), and [FPEXC](#) are not accessible from EL0 using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bit [9]

Reserved, RES1.

**TZ, bit [8]****When FEAT\_SVE is implemented:**

Traps execution at EL2, EL1, or EL0 of SVE instructions and instructions that directly access the [ZCR\\_EL2](#) and [ZCR\\_EL1](#) System registers to EL2 when EL2 is enabled in the current Security state.

The exception is reported using ESR\_ELx.EC value 0x19.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR\_EL2.TZ has precedence over the value of CPTR\_EL2.TFP.

TZ	Meaning
0b0	This control does not cause any instruction to be trapped.
0b1	This control causes these instructions to be trapped, subject to the exception prioritization rules.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**Bits [7:0]**

# CPTR\_EL3, Architectural Feature Trap Register (EL3)

The CPT<sub>R</sub>\_EL3 characteristics are:

## Purpose

Controls trapping to EL3 of accesses to [CPACR](#), [CPACR\\_EL1](#), [HCPTR](#), [CPTR\\_EL2](#), trace, Activity Monitor, SVE, Advanced SIMD and floating-point functionality.

## Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to CPT<sub>R</sub>\_EL3 are UNDEFINED.

## Attributes

CPT<sub>R</sub>\_EL3 is a 64-bit register.

## Field descriptions

The CPT<sub>R</sub>\_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32																	
RES0																																																
TCPAC		TAM		RES0																	TTA		RES0										TFP		RES0		EZ		RES0									
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																	

### Bits [63:32]

Reserved, RES0.

### TCPAC, bit [31]

Traps all of the following to EL3, from both Security states and both Execution states.

- EL2 accesses to [CPTR\\_EL2](#), reported using ESR\_ELx.EC value 0x18, or [HCPTR](#), reported using ESR\_ELx.EC value 0x03.
- EL2 and EL1 accesses to [CPACR\\_EL1](#) reported using ESR\_ELx.EC value 0x18, or [CPACR](#) reported using ESR\_ELx.EC value 0x03.

When CPT<sub>R</sub>\_EL3.TCPAC is:

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 accesses to the <a href="#">CPTR_EL2</a> or <a href="#">HCPTR</a> , and EL2 and EL1 accesses to the <a href="#">CPACR_EL1</a> or <a href="#">CPACR</a> , are trapped to EL3, unless they are trapped by <a href="#">CPTR_EL2</a> .TCPAC.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TAM, bit [30]

When FEAT\_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL2, EL1 and EL0 accesses to all Activity Monitor registers to EL3.

Accesses to the Activity Monitors registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported with ESR\_ELx.EC value 0x18:

- [AMUSERENR\\_EL0](#), [AMCFGR\\_EL0](#), [AMCGCR\\_EL0](#), [AMCNTENCLR0\\_EL0](#), [AMCNTENCLR1\\_EL0](#), [AMCNTENSET0\\_EL0](#), [AMCNTENSET1\\_EL0](#), [AMCR\\_EL0](#), [AMEVCNTR0<n>\\_EL0](#), [AMEVCNTR1<n>\\_EL0](#), [AMEVTYPER0<n>\\_EL0](#), and [AMEVTYPER1<n>\\_EL0](#).
- In AArch32 state, accesses with MRC or MCR to the following registers reported with ESR\_ELx.EC value 0x03:
  - [AMUSERENR](#), [AMCFGR](#), [AMCGCR](#), [AMCNTENCLR0](#), [AMCNTENCLR1](#), [AMCNTENSET0](#), [AMCNTENSET1](#), [AMCR](#), [AMEVTYPER0<n>](#), and [AMEVTYPER1<n>](#).
- In AArch32 state, accesses with MRRC or MCRR to the following registers, reported with ESR\_ELx.EC value 0x04:
  - [AMEVCNTR0<n>](#), [AMEVCNTR1<n>](#).

TAM	Meaning
0b0	Accesses from EL2, EL1, and EL0 to Activity Monitor registers are not trapped.
0b1	Accesses from EL2, EL1, and EL0 to Activity Monitor registers are trapped to EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bits [29:21]

Reserved, RES0.

#### TTA, bit [20]

Traps System register accesses. Accesses to the trace registers, from all Exception levels, both Security states, and both Execution states are trapped to EL3 as follows:

- In AArch64 state, Trace registers with op0=2, op1=1, and CRn<0b1000 are trapped to EL3 and reported using EC syndrome value 0x18.
- In AArch32 state, accesses using MCR or MRC to the Trace registers with cpnum=14, opc1=1, and CRn<0b1000 are reported using EC syndrome value 0x05.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any System register access to the trace registers is trapped to EL3, subject to the exception prioritization rules, unless it is trapped by <a href="#">CPACR</a> .TRCDIS, <a href="#">CPACR_EL1</a> .TTA or <a href="#">CPTR_EL2</a> .TTA.

If System register access to trace functionality is not supported, this bit is RES0.

#### Note

The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT\_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than this trap exception.

EL3 does not provide traps on trace register accesses through the Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, no side-effects occur before the exception is taken, see 'Traps on instructions'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:11]**

Reserved, RES0.

**TFP, bit [10]**

Traps all accesses to SVE, Advanced SIMD and floating-point functionality, from all Exception levels, both Security states, and both Execution states, to EL3.

This includes the following registers, all reported using ESR\_ELx.EC value 0x07:

- [FPCR](#), [FPSR](#), [FPEXC32\\_EL2](#), any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
- [MVFR0](#), [MVFR1](#), [MVFR2](#), [FPSCR](#), [FPEXC](#), and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers.

Permitted VMSR accesses to [FPSID](#) are ignored, but for the purposes of this trap the architecture define a VMSR access to the [FPSID](#) from EL1 or higher as an access to a SIMD and floating-point register.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR\_EL3.EZ has precedence over the value of CPTR\_EL3.TFP.

Defined values are:

TFP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at any Exception level to execute an instruction that uses the registers associated with SVE, Advanced SIMD and floating-point is trapped to EL3, subject to the exception prioritization rules.

**Note**

[FPEXC32\\_EL2](#) is not accessible from EL0 using AArch64.

[FPSID](#), [MVFR0](#), [MVFR1](#), and [FPEXC](#) are not accessible from EL0 using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [9]**

Reserved, RES0.

**EZ, bit [8]****When FEAT\_SVE is implemented:**

Traps execution of SVE instructions and instructions that directly access the [ZCR\\_EL3](#), [ZCR\\_EL2](#), and [ZCR\\_EL1](#) System registers, from all Exception levels and both Security states, to EL3.

The exception is reported using ESR\_ELx.EC value 0x19.

Trapping behavior is affected by precedence as follows: A trap taken as a result of CPTR\_EL3.EZ has precedence over the value of CPTR\_EL3.TFP.

EZ	Meaning
0b0	This control causes these instructions executed at any Exception level to be trapped, subject to the exception prioritization rules.
0b1	This control does not cause any instruction to be trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [7:0]**

Reserved, RES0.

**Accessing the CPTR\_EL3**

Accesses to this register use the following encodings:

MRS <Xt>, CPTR\_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return CPTR_EL3;
```

MSR CPTR\_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b010

```
if PSTATE.EL == EL0 then

# CSSELR\_EL1, Cache Size Selection Register

The CSSELR\_EL1 characteristics are:

## Purpose

Selects the current Cache Size ID Register, [CCSIDR\\_EL1](#), by specifying the required cache level and the cache type (either instruction or data cache).

## Configuration

AArch64 System register CSSELR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CSSELR\[31:0\]](#).

## Attributes

CSSELR\_EL1 is a 64-bit register.

## Field descriptions

The CSSELR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:5]

Reserved, RES0.

### TnD, bit [4]

When FEAT\_MTE is implemented:

Allocation Tag not Data bit.

TnD	Meaning
0b0	Data, Instruction or Unified cache.
0b1	Separate Allocation Tag cache.

When CSSELR\_EL1.InD == 1, this bit is RES0.

If CSSELR\_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR\_EL1 is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

### Level, bits [3:1]

Cache level of required cache.

Level	Meaning
0b000	Level 1 cache.
0b001	Level 2 cache.
0b010	Level 3 cache.
0b011	Level 4 cache.
0b100	Level 5 cache.
0b101	Level 6 cache.
0b110	Level 7 cache.

All other values are reserved.

If CSSELR\_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR\_EL1 is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## InD, bit [0]

Instruction not Data bit.

InD	Meaning
0b0	Data or unified cache.
0b1	Instruction cache.

If CSSELR\_EL1.Level is programmed to a cache level that is not implemented, then a read of CSSELR\_EL1 is CONSTRAINED UNPREDICTABLE, and returns UNKNOWN values for CSSELR\_EL1.{Level, InD}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CSSELR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, CSSELR\_EL1

op0	op1	CRn	CRm	op2

# CTR\_EL0, Cache Type Register

The CTR\_EL0 characteristics are:

## Purpose

Provides information about the architecture of the caches.

## Configuration

AArch64 System register CTR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [CTR\[31:0\]](#).

## Attributes

CTR\_EL0 is a 64-bit register.

## Field descriptions

The CTR\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																										TminLine							
RES1	RES0	DIC	IDC	CWG				ERG				DminLine				L1Ip				RES0								lminLine					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### Bits [63:38]

Reserved, RES0.

### TminLine, bits [37:32]

When FEAT\_MTE is implemented:

Tag minimum Line. Log<sub>2</sub> of the number of words covered by Allocation Tags in the smallest cache line of all caches which can contain Allocation tags that are controlled by the PE.

#### Note

- For an implementation with cache lines containing 64 bytes of data and 4 Allocation Tags, this will be  $\log_2(64/4) = 4$ .
- For an implementation with Allocations Tags in separate cache lines of 128 Allocation Tags per line, this will be  $\log_2(128*16/4) = 9$ .

### Otherwise:

Reserved, RES0.

### Bit [31]

Reserved, RES1.

### Bit [30]

Reserved, RES0.

**DIC, bit [29]**

Instruction cache invalidation requirements for data to instruction coherence.

DIC	Meaning
0b0	Instruction cache invalidation to the Point of Unification is required for data to instruction coherence.
0b1	Instruction cache invalidation to the Point of Unification is not required for data to instruction coherence.

**IDC, bit [28]**

Data cache clean requirements for instruction to data coherence. The meaning of this bit is:

IDC	Meaning
0b0	Data cache clean to the Point of Unification is required for instruction to data coherence, unless CLIDR_EL1.LoC == 0b000 or (CLIDR_EL1.LoUIS == 0b000 && CLIDR_EL1.LoUU == 0b000).
0b1	Data cache clean to the Point of Unification is not required for instruction to data coherence.

**CWG, bits [27:24]**

Cache writeback granule. Log<sub>2</sub> of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of 0b0000 indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than 0b1001 are reserved.

Arm recommends that an implementation that does not support cache write-back implements this field as 0b0001. This applies, for example, to an implementation that supports only write-through caches.

**ERG, bits [23:20]**

Exclusives reservation granule. Log<sub>2</sub> of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.

The use of the value 0b0000 is deprecated.

The value 0b0001 and values greater than 0b1001 are reserved.

**DminLine, bits [19:16]**

Log<sub>2</sub> of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

**L1Ip, bits [15:14]**

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache. Possible values of this field are:

L1Ip	Meaning
0b00	VMID aware Physical Index, Physical tag (VPIPT)
0b01	ASID-tagged Virtual Index, Virtual Tag (AIVIVT)
0b10	Virtual Index, Physical Tag (VIPT)
0b11	Physical Index, Physical Tag (PIPT)

The value 0b01 is reserved in Armv8.

The value 0b00 is permitted only in an implementation that includes FEAT\_VPIPT, otherwise the value is reserved.

### Bits [13:4]

Reserved, RES0.

### IminLine, bits [3:0]

Log<sub>2</sub> of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

## Accessing the CTR\_EL0

Accesses to this register use the following encodings:

MRS <Xt>, CTR\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b0000	0b0000	0b001

```

if PSTATE.EL == EL0 then

# DACR32\_EL2, Domain Access Control Register

The DACR32\_EL2 characteristics are:

## Purpose

Allows access to the AArch32 [DACR](#) register from AArch64 state only. Its value has no effect on execution in AArch64 state.

## Configuration

AArch64 System register DACR32\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [DACR\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to DACR32\_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

## Attributes

DACR32\_EL2 is a 64-bit register.

## Field descriptions

The DACR32\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# DAIF, Interrupt Mask Bits

The DAIF characteristics are:

## Purpose

Allows access to the interrupt mask bits.

## Configuration

There are no configuration notes.

## Attributes

DAIF is a 64-bit register.

## Field descriptions

The DAIF bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																RES0															
RES0										D		A		I		F		RES0

### Bits [63:10]

Reserved, RES0.

### D, bit [9]

Process state D mask. The possible values of this bit are:

D	Meaning
0b0	Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are not masked.
0b1	Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are masked.

When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

On a Warm reset, this field resets to 1.

### A, bit [8]

SError interrupt mask bit. The possible values of this bit are:

A	Meaning
0b0	Exception not masked.
0b1	Exception masked.

On a Warm reset, this field resets to 1.

### I, bit [7]

IRQ mask bit. The possible values of this bit are:

I	Meaning
0b0	Exception not masked.
0b1	Exception masked.

On a Warm reset, this field resets to 1.

## F, bit [6]

FIQ mask bit. The possible values of this bit are:

F	Meaning
0b0	Exception not masked.
0b1	Exception masked.

On a Warm reset, this field resets to 1.

## Bits [5:0]

Reserved, RES0.

# Accessing the DAIF

Accesses to this register use the following encodings:

# DBGAUTHSTATUS\_EL1, Debug Authentication Status register

The DBGAUTHSTATUS\_EL1 characteristics are:

## Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

## Configuration

AArch64 System register DBGAUTHSTATUS\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGAUTHSTATUS\[31:0\]](#).

AArch64 System register DBGAUTHSTATUS\_EL1 bits [31:0] are architecturally mapped to External register [DBGAUTHSTATUS\\_EL1\[31:0\]](#).

## Attributes

DBGAUTHSTATUS\_EL1 is a 64-bit register.

## Field descriptions

The DBGAUTHSTATUS\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32																		
																RES0																																	
																								RES0								SNID		SID		NSNID		NSID											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																		

### Bits [63:8]

Reserved, RES0.

### SNID, bits [7:6]

When FEAT\_Debugv8p4 is implemented:

Secure non-invasive debug.

This field has the same value as DBGAUTHSTATUS\_EL1.SID.

Otherwise:

Secure non-invasive debug.

SNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of <a href="#">SCR_EL3.NS</a> is 1.
0b10	Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

**SID, bits [5:4]**

Secure invasive debug.

SID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of <a href="#">SCR_EL3.NS</a> is 1.
0b10	Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

**NSNID, bits [3:2]**

**When FEAT\_Debugv8p4 is implemented:**

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of <a href="#">SCR_EL3.NS</a> is 0
0b11	Implemented and enabled. EL3 is implemented or the Effective value of <a href="#">SCR_EL3.NS</a> is 1.

All other values are reserved.

**Otherwise:**

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of <a href="#">SCR_EL3.NS</a> is 0.
0b10	Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

**NSID, bits [1:0]**

Non-secure invasive debug.

NSID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of <a href="#">SCR_EL3.NS</a> is 0.
0b10	Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

**Accessing the DBGAUTHSTATUS\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, DBGAUTHSTATUS\_EL1

op0	op1	CRn	CRm	op2
-----	-----	-----	-----	-----

0b10	0b000	0b0111	0b1110	0b1110
------	-------	--------	--------	--------

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HDFGRTR_EL2.DBGAUTHSTATUS_EL1
== '1' then

# DBGBCR<n>\_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>\_EL1 characteristics are:

## Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>\\_EL1](#).

## Configuration

AArch64 System register DBGBCR<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBCR<n>\[31:0\]](#).

AArch64 System register DBGBCR<n>\_EL1 bits [31:0] are architecturally mapped to External register [DBGBCR<n>\\_EL1\[31:0\]](#).

If breakpoint n is not implemented, accesses to this register are UNDEFINED.

## Attributes

DBGBCR<n>\_EL1 is a 64-bit register.

## Field descriptions

The DBGBCR<n>\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0								BT				LBN				SSC		HMC	RES0				BAS				RES0		PMC	E	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:24]

Reserved, RES0.

### BT, bits [23:20]

Breakpoint Type. Possible values are:

BT	Meaning
0b0000	Unlinked instruction address match. <a href="#">DBGBVR&lt;n&gt;_EL1</a> is the address of an instruction.
0b0001	As 0b0000, but linked to a Context matching breakpoint.
0b0010	Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of <a href="#">HCR_EL2.E2H</a> is 1, if either the PE is executing at EL0 with <a href="#">HCR_EL2.TGE</a> set to 1 or the PE is executing at EL2, then <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> must match the <a href="#">CONTEXTIDR_EL2</a> value. Otherwise, <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> must match the <a href="#">CONTEXTIDR_EL1</a> value
0b0011	As 0b0010, with linking enabled.
0b0110	Unlinked <a href="#">CONTEXTIDR_EL1</a> match. <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> is a Context ID compared against <a href="#">CONTEXTIDR_EL1</a> .
0b0111	As 0b0110, with linking enabled.
0b1000	Unlinked VMID match. <a href="#">DBGBVR&lt;n&gt;_EL1.VMID</a> is a VMID compared against <a href="#">VTTBR_EL2.VMID</a> .
0b1001	As 0b1000, with linking enabled.
0b1010	Unlinked VMID and Context ID match. <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> is a Context ID compared against <a href="#">CONTEXTIDR_EL1</a> , and <a href="#">DBGBVR&lt;n&gt;_EL1.VMID</a> is a VMID compared against <a href="#">VTTBR_EL2.VMID</a> .
0b1011	As 0b1010, with linking enabled.
0b1100	Unlinked <a href="#">CONTEXTIDR_EL2</a> match. <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID2</a> is a Context ID compared against <a href="#">CONTEXTIDR_EL2</a> .
0b1101	As 0b1100, with linking enabled.
0b1110	Unlinked Full Context ID match. <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> is compared against <a href="#">CONTEXTIDR_EL1</a> , and <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID2</a> is compared against <a href="#">CONTEXTIDR_EL2</a> .
0b1111	As 0b1110, with linking enabled.

All other values are reserved. Constraints on breakpoint programming mean other values are reserved under some conditions.

The fields that indicate when the breakpoint can be generated are: HMC, SSC, and PMC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved value, see 'Reserved DBGBCR<n>\_EL1.BT values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>\_EL1.E is 0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, SSC, and PMC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>\_EL1.{SSC, HMC, PMC} values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, SSC, and PMC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information, see DBGBCR<n>\_EL1.SSC.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### Bits [12:9]

Reserved, RES0.

### BAS, bits [8:5]

#### When AArch32 is supported at any Exception level:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	<a href="#">DBGBVR&lt;n&gt;_EL1</a>	Use for T32 instructions
0b1100	<a href="#">DBGBVR&lt;n&gt;_EL1</a> + 2	Use for T32 instructions
0b1111	<a href="#">DBGBVR&lt;n&gt;_EL1</a>	Use for A64 and A32 instructions

All other values are reserved. For more information, see 'Reserved DBGBCR<n>\_EL1.BAS values'.

For more information on using the BAS field in address match breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES1.

### Bits [4:3]

Reserved, RES0.

### PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, SSC, and PMC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information, see DBGBCR<n>\_EL1.SSC.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## E, bit [0]

Enable breakpoint [DBGBVR<n>\\_EL1](#).

E	Meaning
0b0	Breakpoint disabled.
0b1	Breakpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## Accessing the DBGBCR<n>\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, DBGBCR<n>\_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	n[3:0]	0b101

# DBGGBVR<n>\_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGGBVR<n>\_EL1 characteristics are:

## Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register [DBGBCR<n>\\_EL1](#).

## Configuration

AArch64 System register DBGGBVR<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGGBVR<n>\[31:0\]](#).

AArch64 System register DBGGBVR<n>\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [DBGGBXVR<n>\[31:0\]](#).

AArch64 System register DBGGBVR<n>\_EL1 bits [63:0] are architecturally mapped to External register [DBGGBVR<n>\\_EL1\[63:0\]](#).

How this register is interpreted depends on the value of [DBGBCR<n>\\_EL1](#).BT.

- When [DBGBCR<n>\\_EL1](#).BT is 0b000x, this register holds a virtual address.
- When [DBGBCR<n>\\_EL1](#).BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When [DBGBCR<n>\\_EL1](#).BT is 0b100x, this register holds a VMID.
- When [DBGBCR<n>\\_EL1](#).BT is 0b101x, this register holds a VMID and a Context ID.
- When [DBGBCR<n>\\_EL1](#).BT is 0b111x, this register holds two Context ID values.

For other values of [DBGBCR<n>\\_EL1](#).BT, this register is RES0.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

## Attributes

DBGGBVR<n>\_EL1 is a 64-bit register.

## Field descriptions

The DBGGBVR<n>\_EL1 bit assignments are:

### When DBGBCR<n>\_EL1.BT == 0b000x:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RESS[14:4]											Bits[52:49]				VA[48:2]																	
VA[48:2]																															RES0	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

- It is CONSTRAINED UNPREDICTABLE whether the PE ignores this field when comparing an address.
- If the breakpoint is not context-aware, it is IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.

## VA[52:49], bits [52:49]

### When FEAT\_LVA is implemented:

Extension to VA[48:2]. See VA[48:2] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### Otherwise:

Extension to RESS[14:4]. See RESS[14:4] for more details.

## VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT\_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, bits [52:49] are part of the RESS field.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## Bits [1:0]

Reserved, RES0.

## When DBGBCR<n>\_EL1.BT == 0b001x:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																RES0																
																ContextID																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

## Bits [63:32]

Reserved, RES0.

## ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR\\_EL2](#) when (FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented), [HCR\\_EL2.E2H](#) is 1, and either:

- The PE is executing at EL2.
- [HCR\\_EL2.TGE](#) is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against [CONTEXTIDR\\_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## When DBGBCR<n>\_EL1.BT == 0b011x:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																RES0																
																ContextID																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

## Bits [63:32]

Reserved, RES0.

## ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR\\_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## When DBGBCR<n>\_EL1.BT == 0b100x and EL2 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																VMID[15:8]								VMID[7:0]

## Bits [63:48]

Reserved, RES0.

## VMID[15:8], bits [47:40]

When FEAT\_VMID16 is implemented, VTCR\_EL2.VS == 1 and EL2 is using AArch64:

Extension to VMID[7:0]. See DBGBVR<n>\_EL1.VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## Otherwise:

Reserved, RES0.

## VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCR\\_EL2.VS](#) is 0.
- FEAT\_VMID16 is not implemented.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## Bits [31:0]

Reserved, RES0.

## When DBGBCR<n>\_EL1.BT == 0b101x and EL2 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																VMID[15:8]								VMID[7:0]

# DBGCLAIMCLR\_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR\_EL1 characteristics are:

## Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

---

### Note

CLAIM tags are typically used for communication between the debugger and target software.

---

Used in conjunction with the [DBGCLAIMSET\\_EL1](#) register.

## Configuration

AArch64 System register DBGCLAIMCLR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMCLR\[31:0\]](#).

AArch64 System register DBGCLAIMCLR\_EL1 bits [31:0] are architecturally mapped to External register [DBGCLAIMCLR\\_EL1\[31:0\]](#).

An implementation must include eight CLAIM tag bits.

## Attributes

DBGCLAIMCLR\_EL1 is a 64-bit register.

## Field descriptions

The DBGCLAIMCLR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RAZ/SBZ																CLAIM															

### Bits [63:32]

Reserved, RES0.

### Bits [31:8]

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

### CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.

## Accessing the DBGCLAIMCLR\_EL1

Accesses to this register use the following encodings:

# DBGDTR\_EL0, Debug Data Transfer Register, half-duplex

The DBGDTR\_EL0 characteristics are:

## Purpose

Transfers 64 bits of data between the PE and an external debugger. Can transfer both ways using only a single register.

## Configuration

AArch64 System register DBGDTR\_EL0 bits [63:32] are architecturally mapped to AArch32 System register [DBGDTRRXint\[31:0\]](#) when written.

AArch64 System register DBGDTR\_EL0 bits [63:32] are architecturally mapped to External register [DBGDTRRX\\_EL0\[31:0\]](#) when written.

AArch64 System register DBGDTR\_EL0 bits [63:32] are architecturally mapped to AArch64 System register [DBGDTRRX\\_EL0\[31:0\]](#) when written.

AArch64 System register DBGDTR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRTXint\[31:0\]](#) when written.

AArch64 System register DBGDTR\_EL0 bits [31:0] are architecturally mapped to External register [DBGDTRTX\\_EL0\[31:0\]](#) when written.

AArch64 System register DBGDTR\_EL0 bits [31:0] are architecturally mapped to AArch64 System register [DBGDTRTX\\_EL0\[31:0\]](#) when written.

AArch64 System register DBGDTR\_EL0 bits [63:32] are architecturally mapped to AArch32 System register [DBGDTRTXint\[31:0\]](#) when read.

AArch64 System register DBGDTR\_EL0 bits [63:32] are architecturally mapped to External register [DBGDTRTX\\_EL0\[31:0\]](#) when read.

AArch64 System register DBGDTR\_EL0 bits [63:32] are architecturally mapped to AArch64 System register [DBGDTRTX\\_EL0\[31:0\]](#) when read.

AArch64 System register DBGDTR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRRXint\[31:0\]](#) when read.

AArch64 System register DBGDTR\_EL0 bits [31:0] are architecturally mapped to External register [DBGDTRRX\\_EL0\[31:0\]](#) when read.

AArch64 System register DBGDTR\_EL0 bits [31:0] are architecturally mapped to AArch64 System register [DBGDTRRX\\_EL0\[31:0\]](#) when read.

## Attributes

DBGDTR\_EL0 is a 64-bit register.

## Field descriptions

The DBGDTR\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																HighWord																
																LowWord																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

**HighWord, bits [63:32]**

Writes to this register set DTRRX to the value in this field and do not change RXfull.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRTX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

**LowWord, bits [31:0]**

Writes to this register set DTRTX to the value in this field and set TXfull to 1.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

**Accessing the DBGDTR\_EL0**

Accesses to this register use the following encodings:

MRS <Xt>, DBGDTR\_EL0

op0	op1	CRn	CRm	op2

# DBGDTRRX\_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX\_EL0 characteristics are:

## Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See [DBGDTR\\_EL0](#) for additional architectural mappings. It is a component of the Debug Communications Channel.

## Configuration

AArch64 System register DBGDTRRX\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRRXint\[31:0\]](#).

AArch64 System register DBGDTRRX\_EL0 bits [31:0] are architecturally mapped to External register [DBGDTRRX\\_EL0\[31:0\]](#).

## Attributes

DBGDTRRX\_EL0 is a 64-bit register.

## Field descriptions

The DBGDTRRX\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Update DTRRX																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### Bits [31:0]

Update DTRRX.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

# DBGDTRTX\_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX\_EL0 characteristics are:

## Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See [DBGDTR\\_EL0](#) for additional architectural mappings. It is a component of the Debug Communication Channel.

## Configuration

AArch64 System register DBGDTRTX\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRTXint\[31:0\]](#).

AArch64 System register DBGDTRTX\_EL0 bits [31:0] are architecturally mapped to External register [DBGDTRTX\\_EL0\[31:0\]](#).

## Attributes

DBGDTRTX\_EL0 is a 64-bit register.

## Field descriptions

The DBGDTRTX\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Return DTRTX																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### Bits [31:0]

Return DTRTX.

Writes to this register:

- If TXfull is set to 1, set DTRRX and DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull is set to 1.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## Accessing the DBGDTRTX\_EL0

Accesses to this register use the following encodings:

# DBGPRCR\_EL1, Debug Power Control Register

The DBGPRCR\_EL1 characteristics are:

## Purpose

Controls behavior of the PE on powerdown request.

## Configuration

AArch64 System register DBGPRCR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGPRCR\[31:0\]](#).

Bit [0] of this register is mapped to [EDPRCR](#).CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

## Attributes

DBGPRCR\_EL1 is a 64-bit register.

## Field descriptions

The DBGPRCR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															CORENPDRQ
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:1]

Reserved, RES0.

### CORENPDRQ, bit [0]

When FEAT\_DoPD is implemented:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to its Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

### Note

---

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

---

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

#### Otherwise:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR.COREPURQ](#) on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

---

#### Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

---

On a Cold reset, this field resets to the value in [EDPRCR.COREPURQ](#).

# DBGVCR32\_EL2, Debug Vector Catch Register

The DBGVCR32\_EL2 characteristics are:

## Purpose

Allows access to the AArch32 register [DBGVCR](#) from AArch64 state only. Its value has no effect on execution in AArch64 state.

## Configuration

AArch64 System register DBGVCR32\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [DBGVCR\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to DBGVCR32\_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

## Attributes

DBGVCR32\_EL2 is a 64-bit register.

## Field descriptions

The DBGVCR32\_EL2 bit assignments are:

### When EL3 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
NSF	NSI	RES0	NSD	NSP	NSS	NSU	RES0																	SF	SI	RES0	SD	SP	SS	SU	RES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### NSF, bit [31]

FIQ vector catch enable in Non-secure state.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### NSI, bit [30]

IRQ vector catch enable in Non-secure state.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [29]

Reserved, RES0.

**NSD, bit [28]**

Data Abort vector catch enable in Non-secure state.

The exception vector offset is 0x10.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSP, bit [27]**

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is 0x0C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSS, bit [26]**

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is 0x08.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSU, bit [25]**

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is 0x04.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [24:8]**

Reserved, RES0.

**SF, bit [7]**

FIQ vector catch enable in Secure state.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SI, bit [6]**

IRQ vector catch enable in Secure state.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [5]**

Reserved, RES0.

**SD, bit [4]**

Data Abort vector catch enable in Secure state.

The exception vector offset is 0x10.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SP, bit [3]**

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is 0x0C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SS, bit [2]**

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is 0x08.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SU, bit [1]**

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is 0x04.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [0]**

Reserved, RES0.

**When EL3 is not implemented:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																RES0																
RES0																								F	I	RES0	D	P	S	U	RES0

**Bits [63:8]**

Reserved, RES0.

**F, bit [7]**

FIQ vector catch enable.

The exception vector offset is 0x1C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [6]**

IRQ vector catch enable.

The exception vector offset is 0x18.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [5]**

Reserved, RES0.

**D, bit [4]**

Data Abort vector catch enable.

The exception vector offset is 0x10.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P, bit [3]**

Prefetch Abort vector catch enable.

The exception vector offset 0x0C.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**S, bit [2]**

Supervisor Call (SVC) vector catch enable.

The exception vector offset is 0x08.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**U, bit [1]**

Undefined Instruction vector catch enable.

The exception vector offset is 0x04.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [0]**

Reserved, RES0.

**Accessing the DBGVCR32\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, DBGVCR32\_EL2

op0	op1	CRn	CRm	op2
0b10	0b100	0b0000	0b0111	0b000

```

# DBGWCR<n>\_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>\_EL1 characteristics are:

## Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>\\_EL1](#).

## Configuration

AArch64 System register DBGWCR<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWCR<n>\[31:0\]](#).

AArch64 System register DBGWCR<n>\_EL1 bits [31:0] are architecturally mapped to External register [DBGWCR<n>\\_EL1\[31:0\]](#).

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

## Attributes

DBGWCR<n>\_EL1 is a 64-bit register.

## Field descriptions

The DBGWCR<n>\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0				MASK				RES0				WT	LBN				SSC	HMC	BAS								LSC	PAC	E		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:29]

Reserved, RES0.

### MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00001	Reserved.
0b00010	Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn\_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [23:21]**

Reserved, RES0.

**WT, bit [20]**

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, SSC, and PAC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'

For more information on the effect of programming the fields to a reserved value, see 'Reserved DBGBCR<n>\_EL1.{SSC, HMC, PMC} values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**HMC, bit [13]**

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, SSC, and PAC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**BAS, bits [12:5]**

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>\\_EL1](#) is being watched.

BAS	Description
xxxxxxx1	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1</a>
xxxxxx1x	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1</a> + 1
xxxxx1xx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1</a> + 2
xxxx1xxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1</a> + 3

In cases where [DBGWVR<n>\\_EL1](#) addresses a double-word:

BAS	Description, if <a href="#">DBGWVR&lt;n&gt;_EL1[2] == 0</a>
xxx1xxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1 + 4</a>
xx1xxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1 + 5</a>
x1xxxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1 + 6</a>
1xxxxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1 + 7</a>

If [DBGWVR<n>\\_EL1\[2\] == 1](#), only BAS[3:0] are used and BAS[7:4] are ignored. Arm deprecates setting [DBGWVR<n>\\_EL1\[2\] == 1](#).

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>\_EL1.BAS values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, SSC, and PAC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### E, bit [0]

Enable watchpoint n. Possible values are:

E	Meaning
0b0	Watchpoint disabled.
0b1	Watchpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## Accessing the DBGWCR<n>\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, DBGWCR<n>\_EL1

# DBGWVR<n>\_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>\_EL1 characteristics are:

## Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>\\_EL1](#).

## Configuration

AArch64 System register DBGWVR<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWVR<n>\[31:0\]](#).

AArch64 System register DBGWVR<n>\_EL1 bits [63:0] are architecturally mapped to External register [DBGWVR<n>\\_EL1\[63:0\]](#).

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

## Attributes

DBGWVR<n>\_EL1 is a 64-bit register.

## Field descriptions

The DBGWVR<n>\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RESS[14:4]											Bits[52:49]			VA[48:2]																		
VA[48:2]																															RES0	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

- It is CONSTRAINED UNPREDICTABLE whether the PE ignores this field when comparing an address.
- It is IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.

### VA[52:49], bits [52:49]

#### When FEAT\_LVA is implemented:

Extension to VA[48:2]. See VA[48:2] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Extension to RESS[14:4]. See RESS[14:4] for more details.

**VA[48:2], bits [48:2]**

Bits[48:2] of the address value for comparison.

When FEAT\_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, bits [52:49] are part of the RESS field.

Arm deprecates setting [DBGWVR<n>\\_EL1\[2\] == 1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [1:0]**

Reserved, RES0.

**Accessing the DBGWVR<n>\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, DBGWVR<n>\_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	n[3:0]	0b110

```

if PSTATE.EL == EL0 then

# DC CGDSW, Clean of Data and Allocation Tags by Set/Way

The DC CGDSW characteristics are:

## Purpose

Clean data and Allocation Tags in data cache by set/way.

## Configuration

This instruction is present only when FEAT\_MTE2 is implemented. Otherwise, direct accesses to DC CGDSW are UNDEFINED.

## Attributes

DC CGDSW is a 64-bit System instruction.

## Field descriptions

The DC CGDSW input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
SetWay																													Level		RES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$ ,  $L = \text{Log}_2(\text{LINELEN})$ ,  $B = (L + S)$ ,  $S = \text{Log}_2(\text{NSETS})$ .

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

### Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

### Bit [0]

Reserved, RES0.

## Executing the DC CGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC CGDSW, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1010	0b110

```

if PSTATE.EL == EL0 then

### Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

## Executing the DC CGDVAC instruction

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in 'Permission fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings:

DC CGDVAC, <Xt>

op0	op1	CRn	CRm	op2

Virtual address to use																															

### Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

## Executing the DC CGVAC instruction

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in 'Permission fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings:

DC CGVAC, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b1010	0b011

```

if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLRL_EL1.UCI == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && HCR_EL2.TPCP == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&

# DC CGVADP, Clean of Allocation Tags by VA to PoDP

The DC CGVADP characteristics are:

## Purpose

Clean Allocation tags by address to Point of Deep Persistence.

If the memory system does not identify a Point of Deep Persistence, then this instruction behaves as a [DC CGVAP](#).

## Configuration

This instruction is present only when FEAT\_DPB2 is implemented and FEAT\_MTE is implemented. Otherwise, direct accesses to DC CGVADP are UNDEFINED.

## Attributes

DC CGVADP is a 64-bit System instruction.

## Field descriptions

The DC CGVADP input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# DC CIGDSW, Clean and Invalidate of Data and Allocation Tags by Set/Way

The DC CIGDSW characteristics are:

## Purpose

Clean and Invalidate data and Allocation Tags in data cache by set/way.

## Configuration

This instruction is present only when FEAT\_MTE2 is implemented. Otherwise, direct accesses to DC CIGDSW are UNDEFINED.

## Attributes

DC CIGDSW is a 64-bit System instruction.

## Field descriptions

The DC CIGDSW input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
SetWay																													Level		RES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$ ,  $L = \text{Log}_2(\text{LINELEN})$ ,  $B = (L + S)$ ,  $S = \text{Log}_2(\text{NSETS})$ .

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

### Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

### Bit [0]

Reserved, RES0.

## Executing the DC CIGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC CIGDSW, <Xt>

# DC CISW, Data or unified Cache line Clean and Invalidate by Set/Way

The DC CISW characteristics are:

## Purpose

Clean and Invalidate data cache by set/way.

When FEAT\_MTE is implemented, this instruction might clean and invalidate Allocation Tags from caches.

## Configuration

AArch64 System instruction DC CISW performs the same function as AArch32 System instruction [DCCISW](#).

## Attributes

DC CISW is a 64-bit System instruction.

## Field descriptions

The DC CISW input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
																RES0																	
SetWay																														Level		RES0	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### Bits [63:32]

Reserved, RES0.

### SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$ ,  $L = \text{Log}_2(\text{LINELEN})$ ,  $B = (L + S)$ ,  $S = \text{Log}_2(\text{NSETS})$ .

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

### Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

### Bit [0]

Reserved, RES0.

## Executing the DC CISW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC CISW, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1110	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;

### Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

## Executing the DC CVAU instruction

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in 'Permission fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings:

DC CVAU, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b1011	0b001

```

if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLR_EL1.UCI == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && HCR_EL2.TPU == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && HCR_EL2.TOCU == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&

# DC GVA, Data Cache set Allocation Tag by VA

The DC GVA characteristics are:

## Purpose

Write a value to the Allocation Tags of a naturally aligned block of N bytes, where the size of N is identified in [DCZID\\_ELO](#). The Allocation Tag used is determined by the input address.

## Configuration

This instruction is present only when FEAT\_MTE2 is implemented. Otherwise, direct accesses to DC GVA are UNDEFINED.

## Attributes

DC GVA is a 64-bit System instruction.

## Field descriptions

The DC GVA input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

### Bits [63:0]

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

## Executing the DC GVA instruction

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR\_ELx.ISS field is not set.

If the memory region being modified is any type of Device memory, this instruction can give an alignment fault that is prioritized in the same way as other alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of stores to each Allocation Tag within the block being accessed, and so it:

- Generates a Permission Fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings:

DC GVA, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0100	0b011

# DC IGDSW, Invalidate of Data and Allocation Tags by Set/Way

The DC IGDSW characteristics are:

## Purpose

Invalidate data and Allocation Tags in data cache by set/way.

## Configuration

This instruction is present only when FEAT\_MTE2 is implemented. Otherwise, direct accesses to DC IGDSW are UNDEFINED.

## Attributes

DC IGDSW is a 64-bit System instruction.

## Field descriptions

The DC IGDSW input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
SetWay																												Level		RES0	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$ ,  $L = \text{Log}_2(\text{LINELEN})$ ,  $B = (L + S)$ ,  $S = \text{Log}_2(\text{NSETS})$ .

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

### Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

### Bit [0]

Reserved, RES0.

## Executing the DC IGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC IGDSW, <Xt>

# DC ISW, Data or unified Cache line Invalidate by Set/Way

The DC ISW characteristics are:

## Purpose

Invalidate data cache by set/way.

When FEAT\_MTE is implemented, this instruction might invalidate Allocation Tags from caches. When it invalidates Allocation Tags from caches, it also cleans them.

## Configuration

AArch64 System instruction DC ISW performs the same function as AArch32 System instruction [DCISW](#).

## Attributes

DC ISW is a 64-bit System instruction.

## Field descriptions

The DC ISW input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																SetWay												Level			RES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$ ,  $L = \text{Log}_2(\text{LINELEN})$ ,  $B = (L + S)$ ,  $S = \text{Log}_2(\text{NSETS})$ .

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

### Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

### Bit [0]

Reserved, RES0.

## Executing the DC ISW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings:

DC ISW, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0110	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TSW == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.DCISW == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.SWI0 == '1' then
        DC_CISW(X[t]);
    elsif EL2Enabled() && HCR_EL2.<DC,VM> != '00' then
        DC_CISW(X[t]);
    else
        DC_ISW(X[t]);
elsif PSTATE.EL == EL2 then
    DC_ISW(X[t]);
elsif PSTATE.EL == EL3 then
    DC_ISW(X[t]);

```

# DC IVAC, Data or unified Cache line Invalidate by VA to PoC

The DC IVAC characteristics are:

## Purpose

Invalidate data cache by address to Point of Coherency.

When FEAT\_MTE is implemented, this instruction might invalidate Allocation Tags from caches. When it invalidates Allocation Tags from caches, it also cleans them.

## Configuration

AArch64 System instruction DC IVAC performs the same function as AArch32 System instruction [DCIMVAC](#).

## Attributes

DC IVAC is a 64-bit System instruction.

## Field descriptions

The DC IVAC input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual address to use																															
Virtual address to use																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

## Executing the DC IVAC instruction

When the instruction is executed, it can generate a watchpoint, which is prioritized in the same way as other watchpoints. If a watchpoint is generated, the CM bit in the ESR\_ELx.ISS field is set to 1.

This instruction requires write access permission to the VA, otherwise it generates a Permission Fault, subject to the constraints described in 'Permission fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings:

DC IVAC, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0110	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TPCP == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.DCIVAC == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<DC,VM> != '00' then
        DC_CIVAC(X[t]);
    else
        DC_IVAC(X[t]);
elsif PSTATE.EL == EL2 then
    DC_IVAC(X[t]);
elsif PSTATE.EL == EL3 then
    DC_IVAC(X[t]);
```

# DC ZVA, Data Cache Zero by VA

The DC ZVA characteristics are:

## Purpose

Zero data cache by address. Zeroes a naturally aligned block of N bytes, where the size of N is identified in [DCZID\\_ELO](#).

## Configuration

There are no configuration notes.

## Attributes

DC ZVA is a 64-bit System instruction.

## Field descriptions

The DC ZVA input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual address to use																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

## Executing the DC ZVA instruction

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR\_ELx.ISS field is set to 0.

If the memory region being zeroed is any type of Device memory, this instruction can give an Alignment fault which is prioritized in the same way as other Alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of Stores to each byte within the block being accessed, and so it:

- Generates a Permission Fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings:

DC ZVA, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0100	0b001

```

if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLR_EL1.DZE == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && HCR_EL2.TDZ == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGITR_EL2.DCZVA == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> == '11' && SCTLR_EL2.DZE == '0' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            DC_ZVA(X[t]);
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TDZ == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.DCZVA == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            DC_ZVA(X[t]);
    elsif PSTATE.EL == EL2 then
        DC_ZVA(X[t]);
    elsif PSTATE.EL == EL3 then
        DC_ZVA(X[t]);

```

# DCZID\_EL0, Data Cache Zero ID register

The DCZID\_EL0 characteristics are:

## Purpose

Indicates the block size that is written with byte values of 0 by the [DC ZVA](#) (Data Cache Zero by Address) System instruction.

If FEAT\_MTE is implemented, this register also indicates the granularity at which the [DC GVA](#) and [DC GZVA](#) instructions write.

## Configuration

There are no configuration notes.

## Attributes

DCZID\_EL0 is a 64-bit register.

## Field descriptions

The DCZID\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																		RES0								DZP		BS			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:5]

Reserved, RES0.

### DZP, bit [4]

Data Zero Prohibited. This field indicates whether use of [DC ZVA](#) instructions is permitted or prohibited.

If FEAT\_MTE is implemented, this field also indicates whether use of the [DC GVA](#) and [DC GZVA](#) instructions are permitted or prohibited.

DZP	Meaning
0b0	Instructions are permitted.
0b1	Instructions are prohibited.

The value read from this field is governed by the access state and the values of the [HCR\\_EL2](#).TDZ and [SCTLR\\_EL1](#).DZE bits.

### BS, bits [3:0]

Log<sub>2</sub> of the block size in words. The maximum size supported is 2KB (value == 9).

## Accessing the DCZID\_EL0

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, DCZID\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b0000	0b0000	0b111

```

if PSTATE.EL == EL0 then
    if EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGTR_EL2.DCZID_EL0 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return DCZID_EL0;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.DCZID_EL0 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return DCZID_EL0;
elsif PSTATE.EL == EL2 then
    return DCZID_EL0;
elsif PSTATE.EL == EL3 then
    return DCZID_EL0;

```

# DISR\_EL1, Deferred Interrupt Status Register

The DISR\_EL1 characteristics are:

## Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

## Configuration

AArch64 System register DISR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DISR\[31:0\]](#).

This register is present only when FEAT\_RAS is implemented. Otherwise, direct accesses to DISR\_EL1 are UNDEFINED.

## Attributes

DISR\_EL1 is a 64-bit register.

## Field descriptions

The DISR\_EL1 bit assignments are:

### When DISR\_EL1.IDS == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
A	RES0						IDS	RES0										AET		EA	RES0			DFSC							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [30:25]

Reserved, RES0.

### IDS, bit [24]

Indicates the deferred SError interrupt type.

IDS	Meaning
0b0	Deferred error uses architecturally-defined format.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:13]

Reserved, RES0.

AET, bits [12:10]

Asynchronous Error Type. See the description of ESR\_ELx.AET for an SError interrupt.  
On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort Type. See the description of ESR\_ELx.EA for an SError interrupt.  
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

Fault Status Code. See the description of ESR\_ELx.DFSC for an SError interrupt.  
On a Warm reset, this field resets to an architecturally UNKNOWN value.

When DISR\_EL1.IDS == 1:

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.  
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

Indicates the deferred SError interrupt type.

IDS	Meaning
0b1	Deferred error uses IMPLEMENTATION DEFINED format.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

IMPLEMENTATION DEFINED syndrome. See the description of ESR\_ELx[23:0] for an SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the DISR\_EL1

An indirect write to DISR\_EL1 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR\_EL1 occurring in program order after the ESB instruction.

DISR\_EL1 is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, [SCR\\_EL3.EA](#) == 1, and any of the following apply:

- At EL2.
- At EL1 and (([SCR\\_EL3.NS](#) == 0 && [SCR\\_EL3.EEL2](#) == 0) || [HCR\\_EL2.AMO](#) == 0).

Accesses to this register use the following encodings:

MRS <Xt>, DISR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0001	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.AMO == '1' then
        return VDISR_EL2;
    else
        return DISR_EL1;
elsif PSTATE.EL == EL2 then
    return DISR_EL1;
elsif PSTATE.EL == EL3 then
    return DISR_EL1;
```

MSR DISR\_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0001	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.AMO == '1' then
        VDISR_EL2 = X[t];
    else
        DISR_EL1 = X[t];
elsif PSTATE.EL == EL2 then
    DISR_EL1 = X[t];
elsif PSTATE.EL == EL3 then
    DISR_EL1 = X[t];
```

# DIT, Data Independent Timing

The DIT characteristics are:

## Purpose

Allows access to the Data Independent Timing bit.

## Configuration

This register is present only when FEAT\_DIT is implemented. Otherwise, direct accesses to DIT are UNDEFINED.

## Attributes

DIT is a 64-bit register.

## Field descriptions

The DIT bit assignments are:

### Bits [63:25]

Reserved, RES0.

### DIT, bit [24]

Data Independent Timing.

DIT	Meaning
0b0	The architecture makes no statement about the timing properties of any instructions.
0b1	The architecture requires that: <ul style="list-style-type: none"><li>The timing of every load and store instruction is insensitive to the value of the data being loaded or stored.</li><li>For certain data processing instructions, the instruction takes a time which is independent of:<ul style="list-style-type: none"><li>The values of the data supplied in any of its registers.</li><li>The values of the NZCV flags.</li></ul></li><li>For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on:<ul style="list-style-type: none"><li>The values of the data supplied in any of its registers.</li><li>The values of the NZCV flags.</li></ul></li></ul>

The data processing instructions affected by this bit are:

- All cryptographic instructions. These instructions are:
  - AESD, AESE, AESIMC, AESMC, SHA1C, SHA1H, SHA1M, SHA1P, SHA1SU0, SHA1SU1, SHA256H, SHA256H2, SHA256SU0, SHA256SU1, SHA512H, SHA512H2, SHA512SU0, SHA512SU1, EOR3, RAX1, XAR, BCAX, SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, SM3PARTW2, SM4E, and SM4EKEY.

- A subset of those instructions which use the general-purpose register file. These instructions are:
  - ADC, ADCS, ADD, ADDS, AND, ANDS, ASR, ASRV, BFC, BFI, BFM, BFXIL, BIC, BICS, CCMN, CCMP, CFINV, CINC, CINV, CLS, CLZ, CMN, CMP, CNEG, CSEL, CSET, CSETM, CSINC, CSINV, CSNEG, EON, EOR, EXTR, LSL, LSLV, LSR, LSRV, MADD, MNEG, MOV, MOVK, MOVN, MOVZ, MSUB, MUL, MVN, NEG, NEGS, NGC, NGCS, NOP, ORN, ORR, RBIT, RET, REV, REV16, REV32, REV64, RMIF, ROR, RORV, SBC, SBCS, SBFIZ, SBFM, SBFX, SETF8, SETF16, SMADDL, SMNEGL, SMSUBL, SMULH, SMULL, SUB, SUBS, SXTB, SXTH, SXTW, TST, UBFIZ, UBFM, UBFX, UMADDL, UMNEGL, UMSUBL, UMULH, UMULL, UXTB, and UXTH.
- A subset of those instructions which use the SIMD&FP register file. These instructions are:
  - ABS, ADD, ADDHN, ADDHN2, ADDP, ADDV, AND, BIC, BIF, BIT, BSL, CLS, CLZ, CMEQ, CMGE, CMGT, CMHI, CMHS, CMLE, CMLT, CMTST, CNT, CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, CRC32CX, DUP, EOR, EXT, FCSEL, INS, MLA, MLS, MOV, MOVI, MUL, MVN, MVNI, NEG, NOT, ORN, ORR, PMUL, PMULL, PMULL2, RADDHN, RADDHN2, RBIT, REV16, REV32, RSHRN, RSHRN2, RSUBHN, RSUBHN2, SABA, SABD, SABAL, SABAL2, SABDL, SABDL2, SADALP, SADDL, SADDL2, SADDLP, SADDLV, SADDW, SADDW2, SHADD, SHL, SHLL, SHLL2, SHRN, SHRN2, SHSUB, SLI, SMAX, SMAXP, SMAXV, SMIN, SMINP, SMINV, SMLAL, SMLAL2, SMLSL, SMLSL2, SMOV, SMULL, SMULL2, SRI, SSSL, SSSL2, SSSL2, SSHR, SSRA, SSUBL, SSUBL2, SSUBW, SSUBW2, SUB, SUBHN, SUBHN2, SXTL, SXTL2, TBL, TBX, TRN1, TRN2, UABA, UABAL, UABAL2, UABD, UABDL, UABDL2, UADALP, UADDL, UADDL2, UADDLP, UADDLV, UADDW, UADDW2, UHADD, UHSUB, UMAX, UMAXP, UMAXV, UMIN, UMINP, UMINV, UMLAL, UMLAL2, UMLSL, UMOV, UMLSL2, UMULL, UMULL2, USHL, USHL2, USHL2, USHR, USRA, USUBL, USUBL2, USUBW, USUBW2, UXTL, UXTL2, UZP1, UZP2, XTN, XTN2, ZIP1, and ZIP2.

### Note

The architecture makes no statement about the timing properties when the PSTATE.DIT bit is not set. However, it is likely that many of these instructions have timing that is invariant of the data in many situations.

In particular, Arm strongly recommends that the Armv8.3 pointer authentication instructions do not have their timing dependent on the key value used in the pointer authentication in all cases, regardless of the PSTATE.DIT bit.

On a Warm reset, this field resets to 0.

### Bits [23:0]

Reserved, RES0.

## Accessing the DIT

Accesses to this register use the following encodings:

MRS <Xt>, DIT

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b101

```

if PSTATE.EL == EL0 then
    return Zeros(39):PSTATE.DIT:Zeros(24);
elsif PSTATE.EL == EL1 then
    return Zeros(39):PSTATE.DIT:Zeros(24);
elsif PSTATE.EL == EL2 then
    return Zeros(39):PSTATE.DIT:Zeros(24);
elsif PSTATE.EL == EL3 then
    return Zeros(39):PSTATE.DIT:Zeros(24);

```

MSR DIT, <Xt>

# DLR\_EL0, Debug Link Register

The DLR\_EL0 characteristics are:

## Purpose

In Debug state, holds the address to restart from.

## Configuration

AArch64 System register DLR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DLR\[31:0\]](#).

## Attributes

DLR\_EL0 is a 64-bit register.

## Field descriptions

The DLR\_EL0 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# DSPSR\_EL0, Debug Saved Program Status Register

The DSPSR\_EL0 characteristics are:

## Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

## Configuration

AArch64 System register DSPSR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DSPSR\[31:0\]](#).

## Attributes

DSPSR\_EL0 is a 64-bit register.

## Field descriptions

The DSPSR\_EL0 bit assignments are:

**When AArch32 is supported at any Exception level and exiting Debug state to AArch32 state:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]	DIT	SSBS	PAN	SS	IL	GE	IT[7:2]	E	A	I	F	T	M[4]	M[3:0]												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### N, bit [31]

Negative Condition flag. Copied to PSTATE.N on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Copied to PSTATE.Z on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry Condition flag. Copied to PSTATE.C on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### V, bit [28]

Overflow Condition flag. Copied to PSTATE.V on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **Q, bit [27]**

Overflow or saturation flag. Copied to PSTATE.Q on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **IT[1:0], bits [26:25]**

If-Then. Copied to PSTATE.IT[1:0] on exiting Debug state.

On exiting Debug state DSPSR\_EL0.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **DIT, bit [24]**

**When FEAT\_DIT is implemented:**

Data Independent Timing. Copied to PSTATE.DIT on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### **SSBS, bit [23]**

**When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Copied to PSTATE.SSBS on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### **PAN, bit [22]**

**When FEAT\_PAN is implemented:**

Privileged Access Never. Copied to PSTATE.PAN on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### **SS, bit [21]**

Software Step. Copied to PSTATE.SS on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IL, bit [20]**

Illegal Execution state. Copied to PSTATE.IL on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Copied to PSTATE.GE on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Copied to PSTATE.IT[7:2] on exiting Debug state.

DSPSR\_EL0.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR\_EL0.E is RES0. If the implementation does not support little-endian operation, DSPSR\_EL0.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR\_EL0.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR\_EL0.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

SError interrupt mask. Copied to PSTATE.A on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Copied to PSTATE.I on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Copied to PSTATE.F on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T, bit [5]**

T32 Instruction set state. Copied to PSTATE.T on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[4], bit [4]**

Execution state. Copied to PSTATE.nRW on exiting Debug state.

<b>M[4]</b>	<b>Meaning</b>
0b1	AArch32 execution state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### M[3:0], bits [3:0]

AArch32 Mode. Copied to PSTATE.M[3:0] on exiting Debug state.

M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0110	Monitor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If DPSR\_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## When AArch64 is supported at any Exception level and entering or exiting Debug state from or to AArch64 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	RES0	TCO	DIT	UAO	PAN	SS	IL	RES0								SSBS	BTYPE	D	A	I	F	RES0	M[4]	M[3:0]				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [27:26]**

Reserved, RES0.

**TCO, bit [25]****When FEAT\_MTE is implemented:**

Tag Check Override. Set to the value of PSTATE.TCO on entering Debug state, and copied to PSTATE.TCO on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [24]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**UAO, bit [23]****When FEAT\_UAO is implemented:**

User Access Override. Set to the value of PSTATE.UAO on entering Debug state, and copied to PSTATE.UAO on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SS, bit [21]**

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **Bits [19:13]**

Reserved, RES0.

### **SSBS, bit [12]**

#### **When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **Otherwise:**

Reserved, RES0.

### **BTYPE, bits [11:10]**

#### **When FEAT\_BTI is implemented:**

Branch Type Indicator. Set to the value of PSTATE.BTYPE on entering Debug state, and copied to PSTATE.BTYPE on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **Otherwise:**

Reserved, RES0.

### **D, bit [9]**

Debug exception mask. Set to the value of PSTATE.D on entering Debug state, and copied to PSTATE.D on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [5]**

Reserved, RES0.

**M[4], bit [4]**

Execution state. Set to 0b0, the value of PSTATE.nRW, on entering Debug state from AArch64 state, and copied to PSTATE.nRW on exiting Debug state.

M[4]	Meaning
0b0	AArch64 execution state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[3:0], bits [3:0]**

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.
0b1000	EL2t.
0b1001	EL2h.
0b1100	EL3t.
0b1101	EL3h.

Other values are reserved. If DPSR\_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on entering Debug state and copied to PSTATE.EL on exiting Debug state.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on entering Debug state and copied to PSTATE.SP on exiting Debug state

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DPSR\_EL0**

Accesses to this register use the following encodings:

MRS <Xt>, DPSR\_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    return DPSR_EL0;
```

MSR DSPSR\_EL0, &lt;Xt&gt;

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    DSPSR_EL0 = X[t];
```

# DVP RCTX, Data Value Prediction Restriction by Context

The DVP RCTX characteristics are:

## Purpose

Data Value Prediction Restriction by Context applies to all Data Value Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

When this instruction is complete and synchronized, data value prediction does not permit later speculative execution within the target execution context to be observable through side channels.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

### Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

## Configuration

This instruction is present only when FEAT\_SPECRES is implemented. Otherwise, direct accesses to DVP RCTX are UNDEFINED.

## Attributes

DVP RCTX is a 64-bit System instruction.

## Field descriptions

The DVP RCTX input value bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0															GVMID	VMID															
RES0					NS	EL		RES0							GASID	ASID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:49]

Reserved, RES0.

### GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

#### VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR\\_EL2.E2H==0](#) or [HCR\\_EL2.TGE==0](#)).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR\\_EL2.E2H==0](#) or [HCR\\_EL2.TGE==0](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR\\_EL2.E2H==1](#) and [HCR\\_EL2.TGE==1](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

#### Bits [31:27]

Reserved, RES0.

#### NS, bit [26]

Security State. Defined values are:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

#### EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

#### Bits [23:17]

Reserved, RES0.

#### GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

<b>GASID</b>	<b>Meaning</b>
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASID for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

### ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

## Executing the DVP RCTX instruction

Accesses to this instruction use the following encodings:

DVP RCTX, <Xt>

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b01	0b011	0b0111	0b0011	0b101

```

        else
            DVP_RCTX(X[t]);
    elsif PSTATE.EL == EL2 then
        DVP_RCTX(X[t]);
    elsif PSTATE.EL == EL3 then
        DVP_RCTX(X[t]);

```

# ELR\_EL1, Exception Link Register (EL1)

The ELR\_EL1 characteristics are:

## Purpose

When taking an exception to EL1, holds the address to return to.

## Configuration

There are no configuration notes.

## Attributes

ELR\_EL1 is a 64-bit register.

## Field descriptions

The ELR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																Return address															
																Return address															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Return address.

An exception return from EL1 using AArch64 makes ELR\_EL1 become UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ELR\_EL1

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic ELR\_EL1 or ELR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, ELR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0000	0b001

# ELR\_EL2, Exception Link Register (EL2)

The ELR\_EL2 characteristics are:

## Purpose

When taking an exception to EL2, holds the address to return to.

## Configuration

AArch64 System register ELR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ELR\\_hyp\[31:0\]](#).

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ELR\_EL2 is a 64-bit register.

## Field descriptions

The ELR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Return address																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Return address																															

### Bits [63:0]

Return address.

An exception return from EL2 using AArch64 makes ELR\_EL2 become UNKNOWN.

When EL2 is in AArch32 Execution state and an exception is taken from EL0, EL1, or EL2 to EL3 and AArch64 execution, the upper 32-bits of ELR\_EL2 are either set to 0 or hold the same value that they did before AArch32 execution. Which option is adopted is determined by an implementation, and might vary dynamically within an implementation. Correspondingly software must regard the value as being an UNKNOWN choice between the two values.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ELR\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic ELR\_EL2 or ELR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, ELR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0000	0b001

```

# ERRIDR\_EL1, Error Record ID Register

The ERRIDR\_EL1 characteristics are:

## Purpose

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

## Configuration

AArch64 System register ERRIDR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERRIDR\[31:0\]](#).

This register is present only when FEAT\_RAS is implemented. Otherwise, direct accesses to ERRIDR\_EL1 are UNDEFINED.

## Attributes

ERRIDR\_EL1 is a 64-bit register.

## Field descriptions

The ERRIDR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																NUM															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:16]

Reserved, RES0.

### NUM, bits [15:0]

Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates no records can be accessed through the Error Record System registers.

Each implemented record is owned by a node. A node might own multiple records.

## Accessing the ERRIDR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ERRIDR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0011	0b000

```

if PSTATE.EL == EL0 then

# ERRSELR\_EL1, Error Record Select Register

The ERRSELR\_EL1 characteristics are:

## Purpose

Selects an error record to be accessed through the Error Record System registers.

## Configuration

AArch64 System register ERRSELR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERRSELR\[31:0\]](#).

This register is present only when FEAT\_RAS is implemented. Otherwise, direct accesses to ERRSELR\_EL1 are UNDEFINED.

If [ERRIDR\\_EL1](#) indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR\_EL1 is UNDEFINED or RES0.

## Attributes

ERRSELR\_EL1 is a 64-bit register.

## Field descriptions

The ERRSELR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																SEL															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:16]

Reserved, RES0.

### SEL, bits [15:0]

Selects the error record accessed through the ERX registers.

For example, if ERRSELR\_EL1.SEL is set to 0x0004, then direct reads and writes of [ERXSTATUS\\_EL1](#) access ERR4STATUS.

If ERRSELR\_EL1.SEL is set to a value greater than or equal to [ERRIDR\\_EL1](#).NUM, then all of the following apply:

- The value read back from ERRSELR\_EL1.SEL is UNKNOWN.
- One of the following occurs:
  - An UNKNOWN error record is selected.
  - The ERX\*\_EL1 registers are RAZ/WI.
  - ERX\*\_EL1 register reads and writes are NOPs.
  - ERX\*\_EL1 register reads and writes are UNDEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ERRSELR\_EL1

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, ERRSELR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0011	0b001

# ERXADDR\_EL1, Selected Error Record Address Register

The ERXADDR\_EL1 characteristics are:

## Purpose

Accesses [ERR<n>ADDR](#) for the error record <n> selected by [ERRSELR\\_EL1](#).SEL.

## Configuration

AArch64 System register ERXADDR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERXADDR\[31:0\]](#).

AArch64 System register ERXADDR\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [ERXADDR2\[31:0\]](#).

This register is present only when FEAT\_RAS is implemented. Otherwise, direct accesses to ERXADDR\_EL1 are UNDEFINED.

## Attributes

ERXADDR\_EL1 is a 64-bit register.

## Field descriptions

The ERXADDR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">ERR&lt;n&gt;ADDR</a>																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">ERR&lt;n&gt;ADDR</a>																															

### Bits [63:0]

ERXADDR\_EL1 accesses [ERR<n>ADDR](#), where <n> is the value in [ERRSELR\\_EL1](#).SEL.

## Accessing the ERXADDR\_EL1

If [ERRIDR\\_EL1](#).NUM == 0x0000 or [ERRSELR\\_EL1](#).SEL is set to a value greater than or equal to [ERRIDR\\_EL1](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR\_EL1 is RAZ/WI.
- Direct reads and writes of ERXADDR\_EL1 are NOPs.
- Direct reads and writes of ERXADDR\_EL1 are UNDEFINED.

[ERR<n>ADDR](#) describes additional constraints that also apply when [ERR<n>ADDR](#) is accessed through ERXADDR\_EL1.

Accesses to this register use the following encodings:

MRS <Xt>, ERXADDR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0100	0b011

# ERXCTLR\_EL1, Selected Error Record Control Register

The ERXCTLR\_EL1 characteristics are:

## Purpose

Accesses [ERR<n>CTLR](#) for the error record <n> selected by [ERRSELR\\_EL1](#).SEL.

## Configuration

AArch64 System register ERXCTLR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERXCTLR\[31:0\]](#).

AArch64 System register ERXCTLR\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [ERXCTLR2\[31:0\]](#).

This register is present only when FEAT\_RAS is implemented. Otherwise, direct accesses to ERXCTLR\_EL1 are UNDEFINED.

## Attributes

ERXCTLR\_EL1 is a 64-bit register.

## Field descriptions

The ERXCTLR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">ERR&lt;n&gt;CTLR</a>																															
<a href="#">ERR&lt;n&gt;CTLR</a>																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

ERXCTLR\_EL1 accesses [ERR<n>CTLR](#), where <n> is the value in [ERRSELR\\_EL1](#).SEL.

## Accessing the ERXCTLR\_EL1

If [ERRIDR\\_EL1](#).NUM == 0x0000 or [ERRSELR\\_EL1](#).SEL is set to a value greater than or equal to [ERRIDR\\_EL1](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTLR\_EL1 is RAZ/WI.
- Direct reads and writes of ERXCTLR\_EL1 are NOPs.
- Direct reads and writes of ERXCTLR\_EL1 are UNDEFINED.

If [ERRSELR\\_EL1](#).SEL is not the index of the first error record owned by a node, then [ERR<n>CTLR](#) is not present, meaning reads and writes of ERXCTLR\_EL1 are RES0.

Accesses to this register use the following encodings:

MRS <Xt>, ERXCTLR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0100	0b001

# ERXMISC2\_EL1, Selected Error Record Miscellaneous Register 2

The ERXMISC2\_EL1 characteristics are:

## Purpose

Accesses [ERR<n>MISC2](#) for the error record <n> selected by [ERRSELR\\_EL1](#).SEL.

## Configuration

AArch64 System register ERXMISC2\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERXMISC4\[31:0\]](#).

AArch64 System register ERXMISC2\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [ERXMISC5\[31:0\]](#).

This register is present only when FEAT\_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC2\_EL1 are UNDEFINED.

## Attributes

ERXMISC2\_EL1 is a 64-bit register.

## Field descriptions

The ERXMISC2\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">ERR&lt;n&gt;MISC2</a>																															
<a href="#">ERR&lt;n&gt;MISC2</a>																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

ERXMISC2\_EL1 accesses [ERR<n>MISC2](#), where <n> is the value in [ERRSELR\\_EL1](#).SEL.

## Accessing the ERXMISC2\_EL1

If [ERRIDR\\_EL1](#).NUM == 0x0000 or [ERRSELR\\_EL1](#).SEL is set to a value greater than or equal to [ERRIDR\\_EL1](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC2\_EL1 is RAZ/WI.
- Direct reads and writes of ERXMISC2\_EL1 are NOPs.
- Direct reads and writes of ERXMISC2\_EL1 are UNDEFINED.

[ERR<n>MISC2](#) describes additional constraints that also apply when [ERR<n>MISC2](#) is accessed through ERXMISC2\_EL1.

Accesses to this register use the following encodings:

MRS <Xt>, ERXMISC2\_EL1

# ERXPFGCDN\_EL1, Selected Pseudo-fault Generation Countdown register

The ERXPFGCDN\_EL1 characteristics are:

## Purpose

Accesses [ERR<n>PFGCDN](#) for the error record <n> selected by [ERRSELR\\_EL1](#).SEL.

## Configuration

This register is present only when FEAT\_RASv1p1 is implemented. Otherwise, direct accesses to ERXPFGCDN\_EL1 are UNDEFINED.

## Attributes

ERXPFGCDN\_EL1 is a 64-bit register.

## Field descriptions

The ERXPFGCDN\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">ERR&lt;n&gt;PFGCDN</a>																															
<a href="#">ERR&lt;n&gt;PFGCDN</a>																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

ERXPFGCDN\_EL1 accesses [ERR<n>PFGCDN](#), where <n> is the value in [ERRSELR\\_EL1](#).SEL.

## Accessing the ERXPFGCDN\_EL1

If [ERRIDR\\_EL1](#).NUM == 0x0000 or [ERRSELR\\_EL1](#).SEL is set to a value greater than or equal to [ERRIDR\\_EL1](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXPFGCDN\_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCDN\_EL1 are NOPs.
- Direct reads and writes of ERXPFGCDN\_EL1 are UNDEFINED.

If [ERRSELR\\_EL1](#).SEL selects an error record owned by a node that does not implement the RAS Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGCDN\_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCDN\_EL1 are NOPs.
- Direct reads and writes of ERXPFGCDN\_EL1 are UNDEFINED.

### Note

A node does not implement the RAS Common Fault Injection Model Extension when [ERR<q>FR.INJ](#) == 0b00. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in [ERRSELR\\_EL1](#).SEL. If the node owns a single record, then q = n.

If [ERRSELR\\_EL1](#).SEL is not the index of the first error record owned by a node, then [ERR<n>PFGCDN](#) is not present, meaning reads and writes of ERXPFGCDN\_EL1 are RES0.

[ERR<n>PFGCDN](#) describes additional constraints that also apply when [ERR<n>PFGCDN](#) is accessed through ERXPFPGCDN\_EL1.

Accesses to this register use the following encodings:

MRS <Xt>, ERXPFPGCDN\_EL1

## Field descriptions

The ERXPFGCTL\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">ERR&lt;n&gt;PFGCTL</a>																															
<a href="#">ERR&lt;n&gt;PFGCTL</a>																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

ERXPFGCTL\_EL1 accesses [ERR<n>PFGCTL](#), where <n> is the value in [ERRSELR\\_EL1](#).SEL.

## Accessing the ERXPFGCTL\_EL1

If [ERRIDR\\_EL1](#).NUM == 0x0000 or [ERRSELR\\_EL1](#).SEL is set to a value greater than or equal to [ERRIDR\\_EL1](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXPFGCTL\_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCTL\_EL1 are NOPs.
- Direct reads and writes of ERXPFGCTL\_EL1 are UNDEFINED.

If [ERRSELR\\_EL1](#).SEL selects an error record owned by a node that does not implement the RAS Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGCTL\_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCTL\_EL1 are NOPs.
- Direct reads and writes of ERXPFGCTL\_EL1 are UNDEFINED.

---

### Note

A node does not implement the RAS Common Fault Injection Model Extension when [ERR<q>FR.INJ](#) == 0b00. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in [ERRSELR\\_EL1](#).SEL. If the node owns a single record, then q = n.

---

If [ERRSELR\\_EL1](#).SEL is not the index of the first error record owned by a node, then [ERR<n>PFGCTL](#) is not present, meaning reads and writes of ERXPFGCTL\_EL1 are RES0.

[ERR<n>PFGCTL](#) describes additional constraints that also apply when [ERR<n>PFGCTL](#) is accessed through ERXPFPGCTL\_EL1.

Accesses to this register use the following encodings:

MRS <Xt>, ERXPFPGCTL\_EL1

# ERXPFGF\_EL1, Selected Pseudo-fault Generation Feature register

The ERXPFGF\_EL1 characteristics are:

## Purpose

Accesses [ERR<n>PFGF](#) for the error record <n> selected by [ERRSELR\\_EL1](#).SEL.

## Configuration

This register is present only when FEAT\_RASv1p1 is implemented. Otherwise, direct accesses to ERXPFGF\_EL1 are UNDEFINED.

## Attributes

ERXPFGF\_EL1 is a 64-bit register.

## Field descriptions

The ERXPFGF\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">ERR&lt;n&gt;PFGF</a>																															
<a href="#">ERR&lt;n&gt;PFGF</a>																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

ERXPFGF\_EL1 accesses [ERR<n>PFGF](#), where <n> is the value in [ERRSELR\\_EL1](#).SEL.

## Accessing the ERXPFGF\_EL1

If [ERRIDR\\_EL1](#).NUM == 0x0000 or [ERRSELR\\_EL1](#).SEL is set to a value greater than or equal to [ERRIDR\\_EL1](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXPFGF\_EL1 is RAZ.
- Direct reads of ERXPFGF\_EL1 are NOPs.
- Direct reads of ERXPFGF\_EL1 are UNDEFINED.

If [ERRSELR\\_EL1](#).SEL selects an error record owned by a node that does not implement the RAS Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGF\_EL1 is RAZ.
- Direct reads of ERXPFGF\_EL1 are NOPs.
- Direct reads of ERXPFGF\_EL1 are UNDEFINED.

---

### Note

A node does not implement the RAS Common Fault Injection Model Extension when [ERR<q>FR](#).INJ == 0b00. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in [ERRSELR\\_EL1](#).SEL. If the node owns a single record, then q = n.

---

If [ERRSELR\\_EL1](#).SEL is not the index of the first error record owned by a node, then [ERR<n>PFGF](#) is not present, meaning reads of ERXPFGF\_EL1 are RES0.

[ERR<n>PFGF](#) describes additional constraints that also apply when [ERR<n>PFGF](#) is accessed through ERXPFPGF\_EL1.

Accesses to this register use the following encodings:

MRS <Xt>, ERXPFPGF\_EL1

# ESR\_EL1, Exception Syndrome Register (EL1)

The ESR\_EL1 characteristics are:

## Purpose

Holds syndrome information for an exception taken to EL1.

## Configuration

AArch64 System register ESR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DFSR\[31:0\]](#).

## Attributes

ESR\_EL1 is a 64-bit register.

## Field descriptions

The ESR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32			
RES0																									ISS2									
EC					IL		ISS																											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			

ESR\_EL1 is made UNKNOWN as a result of an exception return from EL1.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL1, the value of ESR\_EL1 is UNKNOWN. The value written to ESR\_EL1 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

### Bits [63:37]

Reserved, RES0.

### ISS2, bits [36:32]

**When FEAT\_LS64 is implemented:**

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

**Otherwise:**

Reserved, RES0.

### EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	<a href="#">ISS encoding for exceptions with an unknown reason</a>	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	<a href="#">ISS encoding for an exception from a WF* instruction</a>	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an MCR or MRC access</a>	When AArch32 is supported at any Exception level
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an MCRR or MRRC access</a>	When AArch32 is supported at any Exception level
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	<a href="#">ISS encoding for an exception from an MCR or MRC access</a>	When AArch32 is supported at any Exception level
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: <ul style="list-style-type: none"> <li>An STC to write data to memory from <a href="#">DBGDTRRXint.</a></li> <li>An LDC to read data from memory to <a href="#">DBGDTRTXint.</a></li> </ul>	<a href="#">ISS encoding for an exception from an LDC or STC instruction</a>	When AArch32 is supported at any Exception level
0b000111	Access to SVE, Advanced SIMD or floating-point functionality trapped by <a href="#">CPACR_EL1.FPEN</a> , <a href="#">CPTR_EL2.FPEN</a> , <a href="#">CPTR_EL2.TFP</a> , or <a href="#">CPTR_EL3.TFP</a> control. Excludes exceptions resulting from <a href="#">CPACR_EL1</a> when the value of <a href="#">HCR_EL2.TGE</a> is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'The EC used to report an exception routed to EL2 because <a href="#">HCR_EL2.TGE</a> is 1'.	<a href="#">ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality resulting from the FPEN and TFP traps</a>	
0b001010	Trapped execution of an LD64B, ST64B,	<a href="#">ISS encoding for an exception</a>	When FEAT_LS64

	ST64BV, or ST64BV0 instruction.	<a href="#">from an LD64B or ST64B* instruction</a>	is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	<a href="#">ISS encoding for an exception from an MCRR or MRRC access</a>	When AArch32 is supported at any Exception level
0b001101	Branch Target Exception.	<a href="#">ISS encoding for an exception from Branch Target Identification instruction</a>	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>	
0b010001	SVC instruction execution in AArch32 state. This is reported in ESR_EL2 only when the exception is generated because the value of <a href="#">HCR_EL2.TGE</a> is 1.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch32 is supported at any Exception level
0b010101	SVC instruction execution in AArch64 state.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch64 is supported at any Exception level
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001, or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.	<a href="#">ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state</a>	When AArch64 is supported at any Exception level
0b011001	Access to SVE functionality trapped as a result of <a href="#">CPACR_EL1.ZEN</a> , <a href="#">CPTR_EL2.ZEN</a> , <a href="#">CPTR_EL2.TZ</a> , or <a href="#">CPTR_EL3.EZ</a> , that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an access to SVE functionality resulting from CPACR_EL1.ZEN, CPTER_EL2.ZEN, CPTER_EL2.TZ, or CPTER_EL3.EZ</a>	When FEAT_SVE is implemented
0b011100	Exception from a Pointer Authentication instruction authentication failure	<a href="#">ISS encoding for an exception from a Pointer Authentication</a>	When FEAT_FPAC is implemented

0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	<a href="#">instruction authentication failure</a> <a href="#">ISS encoding for an exception from an Instruction Abort</a>
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	<a href="#">ISS encoding for an exception from an Instruction Abort</a>
0b100010	PC alignment fault exception.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>
0b100100	Data Abort from a lower Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	<a href="#">ISS encoding for an exception from a Data Abort</a>
0b100101	Data Abort taken without a change in Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	<a href="#">ISS encoding for an exception from a Data Abort</a>
0b100110	SP alignment fault exception.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>

0b101000	Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	<a href="#">ISS encoding for an exception from a trapped floating-point exception</a>	When AArch32 is supported at any Exception level
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	<a href="#">ISS encoding for an exception from a trapped floating-point exception</a>	When AArch64 is supported at any Exception level
0b101111	SError interrupt.	<a href="#">ISS encoding for an SError interrupt</a>	
0b110000	Breakpoint exception from a lower Exception level.	<a href="#">ISS encoding for an exception from a Breakpoint or Vector Catch debug exception</a>	
0b110001	Breakpoint exception taken without a change in Exception level.	<a href="#">ISS encoding for an exception from a Breakpoint or Vector Catch debug exception</a>	
0b110010	Software Step exception from a lower Exception level.	<a href="#">ISS encoding for an exception from a Software Step exception</a>	
0b110011	Software Step exception taken without a change in Exception level.	<a href="#">ISS encoding for an exception from a Software Step exception</a>	
0b110100	Watchpoint exception from a lower Exception level.	<a href="#">ISS encoding for an exception from a Watchpoint exception</a>	
0b110101	Watchpoint exception taken without a change in Exception level.	<a href="#">ISS encoding for an exception from a Watchpoint exception</a>	
0b111000	BKPT instruction execution in AArch32 state.	<a href="#">ISS encoding for an exception from execution of a Breakpoint instruction</a>	When AArch32 is supported at any

0b111100	BRK instruction execution in AArch64 state. This is reported in <a href="#">ESR_EL3</a> only if a BRK instruction is executed.	<a href="#">ISS encoding for an exception from execution of a Breakpoint instruction</a>	Exception level When AArch64 is supported at any Exception level
----------	--	--	---

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: <ul style="list-style-type: none"> <li>• An SError interrupt.</li> <li>• An Instruction Abort exception.</li> <li>• A PC alignment fault exception.</li> <li>• An SP alignment fault exception.</li> <li>• A Data Abort exception for which the value of the ISV bit is 0.</li> <li>• An Illegal Execution state exception.</li> <li>• Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning: <ul style="list-style-type: none"> <li>◦ 0b0: 16-bit T32 BKPT instruction.</li> <li>◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction.</li> </ul> </li> <li>• An exception reported using EC value 0b000000.</li> </ul>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value 0b11111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

## ISS encoding for exceptions with an unknown reason

### Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR\\_EL1](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by [HCR\\_EL2](#).HCD or [SCR\\_EL3](#).HCE.
  - An SMC instruction when disabled by [SCR\\_EL3](#).SMD.
  - An HLT instruction when disabled by [EDSCR](#).HDE.
- Attempted execution of an MSR or MRS instruction to access [SP\\_EL0](#) when the value of [SPSel](#).SP is 0.
- Attempted execution of an MSR or MRS instruction using a [\\_EL12](#) register name when [HCR\\_EL2](#).E2H == 0.
- Attempted execution, in Debug state, of:
  - A DCPS1 instruction when the value of [HCR\\_EL2](#).TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  - A DCPS3 instruction when the value of [EDSCR](#).SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13\_mon. See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- In Debug state when the value of [EDSCR](#).SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to [SPSR\\_mon](#), [SP\\_mon](#), or [LR\\_mon](#).
- An exception that is taken to EL2 because the value of [HCR\\_EL2](#).TGE is 1 that, if the value of [HCR\\_EL2](#).TGE was 0 would have been reported with an [ESR\\_ELx](#).EC value of 0b000111.

## ISS encoding for an exception from a WF\* instruction

### CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bits [19:2]

Reserved, RES0.

## TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b00	WFI trapped.	
0b01	WFE trapped.	
0b10	WFIT trapped.	When FEAT_WFxT is implemented
0b11	WFET trapped.	When FEAT_WFxT is implemented

When FEAT\_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- [SCTLR\\_EL1](#).{nTWE, nTWI}.
- [HCR\\_EL2](#).{TWE, TWI}.
- [SCR\\_EL3](#).{TWE, TWI}.

**ISS encoding for an exception from an MCR or MRC access**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc2			Opc1			CRn			Rt			CRm			Direction				

**CV, bit [24]**

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc2, bits [19:17]**

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc1, bits [16:14]**

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- [CNTCTL\\_EL1](#).{ELOPTEN, EL0VTEN, ELOPCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#) or [CPACR](#) using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HSTR\\_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL\\_EL2](#).EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- [CPTR\\_EL3](#).TCPAC, for accesses to [CPACR](#) from EL1 and EL2, and accesses to [HCPTR](#) from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- For information on other traps using EC value 0b000011, see 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- If FEAT\_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [CPACR\\_EL1](#).TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [HCR\\_EL2](#).TID0, for accesses to the [JIDR](#) register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and AArch-DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL3](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR\\_EL3](#).TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR\\_EL3](#).TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- [HCR\\_EL2](#).TID0, for accesses to the [FPSID](#) register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- [HCR\\_EL2](#).TID3, for accesses to registers in ID group 3 including [MVFR0](#), [MVFR1](#) and [MVFR2](#), VMRS access trapped to EL2.

## ISS encoding for an exception from an LD64B or ST64B\* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISS																								

ISS, bits [24:0]

ISS	Meaning
0b00000000000000000000000000000000	ST64BV instruction trapped.
0b00000000000000000000000000000001	ST64BV0 instruction trapped.
0b00000000000000000000000000000010	LD64B or ST64B instruction trapped.

All other values are reserved.

## ISS encoding for an exception from an MCRR or MRRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
CV	COND				Opc1				RES0		Rt2				Rt				CRm				Direction			

**CV, bit [24]**

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc1, bits [19:16]**

The Opc1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [15]**

Reserved, RES0.

**Rt2, bits [14:10]**

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [HSTR\\_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL\\_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT\_FGT is implemented, [HDFGRTR\\_EL2](#).PMCCNTR\_EL0 for MRRC access and [HDFGWTR\\_EL2](#).PMCCNTR\_EL0 for MCRR access to [PMCCNTR](#) at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug ROM registers [DBGDSAR](#) and [DBGDRAR](#) at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL3](#).TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- [CPACR\\_EL1](#).TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [CPTR\\_EL2](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL3](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

**Note**

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

**ISS encoding for an exception from an LDC or STC instruction**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				imm8								RES0	Rn				Offset	AM		Direction			

**CV, bit [24]**

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**imm8, bits [19:12]**

The immediate value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:10]**

Reserved, RES0.

**Rn, bits [9:5]**

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Offset, bit [4]**

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AM, bits [3:1]**

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- [MDSCR\\_EL1](#).TDCC, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) trapped to EL1 or EL2.

- [MDCR\\_EL2.TDA](#), for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL2.
- [MDCR\\_EL3.TDA](#), for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL3.
- If FEAT\_FGT is implemented, [MDCR\\_EL2.TDCC](#) for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3.TDCC](#) for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

## ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

### CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:0]**

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- [CPACR\\_EL1.FPEN](#), for accesses to SIMD and floating-point registers trapped to EL1.
- [CPTR\\_EL2.TFP](#), for accesses to SIMD and floating-point registers trapped to EL2.
- [CPTR\\_EL3.TFP](#), for accesses to SIMD and floating-point registers trapped to EL3.

### ISS encoding for an exception from an access to SVE functionality, resulting from CPACR\_EL1.ZEN, CPTTR\_EL2.ZEN, CPTTR\_EL2.TZ, or CPTTR\_EL3.EZ

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE System register, ZCR\_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

**Bits [24:0]**

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b011001:

- [CPACR\\_EL1.ZEN](#), for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL2.
- [CPTR\\_EL2.ZEN](#), for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- [CPTR\\_EL2.TZ](#), for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- [CPTR\\_EL3.EZ](#), for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

### ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

**Bits [24:0]**

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions, see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

### ISS encoding for an exception from HVC or SVC instruction execution

**Bits [24:16]**

Reserved, RES0.

**imm16, bits [15:0]**

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT\_FGT is implemented, [HFGITR\\_EL2](#).{SVC\_EL1, SVC\_EL0} control fine-grained traps on SVC execution.

**ISS encoding for an exception from SMC instruction execution in AArch32 state**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				CCKNOWNPASS						RES0													

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR\\_EL2](#).TSC is 1, the ISS encoding is as shown in the diagram.

**CV, bit [24]**

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

#### Note

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [18:0]

Reserved, RES0.

HCR\_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

## ISS encoding for an exception from SMC instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0									imm16															

### Bits [24:16]

Reserved, RES0.

**imm16, bits [15:0]**

The value of the immediate field from the issued SMC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR\_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

## ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				Op0			Op2			Op1			CRn			Rt			CRm			Direction		

**Bits [24:22]**

Reserved, RES0.

**Op0, bits [21:20]**

The Op0 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Op2, bits [19:17]**

The Op2 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Op1, bits [16:14]**

The Op1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- [SCTLR\\_EL1](#).UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UCT, for accesses to [CTR\\_EL0](#) using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [CPACR\\_EL1](#).TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TTRF, for accesses to the trace filter control register, [TRFCR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL\\_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.

- [HCR\\_EL2](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).AT, for execution of AT S1E\* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- [SCR\\_EL3](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3](#).ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TCPAC, for accesses to [CPTR\\_EL2](#) and [CPACR\\_EL1](#) using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TTRF, for accesses to the trace filter control registers, [TRFCR\\_EL1](#) and [TRFCR\\_EL2](#), using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT\_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - [HCR\\_EL2](#).{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - [HCR2](#).{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT\_FGT is implemented:
  - [SCR\\_EL3](#).FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - [HFGTR\\_EL2](#) for reads and [HFGWTR\\_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - [HFGITR\\_EL2](#) for execution of system instructions, MSR or MRS access trapped to EL2
  - [HDFGTR\\_EL2](#) for reads and [HDFGWTR\\_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - [HAFGTR\\_EL2](#) for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

## ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																								

### IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from an Instruction Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												SET	FnV	EA	RES0	S1PTW	RES0	IFSC						

### Bits [24:13]

Reserved, RES0.

### SET, bits [12:11]

**When FEAT\_RAS is implemented:**

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [8]**

Reserved, RES0.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented

0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

### Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from a Data Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	SAS	SSE				SRT			SF	AR	VNCR	Bits[12:11]	FnV	EA	CM	S1PTW	WnR					DFSC		

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

### ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR\_EL2, ISV is 1 when FEAT\_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR\_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR\_EL1 or ESR\_EL3, ISV is 1 when FEAT\_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR\_EL1 or ESR\_EL3.

When FEAT\_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT\_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT\_MTE is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR\_ELx.FNV is 0 and FAR\_ELx is valid.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### SAS, bits [23:22]

When ISV == '1':

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### SSE, bit [21]

When ISV == '1':

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### SRT, bits [20:16]

When ISV == '1':

Syndrome Register Transfer. When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xt.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SF, bit [15]**

**When ISV == '1':**

Width of the register accessed by the instruction is Sixty-Four.

SF	Meaning
0b0	Instruction loads/stores a 32-bit wide register.
0b1	Instruction loads/stores a 64-bit wide register.

**Note**

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**AR, bit [14]**

**When ISV == '1':**

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**VNCR, bit [13]****When FEAT\_NV2 is implemented:**

Indicates that the fault came from use of [VNCR\\_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of <a href="#">VNCR_EL2</a> , by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of <a href="#">VNCR_EL2</a> , by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR\_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SET, bits [12:11]****When FEAT\_RAS is implemented and FEAT\_LS64 is not implemented:**

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When FEAT\_LS64 is implemented:**

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

LST	Meaning
0b01	An ST64BV instruction generated the Data Abort.
0b10	An LD64B or ST64B instruction generated the Data Abort.
0b11	An ST64BV0 instruction generated the Data Abort.

All other values are reserved.

This field is valid only if the DFSC code is 0b110101. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<b>FnV</b>	<b>Meaning</b>
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CM, bit [8]**

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

<b>CM</b>	<b>Meaning</b>
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The <a href="#">DC ZVA</a> , <a href="#">DC GVA</a> , and <a href="#">DC GZVA</a> instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<b>S1PTW</b>	<b>Meaning</b>
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**WnR, bit [6]**

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

<b>WnR</b>	<b>Meaning</b>
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **DFSC, bits [5:0]**

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented

0b100001	Alignment fault.	
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

#### Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from a trapped floating-point exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV							RES0						VECITR	IDF	RES0	IXF	UFF	OFF	DZF	IOF			

#### Bit [24]

Reserved, RES0.

#### TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

#### Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [22:11]

Reserved, RES0.

### VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [6:5]

Reserved, RES0.

### IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the [FPCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the [FPSCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

## ISS encoding for an SError interrupt

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
IDS		RES0										IESB		AET		EA		RES0		DFSC					

### IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
<b>Note</b> If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

#### Note

This field was previously called ISV.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [23:14]

Reserved, RES0.

**IESB, bit [13]****When FEAT\_IESB is implemented:**

Implicit error synchronization event.

<b>IESB</b>	<b>Meaning</b>
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**AET, bits [12:10]****When FEAT\_RAS is implemented:**

Asynchronous Error Type.

When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

<b>AET</b>	<b>Meaning</b>
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EA, bit [9]****When FEAT\_RAS is implemented:**

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [8:6]**

Reserved, RES0.

**DFSC, bits [5:0]**

When FEAT\_RAS is implemented:

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

## ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																			IFSC					

**Bits [24:6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

## ISS encoding for an exception from a Software Step exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	RES0																	EX	IFSC					

**ISV, bit [24]**

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [23:7]

Reserved, RES0.

### EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Software Step exceptions'.

## ISS encoding for an exception from a Watchpoint exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										RES0VNCR		RES0				CMRES0WnR		DFSC						

### Bits [24:15]

Reserved, RES0.

### Bit [14]

Reserved, RES0.

### VNCR, bit [13]

When FEAT\_NV2 is implemented:

Indicates that the watchpoint came from use of [VNCR\\_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of <a href="#">VNCR_EL2</a> by EL1 code.
0b1	The watchpoint was generated by the use of <a href="#">VNCR_EL2</a> by EL1 code.

This field is 0 in ESR\_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bits [12:9]

Reserved, RES0.

#### CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The <a href="#">DC ZVA</a> , <a href="#">DC GVA</a> , and <a href="#">DC GZVA</a> instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bit [7]

Reserved, RES0.

#### WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

## ISS encoding for an exception from execution of a Breakpoint instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										Comment														

### Bits [24:16]

Reserved, RES0.

### Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

## ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																						ERET		ERETA

This EC value applies when FEAT\_FGT is implemented, or when [HCR\\_EL2.NV](#) is 1.

### Bits [24:2]

Reserved, RES0.

### ERET, bit [1]

Indicates whether an ERET or ERETA\* instruction was trapped to EL2.

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [HCR\\_EL2.NV](#).

If FEAT\_FGT is implemented, [HFGITR\\_EL2.ERET](#) controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

**ISS encoding for an exception from Branch Target Identification instruction****Bits [24:2]**

Reserved, RES0.

**BTYP, bits [1:0]**

This field is set to the PSTATE.BTYP value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

**ISS encoding for an exception from a Pointer Authentication instruction when HCR\_EL2.API == 0 || SCR\_EL3.API == 0****Bits [24:0]**

Reserved, RES0.

For more information about generating these exceptions, see:

- [HCR\\_EL2.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- [SCR\\_EL3.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

**ISS encoding for an exception from a Pointer Authentication instruction authentication failure****Bits [24:2]**

Reserved, RES0.

**Bit [1]**

This field indicates whether the exception is as a result of an Instruction key or a Data key.

Meaning	
0b0	Instruction Key.
0b1	Data Key.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [0]**

This field indicates whether the exception is as a result of an A key or a B key.

Meaning	
0b0	A key.
0b1	B key.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETA, ERETB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

## Accessing the ESR\_EL1

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic ESR\_EL1 or ESR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, ESR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0010	0b000

```

# ESR\_EL2, Exception Syndrome Register (EL2)

The ESR\_EL2 characteristics are:

## Purpose

Holds syndrome information for an exception taken to EL2.

## Configuration

AArch64 System register ESR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HSR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ESR\_EL2 is a 64-bit register.

## Field descriptions

The ESR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																												ISS2							
EC						IL		ISS																											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

ESR\_EL2 is made UNKNOWN as a result of an exception return from EL2.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of ESR\_EL2 is UNKNOWN. The value written to ESR\_EL2 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

### Bits [63:37]

Reserved, RES0.

### ISS2, bits [36:32]

#### When FEAT\_LS64 is implemented:

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

#### Otherwise:

Reserved, RES0.

### EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	<a href="#">ISS encoding for exceptions with an unknown reason</a>	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	<a href="#">ISS encoding for an exception from a WF* instruction</a>	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an MCR or MRC access</a>	When AArch32 is supported at any Exception level
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an MCRR or MRRC access</a>	When AArch32 is supported at any Exception level
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	<a href="#">ISS encoding for an exception from an MCR or MRC access</a>	When AArch32 is supported at any Exception level
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: <ul style="list-style-type: none"> <li>An STC to write data to memory from <a href="#">DBGDTRRXint.</a></li> <li>An LDC to read data from memory to <a href="#">DBGDTRTXint.</a></li> </ul>	<a href="#">ISS encoding for an exception from an LDC or STC instruction</a>	When AArch32 is supported at any Exception level
0b000111	Access to SVE, Advanced SIMD or floating-point functionality trapped by <a href="#">CPACR_EL1.FPEN</a> , <a href="#">CPTR_EL2.FPEN</a> , <a href="#">CPTR_EL2.TFP</a> , or <a href="#">CPTR_EL3.TFP</a> control. Excludes exceptions resulting from <a href="#">CPACR_EL1</a> when the value of <a href="#">HCR_EL2.TGE</a> is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'The EC used to report an exception routed to EL2 because <a href="#">HCR_EL2.TGE</a> is 1'.	<a href="#">ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality resulting from the FPEN and TFP traps</a>	
0b001000	Trapped VMRS access, from ID group trap,	<a href="#">ISS encoding for an exception</a>	When AArch32 is

	that is not reported using EC 0b000111.	<a href="#">from an MCR or MRC access</a>	supported at any Exception level
0b001001	Trapped use of a Pointer authentication instruction because $HCR\_EL2.API == 0 \parallel SCR\_EL3.API == 0$ .	<a href="#">ISS encoding for an exception from a Pointer Authentication instruction when <math>HCR\_EL2.API == 0 \parallel SCR\_EL3.API == 0</math></a>	When FEAT_PAuth is implemented
0b001010	Trapped execution of an LD64B, ST64B, ST64BV, or ST64BV0 instruction.	<a href="#">ISS encoding for an exception from an LD64B or ST64B* instruction</a>	When FEAT_LS64 is implemented
0b001100	Trapped MRRC access with ( $coproc == 0b1110$ ).	<a href="#">ISS encoding for an exception from an MCRR or MRRC access</a>	When AArch32 is supported at any Exception level
0b001101	Branch Target Exception.	<a href="#">ISS encoding for an exception from Branch Target Identification instruction</a>	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>	
0b010001	SVC instruction execution in AArch32 state. This is reported in ESR_EL2 only when the exception is generated because the value of <a href="#">HCR_EL2.TGE</a> is 1.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch32 is supported at any Exception level
0b010010	HVC instruction execution in AArch32 state, when HVC is not disabled.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch32 is supported at any Exception level
0b010011	SMC instruction execution in AArch32 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of <a href="#">HCR_EL2.TSC</a> is 1.	<a href="#">ISS encoding for an exception from SMC instruction execution in AArch32 state</a>	When AArch32 is supported at any Exception level
0b010101	SVC instruction execution in AArch64 state.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch64 is supported at any Exception level
0b010110	HVC instruction execution in AArch64	<a href="#">ISS encoding for an exception from HVC or SVC</a>	When AArch64 is supported at

	state, when HVC is not disabled.	<a href="#">instruction execution</a>	any Exception level
0b010111	SMC instruction execution in AArch64 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of <a href="#">HCR_EL2.TSC</a> is 1.	<a href="#">ISS encoding for an exception from SMC instruction execution in AArch64 state</a>	When AArch64 is supported at any Exception level
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.	<a href="#">ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state</a>	When AArch64 is supported at any Exception level
0b011001	Access to SVE functionality trapped as a result of <a href="#">CPACR_EL1.ZEN</a> , <a href="#">CPTR_EL2.ZEN</a> , <a href="#">CPTR_EL2.TZ</a> , or <a href="#">CPTR_EL3.EZ</a> , that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an access to SVE functionality resulting from CPACR_EL1.ZEN, CPTREL2.ZEN, CPTREL2.TZ, or CPTREL3.EZ</a>	When FEAT_SVE is implemented
0b011010	Trapped ERET, ERETAA, or ERETAB instruction execution.	<a href="#">ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction</a>	When FEAT_PAuth is implemented and FEAT_NV is implemented
0b011100	Exception from a Pointer Authentication instruction authentication failure	<a href="#">ISS encoding for an exception from a Pointer Authentication instruction authentication failure</a>	When FEAT_FPAC is implemented
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	<a href="#">ISS encoding for an exception from an Instruction Abort</a>	

0b100001	<p>Instruction Abort taken without a change in Exception level.</p> <p>Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors.</p> <p>Not used for debug-related exceptions.</p>	<a href="#">ISS encoding for an exception from an Instruction Abort</a>
0b100010	<p>PC alignment fault exception.</p>	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>
0b100100	<p>Data Abort from a lower Exception level, excluding Data Aborts taken to EL2 as a result of accesses generated associated with <a href="#">VNCR_EL2</a> as part of nested virtualization support.</p> <p>These Data Aborts might be generated from Exception levels in any Execution state.</p> <p>Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors.</p> <p>Not used for debug-related exceptions.</p>	<a href="#">ISS encoding for an exception from a Data Abort</a>
0b100101	<p>Data Abort without a change in Exception level, or Data Aborts taken to EL2 as a result of accesses generated associated with <a href="#">VNCR_EL2</a> as part of nested virtualization support.</p> <p>Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors.</p> <p>Not used for debug-related exceptions.</p>	<a href="#">ISS encoding for an exception from a Data Abort</a>
0b100110	<p>SP alignment fault exception.</p>	<a href="#">ISS encoding for an exception from an Illegal Execution state.</a>

0b101000	Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	<a href="#">or a PC or SP alignment fault</a> <a href="#">ISS encoding for an exception from a trapped floating-point exception</a>	When AArch32 is supported at any Exception level
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	<a href="#">ISS encoding for an exception from a trapped floating-point exception</a>	When AArch64 is supported at any Exception level
0b101111	SError interrupt.	<a href="#">ISS encoding for an SError interrupt</a>	
0b110000	Breakpoint exception from a lower Exception level.	<a href="#">ISS encoding for an exception from a Breakpoint or Vector Catch debug exception</a>	
0b110001	Breakpoint exception taken without a change in Exception level.	<a href="#">ISS encoding for an exception from a Breakpoint or Vector Catch debug exception</a>	
0b110010	Software Step exception from a lower Exception level.	<a href="#">ISS encoding for an exception from a Software Step exception</a>	
0b110011	Software Step exception taken without a change in Exception level.	<a href="#">ISS encoding for an exception from a Software Step exception</a>	
0b110100	Watchpoint from a lower Exception level, excluding Watchpoint Exceptions taken to EL2 as a result of accesses generated associated with <a href="#">VNCR_EL2</a> as part of nested virtualization support. These Watchpoint Exceptions might be generated from	<a href="#">ISS encoding for an exception from a Watchpoint exception</a>	

0b110101	Exception levels using any Execution state. Watchpoint exceptions without a change in Exception level, or Watchpoint exceptions taken to EL2 as a result of accesses generated associated with <a href="#">VNCR_EL2</a> as part of nested virtualization support.	<a href="#">ISS encoding for an exception from a Watchpoint exception</a>	
0b111000	BKPT instruction execution in AArch32 state.	<a href="#">ISS encoding for an exception from execution of a Breakpoint instruction</a>	When AArch32 is supported at any Exception level
0b111010	Vector Catch exception from AArch32 state. The only case where a Vector Catch exception is taken to an Exception level that is using AArch64 is when the exception is routed to EL2 and EL2 is using AArch64.	<a href="#">ISS encoding for an exception from a Breakpoint or Vector Catch debug exception</a>	When AArch32 is supported at any Exception level
0b111100	BRK instruction execution in AArch64 state. This is reported in <a href="#">ESR_EL3</a> only if a BRK instruction is executed.	<a href="#">ISS encoding for an exception from execution of a Breakpoint instruction</a>	When AArch64 is supported at any Exception level

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: <ul style="list-style-type: none"> <li>• An SError interrupt.</li> <li>• An Instruction Abort exception.</li> <li>• A PC alignment fault exception.</li> <li>• An SP alignment fault exception.</li> <li>• A Data Abort exception for which the value of the ISV bit is 0.</li> <li>• An Illegal Execution state exception.</li> <li>• Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning: <ul style="list-style-type: none"> <li>◦ 0b0: 16-bit T32 BKPT instruction.</li> <li>◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction.</li> </ul> </li> <li>• An exception reported using EC value 0b000000.</li> </ul>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b1111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value 0b1111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

## ISS encoding for exceptions with an unknown reason

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												

## Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions or System registers that are not implemented in the implementation.

- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR\\_EL1](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by [HCR\\_EL2](#).HCD or [SCR\\_EL3](#).HCE.
  - An SMC instruction when disabled by [SCR\\_EL3](#).SMD.
  - An HLT instruction when disabled by [EDSCR](#).HDE.
- Attempted execution of an MSR or MRS instruction to access [SP\\_EL0](#) when the value of [SPSel](#).SP is 0.
- Attempted execution of an MSR or MRS instruction using a [\\_EL12](#) register name when [HCR\\_EL2](#).E2H == 0.
- Attempted execution, in Debug state, of:
  - A DCPS1 instruction when the value of [HCR\\_EL2](#).TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  - A DCPS3 instruction when the value of [EDSCR](#).SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13\_mon. See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- In Debug state when the value of [EDSCR](#).SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to [SPSR\\_mon](#), [SP\\_mon](#), or [LR\\_mon](#).
- An exception that is taken to EL2 because the value of [HCR\\_EL2](#).TGE is 1 that, if the value of [HCR\\_EL2](#).TGE was 0 would have been reported with an [ESR\\_ELx](#).EC value of 0b000111.

## ISS encoding for an exception from a WF\* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">CV</a>	<a href="#">COND</a>				<a href="#">RES0</a>																		<a href="#">TI</a>	

### CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bits [19:2]

Reserved, RES0.

## TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b00	WFI trapped.	
0b01	WFE trapped.	
0b10	WFIT trapped.	When FEAT_WFxT is implemented
0b11	WFET trapped.	When FEAT_WFxT is implemented

When FEAT\_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- [SCTLR\\_EL1](#).{nTWE, nTWI}.
- [HCR\\_EL2](#).{TWE, TWI}.
- [SCR\\_EL3](#).{TWE, TWI}.

## ISS encoding for an exception from an MCR or MRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc2		Opc1		CRn				Rt				CRm				Direction			

## CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc2, bits [19:17]**

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Opc1, bits [16:14]**

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TLTB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#) or [CPACR](#) using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HSTR\\_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL\\_EL2](#).EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [MDSCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL3](#).TCPAC, for accesses to [CPACR](#) from EL1 and EL2, and accesses to [HCPTR](#) from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [MDSCR\\_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- For information on other traps using EC value 0b000011, see 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- If FEAT\_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [CPACR\\_EL1](#).TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT\_FGT is implemented, [MDSCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDSCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [HCR\\_EL2](#).TID0, for accesses to the [JIDR](#) register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.

- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and AArch-DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL3](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR\\_EL3](#).TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR\\_EL3](#).TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- [HCR\\_EL2](#).TID0, for accesses to the [FPSID](#) register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- [HCR\\_EL2](#).TID3, for accesses to registers in ID group 3 including [MVFR0](#), [MVFR1](#) and [MVFR2](#), VMRS access trapped to EL2.

## ISS encoding for an exception from an LD64B or ST64B\* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">ISS</a>																								

### ISS, bits [24:0]

ISS	Meaning
0b000000000000000000000000000000	ST64BV instruction trapped.
0b000000000000000000000000000001	ST64BV0 instruction trapped.
0b000000000000000000000000000010	LD64B or ST64B instruction trapped.

All other values are reserved.

## ISS encoding for an exception from an MCRR or MRRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc1				RES0	Rt2				Rt				CRm				Direction		

### CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Opc1, bits [19:16]

The Opc1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [15]

Reserved, RES0.

### Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CRm, bits [4:1]

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, ELOPCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [HSTR\\_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL\\_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT\_FGT is implemented, [HDFGRTR\\_EL2](#).PMCCNTR\_EL0 for MRRC access and [HDFGWTR\\_EL2](#).PMCCNTR\_EL0 for MCRR access to [PMCCNTR](#) at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug ROM registers [DBGDSAR](#) and [DBGDRAR](#) at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL3](#).TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- [CPACR\\_EL1](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [CPTR\\_EL2](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL3](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

#### Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

## ISS encoding for an exception from an LDC or STC instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				imm8								RES0	Rn				Offset	AM		Direction			

#### CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### imm8, bits [19:12]

The immediate value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [11:10]

Reserved, RES0.

### Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- [MDSCR\\_EL1](#).TDCC, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) trapped to EL1 or EL2.
- [MDCR\\_EL2](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL2.
- [MDCR\\_EL3](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL3.
- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

## ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

### CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bits [19:0]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- [CPACR\\_EL1.FPEN](#), for accesses to SIMD and floating-point registers trapped to EL1.
- [CPTR\\_EL2.TFP](#), for accesses to SIMD and floating-point registers trapped to EL2.
- [CPTR\\_EL3.TFP](#), for accesses to SIMD and floating-point registers trapped to EL3.

## ISS encoding for an exception from an access to SVE functionality, resulting from CPACR\_EL1.ZEN, CPTR\_EL2.ZEN, CPTR\_EL2.TZ, or CPTR\_EL3.EZ

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE System register, ZCR\_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

**Bits [24:0]**

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b011001:

- [CPACR\\_EL1.ZEN](#), for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL2.
- [CPTR\\_EL2.ZEN](#), for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- [CPTR\\_EL2.TZ](#), for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- [CPTR\\_EL3.EZ](#), for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

**ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault****Bits [24:0]**

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions, see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

**ISS encoding for an exception from HVC or SVC instruction execution****Bits [24:16]**

Reserved, RES0.

**imm16, bits [15:0]**

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT\_FGT is implemented, [HFGITR\\_EL2](#).{SVC\_EL1, SVC\_EL0} control fine-grained traps on SVC execution.

## ISS encoding for an exception from SMC instruction execution in AArch32 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				CCKNOWNPASS										RES0									

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR\\_EL2](#).TSC is 1, the ISS encoding is as shown in the diagram.

### CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CCKNOWNPASS, bit [19]**

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

**Note**

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [18:0]**

Reserved, RES0.

HCR\_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

**ISS encoding for an exception from SMC instruction execution in AArch64 state**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										imm16														

**Bits [24:16]**

Reserved, RES0.

**imm16, bits [15:0]**

The value of the immediate field from the issued SMC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR\_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

**ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0		Op0		Op2		Op1		CRn				Rt				CRm		Direction						

**Bits [24:22]**

Reserved, RES0.

**Op0, bits [21:20]**

The Op0 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Op2, bits [19:17]**

The Op2 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Op1, bits [16:14]**

The Op1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRn, bits [13:10]**

The CRn value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CRm, bits [4:1]**

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- [SCTLR\\_EL1](#).UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UCT, for accesses to [CTR\\_EL0](#) using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [CPACR\\_EL1](#).TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TTRF, for accesses to the trace filter control register, [TRFCR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL\\_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).AT, for execution of AT S1E\* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- [SCR\\_EL3](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3](#).ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TCPAC, for accesses to [CPTR\\_EL2](#) and [CPACR\\_EL1](#) using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TTRF, for accesses to the trace filter control registers, [TRFCR\\_EL1](#) and [TRFCR\\_EL2](#), using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.

- If FEAT\_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - [HCR\\_EL2](#).{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - [HCR2](#).{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT\_FGT is implemented:
  - [SCR\\_EL3](#).FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - [HFGTR\\_EL2](#) for reads and [HFGWTR\\_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - [HFGITR\\_EL2](#) for execution of system instructions, MSR or MRS access trapped to EL2
  - [HDFGRTR\\_EL2](#) for reads and [HDFGWTR\\_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - [HAFGRTR\\_EL2](#) for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

## ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																								

### IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from an Instruction Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												SET	FnV	EA	RES0	S1PTW	RES0	IFSC						

### Bits [24:13]

Reserved, RES0.

### SET, bits [12:11]

When FEAT\_RAS is implemented:

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

### Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<b>FnV</b>	<b>Meaning</b>
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [8]**

Reserved, RES0.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<b>S1PTW</b>	<b>Meaning</b>
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented

0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

### Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from a Data Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	SAS	SSE				SRT			SF	AR	VNCR	Bits[12:11]	FnV	EA	CM	S1PTW	WnR							DFSC

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

### ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR\_EL2, ISV is 1 when FEAT\_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR\_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR\_EL1 or ESR\_EL3, ISV is 1 when FEAT\_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR\_EL1 or ESR\_EL3.

When FEAT\_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT\_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT\_MTE is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR\_ELx.FNV is 0 and FAR\_ELx is valid.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### SAS, bits [23:22]

When ISV == '1':

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### SSE, bit [21]

When ISV == '1':

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### SRT, bits [20:16]

When ISV == '1':

Syndrome Register Transfer. When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xt.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SF, bit [15]**

**When ISV == '1':**

Width of the register accessed by the instruction is Sixty-Four.

<b>SF</b>	<b>Meaning</b>
0b0	Instruction loads/stores a 32-bit wide register.
0b1	Instruction loads/stores a 64-bit wide register.

**Note**

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**AR, bit [14]**

**When ISV == '1':**

Acquire/Release.

<b>AR</b>	<b>Meaning</b>
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**VNCR, bit [13]****When FEAT\_NV2 is implemented:**

Indicates that the fault came from use of [VNCR\\_EL2](#) register by EL1 code.

<b>VNCR</b>	<b>Meaning</b>
0b0	The fault was not generated by the use of <a href="#">VNCR_EL2</a> , by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of <a href="#">VNCR_EL2</a> , by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR\_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SET, bits [12:11]****When FEAT\_RAS is implemented and FEAT\_LS64 is not implemented:**

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception.

<b>SET</b>	<b>Meaning</b>
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When FEAT\_LS64 is implemented:**

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

<b>LST</b>	<b>Meaning</b>
0b01	An ST64BV instruction generated the Data Abort.
0b10	An LD64B or ST64B instruction generated the Data Abort.
0b11	An ST64BV0 instruction generated the Data Abort.

All other values are reserved.

This field is valid only if the DFSC code is 0b110101. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<b>FnV</b>	<b>Meaning</b>
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CM, bit [8]**

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

<b>CM</b>	<b>Meaning</b>
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The <a href="#">DC ZVA</a> , <a href="#">DC GVA</a> , and <a href="#">DC GZVA</a> instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<b>S1PTW</b>	<b>Meaning</b>
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**WnR, bit [6]**

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

<b>WnR</b>	<b>Meaning</b>
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **DFSC, bits [5:0]**

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented

0b100001	Alignment fault.	
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

#### Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from a trapped floating-point exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV							RES0						VECITR	IDF	RES0	IXF	UFF	OFF	DZF	IOF			

#### Bit [24]

Reserved, RES0.

#### TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

#### Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [22:11]

Reserved, RES0.

### VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [6:5]

Reserved, RES0.

### IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the [FPCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the [FPSCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

## ISS encoding for an SError interrupt

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
IDS		RES0										IESB		AET		EA		RES0		DFSC					

### IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
<b>Note</b> If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

#### Note

This field was previously called ISV.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [23:14]

Reserved, RES0.

**IESB, bit [13]****When FEAT\_IESB is implemented:**

Implicit error synchronization event.

<b>IESB</b>	<b>Meaning</b>
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**AET, bits [12:10]****When FEAT\_RAS is implemented:**

Asynchronous Error Type.

When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

<b>AET</b>	<b>Meaning</b>
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EA, bit [9]****When FEAT\_RAS is implemented:**

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [8:6]**

Reserved, RES0.

**DFSC, bits [5:0]**

When FEAT\_RAS is implemented:

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

## ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																			IFSC					

**Bits [24:6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

## ISS encoding for an exception from a Software Step exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	RES0																	EX	IFSC					

**ISV, bit [24]**

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [23:7]

Reserved, RES0.

### EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Software Step exceptions'.

## ISS encoding for an exception from a Watchpoint exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										RES0	VNCR	RES0				CM	RES0	WnR	DFSC					

### Bits [24:15]

Reserved, RES0.

### Bit [14]

Reserved, RES0.

### VNCR, bit [13]

When FEAT\_NV2 is implemented:

Indicates that the watchpoint came from use of [VNCR\\_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of <a href="#">VNCR_EL2</a> by EL1 code.
0b1	The watchpoint was generated by the use of <a href="#">VNCR_EL2</a> by EL1 code.

This field is 0 in ESR\_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bits [12:9]

Reserved, RES0.

#### CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The <a href="#">DC ZVA</a> , <a href="#">DC GVA</a> , and <a href="#">DC GZVA</a> instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bit [7]

Reserved, RES0.

#### WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

## ISS encoding for an exception from execution of a Breakpoint instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										Comment														

### Bits [24:16]

Reserved, RES0.

### Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

## ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																						ERET		ERETA

This EC value applies when FEAT\_FGT is implemented, or when [HCR\\_EL2.NV](#) is 1.

### Bits [24:2]

Reserved, RES0.

### ERET, bit [1]

Indicates whether an ERET or ERETA\* instruction was trapped to EL2.

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [HCR\\_EL2.NV](#).

If FEAT\_FGT is implemented, [HFGITR\\_EL2.ERET](#) controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

**ISS encoding for an exception from Branch Target Identification instruction****Bits [24:2]**

Reserved, RES0.

**BTYP, bits [1:0]**

This field is set to the PSTATE.BTYP value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

**ISS encoding for an exception from a Pointer Authentication instruction when HCR\_EL2.API == 0 || SCR\_EL3.API == 0****Bits [24:0]**

Reserved, RES0.

For more information about generating these exceptions, see:

- [HCR\\_EL2.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- [SCR\\_EL3.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

**ISS encoding for an exception from a Pointer Authentication instruction authentication failure****Bits [24:2]**

Reserved, RES0.

**Bit [1]**

This field indicates whether the exception is as a result of an Instruction key or a Data key.

Meaning	
0b0	Instruction Key.
0b1	Data Key.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [0]**

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETA, ERETB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

## Accessing the ESR\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic ESR\_EL2 or ESR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, ESR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0010	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;

# ESR\_EL3, Exception Syndrome Register (EL3)

The ESR\_EL3 characteristics are:

## Purpose

Holds syndrome information for an exception taken to EL3.

## Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to ESR\_EL3 are UNDEFINED.

## Attributes

ESR\_EL3 is a 64-bit register.

## Field descriptions

The ESR\_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																												ISS2							
EC						IL	ISS																												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

ESR\_EL3 is made UNKNOWN as a result of an exception return from EL3.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL3, the value of ESR\_EL3 is UNKNOWN. The value written to ESR\_EL3 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

### Bits [63:37]

Reserved, RES0.

### ISS2, bits [36:32]

When FEAT\_LS64 is implemented:

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

Otherwise:

Reserved, RES0.

### EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	<a href="#">ISS encoding for exceptions with an unknown reason</a>	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	<a href="#">ISS encoding for an exception from a WF* instruction</a>	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an MCR or MRC access</a>	When AArch32 is supported at any Exception level
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an MCRR or MRRC access</a>	When AArch32 is supported at any Exception level
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	<a href="#">ISS encoding for an exception from an MCR or MRC access</a>	When AArch32 is supported at any Exception level
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: <ul style="list-style-type: none"> <li>An STC to write data to memory from <a href="#">DBGDTRRXint.</a></li> <li>An LDC to read data from memory to <a href="#">DBGDTRTXint.</a></li> </ul>	<a href="#">ISS encoding for an exception from an LDC or STC instruction</a>	When AArch32 is supported at any Exception level
0b000111	Access to SVE, Advanced SIMD or floating-point functionality trapped by <a href="#">CPACR_EL1.FPEN</a> , <a href="#">CPTR_EL2.FPEN</a> , <a href="#">CPTR_EL2.TFP</a> , or <a href="#">CPTR_EL3.TFP</a> control. Excludes exceptions resulting from <a href="#">CPACR_EL1</a> when the value of <a href="#">HCR_EL2.TGE</a> is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'The EC used to report an exception routed to	<a href="#">ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps</a>	

0b001001	EL2 because HCR_EL2.TGE is 1'. Trapped use of a Pointer authentication instruction because HCR_EL2.API == 0    SCR_EL3.API == 0.	<a href="#">ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0    SCR_EL3.API == 0</a>	When FEAT_PAuth is implemented
0b001010	Trapped execution of an LD64B, ST64B, ST64BV, or ST64BV0 instruction.	<a href="#">ISS encoding for an exception from an LD64B or ST64B* instruction</a>	When FEAT_LS64 is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	<a href="#">ISS encoding for an exception from an MCRR or MRRC access</a>	When AArch32 is supported at any Exception level
0b001101	Branch Target Exception.	<a href="#">ISS encoding for an exception from Branch Target Identification instruction</a>	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>	
0b010011	SMC instruction execution in AArch32 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of <a href="#">HCR_EL2.TSC</a> is 1.	<a href="#">ISS encoding for an exception from SMC instruction execution in AArch32 state</a>	When AArch32 is supported at any Exception level
0b010101	SVC instruction execution in AArch64 state.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch64 is supported at any Exception level
0b010110	HVC instruction execution in AArch64 state, when HVC is not disabled.	<a href="#">ISS encoding for an exception from HVC or SVC instruction execution</a>	When AArch64 is supported at any Exception level
0b010111	SMC instruction execution in AArch64 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of <a href="#">HCR_EL2.TSC</a> is 1.	<a href="#">ISS encoding for an exception from SMC instruction execution in AArch64 state</a>	When AArch64 is supported at any Exception level
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000,	<a href="#">ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state</a>	When AArch64 is supported at any Exception level

	0b000001 or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.		
0b011001	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.	<a href="#">ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ</a>	When FEAT_SVE is implemented
0b011100	Exception from a Pointer Authentication instruction authentication failure	<a href="#">ISS encoding for an exception from a Pointer Authentication instruction authentication failure</a>	When FEAT_FPAC is implemented
0b011111	IMPLEMENTATION DEFINED exception to EL3.	<a href="#">ISS encoding for an IMPLEMENTATION DEFINED exception to EL3</a>	
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug- related exceptions.	<a href="#">ISS encoding for an exception from an Instruction Abort</a>	
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug- related exceptions.	<a href="#">ISS encoding for an exception from an Instruction Abort</a>	
0b100010	PC alignment fault exception.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>	
0b100100	Data Abort from a lower Exception level.	<a href="#">ISS encoding for an exception from a Data Abort</a>	

	Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.		
0b100101	Data Abort taken without a change in Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	<a href="#">ISS encoding for an exception from a Data Abort</a>	
0b100110	SP alignment fault exception.	<a href="#">ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault</a>	
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	<a href="#">ISS encoding for an exception from a trapped floating-point exception</a>	When AArch64 is supported at any Exception level
0b101111	SError interrupt.	<a href="#">ISS encoding for an SError interrupt</a>	
0b111100	BRK instruction execution in AArch64 state. This is reported in <a href="#">ESR_EL3</a> only if a BRK instruction is executed.	<a href="#">ISS encoding for an exception from execution of a Breakpoint instruction</a>	When AArch64 is supported at any Exception level

---

All other EC values are reserved by Arm, and:

- Unused values in the range 0b0000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: <ul style="list-style-type: none"> <li>• An SError interrupt.</li> <li>• An Instruction Abort exception.</li> <li>• A PC alignment fault exception.</li> <li>• An SP alignment fault exception.</li> <li>• A Data Abort exception for which the value of the ISV bit is 0.</li> <li>• An Illegal Execution state exception.</li> <li>• Any debug exception except for Breakpoint instruction exceptions.</li> <li>• An exception reported using EC value 0b000000.</li> </ul>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b1111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value 0b1111.

When the EC field is 0b000000, indicating an exception with an unknown reason, the ISS field is not valid, RES0.

## ISS encoding for exceptions with an unknown reason

### Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR\\_EL1](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by [HCR\\_EL2](#).HCD or [SCR\\_EL3](#).HCE.
  - An SMC instruction when disabled by [SCR\\_EL3](#).SMD.
  - An HLT instruction when disabled by [EDSCR](#).HDE.
- Attempted execution of an MSR or MRS instruction to access [SP\\_EL0](#) when the value of [SPSel](#).SP is 0.
- Attempted execution of an MSR or MRS instruction using a [\\_EL12](#) register name when [HCR\\_EL2](#).E2H == 0.
- Attempted execution, in Debug state, of:
  - A DCPS1 instruction when the value of [HCR\\_EL2](#).TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
  - A DCPS3 instruction when the value of [EDSCR](#).SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13\_mon. See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- In Debug state when the value of [EDSCR](#).SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR\_mon, SP\_mon, or LR\_mon.
- An exception that is taken to EL2 because the value of [HCR\\_EL2](#).TGE is 1 that, if the value of [HCR\\_EL2](#).TGE was 0 would have been reported with an ESR\_ELx.EC value of 0b000111.

## ISS encoding for an exception from a WF\* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			TI

### CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [19:2]**

Reserved, RES0.

**TI, bits [1:0]**

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b00	WFI trapped.	
0b01	WFE trapped.	
0b10	WFIT trapped.	When FEAT_WFxT is implemented
0b11	WFET trapped.	When FEAT_WFxT is implemented

When FEAT\_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- [SCTLR\\_EL1](#).{nTWE, nTWI}.
- [HCR\\_EL2](#).{TWE, TWI}.
- [SCR\\_EL3](#).{TWE, TWI}.

**ISS encoding for an exception from an MCR or MRC access**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc2		Opc1		CRn						Rt		CRm				Direction			

**CV, bit [24]**

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **Opc2, bits [19:17]**

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **Opc1, bits [16:14]**

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **CRn, bits [13:10]**

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **Rt, bits [9:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#) or [CPACR](#) using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HSTR\\_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL\\_EL2](#).EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL3](#).TCPAC, for accesses to [CPACR](#) from EL1 and EL2, and accesses to [HCPTR](#) from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- For information on other traps using EC value 0b000011, see 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- If FEAT\_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [CPACR\\_EL1](#).TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.

- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [HCR\\_EL2](#).TID0, for accesses to the [JIDR](#) register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and AArch-DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL3](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR\\_EL3](#).TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR\\_EL3](#).TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- [HCR\\_EL2](#).TID0, for accesses to the [FPSID](#) register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- [HCR\\_EL2](#).TID3, for accesses to registers in ID group 3 including [MVFR0](#), [MVFR1](#) and [MVFR2](#), VMRS access trapped to EL2.

## ISS encoding for an exception from an LD64B or ST64B\* instruction

ISS, bits [24:0]

ISS	Meaning
0b000000000000000000000000000000	ST64BV instruction trapped.
0b000000000000000000000000000001	ST64BV0 instruction trapped.
0b000000000000000000000000000010	LD64B or ST64B instruction trapped.

All other values are reserved.

## ISS encoding for an exception from an MCRR or MRRC access

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **Opc1, bits [19:16]**

The Opc1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **Bit [15]**

Reserved, RES0.

### **Rt2, bits [14:10]**

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **Rt, bits [9:5]**

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **CRm, bits [4:1]**

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, ELOPCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [HSTR\\_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL\\_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT\_FGT is implemented, [HDFGRTR\\_EL2](#).PMCCNTR\_EL0 for MRRC access and [HDFGWTR\\_EL2](#).PMCCNTR\_EL0 for MCRR access to [PMCCNTR](#) at EL0, trapped to EL2.

The following sections describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug ROM registers [DBGDSAR](#) and [DBGDRAR](#) at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and AArch-DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [MDCR\\_EL3](#).TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- [CPACR\\_EL1](#).TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [CPTR\\_EL2](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [CPTR\\_EL3](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

**Note**

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

**ISS encoding for an exception from an LDC or STC instruction**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				imm8								RES0	Rn				Offset	AM		Direction			

**CV, bit [24]**

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**imm8, bits [19:12]**

The immediate value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:10]**

Reserved, RES0.

**Rn, bits [9:5]**

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Offset, bit [4]**

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AM, bits [3:1]**

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- [MDSCR\\_EL1](#).TDCC, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) trapped to EL1 or EL2.
- [MDCR\\_EL2](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL2.
- [MDCR\\_EL3](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL3.
- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

## ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for floating-point and Advanced SIMD, the exception is reported using the EC value 0b000000.

### CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [19:0]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- [CPACR\\_EL1.FPEN](#), for accesses to SIMD and floating-point registers trapped to EL1.
- [CPTR\\_EL2.TFP](#), for accesses to SIMD and floating-point registers trapped to EL2.
- [CPTR\\_EL3.TFP](#), for accesses to SIMD and floating-point registers trapped to EL3.

## ISS encoding for an exception from an access to SVE functionality, resulting from CPACR\_EL1.ZEN, CPTR\_EL2.ZEN, CPTR\_EL2.TZ, or CPTR\_EL3.EZ

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE System register, ZCR\_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

### Bits [24:0]

Reserved, RES0.

The following sections describe the configuration settings for the traps that are reported using EC value 0b011001:

- [CPACR\\_EL1.ZEN](#), for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL2.
- [CPTR\\_EL2.ZEN](#), for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- [CPTR\\_EL2.TZ](#), for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- [CPTR\\_EL3.EZ](#), for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

## ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

### Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions, see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

## ISS encoding for an exception from HVC or SVC instruction execution

### Bits [24:16]

Reserved, RES0.

### imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT\_FGT is implemented, [HFGITR\\_EL2](#).{SVC\_EL1, SVC\_EL0} control fine-grained traps on SVC execution.

## ISS encoding for an exception from SMC instruction execution in AArch32 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				CCKNOWNPASS						RES0													

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR\\_EL2](#).TSC is 1, the ISS encoding is as shown in the diagram.

### CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.

- With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

#### Note

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [18:0]

Reserved, RES0.

HCR\_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

## ISS encoding for an exception from SMC instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0									imm16															

### Bits [24:16]

Reserved, RES0.

### imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR\_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

## ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				Op0		Op2		Op1		CRn			Rt				CRm				Direction			

### Bits [24:22]

Reserved, RES0.

### Op0, bits [21:20]

The Op0 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Op2, bits [19:17]

The Op2 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Op1, bits [16:14]

The Op1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CRn, bits [13:10]

The CRn value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CRm, bits [4:1]

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- [SCTLR\\_EL1](#).UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UCT, for accesses to [CTR\\_EL0](#) using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR\\_EL1](#).UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [CPACR\\_EL1](#).TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [MDSCR\\_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT\_FGT is implemented, [MDCR\\_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR\\_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL\\_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR\\_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [AMUSERENR\\_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR\\_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TCPAC, for accesses to [CPACR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TTRF, for accesses to the trace filter control register, [TRFCR\\_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL\\_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR\\_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR\\_EL2](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR\\_EL2](#).{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).AT, for execution of AT S1E\* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR\\_EL2](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- [SCR\\_EL3](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3](#).ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR\\_EL3](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.

- [CPTR\\_EL3](#).TCPAC, for accesses to [CPTR\\_EL2](#) and [CPACR\\_EL1](#) using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TTRF, for accesses to the trace filter control registers, [TRFCR\\_EL1](#) and [TRFCR\\_EL2](#), using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR\\_EL3](#).TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR\\_EL3](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT\_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - [HCR\\_EL2](#).{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - [HCR2](#).{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT\_FGT is implemented:
  - [SCR\\_EL3](#).FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - [HFGRTR\\_EL2](#) for reads and [HFGWTR\\_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - [HFGITR\\_EL2](#) for execution of system instructions, MSR or MRS access trapped to EL2
  - [HDFGRTR\\_EL2](#) for reads and [HDFGWTR\\_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - [HAFGRTR\\_EL2](#) for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

## ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																								

### IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from an Instruction Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												SET	FnV	EA	RES0	S1PTW	RES0	IFSC						

### Bits [24:13]

Reserved, RES0.

### SET, bits [12:11]

When FEAT\_RAS is implemented:

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

### Note

---

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

---

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bit [8]

Reserved, RES0.

#### S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bit [6]

Reserved, RES0.

#### IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented

0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

#### Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from a Data Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	SAS	SSE				SRT			SF	AR	VNCR	Bits[12:11]	FnV	EA	CM	S1PTW	WnR					DFSC		

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

### ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR\_EL2, ISV is 1 when FEAT\_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR\_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.
  - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR\_EL1 or ESR\_EL3, ISV is 1 when FEAT\_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR\_EL1 or ESR\_EL3.

When FEAT\_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT\_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT\_MTE is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR\_ELx.FNV is 0 and FAR\_ELx is valid.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### SAS, bits [23:22]

When ISV == '1':

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### SSE, bit [21]

When ISV == '1':

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### SRT, bits [20:16]

When ISV == '1':

Syndrome Register Transfer. When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xt.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SF, bit [15]**

**When ISV == '1':**

Width of the register accessed by the instruction is Sixty-Four.

<b>SF</b>	<b>Meaning</b>
0b0	Instruction loads/stores a 32-bit wide register.
0b1	Instruction loads/stores a 64-bit wide register.

**Note**

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**AR, bit [14]**

**When ISV == '1':**

Acquire/Release.

<b>AR</b>	<b>Meaning</b>
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT\_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**VNCR, bit [13]****When FEAT\_NV2 is implemented:**

Indicates that the fault came from use of [VNCR\\_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of <a href="#">VNCR_EL2</a> , by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of <a href="#">VNCR_EL2</a> , by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR\_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**SET, bits [12:11]****When FEAT\_RAS is implemented and FEAT\_LS64 is not implemented:**

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

**Note**

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When FEAT\_LS64 is implemented:**

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

LST	Meaning
0b01	An ST64BV instruction generated the Data Abort.
0b10	An LD64B or ST64B instruction generated the Data Abort.
0b11	An ST64BV0 instruction generated the Data Abort.

All other values are reserved.

This field is valid only if the DFSC code is 0b110101. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

<b>FnV</b>	<b>Meaning</b>
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CM, bit [8]**

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

<b>CM</b>	<b>Meaning</b>
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The <a href="#">DC ZVA</a> , <a href="#">DC GVA</a> , and <a href="#">DC GZVA</a> instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

<b>S1PTW</b>	<b>Meaning</b>
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**WnR, bit [6]**

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

<b>WnR</b>	<b>Meaning</b>
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### **DFSC, bits [5:0]**

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented

0b100001	Alignment fault.	
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

#### Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ISS encoding for an exception from a trapped floating-point exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV							RES0						VECITR	IDF	RES0	IXF	UFF	OFF	DZF	IOF			

#### Bit [24]

Reserved, RES0.

#### TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating point exception from a vector instruction.

#### Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from a vector instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [22:11]

Reserved, RES0.

### VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [6:5]

Reserved, RES0.

### IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the [FPCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the [FPSCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

## ISS encoding for an SError interrupt

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
IDS		RES0										IESB		AET		EA		RES0		DFSC					

### IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
<b>Note</b> If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

#### Note

This field was previously called ISV.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [23:14]

Reserved, RES0.

**IESB, bit [13]****When FEAT\_IESB is implemented:**

Implicit error synchronization event.

<b>IESB</b>	<b>Meaning</b>
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**AET, bits [12:10]****When FEAT\_RAS is implemented:**

Asynchronous Error Type.

When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

<b>AET</b>	<b>Meaning</b>
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

**Note**

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EA, bit [9]****When FEAT\_RAS is implemented:**

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [8:6]**

Reserved, RES0.

**DFSC, bits [5:0]**

When FEAT\_RAS is implemented:

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**ISS encoding for an exception from a Breakpoint or Vector Catch debug exception**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																			IFSC					

**Bits [24:6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

**ISS encoding for an exception from a Software Step exception**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	RES0																	EX	IFSC					

**ISV, bit [24]**

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [23:7]

Reserved, RES0.

#### EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Software Step exceptions'.

### ISS encoding for an exception from a Watchpoint exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										RES0	VNCR	RES0				CM	RES0	WnR	DFSC					

#### Bits [24:15]

Reserved, RES0.

#### Bit [14]

Reserved, RES0.

#### VNCR, bit [13]

When FEAT\_NV2 is implemented:

Indicates that the watchpoint came from use of [VNCR\\_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of <a href="#">VNCR_EL2</a> by EL1 code.
0b1	The watchpoint was generated by the use of <a href="#">VNCR_EL2</a> by EL1 code.

This field is 0 in ESR\_EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bits [12:9]

Reserved, RES0.

#### CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The <a href="#">DC ZVA</a> , <a href="#">DC GVA</a> , and <a href="#">DC GZVA</a> instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bit [7]

Reserved, RES0.

#### WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

## ISS encoding for an exception from execution of a Breakpoint instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										Comment														

### Bits [24:16]

Reserved, RES0.

### Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

## ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																						ERET		ERETA

This EC value applies when FEAT\_FGT is implemented, or when [HCR\\_EL2.NV](#) is 1.

### Bits [24:2]

Reserved, RES0.

### ERET, bit [1]

Indicates whether an ERET or ERETA\* instruction was trapped to EL2.

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [HCR\\_EL2.NV](#).

If FEAT\_FGT is implemented, [HFGITR\\_EL2.ERET](#) controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

**ISS encoding for an exception from Branch Target Identification instruction****Bits [24:2]**

Reserved, RES0.

**BTYP, bits [1:0]**

This field is set to the PSTATE.BTYP value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

**ISS encoding for an exception from a Pointer Authentication instruction when HCR\_EL2.API == 0 || SCR\_EL3.API == 0****Bits [24:0]**

Reserved, RES0.

For more information about generating these exceptions, see:

- [HCR\\_EL2.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- [SCR\\_EL3.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

**ISS encoding for an exception from a Pointer Authentication instruction authentication failure****Bits [24:2]**

Reserved, RES0.

**Bit [1]**

This field indicates whether the exception is as a result of an Instruction key or a Data key.

Meaning	
0b0	Instruction Key.
0b1	Data Key.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [0]**

This field indicates whether the exception is as a result of an A key or a B key.

<b>Meaning</b>	
0b0	A key.
0b1	B key.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETA, ERETB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

**Accessing the ESR\_EL3**

Accesses to this register use the following encodings:

MRS <Xt>, ESR\_EL3

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b11	0b110	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return ESR_EL3;
```

MSR ESR\_EL3, <Xt>

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b11	0b110	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    ESR_EL3 = X[t];
```

# FAR\_EL1, Fault Address Register (EL1)

The FAR\_EL1 characteristics are:

## Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL1.

## Configuration

AArch64 System register FAR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DFAR\[31:0\] \(NS\)](#).

AArch64 System register FAR\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [IFAR\[31:0\] \(NS\)](#).

## Attributes

FAR\_EL1 is a 64-bit register.

## Field descriptions

The FAR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Faulting Virtual Address for synchronous exceptions taken to EL1																															
Faulting Virtual Address for synchronous exceptions taken to EL1																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL1. Exceptions that set the FAR\_EL1 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). [ESR\\_EL1](#).EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR\_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR\_EL1 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if [ESR\\_EL1](#).FnV is 0, and the FAR\_EL1 is UNKNOWN if [ESR\\_EL1](#).FnV is 1.

For all other exceptions taken to EL1, the FAR\_EL1 is UNKNOWN.

If a memory fault that sets FAR\_EL1, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR\_EL1 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by [DC ZVA](#).

If the exception that updates FAR\_EL1 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR\_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state'.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL0 makes FAR\_EL1 become UNKNOWN.

### Note

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR\_EL1 is made UNKNOWN on an exception return from EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the FAR\_EL1

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic FAR\_EL1 or FAR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, FAR\_EL1

# FAR\_EL2, Fault Address Register (EL2)

The FAR\_EL2 characteristics are:

## Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL2.

## Configuration

AArch64 System register FAR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HDFAR\[31:0\]](#).

AArch64 System register FAR\_EL2 bits [63:32] are architecturally mapped to AArch32 System register [HIFAR\[31:0\]](#).

AArch64 System register FAR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [DFAR\[31:0\] \(S\)](#) when EL2 is implemented.

AArch64 System register FAR\_EL2 bits [63:32] are architecturally mapped to AArch32 System register [IFAR\[31:0\] \(S\)](#) when EL2 is implemented.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

FAR\_EL2 is a 64-bit register.

## Field descriptions

The FAR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">Faulting Virtual Address for synchronous exceptions taken to EL2</a>																															
<a href="#">Faulting Virtual Address for synchronous exceptions taken to EL2</a>																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL2. Exceptions that set the FAR\_EL2 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), PC alignment faults (EC 0x22), and Watchpoints (EC 0x34 or 0x35). [ESR\\_EL2.EC](#) holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which  $\text{TCR\_ELx.TBI}\{<0|1>\} == 1$  for the translation regime in use when the abort was generated, then the top eight bits of FAR\_EL2 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if [ESR\\_EL2.FnV](#) is 0, and the FAR\_EL2 is UNKNOWN if [ESR\\_EL2.FnV](#) is 1.

For all other exceptions taken to EL2, the FAR\_EL2 is UNKNOWN.

If a memory fault that sets FAR\_EL2, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR\_EL2 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.

- The address specified in the register argument of the instruction as generated by MMU faults caused by [DC ZVA](#).

If the exception that updates FAR\_EL2 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR\_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state'.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL1 or EL0 makes FAR\_EL2 become UNKNOWN.

### Note

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR\_EL2 is made UNKNOWN on an exception return from EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the FAR\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic FAR\_EL2 or FAR\_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# FAR\_EL3, Fault Address Register (EL3)

The FAR\_EL3 characteristics are:

## Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort and PC alignment fault exceptions that are taken to EL3.

## Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to FAR\_EL3 are UNDEFINED.

## Attributes

FAR\_EL3 is a 64-bit register.

## Field descriptions

The FAR\_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Faulting Virtual Address for synchronous exceptions taken to EL3																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Faulting Virtual Address for synchronous exceptions taken to EL3																															

### Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL3. Exceptions that set the FAR\_EL3 are Instruction Aborts (EC 0x20 or 0x21), Data Aborts (EC 0x24 or 0x25), and PC alignment faults (EC 0x22). [ESR\\_EL3](#).EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which  $\text{TCR\_ELx.TBI}\{\text{<0|1>}\} == 1$  for the translation regime in use when the abort was generated, then the top eight bits of FAR\_EL3 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if [ESR\\_EL3](#).FnV is 0, and the FAR\_EL3 is UNKNOWN if [ESR\\_EL3](#).FnV is 1.

For all other exceptions taken to EL3, the FAR\_EL3 is UNKNOWN.

If a memory fault that sets FAR\_EL3, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR\_EL3 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by [DC ZVA](#).

If the exception that updates FAR\_EL3 is taken from an Exception Level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR\_ELx are 0x00000001:

- The faulting address was generated by a load or store instruction that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state'.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL2, EL1 or EL0 makes FAR\_EL3 become UNKNOWN.

---

### Note

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

---

FAR\_EL3 is made UNKNOWN on an exception return from EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the FAR\_EL3

Accesses to this register use the following encodings:

MRS <Xt>, FAR\_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0110	0b0000	0b000

```

    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    FAR_EL3 = X[t];
```

# FPCR, Floating-point Control Register

The FPCR characteristics are:

## Purpose

Controls floating-point behavior.

## Configuration

The named fields in this register map to the equivalent fields in the AArch32 [FPSCR](#).

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

## Attributes

FPCR is a 64-bit register.

## Field descriptions

The FPCR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32										
RES0																																									
RES0				AHP		DN		FZ		RMode		Stride		FZ16		Len		IDE		RES0		IXE		UFE		OFE		DZE		IOE		RES0				NEP		AH		FIZ	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0										

### Bits [63:27]

Reserved, RES0.

### AHP, bit [26]

Alternative half-precision control bit.

AHP	Meaning
0b0	IEEE half-precision format selected.
0b1	Alternative half-precision format selected.

This bit is used only for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the FEAT\_FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### DN, bit [25]

Default NaN mode control bit.

<b>DN</b>	<b>Meaning</b>
0b0	NaN operands propagate through to the output of a floating-point operation.
0b1	Any operation involving one or more NaNs returns the Default NaN. If FPCR.AH is 1, this bit has no effect on the output of the FMAX, FMAXP, FMAXV, FMIN, FMINP, and FMINV instructions, and a default NaN is never returned as a result of these instructions.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## FZ, bit [24]

Flush-to-zero mode control bit.

<b>FZ</b>	<b>Meaning</b>
0b0	Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
0b1	Flush-to-zero mode enabled. If FPCR.AH is 1: <ul style="list-style-type: none"> <li>• This bit does not generate Input Denormal exceptions.</li> <li>• This bit does not cause input denormal operands to be flushed to zero.</li> <li>• When the output is flushed to zero: <ul style="list-style-type: none"> <li>◦ An Inexact floating-point exception is generated.</li> <li>◦ The test for a denormalized number for half-precision, single-precision, and double-precision numbers occurs after rounding with an unbounded exponent.</li> </ul> </li> </ul>

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

This bit has no effect on half-precision calculations.

If the result of an FMAX, FMAXP, FMAXV, FMIN, FMINP, or FMINV instruction is a denormalized number, it is not flushed to zero, regardless of the value of this bit.

Denormalized outputs of the following instructions, as determined after rounding with an unbounded exponent, are not affected by the value of this bit:

- The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions.
- Single-precision and double-precision FRECP, FRECPX, FRSQRTE, and FRSQRTS instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## RMode, bits [23:22]

Rounding Mode control field.

<b>RMode</b>	<b>Meaning</b>
0b00	Round to Nearest (RN) mode.
0b01	Round towards Plus Infinity (RP) mode.
0b10	Round towards Minus Infinity (RM) mode.
0b11	Round towards Zero (RZ) mode.

The specified rounding mode is used by both scalar and Advanced SIMD floating-point instructions.

If FPCR.AH is 1, then the following instructions use Round to Nearest mode regardless of the value of this bit:

- The FRECP, FRECPX, FRSQRTE, and FRSQRTS instructions.
- The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Stride, bits [21:20]**

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state.

This field is included only for context saving and restoration of the AArch32 [FPSCR](#).Stride field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FZ16, bit [19]**

**When FEAT\_FP16 is implemented:**

Flush-to-zero mode control bit on half-precision data-processing instructions.

FZ16	Meaning
0b0	Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
0b1	Flush-to-zero mode enabled. If FPCR.AH is 1: <ul style="list-style-type: none"><li>When the output is flushed to zero:<ul style="list-style-type: none"><li>An Inexact floating-point exception is generated.</li><li>The test for a denormalized number for half-precision, single-precision, and double-precision numbers occurs after rounding with an unbounded exponent.</li></ul></li></ul>

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations. A half-precision floating-point number that is flushed to zero as a result of the value of the FZ16 bit does not generate an Input Denormal exception.

If the result of an FMAX, FMAXP, FMAXV, FMIN, FMINP, or FMINV instruction is a denormalized number, it is not flushed to zero, regardless of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Len, bits [18:16]**

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state.

This field is included only for context saving and restoration of the AArch32 [FPSCR](#).Len field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IDE, bit [15]**

Input Denormal floating-point exception trap enable.

IDE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the <a href="#">FPSR</a> .IDC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the <a href="#">FPSR</a> .IDC bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [14:13]**

Reserved, RES0.

**IXE, bit [12]**

Inexact floating-point exception trap enable.

IXE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the <a href="#">FPSR.IXC</a> bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the <a href="#">FPSR.IXC</a> bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**UFE, bit [11]**

Underflow floating-point exception trap enable.

UFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the <a href="#">FPSR.UFC</a> bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs and Flush-to-zero is not enabled, the PE does not update the <a href="#">FPSR.UFC</a> bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**OFE, bit [10]**

Overflow floating-point exception trap enable.

OFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the <a href="#">FPSR.OFC</a> bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the <a href="#">FPSR.OFC</a> bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DZE, bit [9]**

Divide by Zero floating-point exception trap enable.

DZE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the <a href="#">FPSR.DZC</a> bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the <a href="#">FPSR.DZC</a> bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## IOE, bit [8]

Invalid Operation floating-point exception trap enable.

IOE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the <a href="#">FPSR</a> .IOC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the <a href="#">FPSR</a> .IOC bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bits [7:3]

Reserved, RES0.

## NEP, bit [2]

### When FEAT\_AFP is implemented:

Controls how the output elements other than the lowest element of the vector are determined for Advanced SIMD scalar instructions.

NEP	Meaning
0b0	Does not affect how the output elements other than the lowest are determined for Advanced SIMD scalar instructions.
0b1	The output elements other than the lowest are taken from the following registers: <ul style="list-style-type: none"> <li>For 3-input scalar versions of the FMLA (by element) and FMLS (by element) instructions, the &lt;Hd&gt;, &lt;Sd&gt;, or &lt;Dd&gt; register.</li> <li>For 3-input versions of the FMADD, FMSUB, FNMADD, and FNMSUB instructions, the &lt;Ha&gt;, &lt;Sa&gt;, or &lt;Da&gt; register.</li> <li>For 2-input scalar versions of the FACGE, FACGT, FCMEQ (register), FCMGE (register), and FCMGT (register) instructions, the &lt;Hm&gt;, &lt;Sm&gt;, or &lt;Dm&gt; register.</li> <li>For 2-input scalar versions of the FABD, FADD (scalar), FDIV (scalar), FMAX (scalar), FMAXNM (scalar), FMIN (scalar), FMINNM (scalar), FMUL (by element), FMUL (scalar), FMULX, FNMUL (scalar), FRECPs, FRSQRTS, and FSUB (scalar) instructions, the &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register.</li> <li>For 1-input scalar versions of the following instructions, the &lt;Hd&gt;, &lt;Sd&gt;, or &lt;Dd&gt; register: <ul style="list-style-type: none"> <li>The (vector) versions of the FCVTAS, FCVTAU, FCVTMS, FCVTMU, FCVTNS, FCVTNU, FCVTPS, and FCVTPU instructions.</li> <li>The (vector, fixed-point) and (vector, integer) versions of the FCVTZS, FCVTZU, SCVTF, and UCVTF instructions.</li> <li>The (scalar) versions of the FABS, FNEG, FRINT32X, FRINT32Z, FRINT64X, FRINT64Z, FRINTA, FRINTI, FRINTM, FRINTN, FRINTP, FRINTX, FRINTZ, and FSQRT instructions.</li> <li>The (scalar, fixed-point) and (scalar, integer) versions of the SCVTF and UCVTF instructions.</li> <li>The BFCVT, FCVT, FCVTXN, FRECPe, FRECPX, and FRSQRTE instructions.</li> </ul> </li> </ul>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**AH, bit [1]**

**When FEAT\_AFP is implemented:**

Alternate Handling. Controls alternate handling of denormalized floating-point numbers.

AH	Meaning
0b0	Does not affect handling of denormalized floating-point numbers.
0b1	<p>The sign-bit of the default NaN encoding is set to 1.</p> <p>For all floating-point instructions other than BFDOT and BFMMLA, detection of underflow occurs after rounding with an unbounded exponent.</p> <p>If an operation, other than FMAX, FMAXP, FMAXV, FMIN, FMINP, and FMINV, has two floating-point inputs in the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register or the &lt;Vm&gt;, &lt;Hm&gt;, &lt;Sm&gt;, or &lt;Dm&gt; register, and two NaN inputs, then the output is derived from the NaN held in the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register, regardless of whether any input is a signaling NaN or a quiet NaN.</p> <p>For the BFMLALB, BFMLALT, FCMLA, FMADD, FMLA, FMLAL, FMLAL2, FMLSL, FMLSL2, FMSUB, FNMADD, and FNMSUB instructions, regardless of whether any input is a signaling NaN or a quiet NaN:</p> <ul style="list-style-type: none"> <li>• If the operation has three NaN inputs, then the output is derived from the NaN held in the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register.</li> <li>• If the operation has two NaN inputs and the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register holds a NaN, then the output is derived from the NaN held in that register.</li> <li>• If the operation has two NaN inputs and the &lt;Vn&gt;, &lt;Hn&gt;, &lt;Sn&gt;, or &lt;Dn&gt; register does not hold a NaN, then the output is derived from the NaN held in the &lt;Hm&gt;, &lt;Sm&gt;, or &lt;Dm&gt; register.</li> </ul> <p>The FMAX, FMAXP, FMAXV, FMIN, FMINP, and FMINV instructions change their algorithm to calculate the minimum and maximum so that:</p> <ul style="list-style-type: none"> <li>• If the result is a denormalized number, it is not flushed to zero, regardless of FPCR.FZ or FPCR.FZ16.</li> <li>• If either input is a quiet NaN or a signaling NaN, then the second operand is returned as the result of the instruction and an Invalid Operation floating-point exception is generated.</li> <li>• If the two operands are +0 and -0 in any order, the second operand of the instruction is returned as the result of the instruction.</li> <li>• FPCR.DN has no effect on the output and a default NaN is never returned as the result of the instruction.</li> </ul> <p>The FCVTAS, FCVTAU, FCVTMS, FCVTMU, FCVTNS, FCVTNU, FCVTPS, FCVTPU, FCVTZS, FCVTZU, FJCVTZS, FRINT32X, FRINT32Z, FRINT64X, FRINT64Z, FRINTA, FRINTI, FRINTM, FRINTN, FRINTP, FRINTX, and FRINTZ instructions never generate an Input Denormal floating-point exception.</p> <p>The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions:</p> <ul style="list-style-type: none"> <li>• Use Round to Nearest rounding mode, regardless of the rounding mode selected in FPCR.RMode.</li> <li>• Flush all denormalized inputs to zero, retaining the sign, regardless of FPCR.FIZ.</li> <li>• Flush all denormalized outputs, as determined after rounding with an unbounded exponent, to zero, retaining the sign, regardless of FPCR.FZ.</li> <li>• Do not generate any floating-point exceptions, regardless of their input or output values.</li> </ul> <p>The FRECPPE, FRECPSP, FRECPX, FRSQRTE, and FRSQRTS instructions:</p> <ul style="list-style-type: none"> <li>• Use Round to Nearest rounding mode, regardless of the rounding mode selected in FPCR.RMode.</li> <li>• Do not generate any floating-point exceptions.</li> <li>• The single-precision and double-precision variants of these instructions: <ul style="list-style-type: none"> <li>◦ Flush all denormalized inputs to zero, retaining the sign, regardless of FPCR.FIZ.</li> <li>◦ Flush all denormalized outputs, as determined after rounding with an unbounded exponent, to zero, retaining the sign, regardless of FPCR.FZ.</li> </ul> </li> </ul> <p>When the output is flushed to zero:</p> <ul style="list-style-type: none"> <li>• An Inexact floating-point exception is generated.</li> </ul>

- The test for a denormalized number for half-precision, single-precision, and double-precision numbers occurs after rounding with an unbounded exponent.

If FPCR.FZ is 1, this does not cause any Input Denormal exceptions and does not cause input denormal operands to be flushed to zero. If FPCR.FIZ is 0, any operation that unpacks a denormalized floating-point number, other than a BFloat or half-precision number, will generate an Input Denormal floating-point exception, except when:

- One of the other operands of the instruction is a NaN.
- The operation also generates an Invalid Operation floating-point exception or a Divide by Zero floating-point exception.
- The operation was generated by a BFCVT, BFCVTN, BFCVTN2, or BFCVTNT instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FIZ, bit [0]**

**When FEAT\_AFP is implemented:**

Flush Inputs to Zero. Controls whether single-precision, double-precision, and BFloat16 input operands that are denormalized numbers are flushed to zero.

FIZ	Meaning
0b0	If FPCR.AH is 0, does not affect whether denormalized floating-point inputs are flushed to zero. If FPCR.AH is 1, any operation that unpacks a single-precision or double-precision denormalized floating-point number will generate an Input Denormal floating-point exception, except when: <ul style="list-style-type: none"><li>• One of the other operands of the instruction is a NaN.</li><li>• The operation also generates an Invalid Operation floating-point exception or a Divide by Zero floating-point exception.</li><li>• The operation was generated by a BFCVTN, BFCVTN2, BFCVT, or a BFCVTNT instruction.</li></ul>
0b1	All single-precision, double-precision, and BFloat16 input operands that are denormalized numbers, except FABS and FNEG, are flushed to zero, retaining the sign. If FPCR.AH is 1 or FPCR.FZ is 0, denormalized numbers that are flushed to zero by this field do not generate an Input Denormal exception.

The following instructions are not affected by the value of this bit:

- The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions.
- Single-precision and double-precision variants of the FRECP, FRECPX, FRSQRTE, and FRSQRTS instructions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Accessing the FPCR**

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, FPCR

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0100	0b000

# FPEXC32\_EL2, Floating-Point Exception Control register

The FPEXC32\_EL2 characteristics are:

## Purpose

Allows access to the AArch32 register [FPEXC](#) from AArch64 state only. Its value has no effect on execution in AArch64 state.

## Configuration

AArch64 System register FPEXC32\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [FPEXC\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to FPEXC32\_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

## Attributes

FPEXC32\_EL2 is a 64-bit register.

## Field descriptions

The FPEXC32\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

### Bits [63:32]

Reserved, RES0.

### EX, bit [31]

Exception bit. From Armv8, this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EN, bit [30]

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the [FPEXC](#) or [FPSID](#).
- VMRS accesses from the [FPEXC](#), [FPSID](#), [MVFR0](#), [MVFR1](#), or [MVFR2](#).

EN	Meaning
0b0	Accesses to the <a href="#">FPSCR</a> , and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.
0b1	This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of floating-point and Advanced SIMD instructions in AArch32 state can be disabled or trapped by the following controls:

- [CPACR](#).cp10, or, if executing at EL0, [CPACR\\_EL1](#).FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - [HCPTR](#).TCP10, or if EL2 is using AArch64, [CPTR\\_EL2](#).TFP.
  - [NSACR](#).cp10, or if EL3 is using AArch64, [CPTR\\_EL3](#).TFP.
- For Advanced SIMD instructions only:
  - [CPACR](#).ASEDIS.
  - If executing in Non-secure state, [HCPTR](#).TASE and [NSACR](#).NSTRCDIS.

See the descriptions of the controls for more information.

### Note

When executing at EL0 using AArch32:

- If EL1 is using AArch64 then behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of [HCR\\_EL2](#).{RW, TGE} is {1, 1} then behavior is as if the value of FPEXC.EN is 1.
- If EL2 is using AArch64 and enabled in the current Security state, and the value of [HCR\\_EL2](#).{RW, TGE} is {0, 1} then it is IMPLEMENTATION DEFINED whether the behavior is:
  - As if the value of FPEXC.EN is 1.
  - Determined by the value of FPEXC32\_EL2.EN, as described in this field description. However, Arm deprecates using the value of FPEXC32\_EL2.EN to determine behavior.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### DEX, bit [29]

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC32\_EL2.TFV field is valid.

The meaning of this bit is:

DEX	Meaning
0b0	The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC32_EL2.TFV is RW then it is invalid and UNKNOWN. If FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
0b1	The exception was generated during the execution of an unallocated encoding. FPEXC32_EL2.TFV is valid and indicates the cause of the exception.

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the AArch32 [FPSCR](#).{Stride, Len} fields as RAZ, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FP2V, bit [28]**

FPINST2 instruction valid bit. From Armv8, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VV, bit [27]**

VECITR valid bit. From Armv8, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TFV, bit [26]**

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

TFV	Meaning
0b0	The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of <a href="#">FPSCR</a> .{Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.
0b1	FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements [FPSCR](#).{Stride, Len} as RAZ, this bit is RAO/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [25:11]**

Reserved, RES0.

**VECITR, bits [10:8]**

Vector iteration count. From Armv8, this field is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IDF, bit [7]**

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while [FPSCR](#).IDE was 1:

IDF	Meaning
0b0	Input Denormal exception has not occurred.
0b1	Input Denormal exception has occurred.

Input Denormal exceptions can occur only when [FPSCR](#).FZ is 1.

**Note**

---

A half-precision floating-point value that is flushed to zero because the value of [FPSCR.FZ16](#) is 1 does not generate an Input Denormal exception.

---

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32\_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [6:5]

Reserved, RES0.

#### IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while [FPSCR.IXE](#) was 1:

IXF	Meaning
0b0	Inexact exception has not occurred.
0b1	Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while [FPSCR.UFE](#) was 1:

UFF	Meaning
0b0	Underflow exception has not occurred.
0b1	Underflow exception has occurred.

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when [FPSCR.FZ16](#) is 0.
- Otherwise only when [FPSCR.FZ](#) is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32\_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while [FPSCR.OFE](#) was 1:

OFF	Meaning
0b0	Overflow exception has not occurred.
0b1	Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while [FPSCR.DZE](#) was 1:

DZF	Meaning
0b0	Divide by Zero exception has not occurred.
0b1	Divide by Zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while [FPSCR.IOE](#) was 1:

IOF	Meaning
0b0	Invalid Operation exception has not occurred.
0b1	Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the FPEXC32\_EL2

Accesses to this register use the following encodings:

# FPSR, Floating-point Status Register

The FPSR characteristics are:

## Purpose

Provides floating-point system status information.

## Configuration

The named fields in this register map to the equivalent fields in the AArch32 [FPSCR](#).

## Attributes

FPSR is a 64-bit register.

## Field descriptions

The FPSR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																RES0																
N	Z	C	V	QC	RES0																		IDC	RES0	IXC	UFC	OFC	DZC	IOC			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### Bits [63:32]

Reserved, RES0.

### N, bit [31]

When AArch32 is supported at any Exception level and AArch32 floating-point is implemented:

Negative condition flag for AArch32 floating-point comparison operations.

**Note**

AArch64 floating-point comparisons set the PSTATE.N flag instead.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

### Z, bit [30]

When AArch32 is supported at any Exception level and AArch32 floating-point is implemented:

Zero condition flag for AArch32 floating-point comparison operations.

**Note**

AArch64 floating-point comparisons set the PSTATE.Z flag instead.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**C, bit [29]**

**When AArch32 is supported at any Exception level and AArch32 floating-point is implemented:**

Carry condition flag for AArch32 floating-point comparison operations.

---

**Note**

AArch64 floating-point comparisons set the PSTATE.C flag instead.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**V, bit [28]**

**When AArch32 is supported at any Exception level and AArch32 floating-point is implemented:**

Overflow condition flag for AArch32 floating-point comparison operations.

---

**Note**

AArch64 floating-point comparisons set the PSTATE.V flag instead.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**QC, bit [27]**

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [26:8]**

Reserved, RES0.

**IDC, bit [7]**

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.IDE](#) bit. This bit is set to 1 to indicate a floating-point exception only if [FPCR.IDE](#) is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:5]**

Reserved, RES0.

**IXC, bit [4]**

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact exception floating-point has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.IXE](#) bit. This bit is set to 1 to indicate a floating-point exception only if [FPCR.IXE](#) is 0.

The criteria for the Inexact floating-point exception to occur are different in Flush-to-zero mode. For details, see 'Flush-to-zero'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**UFC, bit [3]**

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.UFE](#) bit. This bit is set to 1 to indicate a floating-point exception only if [FPCR.UFE](#) is 0 or Flush-to-zero is enabled.

The criteria for the Underflow floating-point exception to occur are different in Flush-to-zero mode. For details, see 'Flush-to-zero'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**OFC, bit [2]**

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.OFE](#) bit. This bit is set to 1 to indicate a floating-point exception only if [FPCR.OFE](#) is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DZC, bit [1]**

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.DZE](#) bit. This bit is set to 1 to indicate a floating-point exception only if [FPCR.DZE](#) is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IOC, bit [0]**

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.IOE](#) bit. This bit is set to 1 to indicate a floating-point exception only if [FPCR.IOE](#) is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the FPSR**

Accesses to this register use the following encodings:

# GCR\_EL1, Tag Control Register.

The GCR\_EL1 characteristics are:

## Purpose

Tag Control Register.

## Configuration

This register is present only when FEAT\_MTE2 is implemented. Otherwise, direct accesses to GCR\_EL1 are UNDEFINED.

## Attributes

GCR\_EL1 is a 64-bit register.

## Field descriptions

The GCR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																RES0															
RES0																RRND	Exclude														
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:17]

Reserved, RES0.

### RRND, bit [16]

Controls generation of tag values by the IRG instruction.

RRND	Meaning
0b0	IRG generates a tag value as defined by RandomTag().
0b1	IRG generates an implementation-specific tag value with a distribution of tag values no worse than generated with GCR_EL1.RRND == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Exclude, bits [15:0]

Allocation Tag values excluded from selection by ChooseNonExcludedTag().

If all bits of GCR\_EL1.Exclude are 1, then the Allocation Tag value 0 will be used.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the GCR\_EL1

# GMID\_EL1, Multiple tag transfer ID register

The GMID\_EL1 characteristics are:

## Purpose

Indicates the block size that is accessed by the LDGM and STGM System instructions.

## Configuration

This register is present only when FEAT\_MTE2 is implemented. Otherwise, direct accesses to GMID\_EL1 are UNDEFINED.

## Attributes

GMID\_EL1 is a 64-bit register.

## Field descriptions

The GMID\_EL1 bit assignments are:

### Bits [63:4]

Reserved, RES0.

### BS, bits [3:0]

Log<sub>2</sub> of the block size in words. The minimum supported size is 16B (value == 2) and the maximum is 256B (value == 6).

## Accessing the GMID\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, GMID\_EL1

CRn	op0	op1	op2	CRm
0b0000	0b11	0b001	0b100	0b0000

# HACR\_EL2, Hypervisor Auxiliary Control Register

The HACR\_EL2 characteristics are:

## Purpose

Controls trapping to EL2 of IMPLEMENTATION DEFINED aspects of EL1 or EL0 operation.

### Note

Arm recommends that the values in this register do not cause unnecessary traps to EL2 when [HCR\\_EL2](#).{E2H, TGE} == {1, 1}.

## Configuration

AArch64 System register HACR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HACR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

HACR\_EL2 is a 64-bit register.

## Field descriptions

The HACR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# HAFGRTR\_EL2, Hypervisor Activity Monitors Fine-Grained Read Trap Register

The HAFGRTR\_EL2 characteristics are:

## Purpose

Provides controls for traps of MRS reads of Activity Monitors System registers.

## Configuration

This register is present only when FEAT\_AMUv1 is implemented and FEAT\_FGT is implemented. Otherwise, direct accesses to HAFGRTR\_EL2 are UNDEFINED.

## Attributes

HAFGRTR\_EL2 is a 64-bit register.

## Field descriptions

The HAFGRTR\_EL2 bit assignments are:

63	62	61	60	59	58
AMEVTYPER16_EL0	AMEVCNTR16_EL0	AMEVTYPER15_EL0	AMEVCNTR15_EL0	AMEVTYPER14_EL0	AMEVCNTR14_EL0
31	30	29	28	27	26

### Bits [63:50]

Reserved, RES0.

### AMEVTYPER1<x>\_EL0, bit [19+2x], for x = 15 to 0

Trap MRS reads of [AMEVTYPER1<x>\\_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [AMEVTYPER1<x>](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER1<x>_EL0	Meaning
0b0	MRS reads of <a href="#">AMEVTYPER1&lt;x&gt;_EL0</a> at EL1 and EL0 using AArch64 and MRC reads of <a href="#">AMEVTYPER1&lt;x&gt;</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of <a href="#">AMEVTYPER1&lt;x&gt;_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of <a href="#">AMEVTYPER1&lt;x&gt;</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**AMEVCNTR1<x>\_EL0, bit [18+2x], for x = 15 to 0**

Trap MRS reads of [AMEVCNTR1<x>\\_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [AMEVCNTR1<x>](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

<b>AMEVCNTR1&lt;x&gt;_EL0</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">AMEVCNTR1&lt;x&gt;_EL0</a> at EL1 and EL0 using AArch64 and MRC reads of <a href="#">AMEVCNTR1&lt;x&gt;</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>• MRS reads of <a href="#">AMEVCNTR1&lt;x&gt;_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>• MRC reads of <a href="#">AMEVCNTR1&lt;x&gt;</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**AMCNTEN<x>, bit [17x], for x = 1 to 0**

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of [AMCNTENCLR<x>\\_EL0](#) and [AMCNTENSET<x>\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [AMCNTENCLR<x>](#) and [AMCNTENSET<x>](#).

<b>AMCNTEN&lt;x&gt;</b>	<b>Meaning</b>
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>• MRS reads at EL1 and EL0 using AArch64 of <a href="#">AMCNTENCLR&lt;x&gt;_EL0</a> and <a href="#">AMCNTENSET&lt;x&gt;_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>• MRC reads at EL0 using AArch32 of <a href="#">AMCNTENCLR&lt;x&gt;</a> and <a href="#">AMCNTENSET&lt;x&gt;</a> are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Bits [16:5]**

Reserved, RES0.

**AMEVCNTR0<x>\_EL0, bit [x+1], for x = 3 to 0**

Trap MRS reads of [AMEVCNTR0<x>\\_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [AMEVCNTR0<x>](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR0<x>_EL0	Meaning
0b0	MRS reads of <a href="#">AMEVCNTR0&lt;x&gt;_EL0</a> at EL1 and EL0 using AArch64 and MRC reads of <a href="#">AMEVCNTR0&lt;x&gt;</a> at EL0 using AArch32 are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 0b1, then, unless the read generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MRS reads of <a href="#">AMEVCNTR0&lt;x&gt;_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of <a href="#">AMEVCNTR0&lt;x&gt;</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

## Accessing the HAFGRTR\_EL2

Accesses to this register use the following encodings:

# HCR\_EL2, Hypervisor Configuration Register

The HCR\_EL2 characteristics are:

## Purpose

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

## Configuration

AArch64 System register HCR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HCR\[31:0\]](#).

AArch64 System register HCR\_EL2 bits [63:32] are architecturally mapped to AArch32 System register [HCR2\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

The bits in this register behave as if they are 0 for all purposes other than direct reads of the register if EL2 is not enabled in the current Security state.

## Attributes

HCR\_EL2 is a 64-bit register.

## Field descriptions

The HCR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

### TWEDEL, bits [63:60]

When FEAT\_TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when HCR\_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE\* caused by HCR\_EL2.TWE as  $2^{(TWEDEL + 8)}$  cycles.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### TWEDEn, bit [59]

When FEAT\_TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE\* instruction caused by HCR\_EL2.TWE.

TWEDEn	Meaning
0b0	The delay for taking the trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking the trap is at least the number of cycles defined in HCR_EL2.TWEDEL.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TID5, bit [58]****When FEAT\_MTE2 is implemented:**

Trap ID group 5. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- [GMID\\_EL1](#).

TID5	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 5 registers are trapped to EL2.

When the value of HCR\_EL2.{E2H, TGE} is {1, 1}, this field has an Effective value of 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DCT, bit [57]****When FEAT\_MTE2 is implemented:**

Default Cacheability Tagging. When HCR\_EL2.DC is in effect, controls whether stage 1 translations are treated as Tagged or Untagged.

DCT	Meaning
0b0	Stage 1 translations are treated as Untagged.
0b1	Stage 1 translations are treated as Tagged.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**ATA, bit [56]****When FEAT\_MTE2 is implemented:**

Allocation Tag Access. When [HCR\\_EL2](#).{E2H,TGE} != {1,1}, controls EL1 and EL0 access to Allocation Tags.

When access is prevented:

- Instructions which Load or Store data are Unchecked.
- Instructions which Load or Store Allocation Tags treat the Allocation Tag as RAZ/WI.
- Instructions which insert Logical Address Tags into addresses treat the Allocation Tag used to generate the Logical Address Tag as 0.
- Cache maintenance instructions which invalidate Allocation Tags from caches behave as the equivalent Clean and Invalidate operation on Allocation Tags.
- MRS and MSR instructions at EL1 using [GCR\\_EL1](#), [RGSRR\\_EL1](#), [TFSRR\\_EL1](#), [TFSRR\\_EL2](#), or [TFSRR0\\_EL1](#) that are not UNDEFINED are trapped to EL2.

ATA	Meaning
0b0	Access is prevented.
0b1	Access is not prevented.

This field is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TTLBOS, bit [55]**

**When FEAT\_EVT is implemented:**

Trap TLB maintenance instructions that operate on the Outer Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

[TLBI VMALLE1OS](#), [TLBI VAE1OS](#), [TLBI ASIDE1OS](#), [TLBI VAAE1OS](#), [TLBI VALE1OS](#), [TLBI VAALE1OS](#), [TLBI RVAE1OS](#), [TLBI RVAAE1OS](#), [TLBI RVALE1OS](#), and [TLBI RVAALE1OS](#).

TTLBOS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TTLBIS, bit [54]**

**When FEAT\_EVT is implemented:**

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, [TLBI VMALLE1IS](#), [TLBI VAE1IS](#), [TLBI ASIDE1IS](#), [TLBI VAAE1IS](#), [TLBI VALE1IS](#), [TLBI VAALE1IS](#), [TLBI RVAE1IS](#), [TLBI RVAAE1IS](#), [TLBI RVALE1IS](#), and [TLBI RVAALE1IS](#).
- When EL1 is using AArch32, [TLBIALLIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAAIS](#), [TLBIMVALIS](#), and [TLBIMVAALIS](#).

TTLBIS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**EnSCXT, bit [53]**

**When FEAT\_CSV2 is implemented:**

Enable Access to the [SCXTNUM\\_EL1](#) and [SCXTNUM\\_EL0](#) registers. The defined values are:

EnSCXT	Meaning
0b0	When (HCR_EL2.TGE==0 or HCR_EL2.E2H==0) and EL2 is enabled in the current Security state, EL1 and EL0 access to <a href="#">SCXTNUM_EL0</a> and EL1 access to <a href="#">SCXTNUM_EL1</a> is disabled by this mechanism, causing an exception to EL2, and the values of these registers to be treated as 0. When ((HCR_EL2.TGE==1 and HCR_EL2.E2H==1) and EL2 is enabled in the current Security state, EL0 access to <a href="#">SCXTNUM_EL0</a> is disabled by this mechanism, causing an exception to EL2, and the value of this register to be treated as 0.
0b1	This control does not cause accesses to <a href="#">SCXTNUM_EL0</a> or <a href="#">SCXTNUM_EL1</a> to be trapped.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TOCU, bit [52]****When FEAT\_EVT is implemented:**

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When [SCTLR\\_EL1](#).UCI is 1, HCR\_EL2.{TGE, E2H} is not {1, 1}, and EL0 is using AArch64, [IC IVAU](#), [DC CVAU](#).
- When EL1 is using AArch64, [IC IVAU](#), [IC IALLU](#), [DC CVAU](#).
- When EL1 is using AArch32, [ICIMVAU](#), [IC IALLU](#), [DCCMVAU](#).

**Note**

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- [IC IALLUIS](#) and [IC IALLU](#) are always UNDEFINED at EL0 using AArch64.
- [ICIMVAU](#), [IC IALLU](#), [IC IALLUIS](#), and [DCCMVAU](#) are always UNDEFINED at EL0 using AArch32.

TOCU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**AMVOFFEN, bit [51]****When FEAT\_AMUv1p1 is implemented:**

Activity Monitors Virtual Offsets Enable.

AMVOFFEN	Meaning
0b0	Virtualization of the Activity Monitors is disabled. Indirect reads of the virtual offset registers are zero.
0b1	Virtualization of the Activity Monitors is enabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TICAB, bit [50]****When FEAT\_EVT is implemented:**

Trap ICIALLUIS/IC IALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, [IC IALLUIS](#).
- When EL1 is using AArch32, [ICIALLUIS](#).

TICAB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified instructions is trapped to EL2.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TID4, bit [49]****When FEAT\_EVT is implemented:**

Trap ID group 4. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- EL1 reads of [CCSIDR\\_EL1](#), [CCSIDR2\\_EL1](#), [CLIDR\\_EL1](#), and [CSSELR\\_EL1](#).
- EL1 writes to [CSSELR\\_EL1](#).

AArch32:

- EL1 reads of [CCSIDR](#), [CCSIDR2](#), [CLIDR](#), and [CSSELR](#).
- EL1 writes to [CSSELR](#).

TID4	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.

When FEAT\_VHE is implemented, and the value of HCR\_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bit [48]

Reserved, RES0.

#### FIEN, bit [47]

##### When FEAT\_RASv1p1 is implemented:

Fault Injection Enable. Unless this bit is set to 1, accesses to the [ERXPFPCDN\\_EL1](#), [ERXPFPCCTL\\_EL1](#), and [ERXPFPCF\\_EL1](#) registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18.

FIEN	Meaning
0b0	Accesses to the specified registers from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

If EL2 is disabled in the current Security state, the Effective value of HCR\_EL2.FIEN is 0b1.

If [ERRIDR\\_EL1](#).NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### FWB, bit [46]

##### When FEAT\_S2FWB is implemented:

Forced Write-Back. Defines the combined cacheability attributes in a 2 stage translation regime.

#### Note

When FEAT\_MTE2 is implemented, if the stage 1 page or block descriptor specifies the Tagged attribute, the final memory type is Tagged only if the final cacheable memory type is Inner and Outer Write-back cacheable and the final allocation hints are Read-Allocate, Write-Allocate.

<b>FWB</b>	<b>Meaning</b>
0b0	<p>When this bit is 0, then:</p> <ul style="list-style-type: none"> <li>The combination of stage 1 and stage 2 translations on memory type and cacheability attributes are as described in the Armv8.0 architecture. For more information, see 'Combining the stage 1 and stage 2 attributes, EL1&amp;0 translation regime'.</li> <li>The encoding of the stage 2 memory type and cacheability attributes in bits[5:2] of the stage 2 page or block descriptors are as described in the Armv8.0 architecture.</li> </ul>
0b1	<p>When this bit is 1, then:</p> <ul style="list-style-type: none"> <li>Bit[5] of stage 2 page or block descriptor is RES0.</li> <li>When bit[4] of stage 2 page or block descriptor is 1 and when: <ul style="list-style-type: none"> <li>Bits[3:2] of stage 2 page or block descriptor are 0b11, the resultant memory type and inner or outer cacheability attribute is the same as the stage 1 memory type and inner or outer cacheability attribute.</li> <li>Bits[3:2] of stage 2 page or block descriptor are 0b10, the resultant memory type and attribute is Normal Write-Back.</li> <li>Bits[3:2] of stage 2 page or block descriptor are 0b0x, the resultant memory type will be Normal Non-cacheable except where the stage 1 memory type was Device-&lt;attr&gt; the resultant memory type will be Device-&lt;attr&gt;</li> </ul> </li> <li>When bit[4] of stage 2 page or block descriptor is 0 the memory type is Device, and when: <ul style="list-style-type: none"> <li>Bits[3:2] of stage 2 page or block descriptor are 0b00, the stage 2 memory type is Device-nGnRnE.</li> <li>Bits[3:2] of stage 2 page or block descriptor are 0b01, the stage 2 memory type is Device-nGnRE.</li> <li>Bits[3:2] of stage 2 page or block descriptor are 0b10, the stage 2 memory type is Device-nGRE.</li> <li>Bits[3:2] of stage 2 page or block descriptor are 0b11, the stage 2 memory type is Device-GRE.</li> </ul> </li> <li>If the stage 1 translation specifies a cacheable memory type, then the stage 1 cache allocation hint is applied to the final cache allocation hint where the final memory type is cacheable.</li> <li>If the stage 1 translation does not specify a cacheable memory type, then if the final memory type is cacheable, it is treated as read allocate, write allocate.</li> </ul> <p>The stage 1 and stage 2 memory types are combined in the manner described in 'Combining the stage 1 and stage 2 attributes, EL1&amp;0 translation regime'.</p>

In Secure state, this bit applies to both the Secure stage 2 translation and the Non-secure stage 2 translation.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### NV2, bit [45]

##### When FEAT\_NV2 is implemented:

Nested Virtualization. Changes the behaviors of HCR\_EL2.{NV1, NV} to provide a mechanism for hardware to transform reads and writes from System registers into reads and writes from memory.

NV2	Meaning
0b0	This bit has no effect on the behavior of HCR_EL2.{NV1, NV}. The behavior of HCR_EL2.{NV1, NV} is as defined for FEAT_NV.
0b1	Redefines behavior of HCR_EL2.{NV1, NV} to enable: <ul style="list-style-type: none"> <li>Transformation of read/writes to registers into read/writes to memory.</li> <li>Redirection of EL2 registers to EL1 registers.</li> </ul> Any exception taken from EL1 and taken to EL1 causes <a href="#">SPSR_EL1.M[3:2]</a> to be set to 0b10 and not 0b01.

When HCR\_EL2.NV is 0, the Effective value of this field is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### AT, bit [44]

##### When FEAT\_NV is implemented:

Address Translation. EL1 execution of the following address translation instructions is trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- [AT S1E0R](#), [AT S1E0W](#), [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#).

AT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified instructions is trapped to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### NV1, bit [43]

##### When FEAT\_NV2 is implemented:

Nested Virtualization.

NV1	Meaning
0b0	If HCR_EL2.{NV2, NV} are both 1, accesses executed from EL1 to implemented EL12, EL02, or EL2 registers are transformed to loads and stores. If HCR_EL2.NV2 is 0 or HCR_EL2.{NV2, NV} == {1, 0}, this control does not cause any instructions to be trapped.
0b1	If HCR_EL2.NV2 is 1, accesses executed from EL1 to implemented EL2 registers are transformed to loads and stores. If HCR_EL2.NV2 is 0, EL1 accesses to <a href="#">VBAR_EL1</a> , <a href="#">ELR_EL1</a> , <a href="#">SPSR_EL1</a> , and, when FEAT_CSV2 is implemented, <a href="#">SCXTNUM_EL1</a> , are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.

If HCR\_EL2.NV2 is 1, the value of HCR\_EL2.NV1 defines which EL1 register accesses are transformed to loads and stores. These transformed accesses have priority over the trapping of registers.

The trapping of EL1 registers caused by other control bits has priority over the transformation of these accesses.

If a register is specified that is not implemented by an implementation, then access to that register are UNDEFINED.

For the list of registers affected, see 'Enhanced support for nested virtualization'.

If HCR\_EL2.{NV1, NV} is {0, 1}, any exception taken from EL1, and taken to EL1, causes the [SPSR\\_EL1.M\[3:2\]](#) to be set to 0b10, and not 0b01.

If HCR\_EL2.{NV1, NV} is {1, 1}, then:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR\* instructions are treated as the equivalent LDR\* instructions, and the STTR\* instructions are treated as the equivalent STR\* instructions.

If HCR\_EL2.{NV1, NV} are {1, 0}, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR\_EL2.NV is 1 and HCR\_EL2.NV1 is 1 for all purposes other than reading than reading back the value of the HCR\_EL2.NV bit.
- Behaving as if HCR\_EL2.NV is 0 and HCR\_EL2.NV1 is 0 for all purposes other than reading than reading back the value of the HCR\_EL2.NV1 bit.
- Behaving with regard to the HCR\_EL2.NV and HCR\_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### When FEAT\_NV is implemented:

Nested Virtualization. EL1 accesses to certain registers are trapped to EL2, when EL2 is enabled in the current Security state.

NV1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to <a href="#">VBAR_EL1</a> , <a href="#">ELR_EL1</a> , <a href="#">SPSR_EL1</a> , and, when FEAT_CSV2 is implemented, <a href="#">SCXTNUM_EL1</a> , are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.

If HCR\_EL2.NV is 1 and HCR\_EL2.NV1 is 0, then the following effects also apply:

- Any exception taken from EL1, and taken to EL1, causes the [SPSR\\_EL1.M\[3:2\]](#) to be set to 0b10, and not 0b01.

If HCR\_EL2.NV and HCR\_EL2.NV1 are both set to 1, then the following effects also apply:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR\* instructions are treated as the equivalent LDR\* instructions, and the STTR\* instructions are treated as the equivalent STR\* instructions.

If HCR\_EL2.NV is 0 and HCR\_EL2.NV1 is 1, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR\_EL2.NV is 1 and HCR\_EL2.NV1 is 1 for all purposes other than reading than reading back the value of the HCR\_EL2.NV bit.
- Behaving as if HCR\_EL2.NV is 0 and HCR\_EL2.NV1 is 0 for all purposes other than reading than reading back the value of the HCR\_EL2.NV1 bit.

- Behaving with regard to the HCR\_EL2.NV and HCR\_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### NV, bit [42]

##### When FEAT\_NV2 is implemented:

Nested Virtualization.

When HCR\_EL2.NV2 is 1, redefines register accesses so that:

- Instructions accessing the Special purpose registers [SPSR\\_EL2](#) and [ELR\\_EL2](#) instead access [SPSR\\_EL1](#) and [ELR\\_EL1](#) respectively.
- Instructions accessing the System registers [ESR\\_EL2](#) and [FAR\\_EL2](#) instead access [ESR\\_EL1](#) and [FAR\\_EL1](#).

When HCR\_EL2.NV2 is 0, or if FEAT\_NV2 is not implemented, traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

NV	Meaning
0b0	When this bit is set to 0, then the PE behaves as if HCR_EL2.NV2 is 0 for all purposes other than reading this register. This control does not cause any instructions to be trapped. When HCR_EL2.NV2 is 1, no FEAT_NV2 functionality is implemented.
0b1	When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the <a href="#">CurrentEL</a> register return a value of 0x2. When HCR_EL2.NV2 is 1, this control redefines EL1 register accesses so that instructions accessing <a href="#">SPSR_EL2</a> , <a href="#">ELR_EL2</a> , <a href="#">ESR_EL2</a> , and <a href="#">FAR_EL2</a> instead access <a href="#">SPSR_EL1</a> , <a href="#">ELR_EL1</a> , <a href="#">ESR_EL1</a> , and <a href="#">FAR_EL1</a> respectively.

When HCR\_EL2.NV2 is 0, or if FEAT\_NV2 is not implemented, then:

- The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:
  - Registers accessed using MRS or MSR with a name ending in \_EL2, except [SP\\_EL2](#).
  - Registers accessed using MRS or MSR with a name ending in \_EL12.
  - Registers accessed using MRS or MSR with a name ending in \_EL02.
  - Special-purpose registers [SPSR\\_irq](#), [SPSR\\_abt](#), [SPSR\\_und](#) and [SPSR\\_fiq](#), accessed using MRS or MSR.
  - Special-purpose register [SP\\_EL1](#) accessed using the dedicated MRS or MSR instruction.
- The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:
  - EL2 translation regime Address Translation instructions and TLB maintenance instructions.
  - EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.
- The instructions for which the execution is trapped as follows:
  - SMC in an implementation that does not include EL3 and when HCR\_EL2.TSC is 1. HCR\_EL2.TSC bit is not RES0 in this case. This is reported using EC syndrome value 0x17.
  - The ERET, ERETAA, and ERETAB instructions, reported using EC syndrome value 0x1A.

#### Note

---

The priority of this trap is higher than the priority of the HCR\_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### When FEAT\_NV is implemented:

Nested Virtualization. Traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

The possible values are:

NV	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the <a href="#">CurrentEL</a> register return a value of 0x2.

The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:

- Registers accessed using MRS or MSR with a name ending in \_EL2, except [SP\\_EL2](#).
- Registers accessed using MRS or MSR with a name ending in \_EL12.
- Registers accessed using MRS or MSR with a name ending in \_EL02.
- Special-purpose registers [SPSR\\_irq](#), [SPSR\\_abt](#), [SPSR\\_und](#) and [SPSR\\_fiq](#), accessed using MRS or MSR.
- Special-purpose register [SP\\_EL1](#) accessed using the dedicated MRS or MSR instruction.

The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:

- EL2 translation regime Address Translation instructions and TLB maintenance instructions.
- EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.

The execution of the ERET, ERETAA, and ERETAB instructions are trapped and reported using EC syndrome value 0x1A

---

#### Note

The priority of this trap is higher than the priority of the HCR\_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

---

The execution of the SMC instructions in an implementation that does not include EL3 and when HCR\_EL2.TSC is 1 are trapped and reported using EC syndrome value 0x17. HCR\_EL2.TSC bit is not RES0 in this case.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

**API, bit [41]****When FEAT\_PAuth is implemented:**

Controls the use of instructions related to Pointer Authentication:

- In EL0, when HCR\_EL2.TGE==0 or HCR\_EL2.E2H==0, and the associated [SCTLR\\_EL1.En<N><M>==1](#).
- In EL1, the associated [SCTLR\\_EL1.En<N><M>==1](#).

Traps are reported using EC syndrome value 0x09. The Pointer Authentication instructions trapped are:

- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB.
- PACGA, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB.
- RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB, LDRAA and LDRAB.

API	Meaning
0b0	<p>The instructions related to Pointer Authentication are trapped to EL2, when EL2 is enabled in the current Security state and the instructions are enabled for the EL1&amp;0 translation regime, from:</p> <ul style="list-style-type: none"> <li>• EL0 when HCR_EL2.TGE==0 or HCR_EL2.E2H==0.</li> <li>• EL1.</li> </ul> <p>If HCR_EL2.NV is 1, the HCR_EL2.NV trap takes precedence over the HCR_EL2.API trap for the ERETAA and ERETAB instructions. If EL2 is implemented and enabled in the current Security state and <a href="#">HFGITR_EL2.ERET == 1</a>, execution at EL1 using AArch64 of ERETAA or ERETAB instructions is reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the HCR_EL2.API == 0.</p>
0b1	This control does not cause any instructions to be trapped.

If FEAT\_PAuth is implemented but EL2 is not implemented or disabled in the current Security state, the system behaves as if this bit is 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**APK, bit [40]****When FEAT\_PAuth is implemented:**

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers from EL1 to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- [APIAKeyLo\\_EL1](#), [APIAKeyHi\\_EL1](#), [APIBKeyLo\\_EL1](#), [APIBKeyHi\\_EL1](#), [APDAKeyLo\\_EL1](#), [APDAKeyHi\\_EL1](#), [APDBKeyLo\\_EL1](#), [APDBKeyHi\\_EL1](#), [APGAKeyLo\\_EL1](#), and [APGAKeyHi\\_EL1](#).

APK	Meaning
0b0	Access to the registers holding "key" values for pointer authentication from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

**Note**

If FEAT\_PAuth is implemented but EL2 is not implemented or is disabled in the current Security state, the system behaves as if this bit is 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [39]**

Reserved, RES0.

**MIOCNCNCE, bit [38]**

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the EL1&0 translation regimes.

<b>MIOCNCNCE</b>	<b>Meaning</b>
0b0	For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.
0b1	For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

For more information see 'Mismatched memory attributes'.

This field can be implemented as RAZ/WI.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TEA, bit [37]****When FEAT\_RAS is implemented:**

Route synchronous External abort exceptions to EL2.

<b>TEA</b>	<b>Meaning</b>
0b0	This control does not cause exceptions to be routed from EL0 and EL1 to EL2.
0b1	Route synchronous External abort exceptions from EL0 and EL1 to EL2, when EL2 is enabled in the current Security state, if not routed to EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TERR, bit [36]****When FEAT\_RAS is implemented:**

Trap Error record accesses. Trap accesses to the RAS error registers from EL1 to EL2 as follows:

- If EL1 is using AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - [ERRIDR\\_EL1](#), [ERRSELR\\_EL1](#), [ERXADDR\\_EL1](#), [ERXCTLR\\_EL1](#), [ERXFR\\_EL1](#), [ERXMISC0\\_EL1](#), [ERXMISC1\\_EL1](#), and [ERXSTATUS\\_EL1](#).

- When FEAT\_RASv1p1 is implemented, [ERXMISC2\\_EL1](#), and [ERXMISC3\\_EL1](#).
- If EL1 is using AArch32 state, MCR or MRC accesses are trapped to EL2, reported using EC syndrome value 0x03, MCRR or MRRC accesses are trapped to EL2, reported using EC syndrome value 0x04:
  - [ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#).
  - When FEAT\_RASv1p1 is implemented, [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), and [ERXMISC7](#).

<b>TERR</b>	<b>Meaning</b>
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses to the specified registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TLOR, bit [35]**

**When FEAT\_LOR is implemented:**

Trap LOR registers. Traps Non-secure EL1 accesses to [LORSA\\_EL1](#), [LOREA\\_EL1](#), [LORN\\_EL1](#), [LORC\\_EL1](#), and [LORID\\_EL1](#) registers to EL2.

<b>TLOR</b>	<b>Meaning</b>
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 accesses to the LOR registers are trapped to EL2.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**E2H, bit [34]**

**When FEAT\_VHE is implemented:**

EL2 Host. Enables a configuration where a Host Operating System is running in EL2, and the Host Operating System's applications are running in EL0.

<b>E2H</b>	<b>Meaning</b>
0b0	The facilities to support a Host Operating System at EL2 are disabled.
0b1	The facilities to support a Host Operating System at EL2 are enabled.

For information on the behavior of this bit see 'Behavior of HCR\_EL2.E2H'.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**ID, bit [33]**

Stage 2 Instruction access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR\_EL2.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

ID	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime.
0b1	Forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CD, bit [32]**

Stage 2 Data access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR\_EL2.VM==1, this control forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

CD	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime for data accesses and translation table walks.
0b1	Forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**RW, bit [31]**

**When AArch32 is supported at any Exception level:**

Execution state control for lower Exception levels:

RW	Meaning
0b0	Lower levels are all AArch32.
0b1	The Execution state for EL1 is AArch64. The Execution state for EL0 is determined by the current value of PSTATE.nRW when executing at EL0.

If AArch32 state is not supported by the implementation at EL1, then this bit is RAO/WI.

In an implementation that includes EL3, when EL2 is not enabled in Secure state, the PE behaves as if this bit has the same value as the [SCR\\_EL3](#).RW bit for all purposes other than a direct read or write access of HCR\_EL2.

The RW bit is permitted to be cached in a TLB.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 1 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RAO/WI.

**TRVM, bit [30]**

Trap Reads of Virtual Memory controls. Traps EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18.
  - [SCTLR\\_EL1](#), [TTBR0\\_EL1](#), [TTBR1\\_EL1](#), [TCR\\_EL1](#), [ESR\\_EL1](#), [FAR\\_EL1](#), [AFSR0\\_EL1](#), [AFSR1\\_EL1](#), [MAIR\\_EL1](#), [AMAIR\\_EL1](#), [CONTEXTIDR\\_EL1](#).
- If EL1 is using AArch32 state, accesses using MRC to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MRRC are trapped to EL2 and reported using EC syndrome value 0x04:
  - [SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIR0](#), [MAIR1](#), [AMAIR0](#), [AMAIR1](#), [CONTEXTIDR](#).

TRVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 read accesses to the specified Virtual Memory controls are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

**Note**

EL2 provides a second stage of address translation, that a hypervisor can use to remap the address map defined by a Guest OS. In addition, a hypervisor can trap attempts by a Guest OS to write to the registers that control the memory system. A hypervisor might use this trap as part of its virtualization of memory management.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**HCD, bit [29]****When EL3 is not implemented:**

HVC instruction disable. Disables EL1 execution of HVC instructions, from both Execution states, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x00.

HCD	Meaning
0b0	HVC instruction execution is enabled at EL2 and EL1.
0b1	HVC instructions are UNDEFINED at EL2 and EL1. Any resulting exception is taken to the Exception level at which the HVC instruction is executed.

**Note**

HVC instructions are always UNDEFINED at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TDZ, bit [28]**

Trap [DC ZVA](#) instructions. Traps EL0 and EL1 execution of [DC ZVA](#) instructions to EL2, when EL2 is enabled in the current Security state, from AArch64 state only, reported using EC syndrome value 0x18.

If FEAT\_MTE2 is implemented, this trap also applies to [DC GVA](#) and [DC GZVA](#).

TDZ	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	In AArch64 state, any attempt to execute an instruction this trap applies to at EL1, or at EL0 when the instruction is not UNDEFINED at EL0, is trapped to EL2 when EL2 is enabled in the current Security state. Reading the <a href="#">DCZID_EL0</a> returns a value that indicates that the instructions this trap applies to are not supported.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## TGE, bit [27]

Trap General Exceptions, from EL0.

TGE	Meaning
0b0	This control has no effect on execution at EL0.
0b1	When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0. When EL2 is enabled in the current Security state, in all cases: <ul style="list-style-type: none"> <li>All exceptions that would be routed to EL1 are routed to EL2.</li> <li>If EL1 is using AArch64, the <a href="#">SCTLR_EL1</a>.M field is treated as being 0 for all purposes other than returning the result of a direct read of <a href="#">SCTLR_EL1</a>.</li> <li>If EL1 is using AArch32, the <a href="#">SCTLR</a>.M field is treated as being 0 for all purposes other than returning the result of a direct read of <a href="#">SCTLR</a>.</li> <li>All virtual interrupts are disabled.</li> <li>Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled.</li> <li>An exception return to EL1 is treated as an illegal exception return.</li> <li>The <a href="#">MDCR_EL2</a>.{TDRA, TDOSA, TDA, TDE} fields are treated as being 1 for all purposes other than returning the result of a direct read of <a href="#">MDCR_EL2</a>.</li> </ul> In addition, when EL2 is enabled in the current Security state, if: <ul style="list-style-type: none"> <li>HCR_EL2.E2H is 0, the Effective values of the <a href="#">HCR_EL2</a>.{FMO, IMO, AMO} fields are 1.</li> <li>HCR_EL2.E2H is 1, the Effective values of the <a href="#">HCR_EL2</a>.{FMO, IMO, AMO} fields are 0.</li> </ul> For further information on the behavior of this bit when E2H is 1, see 'Behavior of HCR_EL2.E2H'.

HCR\_EL2.TGE must not be cached in a TLB.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## TVM, bit [26]

Trap Virtual Memory controls. Traps EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18:
  - [SCTLR\\_EL1](#), [TTBR0\\_EL1](#), [TTBR1\\_EL1](#), [TCR\\_EL1](#), [ESR\\_EL1](#), [FAR\\_EL1](#), [AFSR0\\_EL1](#), [AFSR1\\_EL1](#), [MAIR\\_EL1](#), [AMAIR\\_EL1](#), [CONTEXTIDR\\_EL1](#).
- If EL1 is using AArch32 state, accesses using MCR to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MCRR are trapped to EL2 and reported using EC syndrome value 0x04:
  - [SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIR0](#), [MAIR1](#), [AMAIR0](#), [AMAIR1](#), [CONTEXTIDR](#).

TVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 write accesses to the specified EL1 virtual memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TTLB, bit [25]

Trap TLB maintenance instructions. Traps EL1 execution of TLB maintenance instructions to EL2, when EL2 is enabled in the current Security state, as follows:

- When EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
  - [TLBI VMALLE1](#), [TLBI VAE1](#), [TLBI ASIDE1](#), [TLBI VAAE1](#), [TLBI VALE1](#), [TLBI VAALE1](#).
  - [TLBI VMALLE1IS](#), [TLBI VAE1IS](#), [TLBI ASIDE1IS](#), [TLBI VAAE1IS](#), [TLBI VALE1IS](#), [TLBI VAALE1IS](#).
  - If FEAT\_TLBIOS is implemented, this trap applies to [TLBI VMALLE1OS](#), [TLBI VAE1OS](#), [TLBI ASIDE1OS](#), [TLBI VAAE1OS](#), [TLBI VALE1OS](#), [TLBI VAALE1OS](#).
  - If FEAT\_TLBIRANGE is implemented, this trap applies to [TLBI RVAE1](#), [TLBI RVAE1IS](#), [TLBI RVAE1OS](#), [TLBI RVAE1IS](#), [TLBI RVAE1OS](#), [TLBI RVAE1IS](#).
  - If FEAT\_TLBIOS and FEAT\_TLBIRANGE are implemented, this trap applies to [TLBI RVAE1OS](#), [TLBI RVAE1IS](#), [TLBI RVAE1OS](#), [TLBI RVAE1IS](#).
- When EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
  - [TLBIALLIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAAIS](#), [TLBIMVALIS](#), [TLBIMVAALIS](#).
  - [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [TLBIMVAA](#), [TLBIMVAL](#), [TLBIMVAAL](#).
  - [ITLBIALL](#), [ITLBIMVA](#), [ITLBIASID](#).
  - [DTLBIALL](#), [DTLBIMVA](#), [DTLBIASID](#).

TTLB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

### Note

The TLB maintenance instructions are UNDEFINED at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of [SCTLR\\_EL1.UCI](#) is not 0, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - [IC IVAU](#), [DC CVAU](#). If the value of [SCTLR\\_EL1.UCI](#) is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - [IC IVAU](#), [IC IALLU](#), [IC IALLUIS](#), [DC CVAU](#).
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - [ICIMVAU](#), [IC IALLU](#), [IC IALLUIS](#), [DCCMVAU](#).

### Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- [IC IALLUIS](#) and [IC IALLU](#) are always UNDEFINED at EL0 using AArch64.
- [ICIMVAU](#), [ICIALLU](#), [ICIALLUIS](#), and [DCCMVAU](#) are always UNDEFINED at EL0 using AArch32.

TPU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TPCP, bit [23]

When FEAT\_DPB is implemented:

Trap data or unified cache maintenance instructions that operate to the Point of Coherency or Persistence. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of [SCTLR\\_EL1](#).UCI is not 0, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
  - [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#). If the value of [SCTLR\\_EL1](#).UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
  - [DC IVAC](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#).
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
  - [DCIMVAC](#), [DCCIMVAC](#), [DCCMVAC](#).

If FEAT\_DPB2 is implemented, this trap also applies to [DC CVADP](#).

If FEAT\_MTE2 is implemented, this trap also applies to [DC CIGVAC](#), [DC CIGDVAC](#), [DC IGVAC](#), [DC IGDVAC](#), [DC CGVAC](#), [DC CGDVAC](#), [DC CGVAP](#) and [DC CGDVAP](#).

If FEAT\_DPB2 and FEAT\_MTE2 are implemented, this trap also applies to [DC CGVADP](#) and [DC CGDVADP](#).

### Note

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
  - AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
  - [DCIMVAC](#), [DCCIMVAC](#), and [DCCMVAC](#) are always UNDEFINED at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2 it is named TPCP.

TPCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If [HCR\\_EL2](#).{E2H, TGE} is set to {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of [SCTLR\\_EL1](#).UCI is not 0, accesses to the following registers are trapped and reported using EC syndrome value 0x18:
  - [DC CIVAC](#), [DC CVAC](#). However, if the value of [SCTLR\\_EL1](#).UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, accesses to [DC IVAC](#), [DC CIVAC](#), [DC CVAC](#) are trapped and reported using EC syndrome value 0x18.
- When EL1 is using AArch32, accesses to [DCIMVAC](#), [DCCIMVAC](#), and [DCCMVAC](#) are trapped and reported using EC syndrome value 0x03.

#### Note

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
  - AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
  - [DCIMVAC](#), [DCCIMVAC](#), and [DCCMVAC](#) are always UNDEFINED at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2 it is named TPCP.

TPC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to [DC ISW](#), [DC CSW](#), [DC CISW](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL1 is using AArch32 state, accesses to [DCISW](#), [DCCSW](#), [DCCISW](#) are trapped to EL2, reported using EC syndrome value 0x03.

If FEAT\_MTE2 is implemented, this trap also applies to [DC IGSW](#), [DC IGDSW](#), [DC CGSW](#), [DC CGDW](#), [DC CIGSW](#), and [DC CIGDSW](#).

#### Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TSW	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TACR, bit [21]

Trap Auxiliary Control Registers. Traps EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, accesses to [ACTLR\\_EL1](#) to EL2, are trapped to EL2 and reported using EC syndrome value 0x18.
- If EL1 is using AArch32 state, accesses to [ACTLR](#) and, if implemented, [ACTLR2](#) are trapped to EL2 and reported using EC syndrome value 0x03.

TACR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

#### Note

[ACTLR\\_EL1](#) is not accessible at EL0

[ACTLR](#), and [ACTLR2](#) are not accessible at EL0.

The Auxiliary Control Registers are IMPLEMENTATION DEFINED registers that might implement global control bits for the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps EL1 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, access to any of the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome 0x18:
  - IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}.
  - IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the [S3\\_op1>\\_<Cn>\\_<Cm>\\_<op2>](#) register name.
- In AArch32 state, MCR and MRC access to instructions with the following encodings are trapped and reported using EC syndrome 0x03:
  - All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}.
  - All coproc==p15, CRn==c10, opc1 == {0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}.
  - All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

When the value of [HCR\\_EL2.TIDCP](#) is 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from EL0 is trapped to EL2. If it is not, then it is UNDEFINED, and any attempt to access it from EL0 generates an exception that is taken to EL1.

TIDCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to or execution of the specified encodings reserved for IMPLEMENTATION DEFINED functionality are trapped to EL2, when EL2 is enabled in the current Security state.

An implementation can also include IMPLEMENTATION DEFINED registers that provide additional controls, to give finer-grained control of the trapping of IMPLEMENTATION DEFINED features.

#### Note

Arm expects the trapping of EL0 accesses to these functions to EL2 to be unusual, and used only when the hypervisor is virtualizing EL0 operation. Arm

strongly recommends that unless the hypervisor must virtualize EL0 operation, an EL0 access to any of these functions is UNDEFINED, as it would be if the implementation did not include EL2. The PE then takes any resulting exception to EL1.

The trapping of accesses to these registers from EL1 is higher priority than an exception resulting from the register access being UNDEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TSC, bit [19]

Trap SMC instructions. Traps EL1 execution of SMC instructions to EL2, when EL2 is enabled in the current Security state.

If execution is in AArch64 state, the trap is reported using EC syndrome value 0x17.

If execution is in AArch32 state, the trap is reported using EC syndrome value 0x13.

#### Note

[HCR\\_EL2](#).TSC traps execution of the SMC instruction. It is not a routing control for the SMC exception. Trap exceptions and SMC exceptions have different preferred return addresses.

TSC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	<p>If EL3 is implemented, then any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state, regardless of the value of <a href="#">SCR_EL3</a>.SMD.</p> <p>If EL3 is not implemented, FEAT_NV is implemented, and HCR_EL2.NV is 1, then any attempt to execute an SMC instruction at EL1 using AArch64 is trapped to EL2, when EL2 is enabled in the current Security state.</p> <p>If EL3 is not implemented, and either FEAT_NV is not implemented or HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether:</p> <ul style="list-style-type: none"> <li>Any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state.</li> <li>Any attempt to execute an SMC instruction is UNDEFINED.</li> </ul>

In AArch32 state, the Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

SMC instructions are UNDEFINED at EL0.

If EL3 is not implemented and HCR\_EL2.NV is 0, it is IMPLEMENTATION DEFINED whether this bit is:

- RES0.
- Implemented with the functionality as described in HCR\_EL2.TSC.

When [HCR\\_EL2](#).TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TID3, bit [18]

Trap ID group 3. Traps EL1 reads of group 3 ID registers to EL2, when EL2 is enabled in the current Security state, as follows:

In AArch64 state:

- Reads of the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - [ID\\_PFR0\\_EL1](#), [ID\\_PFR1\\_EL1](#), [ID\\_PFR2\\_EL1](#), [ID\\_DFR0\\_EL1](#), [ID\\_AFR0\\_EL1](#), [ID\\_MMFR0\\_EL1](#), [ID\\_MMFR1\\_EL1](#), [ID\\_MMFR2\\_EL1](#), [ID\\_MMFR3\\_EL1](#), [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#),

[ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), [ID\\_ISAR4\\_EL1](#), [ID\\_ISAR5\\_EL1](#), [MVFR0\\_EL1](#), [MVFR1\\_EL1](#), [MVFR2\\_EL1](#).

- [ID\\_AA64PFR0\\_EL1](#), [ID\\_AA64PFR1\\_EL1](#), [ID\\_AA64DFR0\\_EL1](#), [ID\\_AA64DFR1\\_EL1](#), [ID\\_AA64ISAR0\\_EL1](#), [ID\\_AA64ISAR1\\_EL1](#), [ID\\_AA64MMFR0\\_EL1](#), [ID\\_AA64MMFR1\\_EL1](#), [ID\\_AA64AFR0\\_EL1](#), [ID\\_AA64AFR1\\_EL1](#).
- If FEAT\_FGT is implemented:
  - [ID\\_MMFR4\\_EL1](#) and [ID\\_MMFR5\\_EL1](#) are trapped to EL2.
  - [ID\\_AA64MMFR2\\_EL1](#) and [ID\\_ISAR6\\_EL1](#) are trapped to EL2.
  - [ID\\_DFR1\\_EL1](#) is trapped to EL2.
  - [ID\\_AA64ZFR0\\_EL1](#) is trapped to EL2.
  - [ID\\_AA64ISAR2\\_EL1](#) is trapped to EL2.
  - This field traps all MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.
- If FEAT\_FGT is not implemented:
  - [ID\\_MMFR4\\_EL1](#) and [ID\\_MMFR5\\_EL1](#) are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_MMFR4\\_EL1](#) or [ID\\_MMFR5\\_EL1](#) are trapped to EL2.
  - [ID\\_AA64MMFR2\\_EL1](#) and [ID\\_ISAR6\\_EL1](#) are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_AA64MMFR2\\_EL1](#) or [ID\\_ISAR6\\_EL1](#) are trapped to EL2.
  - [ID\\_DFR1\\_EL1](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_DFR1\\_EL1](#) are trapped to EL2.
  - [ID\\_AA64ZFR0\\_EL1](#) is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to [ID\\_AA64ZFR0\\_EL1](#) are trapped to EL2.
  - [ID\\_AA64ISAR2\\_EL1](#) is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to [ID\\_AA64ISAR2\\_EL1](#) are trapped to EL2.
  - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.

In AArch32 state:

- VMRS access to [MVFR0](#), [MVFR1](#), and [MVFR2](#), are trapped to EL2, reported using EC syndrome value 0x08, unless access is also trapped by [HCPTR](#) which takes priority.
- MRC access to the following registers are trapped to EL2, reported using EC syndrome value 0x03:
  - [ID\\_PFR0](#), [ID\\_PFR1](#), [ID\\_PFR2](#), [ID\\_DFR0](#), [ID\\_AFR0](#), [ID\\_MMFR0](#), [ID\\_MMFR1](#), [ID\\_MMFR2](#), [ID\\_MMFR3](#), [ID\\_ISAR0](#), [ID\\_ISAR1](#), [ID\\_ISAR2](#), [ID\\_ISAR3](#), [ID\\_ISAR4](#), [ID\\_ISAR5](#).
  - If FEAT\_FGT is implemented:
    - [ID\\_MMFR4](#) and [ID\\_MMFR5](#) are trapped to EL2.
    - [ID\\_ISAR6](#) is trapped to EL2.
    - [ID\\_DFR1](#) is trapped to EL2.
    - This field traps all MRC accesses to encodings in the following range that are not already mentioned in this field description: coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.
  - If FEAT\_FGT is not implemented:
    - [ID\\_MMFR4](#) and [ID\\_MMFR5](#) are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_MMFR4](#) or [ID\\_MMFR5](#) are trapped.

- [ID\\_ISAR6](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_ISAR6](#) are trapped to EL2.
- [ID\\_DFR1](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_DFR1](#) are trapped to EL2.
- Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps all MRC accesses to registers in the following range not already mentioned in this field description with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

TID3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 3 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, reads of [CTR\\_EL0](#), [CCSIDR\\_EL1](#), [CCSIDR2\\_EL1](#), [CLIDR\\_EL1](#), and [CSSELR\\_EL1](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 is using AArch64 and the value of [SCTLR\\_EL1.UCT](#) is not 0, reads of [CTR\\_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18. If the value of [SCTLR\\_EL1.UCT](#) is 0 then EL0 reads of [CTR\\_EL0](#) are UNDEFINED and any resulting exception takes precedence over this trap.
- If EL1 is using AArch64, writes to [CSSELR\\_EL1](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL1 is using AArch32, reads of [CTR](#), [CCSIDR](#), [CCSIDR2](#), [CLIDR](#), and [CSSELR](#) are trapped to EL2, reported using EC syndrome value 0x03.
- If EL1 is using AArch32, writes to [CSSELR](#) are trapped to EL2, reported using EC syndrome value 0x03.

TID2	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 2 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2.{E2H, TGE}](#) is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### TID1, bit [16]

Trap ID group 1. Traps EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, accesses of [REVIDR\\_EL1](#), [AIDR\\_EL1](#), reported using EC syndrome value 0x18.
- In AArch32 state, accesses of [TCMTR](#), [TLBTR](#), [REVIDR](#), [AIDR](#), reported using EC syndrome value 0x03.

TID1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 1 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TID0, bit [15]**

**When AArch32 is supported at any Exception level:**

Trap ID group 0. Traps the following register accesses to EL2:

- EL1 reads of the [JIDR](#), reported using EC syndrome value 0x05.
- If the [JIDR](#) is RAZ from EL0, EL0 reads of the [JIDR](#), reported using EC syndrome value 0x05.
- EL1 accesses using VMRS of the [FPSID](#), reported using EC syndrome value 0x08.

**Note**

- It is IMPLEMENTATION DEFINED whether the [JIDR](#) is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then any resulting exception takes precedence over this trap.
- The [FPSID](#) is not accessible at EL0 using AArch32.
- Writes to the [FPSID](#) are ignored, and not trapped by this control.

TID0	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 0 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TWE, bit [14]**

Traps EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT\_WFxT is implemented, this trap also applies to the WFET instruction.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by <a href="#">SCTLR.nTWE</a> or <a href="#">SCTLR_EL1.nTWE</a> .

In AArch32 state, the attempted execution of a conditional WFE instruction is trapped only if the instruction passes its condition code check.

**Note**

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TWI, bit [13]**

Traps EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT\_WFxT is implemented, this trap also applies to the WFIT instruction.

<b>TWI</b>	<b>Meaning</b>
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by <a href="#">SCTLR.nTWI</a> or <a href="#">SCTLR_EL1.nTWI</a> .

In AArch32 state, the attempted execution of a conditional WFI instruction is trapped only if the instruction passes its condition code check.

**Note**

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DC, bit [12]**

Default Cacheability.

<b>DC</b>	<b>Meaning</b>
0b0	This control has no effect on the EL1&0 translation regime.
0b1	In both Security states: <ul style="list-style-type: none"> <li>When EL1 is using AArch64, the PE behaves as if the value of the <a href="#">SCTLR_EL1.M</a> field is 0 for all purposes other than returning the value of a direct read of <a href="#">SCTLR_EL1</a>.</li> <li>When EL1 is using AArch32, the PE behaves as if the value of the <a href="#">SCTLR.M</a> field is 0 for all purposes other than returning the value of a direct read of <a href="#">SCTLR</a>.</li> <li>The PE behaves as if the value of the HCR_EL2.VM field is 1 for all purposes other than returning the value of a direct read of HCR_EL2.</li> <li>The memory type produced by stage 1 of the EL1&amp;0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.</li> </ul>

This field has no effect on the EL2, EL2&0, and EL3 translation regimes.

This field is permitted to be cached in a TLB.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**BSU, bits [11:10]**

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from EL1 or EL0:

BSU	Meaning
0b00	No effect.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0b00 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**FB, bit [9]**

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from EL1:

AArch32: [BPIALL](#), [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [DTLBIALL](#), [DTLBIMVA](#), [DTLBIASID](#), [ITLBIALL](#), [ITLBIMVA](#), [ITLBIASID](#), [TLBIMVAA](#), [ICIALLU](#), [TLBIMVAL](#), [TLBIMVAAL](#).

AArch64: [TLBIMVAALE1](#), [TLBIVAAE1](#), [TLBIASIDE1](#), [TLBIVAAE1](#), [TLBIVALE1](#), [TLBIVAALE1](#), [ICIALLU](#), [TLBIVAAE1](#), [TLBIVAAE1](#), [TLBIVALE1](#), [TLBIVAALE1](#).

FB	Meaning
0b0	This field has no effect on the operation of the specified instructions.
0b1	When one of the specified instruction is executed at EL1, the instruction is broadcast within the Inner Shareable shareability domain.

When [HCR\\_EL2](#).TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VSE, bit [8]**

Virtual SError interrupt.

VSE	Meaning
0b0	This mechanism is not making a virtual SError interrupt pending.
0b1	A virtual SError interrupt is pending because of this mechanism.

The virtual SError interrupt is enabled only when the value of [HCR\\_EL2](#).{TGE, AMO} is {0, 1}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VI, bit [7]**

Virtual IRQ Interrupt.

VI	Meaning
0b0	This mechanism is not making a virtual IRQ pending.
0b1	A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of [HCR\\_EL2](#).{TGE, IMO} is {0, 1}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**VF, bit [6]**

Virtual FIQ Interrupt.

VF	Meaning
0b0	This mechanism is not making a virtual FIQ pending.
0b1	A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR\_EL2.{TGE, FMO} is {0, 1}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AMO, bit [5]**

Physical SError interrupt routing.

AMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> <li>Physical SError interrupts are not taken to EL2.</li> <li>When the value of <a href="#">HCR_EL2.TGE</a> is 0, if the PE is executing at EL2 using AArch64, physical SError interrupts are not taken unless they are routed to EL3 by the <a href="#">SCR_EL3.EA</a> bit.</li> <li>Virtual SError interrupts are disabled.</li> </ul>
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> <li>Physical SError interrupts are taken to EL2, unless they are routed to EL3.</li> <li>When the value of HCR_EL2.TGE is 0, then virtual SError interrupts are enabled.</li> </ul>

If EL2 is enabled in the current Security state and the value of HCR\_EL2.TGE is 1:

- Regardless of the value of the AMO bit physical asynchronous External aborts and SError interrupts target EL2 unless they are routed to EL3.
- When FEAT\_VHE is not implemented, or if [HCR\\_EL2.E2H](#) is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When FEAT\_VHE is implemented and [HCR\\_EL2.E2H](#) is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IMO, bit [4]**

Physical IRQ Routing.

IMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> <li>Physical IRQ interrupts are not taken to EL2.</li> <li>When the value of <a href="#">HCR_EL2.TGE</a> is 0, if the PE is executing at EL2 using AArch64, physical IRQ interrupts are not taken unless they are routed to EL3 by the <a href="#">SCR_EL3.IRQ</a> bit.</li> <li>Virtual IRQ interrupts are disabled.</li> </ul>
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> <li>Physical IRQ interrupts are taken to EL2, unless they are routed to EL3.</li> <li>When the value of HCR_EL2.TGE is 0, then Virtual IRQ interrupts are enabled.</li> </ul>

If EL2 is enabled in the current Security state, and the value of HCR\_EL2.TGE is 1:

- Regardless of the value of the IMO bit, physical IRQ Interrupts target EL2 unless they are routed to EL3.
- When FEAT\_VHE is not implemented, or if [HCR\\_EL2.E2H](#) is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.

- When FEAT\_VHE is implemented and [HCR\\_EL2.E2H](#) is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### FMO, bit [3]

Physical FIQ Routing.

FMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> <li>• Physical FIQ interrupts are not taken to EL2.</li> <li>• When the value of <a href="#">HCR_EL2.TGE</a> is 0, if the PE is executing at EL2 using AArch64, physical FIQ interrupts are not taken unless they are routed to EL3 by the <a href="#">SCR_EL3.FIQ</a> bit.</li> <li>• Virtual FIQ interrupts are disabled.</li> </ul>
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> <li>• Physical FIQ interrupts are taken to EL2, unless they are routed to EL3.</li> <li>• When <a href="#">HCR_EL2.TGE</a> is 0, then Virtual FIQ interrupts are enabled.</li> </ul>

If EL2 is enabled in the current Security state and the value of [HCR\\_EL2.TGE](#) is 1:

- Regardless of the value of the FMO bit, physical FIQ Interrupts target EL2 unless they are routed to EL3.
- When FEAT\_VHE is not implemented, or if [HCR\\_EL2.E2H](#) is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When FEAT\_VHE is implemented and [HCR\\_EL2.E2H](#) is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PTW, bit [2]

Protected Table Walk. In the EL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs, then the value of this bit determines the behavior:

PTW	Meaning
0b0	The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.
0b1	The memory access generates a stage 2 Permission fault.

This field is permitted to be cached in a TLB.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### SWIO, bit [1]

Set/Way Invalidation Override. Causes EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way:

SWIO	Meaning
0b0	This control has no effect on the operation of data cache invalidate by set/way instructions.
0b1	Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When the value of this bit is 1:

AArch32: [DCISW](#) performs the same invalidation as a [DCCISW](#) instruction.

AArch64: [DC ISW](#) performs the same invalidation as a [DC CISW](#) instruction.

This bit can be implemented as RES1.

When [HCR\\_EL2.TGE](#) is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the EL1&0 translation regime, when EL2 is enabled in the current Security state.

VM	Meaning
0b0	EL1&0 stage 2 address translation disabled.
0b1	EL1&0 stage 2 address translation enabled.

When the value of this bit is 1, data cache invalidate instructions executed at EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the [HCR\\_EL2.SWIO](#) bit.

This bit is permitted to be cached in a TLB.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2.{E2H, TGE}](#) is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the HCR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, HCR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x078];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HCR_EL2;
elsif PSTATE.EL == EL3 then
    return HCR_EL2;

```

# HCRX\_EL2, Extended Hypervisor Configuration Register

The HCRX\_EL2 characteristics are:

## Purpose

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

## Configuration

This register is present only when FEAT\_HCX is implemented. Otherwise, direct accesses to HCRX\_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

The bits in this register behave as if they are 0 for all purposes other than direct reads of the register if:

- EL2 is not enabled in the current Security state.
- [SCR\\_EL3.HXEn](#) is 0.

## Attributes

HCRX\_EL2 is a 64-bit register.

## Field descriptions

The HCRX\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:5]

Reserved, RES0.

### FGTnXS, bit [4]

When FEAT\_XS is implemented:

Determines if the fine-grained traps in HFGITR\_EL2 that apply to each of the TLBI maintenance instructions that are accessible at EL1 also apply to the corresponding TLBI maintenance instructions with the nXS qualifier.

FGTnXS	Meaning
0b0	The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 also applies to the corresponding TLBI instruction with the nXS qualifier at EL1.
0b1	The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 does not apply to the corresponding TLBI instruction with the nXS qualifier at EL1.

Otherwise:

Reserved, RES0.

**FnXS, bit [3]****When FEAT\_XS is implemented:**

Determines the behavior of TLBI instructions affected by the XS attribute.

This control bit also determines whether an AArch64 DSB instruction behaves as a DSB instruction with an nXS qualifier when executed at EL0 and EL1.

FnXS	Meaning
0b0	This control does not have any effect on the behavior of the TLBI maintenance instructions.
0b1	A TLBI maintenance instruction without the nXS qualifier executed at EL1 behaves in the same way as the corresponding TLBI maintenance instruction with the nXS qualifier. An AArch64 DSB instruction executed at EL1 or EL0 behaves in the same way as the corresponding DSB instruction with the nXS qualifier executed at EL1 or EL0.

This bit is permitted to be cached in a TLB.

**Otherwise:**

Reserved, RES0.

**EnASR, bit [2]****When FEAT\_LS64 is implemented:**

When [HCR\\_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an ST64BV instruction at EL0 or EL1 to EL2.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL2 if the execution is not trapped by <a href="#">SCTLR_EL1</a> .EnASR. Execution of an ST64BV instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR\_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**EnALS, bit [1]****When FEAT\_LS64 is implemented:**

When [HCR\\_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 or EL1 to EL2.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2 if the execution is not trapped by <a href="#">SCTLR_EL1</a> .EnALS. Execution of an LD64B or ST64B instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR\_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**EnAS0, bit [0]****When FEAT\_LS64 is implemented:**

When [HCR\\_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an ST64BV0 instruction at EL0 or EL1 to EL2.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL2 if the execution is not trapped by <a href="#">SCTLR_EL1</a> .EnAS0.
0b1	Execution of an ST64BV0 instruction at EL1 is trapped to EL2. This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR\_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Accessing the HCRX\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, HCRX\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0010	0b010

```

# HDFGRTR\_EL2, Hypervisor Debug Fine-Grained Read Trap Register

The HDFGRTR\_EL2 characteristics are:

## Purpose

Provides controls for traps of MRS and MRC reads of debug, trace, PMU, and Statistical Profiling System registers.

## Configuration

This register is present only when FEAT\_FGT is implemented. Otherwise, direct accesses to HDFGRTR\_EL2 are UNDEFINED.

## Attributes

HDFGRTR\_EL2 is a 64-bit register.

## Field descriptions

The HDFGRTR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56
RES0	nPMSNEVFR_EL1	RES0			PMCEIDn_ELO	PMUSERENR_ELO	
PMSIRR_EL1	PMSIDR_EL1	PMSICR_EL1	PMSFCR_EL1	PMSEVFR_EL1	PMSCR_EL1	PMBSR_EL1	PMBPTR_EL1
31	30	29	28	27	26	25	24

### Bit [63]

Reserved, RES0.

### nPMSNEVFR\_EL1, bit [62]

When FEAT\_SPEv1p2 is implemented:

Trap MRS reads of PMSNEVFR\_EL1 at EL1 using AArch64 to EL2.

nPMSNEVFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state then MRS reads of PMSNEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMSNEVFR_EL1 are not affected by this bit.

This bit is ignored by the PE and treated as zero when EL3 is implemented and SCR\_EL3.FGTEn == 0b0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### Otherwise:

Reserved, RES0.

**Bits [61:59]**

Reserved, RES0.

**PMCEIDn\_EL0, bit [58]**

When FEAT\_PMUv3 is implemented:

Trap MRS reads of PMCEID<n>\_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCEIDn_EL0	Meaning
0b0	MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of PMCEID&lt;n&gt;_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of PMCEID&lt;n&gt; at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**PMUSERENR\_EL0, bit [57]**

When FEAT\_PMUv3 is implemented:

Trap MRS reads of [PMUSERENR\\_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [PMUSERENR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMUSERENR_EL0	Meaning
0b0	MRS reads of <a href="#">PMUSERENR_EL0</a> at EL1 and EL0 using AArch64 and MRC reads of <a href="#">PMUSERENR</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of <a href="#">PMUSERENR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of <a href="#">PMUSERENR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**Bits [56:49]**

Reserved, RES0.

**TRCVICTLR, bit [48]**

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of [TRCVICTLR](#) at EL1 using AArch64 to EL2.

TRCVICTLR	Meaning
0b0	MRS reads of <a href="#">TRCVICTLR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">TRCVICTLR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**TRCSTATR, bit [47]**

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of [TRCSTATR](#) at EL1 using AArch64 to EL2.

TRCSTATR	Meaning
0b0	MRS reads of <a href="#">TRCSTATR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">TRCSTATR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**TRCSSCSRn, bit [46]**

When FEAT\_ETMv4 is implemented, TRCSSCSR<n> are implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of [TRCSSCSR<n>](#) at EL1 using AArch64 to EL2.

TRCSSCSRn	Meaning
0b0	MRS reads of <a href="#">TRCSSCSR&lt;n&gt;</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">TRCSSCSR&lt;n&gt;</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Single-shot Comparator n is not implemented, a read of [TRCSSCSR<n>](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TRCSEQSTR, bit [45]

When FEAT\_ETMv4 is implemented, TRCSEQSTR is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of [TRCSEQSTR](#) at EL1 using AArch64 to EL2.

TRCSEQSTR	Meaning
0b0	MRS reads of <a href="#">TRCSEQSTR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">TRCSEQSTR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TRCPRGCTLR, bit [44]

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of [TRCPRGCTLR](#) at EL1 using AArch64 to EL2.

TRCPRGCTLR	Meaning
0b0	MRS reads of <a href="#">TRCPRGCTLR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">TRCPRGCTLR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### TRCOSLSR, bit [43]

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of [TRCOSLSR](#) at EL1 using AArch64 to EL2.

TRCOSLSR	Meaning
0b0	MRS reads of <a href="#">TRCOSLSR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">TRCOSLSR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [42]**

Reserved, RES0.

**TRCIMSPECn, bit [41]**

**When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MRS reads of [TRCIMSPEC<n>](#) at EL1 using AArch64 to EL2.

TRCIMSPECn	Meaning
0b0	MRS reads of <a href="#">TRCIMSPEC&lt;n&gt;</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">TRCIMSPEC&lt;n&gt;</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If [TRCIMSPEC<n>](#) is not implemented, a read of [TRCIMSPEC<n>](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCID, bit [40]**

**When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [TRCDEVARCH](#).
- [TRCDEVID](#).
- TRCIDR<n>.

TRCID	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [39:38]**

Reserved, RES0.

**TRCCNTVRn, bit [37]**

When FEAT\_ETMv4 is implemented, TRCCNTVR<n> are implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of [TRCCNTVR<n>](#) at EL1 using AArch64 to EL2.

TRCCNTVRn	Meaning
0b0	MRS reads of <a href="#">TRCCNTVR&lt;n&gt;</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">TRCCNTVR&lt;n&gt;</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Counter n is not implemented, a read of [TRCCNTVR<n>](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCCLAIM, bit [36]**

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [TRCCLAIMCLR](#).
- [TRCCLAIMSET](#).

TRCCLAIM	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCAUXCTLR, bit [35]**

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of [TRCAUXCTLR](#) at EL1 using AArch64 to EL2.

TRCAUXCTLR	Meaning
0b0	MRS reads of <a href="#">TRCAUXCTLR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">TRCAUXCTLR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCAUTHSTATUS, bit [34]**

**When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MRS reads of [TRCAUTHSTATUS](#) at EL1 using AArch64 to EL2.

TRCAUTHSTATUS	Meaning
0b0	MRS reads of <a href="#">TRCAUTHSTATUS</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">TRCAUTHSTATUS</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRC, bit [33]**

**When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [TRCACATR<n>](#).
- [TRCACVR<n>](#).
- [TRCBBCTLR](#).
- [TRCCCCTLR](#).
- [TRCCIDCCTLR0](#).
- [TRCCIDCCTLR1](#).
- [TRCCIDCVR<n>](#).
- [TRCCNTCTLR<n>](#).
- [TRCCNTRLDVR<n>](#).
- [TRCCONFIGR](#).
- [TRCEVENTCTL0R](#).
- [TRCEVENTCTL1R](#).
- [TRCEXTINSELR](#).
- [TRCQCTLR](#).
- [TRCRSCTLR<n>](#).
- [TRCSEQEVR<n>](#).
- [TRCSEQRSTEVR](#).
- [TRCSSCCR<n>](#).
- [TRCSSPCICR<n>](#).
- [TRCSTALLCTLR](#).

- [TRCSYNCPR](#).
- [TRCTTRACEIDR](#).
- [TRCTSCTLR](#).
- [TRCVIIECTLR](#).
- [TRCVIPCSSCTLR](#).
- [TRCVISSCTLR](#).
- [TRCVMIDCCTLR0](#).
- [TRCVMIDCCTLR1](#).
- [TRCVMIDCVR<n>](#).

TRC	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

A read of an unimplemented register is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

### PMSLATFR\_EL1, bit [32]

#### When FEAT\_SPE is implemented:

Trap MRS reads of [PMSLATFR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSLATFR_EL1	Meaning
0b0	MRS reads of <a href="#">PMSLATFR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">PMSLATFR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

### PMSIRR\_EL1, bit [31]

#### When FEAT\_SPE is implemented:

Trap MRS reads of [PMSIRR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSIRR_EL1	Meaning
0b0	MRS reads of <a href="#">PMSIRR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">PMSIRR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### PMSIDR\_EL1, bit [30]

When FEAT\_SPE is implemented:

Trap MRS reads of [PMSIDR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSIDR_EL1	Meaning
0b0	MRS reads of <a href="#">PMSIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">PMSIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### PMSICR\_EL1, bit [29]

When FEAT\_SPE is implemented:

Trap MRS reads of [PMSICR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSICR_EL1	Meaning
0b0	MRS reads of <a href="#">PMSICR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">PMSICR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### PMSFCR\_EL1, bit [28]

When FEAT\_SPE is implemented:

Trap MRS reads of [PMSFCR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSFCR_EL1	Meaning
0b0	MRS reads of <a href="#">PMSFCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">PMSFCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### PMSEVFR\_EL1, bit [27]

When FEAT\_SPE is implemented:

Trap MRS reads of [PMSEVFR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSEVFR_EL1	Meaning
0b0	MRS reads of <a href="#">PMSEVFR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">PMSEVFR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### PMSCR\_EL1, bit [26]

When FEAT\_SPE is implemented:

Trap MRS reads of [PMSCR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSCR_EL1	Meaning
0b0	MRS reads of <a href="#">PMSCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">PMSCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### PMBSR\_EL1, bit [25]

When FEAT\_SPE is implemented:

Trap MRS reads of [PMBSR\\_EL1](#) at EL1 using AArch64 to EL2.

PMBSR_EL1	Meaning
0b0	MRS reads of <a href="#">PMBSR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">PMBSR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMBPTR\_EL1, bit [24]**

**When FEAT\_SPE is implemented:**

Trap MRS reads of [PMBPTR\\_EL1](#) at EL1 using AArch64 to EL2.

PMBPTR_EL1	Meaning
0b0	MRS reads of <a href="#">PMBPTR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">PMBPTR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMBLIMITR\_EL1, bit [23]**

**When FEAT\_SPE is implemented:**

Trap MRS reads of [PMBLIMITR\\_EL1](#) at EL1 using AArch64 to EL2.

PMBLIMITR_EL1	Meaning
0b0	MRS reads of <a href="#">PMBLIMITR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">PMBLIMITR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMMIR\_EL1, bit [22]**

**When FEAT\_PMUv3 is implemented:**

Trap MRS reads of [PMMIR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMMIR_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">PMMIR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">PMMIR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [21:20]**

Reserved, RES0.

**PMSELR\_EL0, bit [19]**

**When FEAT\_PMUv3 is implemented:**

Trap MRS reads of [PMSELR\\_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [PMSELR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

<b>PMSELR_EL0</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">PMSELR_EL0</a> at EL1 and EL0 using AArch64 and MRC reads of <a href="#">PMSELR</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2.{E2H,TGE}</a> != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of <a href="#">PMSELR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of <a href="#">PMSELR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMOVS, bit [18]**

**When FEAT\_PMUv3 is implemented:**

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of [PMOVSCLR\\_EL0](#) and [PMOVSSET\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [PMOVSr](#) and [PMOVSSET](#).

PMOVS	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads at EL1 and EL0 using AArch64 of <a href="#">PMOVSLR_EL0</a> and <a href="#">PMOVSSSET_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads at EL0 using AArch32 of <a href="#">PMOVSR</a> and <a href="#">PMOVSSSET</a> are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMINTEN, bit [17]**

**When FEAT\_PMUv3 is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [PMINTENCLR\\_EL1](#).
- [PMINTENSET\\_EL1](#).

PMINTEN	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMCNTEN, bit [16]**

**When FEAT\_PMUv3 is implemented:**

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of [PMCNTENCLR\\_EL0](#) and [PMCNTENSET\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [PMCNTENCLR](#) and [PMCNTENSET](#).

PMCNTEN	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads at EL1 and EL0 using AArch64 of <a href="#">PMCNTENCLR_EL0</a> and <a href="#">PMCNTENSET_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads at EL0 using AArch32 of <a href="#">PMCNTENCLR</a> and <a href="#">PMCNTENSET</a> are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMCCNTR\_EL0, bit [15]**

**When FEAT\_PMUv3 is implemented:**

Trap MRS reads of [PMCCNTR\\_EL0](#) at EL1 and EL0 using AArch64 and MRC and MRRC reads of [PMCCNTR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCNTR_EL0	Meaning
0b0	MRS reads of <a href="#">PMCCNTR_EL0</a> at EL1 and EL0 using AArch64 and MRC and MRRC reads of <a href="#">PMCCNTR</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of <a href="#">PMCCNTR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC and MRRC reads of <a href="#">PMCCNTR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03 (for MRC) or 0x04 (for MRRC).</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMCCFILTR\_EL0, bit [14]**

**When FEAT\_PMUv3 is implemented:**

Trap MRS reads of [PMCCFILTR\\_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [PMCCFILTR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

<b>PMCCFILTR_EL0</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">PMCCFILTR_EL0</a> at EL1 and EL0 using AArch64 and MRC reads of <a href="#">PMCCFILTR</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>• MRS reads of <a href="#">PMCCFILTR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>• MRC reads of <a href="#">PMCCFILTR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

[PMCCFILTR\\_EL0](#) can also be accessed in AArch64 state using [PMXEVTYPEn\\_EL0](#) when [PMSELR\\_EL0](#).SEL == 31, and [PMCCFILTR](#) can also be accessed in AArch32 state using [PMXEVTYPEn](#) when [PMSELR](#).SEL == 31.

Setting this bit to 1 has no effect on accesses to [PMXEVTYPEn\\_EL0](#) and [PMXEVTYPEn](#), regardless of the value of [PMSELR\\_EL0](#).SEL or [PMSELR](#).SEL.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### **PMEVTYPEn\_EL0, bit [13]**

##### **When FEAT\_PMUv3 is implemented:**

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of [PMEVTYPEn<n>\\_EL0](#) and [PMXEVTYPEn\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [PMEVTYPEn<n>](#) and [PMXEVTYPEn](#).

<b>PMEVTYPEn_EL0</b>	<b>Meaning</b>
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>• MRS reads at EL1 and EL0 using AArch64 of <a href="#">PMEVTYPEn&lt;n&gt;_EL0</a> and <a href="#">PMXEVTYPEn_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>• MRC reads at EL0 using AArch32 of <a href="#">PMEVTYPEn&lt;n&gt;</a> and <a href="#">PMXEVTYPEn</a> are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

When FEAT\_FGT is implemented, then, regardless of the value of this bit, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of [PMEVTYPEn<n>\\_EL0](#), or, if n is not 31, a read of [PMXEVTYPEn\\_EL0](#) when [PMSELR\\_EL0](#).SEL == n.
  - In AArch32 state, a read of [PMEVTYPEn<n>](#), or, if n is not 31, a read of [PMXEVTYPEn](#) when [PMSELR](#).SEL == n.
- If event counter n is implemented and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:

- In AArch64 state, a read of [PMEVTYPEPER<n>\\_EL0](#), or a read of [PMXEVTYPER\\_EL0](#) when [PMSELR\\_EL0.SEL](#) == n, reported with EC syndrome value 0x18.
- In AArch32 state, a read of [PMEVTYPEPER<n>](#), or a read of [PMXEVTYPER](#) when [PMSELR.SEL](#) == n, reported with EC syndrome value 0x03.

See also [HDFGRTR\\_EL2.PMCCFILTR\\_EL0](#).

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

### PMEVCNTRn\_EL0, bit [12]

#### When FEAT\_PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of [PMEVCNTR<n>\\_EL0](#) and [PMXEVCNTR\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MRC reads of [PMEVCNTR<n>](#) and [PMXEVCNTR](#).

<a href="#">PMEVCNTRn_EL0</a>	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2.{E2H,TGE}</a> != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>• MRS reads at EL1 and EL0 using AArch64 of <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> and <a href="#">PMXEVCNTR_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>• MRC reads at EL0 using AArch32 of <a href="#">PMEVCNTR&lt;n&gt;</a> and <a href="#">PMXEVCNTR</a> are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

When FEAT\_FGT is implemented, then, regardless of the value of this bit, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of [PMEVCNTR<n>\\_EL0](#), or a read of [PMXEVCNTR\\_EL0](#) when [PMSELR\\_EL0.SEL](#) == n.
  - In AArch32 state, a read of [PMEVCNTR<n>](#), or a read of [PMXEVCNTR](#) when [PMSELR.SEL](#) == n.
- If event counter n is implemented, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - In AArch64 state, a read of [PMEVCNTR<n>\\_EL0](#), or a read of [PMXEVCNTR\\_EL0](#) when [PMSELR\\_EL0.SEL](#) == n, reported with EC syndrome value 0x18.
  - In AArch32 state, a read of [PMEVCNTR<n>](#), or a read of [PMXEVCNTR](#) when [PMSELR.SEL](#) == n, reported with EC syndrome value 0x03.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

### OSDLR\_EL1, bit [11]

#### When FEAT\_DoubleLock is implemented:

Trap MRS reads of [OSDLR\\_EL1](#) at EL1 using AArch64 to EL2.

OSDLR_EL1	Meaning
0b0	MRS reads of <a href="#">OSDLR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">OSDLR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### OSECCR\_EL1, bit [10]

Trap MRS reads of [OSECCR\\_EL1](#) at EL1 using AArch64 to EL2.

OSECCR_EL1	Meaning
0b0	MRS reads of <a href="#">OSECCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">OSECCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### OSLSR\_EL1, bit [9]

Trap MRS reads of [OSLSR\\_EL1](#) at EL1 using AArch64 to EL2.

OSLSR_EL1	Meaning
0b0	MRS reads of <a href="#">OSLSR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">OSLSR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Bit [8]

Reserved, RES0.

#### DBGPRCR\_EL1, bit [7]

Trap MRS reads of [DBGPRCR\\_EL1](#) at EL1 using AArch64 to EL2.

DBGPRCR_EL1	Meaning
0b0	MRS reads of <a href="#">DBGPRCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">DBGPRCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DBGAUTHSTATUS\_EL1, bit [6]**

Trap MRS reads of [DBGAUTHSTATUS\\_EL1](#) at EL1 using AArch64 to EL2.

<b>DBGAUTHSTATUS_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">DBGAUTHSTATUS_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">DBGAUTHSTATUS_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DBGCLAIM, bit [5]**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [DBGCLAIMCLR\\_EL1](#).
- [DBGCLAIMSET\\_EL1](#).

<b>DBGCLAIM</b>	<b>Meaning</b>
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**MDSCR\_EL1, bit [4]**

Trap MRS reads of [MDSCR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>MDSCR_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">MDSCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">MDSCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DBGWVRn\_EL1, bit [3]**

Trap MRS reads of [DBGWVR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

<b>DBGWVRn_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">DBGWVR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">DBGWVR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint *n* is not implemented, a read of [DBGWVR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### DBGWCRn\_EL1, bit [2]

Trap MRS reads of [DBGWCR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

DBGWCRn_EL1	Meaning
0b0	MRS reads of <a href="#">DBGWCR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">DBGWCR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint *n* is not implemented, a read of [DBGWCR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### DBGBVRn\_EL1, bit [1]

Trap MRS reads of [DBGBVR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

DBGBVRn_EL1	Meaning
0b0	MRS reads of <a href="#">DBGBVR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">DBGBVR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint *n* is not implemented, a read of [DBGBVR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### DBGBCRn\_EL1, bit [0]

Trap MRS reads of [DBGBCR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

DBGBCRn_EL1	Meaning
0b0	MRS reads of <a href="#">DBGBCR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">DBGBCR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint *n* is not implemented, a read of [DBGBCR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

## Accessing the HDFGRTR\_EL2

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, HDFGRTR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x1D0];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then

    HDFGRTR_EL2 = X[t];

```

# HDFGWTR\_EL2, Hypervisor Debug Fine-Grained Write Trap Register

The HDFGWTR\_EL2 characteristics are:

## Purpose

Provides controls for traps of MSR and MCR writes of debug, trace, PMU, and Statistical Profiling System registers.

## Configuration

This register is present only when FEAT\_FGT is implemented. Otherwise, direct accesses to HDFGWTR\_EL2 are UNDEFINED.

## Attributes

HDFGWTR\_EL2 is a 64-bit register.

## Field descriptions

The HDFGWTR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56
RES0	nPMSNEVFR_EL1	RES0				PMUSERENR_ELO	
PMSIRR_EL1	RES0	PMSICR_EL1	PMSFCR_EL1	PMSEVFR_EL1	PMSCR_EL1	PMBSR_EL1	PMBPTR_EL1
31	30	29	28	27	26	25	24

### Bit [63]

Reserved, RES0.

### nPMSNEVFR\_EL1, bit [62]

When FEAT\_SPEv1p2 is implemented:

Trap MSR writes of PMSNEVFR\_EL1 at EL1 using AArch64 to EL2.

nPMSNEVFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state then MSR writes of PMSNEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMSNEVFR_EL1 are not affected by this bit.

This bit is ignored by the PE and treated as zero when EL3 is implemented and SCR\_EL3.FGTEn == 0b0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### Otherwise:

Reserved, RES0.

**Bits [61:58]**

Reserved, RES0.

**PMUSERENR\_EL0, bit [57]**

When FEAT\_PMUv3 is implemented:

Trap MSR writes of [PMUSERENR\\_EL0](#) at EL1 using AArch64 to EL2.

PMUSERENR_EL0	Meaning
0b0	MSR writes of <a href="#">PMUSERENR_EL0</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">PMUSERENR_EL0</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**Bits [56:50]**

Reserved, RES0.

**TRFCR\_EL1, bit [49]**

When FEAT\_TRF is implemented:

Trap MSR writes of [TRFCR\\_EL1](#) at EL1 using AArch64 to EL2.

TRFCR_EL1	Meaning
0b0	MSR writes of <a href="#">TRFCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">TRFCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**TRCVICTLR, bit [48]**

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of [TRCVICTLR](#) at EL1 using AArch64 to EL2.

TRCVICTLR	Meaning
0b0	MSR writes of <a href="#">TRCVICTLR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">TRCVICTLR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [47]**

Reserved, RES0.

**TRCSSCSRn, bit [46]**

**When FEAT\_ETMv4 is implemented, TRCSSCSR<n> are implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MSR writes of [TRCSSCSR<n>](#) at EL1 using AArch64 to EL2.

TRCSSCSRn	Meaning
0b0	MSR writes of <a href="#">TRCSSCSR&lt;n&gt;</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">TRCSSCSR&lt;n&gt;</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Single-shot Comparator n is not implemented, a write of [TRCSSCSR<n>](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCSEQSTR, bit [45]**

**When FEAT\_ETMv4 is implemented, TRCSEQSTR is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MSR writes of [TRCSEQSTR](#) at EL1 using AArch64 to EL2.

TRCSEQSTR	Meaning
0b0	MSR writes of <a href="#">TRCSEQSTR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">TRCSEQSTR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCPRGCTLR, bit [44]**

**When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MSR writes of [TRCPRGCTLR](#) at EL1 using AArch64 to EL2.

TRCPRGCTLR	Meaning
0b0	MSR writes of <a href="#">TRCPRGCTLR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">TRCPRGCTLR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [43]**

Reserved, RES0.

**TRCOSLAR, bit [42]**

**When System register access to the PE Trace Unit registers is implemented and FEAT\_ETMv4 is implemented:**

Trap MSR writes of TRCOSLAR at EL1 using AArch64 to EL2.

TRCOSLAR	Meaning
0b0	MSR writes of TRCOSLAR are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of TRCOSLAR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCIMSPECn, bit [41]**

**When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MSR writes of [TRCIMSPEC<n>](#) at EL1 using AArch64 to EL2.

TRCIMSPECn	Meaning
0b0	MSR writes of <a href="#">TRCIMSPEC&lt;n&gt;</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">TRCIMSPEC&lt;n&gt;</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If [TRCIMSPEC<n>](#) is not implemented, a write of [TRCIMSPEC<n>](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [40:38]**

Reserved, RES0.

**TRCCNTVRn, bit [37]**

**When FEAT\_ETMv4 is implemented, TRCCNTVR<n> are implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MSR writes of [TRCCNTVR<n>](#) at EL1 using AArch64 to EL2.

TRCCNTVRn	Meaning
0b0	MSR writes of <a href="#">TRCCNTVR&lt;n&gt;</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">TRCCNTVR&lt;n&gt;</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Counter n is not implemented, a write of [TRCCNTVR<n>](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TRCCLAIM, bit [36]**

**When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:**

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [TRCCLAIMCLR](#).
- [TRCCLAIMSET](#).

TRCCLAIM	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### TRCAUXCTLR, bit [35]

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of [TRCAUXCTLR](#) at EL1 using AArch64 to EL2.

TRCAUXCTLR	Meaning
0b0	MSR writes of <a href="#">TRCAUXCTLR</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">TRCAUXCTLR</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### Bit [34]

Reserved, RES0.

#### TRC, bit [33]

When FEAT\_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [TRCACATR<n>](#).
- [TRCACVR<n>](#).
- [TRCBBCTLR](#).
- [TRCCCCTLR](#).
- [TRCCIDCCTLR0](#).
- [TRCCIDCCTLR1](#).
- [TRCCIDCVR<n>](#).
- [TRCCNTCTLR<n>](#).
- [TRCCNTRLDVR<n>](#).
- [TRCCONFIGR](#).
- [TRCEVENTCTL0R](#).
- [TRCEVENTCTL1R](#).
- [TRCEXTINSELR](#).
- [TRCQCTLR](#).
- [TRCRSCTLR<n>](#).

- [TRCSEQEVR<n>](#).
- [TRCSEQRSTEVR](#).
- [TRCSSCCR<n>](#).
- [TRCSSPCICR<n>](#).
- [TRCSTALLCTLR](#).
- [TRCSYNCPR](#).
- [TRCTRACEIDR](#).
- [TRCTSCTLR](#).
- [TRCVIICTLR](#).
- [TRCVIPCSSCTLR](#).
- [TRCVISSCTLR](#).
- [TRCVMIDCCTLR0](#).
- [TRCVMIDCCTLR1](#).
- [TRCVMIDCVR<n>](#).

TRC	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

A write of an unimplemented register is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### PMSLATFR\_EL1, bit [32]

##### When FEAT\_SPE is implemented:

Trap MSR writes of [PMSLATFR\\_EL1](#) at EL1 using AArch64 to EL2.

PMSLATFR_EL1	Meaning
0b0	MSR writes of <a href="#">PMSLATFR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">PMSLATFR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### PMSIRR\_EL1, bit [31]

##### When FEAT\_SPE is implemented:

Trap MSR writes of [PMSIRR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMSIRR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">PMSIRR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">PMSIRR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [30]**

Reserved, RES0.

**PMSICR\_EL1, bit [29]**

**When FEAT\_SPE is implemented:**

Trap MSR writes of [PMSICR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMSICR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">PMSICR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">PMSICR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMSFCR\_EL1, bit [28]**

**When FEAT\_SPE is implemented:**

Trap MSR writes of [PMSFCR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMSFCR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">PMSFCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">PMSFCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMSEVFR\_EL1, bit [27]**

**When FEAT\_SPE is implemented:**

Trap MSR writes of [PMSEVFR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMSEVFR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">PMSEVFR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">PMSEVFR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMSCR\_EL1, bit [26]****When FEAT\_SPE is implemented:**

Trap MSR writes of [PMSCR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMSCR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">PMSCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">PMSCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMBSR\_EL1, bit [25]****When FEAT\_SPE is implemented:**

Trap MSR writes of [PMBSR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMBSR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">PMBSR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">PMBSR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMBPTR\_EL1, bit [24]****When FEAT\_SPE is implemented:**

Trap MSR writes of [PMBPTR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMBPTR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">PMBPTR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">PMBPTR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMBLIMITR\_EL1, bit [23]****When FEAT\_SPE is implemented:**

Trap MSR writes of [PMBLIMITR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PMBLIMITR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">PMBLIMITR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">PMBLIMITR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [22]**

Reserved, RES0.

**PMCR\_EL0, bit [21]****When FEAT\_PMUv3 is implemented:**

Trap MSR writes of [PMCR\\_EL0](#) at EL1 and EL0 using AArch64 and MCR writes of [PMCR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCR_EL0	Meaning
0b0	MSR writes of <a href="#">PMCR_EL0</a> at EL1 and EL0 using AArch64 and MCR writes of <a href="#">PMCR</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> <li>MSR writes of <a href="#">PMCR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR writes of <a href="#">PMCR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMSWINC\_EL0, bit [20]**

**When FEAT\_PMUv3 is implemented:**

Trap MSR writes of [PMSWINC\\_EL0](#) at EL1 and EL0 using AArch64 and MCR writes of [PMSWINC](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSWINC_EL0	Meaning
0b0	MSR writes of <a href="#">PMSWINC_EL0</a> at EL1 and EL0 using AArch64 and MCR writes of <a href="#">PMSWINC</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> <li>MSR writes of <a href="#">PMSWINC_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR writes of <a href="#">PMSWINC</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMSELR\_EL0, bit [19]**

**When FEAT\_PMUv3 is implemented:**

Trap MSR writes of [PMSELR\\_EL0](#) at EL1 and EL0 using AArch64 and MCR writes of [PMSELR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSELR_EL0	Meaning
0b0	MSR writes of <a href="#">PMSELR_EL0</a> at EL1 and EL0 using AArch64 and MCR writes of <a href="#">PMSELR</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> <li>MSR writes of <a href="#">PMSELR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR writes of <a href="#">PMSELR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMOVS, bit [18]**

**When FEAT\_PMUv3 is implemented:**

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of [PMOVSCLR\\_EL0](#) and [PMOVSSET\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of [PMOVSR](#) and [PMOVSSET](#).

PMOVS	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> <li>MSR writes at EL1 and EL0 using AArch64 of <a href="#">PMOVSCLR_EL0</a> and <a href="#">PMOVSSET_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR writes at EL0 using AArch32 of <a href="#">PMOVSR</a> and <a href="#">PMOVSSET</a> are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMINTEN, bit [17]**

**When FEAT\_PMUv3 is implemented:**

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [PMINTENCLR\\_EL1](#).
- [PMINTENSET\\_EL1](#).

PMINTEN	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMCNTEN, bit [16]**

**When FEAT\_PMUv3 is implemented:**

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of [PMCNTENCLR\\_EL0](#) and [PMCNTENSET\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of [PMCNTENCLR](#) and [PMCNTENSET](#).

PMCNTEN	Meaning
0b0	The operations listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2.{E2H,TGE}</a> != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> <li>• MSR writes at EL1 and EL0 using AArch64 of <a href="#">PMCNTENCLR_EL0</a> and <a href="#">PMCNTENSET_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>• MCR writes at EL0 using AArch32 of <a href="#">PMCNTENCLR</a> and <a href="#">PMCNTENSET</a> are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**PMCCNTR\_EL0, bit [15]**

**When FEAT\_PMUv3 is implemented:**

Trap MSR writes of [PMCCNTR\\_EL0](#) at EL1 and EL0 using AArch64 and MCR and MCRR writes of [PMCCNTR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCNTR_EL0	Meaning
0b0	MSR writes of <a href="#">PMCCNTR_EL0</a> at EL1 and EL0 using AArch64 and MCR and MCRR writes of <a href="#">PMCCNTR</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> <li>MSR writes of <a href="#">PMCCNTR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR and MCRR writes of <a href="#">PMCCNTR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03 (for MCR) or 0x04 (for MCRR).</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

### PMCCFILTR\_EL0, bit [14]

#### When FEAT\_PMUv3 is implemented:

Trap MSR writes of [PMCCFILTR\\_EL0](#) at EL1 and EL0 using AArch64 and MCR writes of [PMCCFILTR](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCFILTR_EL0	Meaning
0b0	MSR writes of <a href="#">PMCCFILTR_EL0</a> at EL1 and EL0 using AArch64 and MCR writes of <a href="#">PMCCFILTR</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> <li>MSR writes of <a href="#">PMCCFILTR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR writes of <a href="#">PMCCFILTR</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

[PMCCFILTR\\_EL0](#) can also be accessed in AArch64 state using [PMXEVTYPER\\_EL0](#) when [PMSELR\\_EL0](#).SEL == 31, and [PMCCFILTR](#) can also be accessed in AArch32 state using [PMXEVTYPER](#) when [PMSELR](#).SEL == 31.

Setting this bit to 1 has no effect on accesses to [PMXEVTYPER\\_EL0](#) and [PMXEVTYPER](#), regardless of the value of [PMSELR\\_EL0](#).SEL or [PMSELR](#).SEL.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

### PMEVTYPERn\_EL0, bit [13]

#### When FEAT\_PMUv3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of [PMEVTYPER<n>\\_EL0](#) and [PMXEVTYPER\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of [PMEVTYPER<n>](#) and [PMXEVTYPER](#).

<b>PMEVTYPERn_EL0</b>	<b>Meaning</b>
0b0	The operations listed above are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 0b1, then, unless the write generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>• MSR writes at EL1 and EL0 using AArch64 of <a href="#">PMEVTYPER&lt;n&gt;_EL0</a> and <a href="#">PMXEVTYPER_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>• MCR writes at EL0 using AArch32 of <a href="#">PMEVTYPER&lt;n&gt;</a> and <a href="#">PMXEVTYPER</a> are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

When FEAT\_FGT is implemented, then, regardless of the value of this bit, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a write of [PMEVTYPER<n>\\_EL0](#), or, if n is not 31, a write of [PMXEVTYPER\\_EL0](#) when [PMSELR\\_EL0](#).SEL == n.
  - In AArch32 state, a write of [PMEVTYPER<n>](#), or, if n is not 31, a write of [PMXEVTYPER](#) when [PMSELR](#).SEL == n.
- If event counter n is implemented and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - In AArch64 state, a write of [PMEVTYPER<n>\\_EL0](#), or a write of [PMXEVTYPER\\_EL0](#) when [PMSELR\\_EL0](#).SEL == n, reported with EC syndrome value 0x18.
  - In AArch32 state, a write of [PMEVTYPER<n>](#), or a write of [PMXEVTYPER](#) when [PMSELR](#).SEL == n, reported with EC syndrome value 0x03.

See also HDFGWTR\_EL2.PMCCFILTR\_EL0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### PMEVCNTRn\_EL0, bit [12]

##### When FEAT\_PMUv3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of [PMEVCNTR<n>\\_EL0](#) and [PMXEVCNTR\\_EL0](#).
- At EL0 using Arch32 when EL1 is using AArch64: MCR writes of [PMEVCNTR<n>](#) and [PMXEVCNTR](#).

<b>PMEVCNTRn_EL0</b>	<b>Meaning</b>
0b0	The operations listed above are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a>.{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 0b1, then, unless the write generates a higher priority exception:</p> <ul style="list-style-type: none"> <li>MSR writes at EL1 and EL0 using AArch64 of <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> and <a href="#">PMXEVCNTR_EL0</a> are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR writes at EL0 using AArch32 of <a href="#">PMEVCNTR&lt;n&gt;</a> and <a href="#">PMXEVCNTR</a> are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

When FEAT\_FGT is implemented, then, regardless of the value of this bit, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a write of [PMEVCNTR<n>\\_EL0](#), or a write of [PMXEVCNTR\\_EL0](#) when [PMSELR\\_EL0](#).SEL == n.
  - In AArch32 state, a write of [PMEVCNTR<n>](#), or a write of [PMXEVCNTR](#) when [PMSELR](#).SEL == n.
- If event counter n is implemented, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - In AArch64 state, a write of [PMEVCNTR<n>\\_EL0](#), or a write of [PMXEVCNTR\\_EL0](#) when [PMSELR\\_EL0](#).SEL == n, reported with EC syndrome value 0x18.
  - In AArch32 state, a write of [PMEVCNTR<n>](#), or a write of [PMXEVCNTR](#) when [PMSELR](#).SEL == n, reported with EC syndrome value 0x03.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

### OSDLR\_EL1, bit [11]

**When FEAT\_DoubleLock is implemented:**

Trap MSR writes of [OSDLR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>OSDLR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">OSDLR_EL1</a> are not affected by this bit.
0b1	<p>If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a>.FGTEn == 0b1, then MSR writes of <a href="#">OSDLR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.</p>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

### OSECCR\_EL1, bit [10]

Trap MSR writes of [OSECCR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>OSECCR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">OSECCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">OSECCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Bit [9]

Reserved, RES0.

#### OSLAR\_EL1, bit [8]

Trap MSR writes of [OSLAR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>OSLAR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">OSLAR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">OSLAR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DBGPRCR\_EL1, bit [7]

Trap MSR writes of [DBGPRCR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>DBGPRCR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">DBGPRCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">DBGPRCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Bit [6]

Reserved, RES0.

#### DBGCLAIM, bit [5]

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [DBGCLAIMCLR\\_EL1](#).
- [DBGCLAIMSET\\_EL1](#).

DBGCLAIM	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### MDSCR\_EL1, bit [4]

Trap MSR writes of [MDSCR\\_EL1](#) at EL1 using AArch64 to EL2.

MDSCR_EL1	Meaning
0b0	MSR writes of <a href="#">MDSCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">MDSCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DBGWVRn\_EL1, bit [3]

Trap MSR writes of [DBGWVR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

DBGWVRn_EL1	Meaning
0b0	MSR writes of <a href="#">DBGWVR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">DBGWVR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of [DBGWVR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DBGWCRn\_EL1, bit [2]

Trap MSR writes of [DBGWCR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

DBGWCRn_EL1	Meaning
0b0	MSR writes of <a href="#">DBGWCR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">DBGWCR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of [DBGWCR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DBGBVRn\_EL1, bit [1]**

Trap MSR writes of [DBGBVR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

<b>DBGBVRn_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">DBGBVR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">DBGBVR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of [DBGBVR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DBGBCRn\_EL1, bit [0]**

Trap MSR writes of [DBGBCR<n>\\_EL1](#) at EL1 using AArch64 to EL2.

<b>DBGBCRn_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">DBGBCR&lt;n&gt;_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">DBGBCR&lt;n&gt;_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of [DBGBCR<n>\\_EL1](#) is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Accessing the HDFGWTR\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, HDFGWTR\_EL2

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b11	0b100	0b0011	0b0001	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x1D8];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then

# HFGITR\_EL2, Hypervisor Fine-Grained Instruction Trap Register

The HFGITR\_EL2 characteristics are:

## Purpose

Provides instruction trap controls.

## Configuration

This register is present only when FEAT\_FGT is implemented. Otherwise, direct accesses to HFGITR\_EL2 are UNDEFINED.

## Attributes

HFGITR\_EL2 is a 64-bit register.

## Field descriptions

The HFGITR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56
RES0							
TLBIVAAE1IS	TLBIASIDE1IS	TLBIVAE1IS	TLBIVMALE1IS	TLBIRVAAE1IOS	TLBIRVALE1IOS	TLBIRVAAE1IOS	TLBIRVAE1IOS
31	30	29	28	27	26	25	24

### Bits [63:55]

Reserved, RES0.

### DCCVAC, bit [54]

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC CVAC](#).
- [DC CGVAC](#), if FEAT\_MTE is implemented.
- [DC CGDVAC](#), if FEAT\_MTE is implemented.

DCCVAC	Meaning
0b0	Execution of the instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### SVC\_EL1, bit [53]

Trap execution of SVC at EL1 using AArch64 to EL2.

SVC_EL1	Meaning
0b0	Execution of SVC is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of SVC at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### SVC\_EL0, bit [52]

Trap execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 when EL1 is using AArch64 to EL2.

SVC_EL0	Meaning
0b0	Execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2.{E2H,TGE}</a> != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then, unless the instruction generates a higher priority exception: <ul style="list-style-type: none"> <li>• Execution of SVC at EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15.</li> <li>• Execution of SVC at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x11.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### ERET, bit [51]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- ERET.
- ERETAA, if FEAT\_PAuth is implemented.
- ERETAB, if FEAT\_PAuth is implemented.

ERET	Meaning
0b0	Execution of the instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x1A, unless the instruction generates a higher priority exception.

If EL2 is implemented and enabled in the current Security state, [HCR\\_EL2.API](#) == 0b0, and this bit enables a fine-grained trap on the instruction, then execution at EL1 using AArch64 of ERETAA or ERETAB instructions is trapped to EL2 and reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the trap enabled by [HCR\\_EL2.API](#) == 0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### CPPRCTX, bit [50]

When FEAT\_SPECRES is implemented:

Trap execution of [CPPRCTX](#) at EL1 and EL0 using AArch64 and execution of [CPPRCTX](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

CPPRCTX	Meaning
0b0	Execution of <a href="#">CPP RCTX</a> at EL1 and EL0 using AArch64 and execution of <a href="#">CPPRCTX</a> at EL0 using AArch32 is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the instruction generates a higher priority exception: <ul style="list-style-type: none"> <li>• Execution of <a href="#">CPP RCTX</a> at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>• Execution of <a href="#">CPPRCTX</a> at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**DVPRCTX, bit [49]**

**When FEAT\_SPECRES is implemented:**

Trap execution of [DVP RCTX](#) at EL1 and EL0 using AArch64 and execution of [DVPRCTX](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

DVPRCTX	Meaning
0b0	Execution of <a href="#">DVP RCTX</a> at EL1 and EL0 using AArch64 and execution of <a href="#">DVPRCTX</a> at EL0 using AArch32 is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the instruction generates a higher priority exception: <ul style="list-style-type: none"> <li>• Execution of <a href="#">DVP RCTX</a> at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>• Execution of <a href="#">DVPRCTX</a> at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**CFPRCTX, bit [48]**

**When FEAT\_SPECRES is implemented:**

Trap execution of [CFP RCTX](#) at EL1 and EL0 using AArch64 and execution of [CFPRCTX](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

CFPRCTX	Meaning
0b0	Execution of <a href="#">CFP RCTX</a> at EL1 and EL0 using AArch64 and execution of <a href="#">CFPRCTX</a> at EL0 using AArch32 is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the instruction generates a higher priority exception: <ul style="list-style-type: none"> <li>Execution of <a href="#">CFP RCTX</a> at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>Execution of <a href="#">CFPRCTX</a> at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### TLBIVAALE1, bit [47]

Trap execution of [TLBI VAALE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI VAALE1NXS](#).

TLBIVAALE1	Meaning
0b0	Execution of <a href="#">TLBI VAALE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI VAALE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TLBIVALE1, bit [46]

Trap execution of [TLBI VALE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI VALE1NXS](#).

TLBIVALE1	Meaning
0b0	Execution of <a href="#">TLBI VALE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI VALE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TLBIVAAE1, bit [45]

Trap execution of [TLBI VAAE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI VAAE1NXS](#).

<b>TLBIVAAE1</b>	<b>Meaning</b>
0b0	Execution of <a href="#">TLBI VAAE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI VAAE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### **TLBIASIDE1, bit [44]**

Trap execution of [TLBI ASIDE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI ASIDE1NXS](#).

<b>TLBIASIDE1</b>	<b>Meaning</b>
0b0	Execution of <a href="#">TLBI ASIDE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI ASIDE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### **TLBIVAE1, bit [43]**

Trap execution of [TLBI VAE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VAE1NXS](#).

<b>TLBIVAE1</b>	<b>Meaning</b>
0b0	Execution of <a href="#">TLBI VAE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI VAE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### **TLBIVMALLE1, bit [42]**

Trap execution of [TLBI VMALLE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VMALLE1NXS](#).

<b>TLBIVMALLE1</b>	<b>Meaning</b>
0b0	Execution of <a href="#">TLBI VMALLE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI VMALLE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TLBIRVAALE1, bit [41]****When FEAT\_TLBIRANGE is implemented:**

Trap execution of [TLBI RVAALE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI RVAALE1NXS](#).

TLBIRVAALE1	Meaning
0b0	Execution of <a href="#">TLBI RVAALE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI RVAALE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIRVALE1, bit [40]****When FEAT\_TLBIRANGE is implemented:**

Trap execution of [TLBI RVALE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI RVALE1NXS](#).

TLBIRVALE1	Meaning
0b0	Execution of <a href="#">TLBI RVALE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI RVALE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIRVAAE1, bit [39]****When FEAT\_TLBIRANGE is implemented:**

Trap execution of [TLBI RVAAE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI RVAAE1NXS](#).

TLBIRVAAE1	Meaning
0b0	Execution of <a href="#">TLBI RVAAE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI RVAAE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIRVAE1, bit [38]****When FEAT\_TLBIRANGE is implemented:**

Trap execution of [TLBI RVAE1](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI RVAE1NXS](#).

TLBIRVAE1	Meaning
0b0	Execution of <a href="#">TLBI RVAE1</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI RVAE1</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIRVAALE1IS, bit [37]****When FEAT\_TLBIRANGE is implemented:**

Trap execution of [TLBI RVAALE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI RVAALE1ISNXS](#).

TLBIRVAALE1IS	Meaning
0b0	Execution of <a href="#">TLBI RVAALE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI RVAALE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIRVALE1IS, bit [36]****When FEAT\_TLBIRANGE is implemented:**

Trap execution of [TLBI RVALE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI RVALE1ISNXS](#).

TLBIRVALE1IS	Meaning
0b0	Execution of <a href="#">TLBI RVALE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI RVALE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIRVAAE1IS, bit [35]**

**When FEAT\_TLBIRANGE is implemented:**

Trap execution of [TLBI RVAAE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI RVAAE1ISNXS](#).

TLBIRVAAE1IS	Meaning
0b0	Execution of <a href="#">TLBI RVAAE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI RVAAE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIRVAE1IS, bit [34]**

**When FEAT\_TLBIRANGE is implemented:**

Trap execution of [TLBI RVAE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI RVAE1ISNXS](#).

TLBIRVAE1IS	Meaning
0b0	Execution of <a href="#">TLBI RVAE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI RVAE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIVAALE1IS, bit [33]**

Trap execution of [TLBI VAALE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI VAALE1ISNXS](#).

TLBIVAALE1IS	Meaning
0b0	Execution of <a href="#">TLBI VAALE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI VAALE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TLBIVALE1IS, bit [32]**

Trap execution of [TLBI VALE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI VALE1ISNXS](#).

TLBIVALE1IS	Meaning
0b0	Execution of <a href="#">TLBI VALE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI VALE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TLBIVAAE1IS, bit [31]**

Trap execution of [TLBI VAAE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI VAAE1ISNXS](#).

TLBIVAAE1IS	Meaning
0b0	Execution of <a href="#">TLBI VAAE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI VAAE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TLBIASIDE1IS, bit [30]**

Trap execution of [TLBI ASIDE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI ASIDE1ISNXS](#).

TLBIASIDE1IS	Meaning
0b0	Execution of <a href="#">TLBI ASIDE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI ASIDE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### TLBIVAE1IS, bit [29]

Trap execution of [TLBI VAE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VAE1ISNXS](#).

TLBIVAE1IS	Meaning
0b0	Execution of <a href="#">TLBI VAE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI VAE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### TLBIVMALE1IS, bit [28]

Trap execution of [TLBI VMALLE1IS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VMALLE1ISNXS](#).

TLBIVMALE1IS	Meaning
0b0	Execution of <a href="#">TLBI VMALLE1IS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI VMALLE1IS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### TLBIRVAALE1OS, bit [27]

**When FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented:**

Trap execution of [TLBI RVAALE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI RVAALE1OSNXS](#).

TLBIRVAALE1OS	Meaning
0b0	Execution of <a href="#">TLBI RVAALE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI RVAALE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### Otherwise:

Reserved, RES0.

**TLBIRVALE1OS, bit [26]**

When FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented:

Trap execution of [TLBI RVALE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI RVALE1OSNXS](#).

TLBIRVALE1OS	Meaning
0b0	Execution of <a href="#">TLBI RVALE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI RVALE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**TLBIRVAAE1OS, bit [25]**

When FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented:

Trap execution of [TLBI RVAAE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI RVAAE1OSNXS](#).

TLBIRVAAE1OS	Meaning
0b0	Execution of <a href="#">TLBI RVAAE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI RVAAE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**TLBIRVAE1OS, bit [24]**

When FEAT\_TLBIRANGE is implemented and FEAT\_TLBIOS is implemented:

Trap execution of [TLBI RVAE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI RVAE1OSNXS](#).

TLBIRVAE1OS	Meaning
0b0	Execution of <a href="#">TLBI RVAE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI RVAE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIVAALE1OS, bit [23]**

**When FEAT\_TLBIOS is implemented:**

Trap execution of [TLBI VAALE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VAALE1OSNXS](#).

TLBIVAALE1OS	Meaning
0b0	Execution of <a href="#">TLBI VAALE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI VAALE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIVALE1OS, bit [22]**

**When FEAT\_TLBIOS is implemented:**

Trap execution of [TLBI VALE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VALE1OSNXS](#).

TLBIVALE1OS	Meaning
0b0	Execution of <a href="#">TLBI VALE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI VALE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIVAAE1OS, bit [21]**

**When FEAT\_TLBIOS is implemented:**

Trap execution of [TLBI VAAE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VAAE1OSNXS](#).

TLBIVAAE1OS	Meaning
0b0	Execution of <a href="#">TLBI VAAE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI VAAE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIASIDE1OS, bit [20]**

**When FEAT\_TLBIOS is implemented:**

Trap execution of [TLBI ASIDE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI ASIDE1OSNXS](#).

TLBIASIDE1OS	Meaning
0b0	Execution of <a href="#">TLBI ASIDE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI ASIDE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIVAE1OS, bit [19]**

**When FEAT\_TLBIOS is implemented:**

Trap execution of [TLBI VAE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2.FGTnXS](#) == 0b0, this field also traps execution of [TLBI VAE1OSNXS](#).

TLBIVAE1OS	Meaning
0b0	Execution of <a href="#">TLBI VAE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">TLBI VAE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TLBIVMALE1OS, bit [18]**

**When FEAT\_TLBIOS is implemented:**

Trap execution of [TLBI VMALLE1OS](#) at EL1 using AArch64 to EL2.

If FEAT\_XS is implemented and [HCRX\\_EL2](#).FGTnXS == 0b0, this field also traps execution of [TLBI VMALLE1OSNXS](#).

<b>TLBIVMALLE1OS</b>	<b>Meaning</b>
0b0	Execution of <a href="#">TLBI VMALLE1OS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">TLBI VMALLE1OS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ATS1E1WP, bit [17]****When FEAT\_PAN2 is implemented:**

Trap execution of [AT S1E1WP](#) at EL1 using AArch64 to EL2.

<b>ATS1E1WP</b>	<b>Meaning</b>
0b0	Execution of <a href="#">AT S1E1WP</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">AT S1E1WP</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ATS1E1RP, bit [16]****When FEAT\_PAN2 is implemented:**

Trap execution of [AT S1E1RP](#) at EL1 using AArch64 to EL2.

<b>ATS1E1RP</b>	<b>Meaning</b>
0b0	Execution of <a href="#">AT S1E1RP</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">AT S1E1RP</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ATS1E0W, bit [15]**

Trap execution of [AT S1E0W](#) at EL1 using AArch64 to EL2.

ATS1E0W	Meaning
0b0	Execution of <a href="#">AT S1E0W</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">AT S1E0W</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**ATS1E0R, bit [14]**

Trap execution of [AT S1E0R](#) at EL1 using AArch64 to EL2.

ATS1E0R	Meaning
0b0	Execution of <a href="#">AT S1E0R</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">AT S1E0R</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**ATS1E1W, bit [13]**

Trap execution of [AT S1E1W](#) at EL1 using AArch64 to EL2.

ATS1E1W	Meaning
0b0	Execution of <a href="#">AT S1E1W</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">AT S1E1W</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**ATS1E1R, bit [12]**

Trap execution of [AT S1E1R](#) at EL1 using AArch64 to EL2.

ATS1E1R	Meaning
0b0	Execution of <a href="#">AT S1E1R</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution of <a href="#">AT S1E1R</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DCZVA, bit [11]**

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC ZVA](#).
- [DC GVA](#), if FEAT\_MTE is implemented.
- [DC GZVA](#), if FEAT\_MTE is implemented.

DCZVA	Meaning
0b0	Execution of the instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DCCIVAC, bit [10]**

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC CIVAC](#).
- [DC CIGVAC](#), if FEAT\_MTE is implemented.
- [DC CIGDVAC](#), if FEAT\_MTE is implemented.

DCCIVAC	Meaning
0b0	Execution of the instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DCCVADP, bit [9]**

When FEAT\_DPB2 is implemented:

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC CVADP](#).
- [DC CGVADP](#), if FEAT\_MTE is implemented.
- [DC CGDVADP](#), if FEAT\_MTE is implemented.

DCCVADP	Meaning
0b0	Execution of the instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**DCCVAP, bit [8]**

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC CVAP](#).
- [DC CGVAP](#), if FEAT\_MTE is implemented.
- [DC CGDVAP](#), if FEAT\_MTE is implemented.

DCCVAP	Meaning
0b0	Execution of the instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DCCVAU, bit [7]**

Trap execution of [DC CVAU](#) at EL1 and EL0 using AArch64 to EL2.

DCCVAU	Meaning
0b0	Execution of <a href="#">DC CVAU</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">DC CVAU</a> at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DCCISW, bit [6]**

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC CISW](#).
- [DC CIGSW](#), if FEAT\_MTE is implemented.
- [DC CIGDSW](#), if FEAT\_MTE is implemented.

DCCISW	Meaning
0b0	Execution of the instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**DCCSW, bit [5]**

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC CSW](#).
- [DC CGSW](#), if FEAT\_MTE is implemented.
- [DC CGDSW](#), if FEAT\_MTE is implemented.

DCCSW	Meaning
0b0	Execution of the instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DCISW, bit [4]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC ISW](#).
- [DC IGSW](#), if FEAT\_MTE is implemented.
- [DC IGDSW](#), if FEAT\_MTE is implemented.

DCISW	Meaning
0b0	Execution of the instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DCIVAC, bit [3]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- [DC IVAC](#).
- [DC IGVAC](#), if FEAT\_MTE is implemented.
- [DC IGDVAC](#), if FEAT\_MTE is implemented.

DCIVAC	Meaning
0b0	Execution of the instructions listed above is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### ICIVAU, bit [2]

Trap execution of [IC IVAU](#) at EL1 and EL0 using AArch64 to EL2.

ICIVAU	Meaning
0b0	Execution of <a href="#">IC IVAU</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">IC IVAU</a> at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### ICIALLU, bit [1]

Trap execution of [IC IALLU](#) at EL1 using AArch64 to EL2.

ICIALLU	Meaning
0b0	Execution of <a href="#">IC IALLU</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">IC IALLU</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### ICIALUIS, bit [0]

Trap execution of [IC IALLUIS](#) at EL1 using AArch64 to EL2.

ICIALUIS	Meaning
0b0	Execution of <a href="#">IC IALLUIS</a> is not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then execution of <a href="#">IC IALLUIS</a> at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

## Accessing the HFGITR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, HFGITR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b110

```

if PSTATE.EL == EL0 then

# HFGRTR\_EL2, Hypervisor Fine-Grained Read Trap Register

The HFGRTR\_EL2 characteristics are:

## Purpose

Provides controls for traps of MRS and MRC reads of System registers.

## Configuration

This register is present only when FEAT\_FGT is implemented. Otherwise, direct accesses to HFGRTR\_EL2 are UNDEFINED.

## Attributes

HFGRTR\_EL2 is a 64-bit register.

## Field descriptions

The HFGRTR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	
						RES0				
SCXTNUM_EL0	SCXTNUM_EL1	SCTLR_EL1	REVIDR_EL1	PAR_EL1	MPIDR_EL1	MIDR_EL1	MAIR_EL1	LORSA_EL1	LORN_EL1	
31	30	29	28	27	26	25	24	23	22	

### Bits [63:51]

Reserved, RES0.

### nACCDATA\_EL1, bit [50]

When FEAT\_LS64 is implemented:

Trap MRS reads of [ACCDATA\\_EL1](#) at EL1 using AArch64 to EL2.

nACCDATA_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state then MRS reads of <a href="#">ACCDATA_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of <a href="#">ACCDATA_EL1</a> are not affected by this bit.

This bit is ignored by the PE and treated as zero when EL3 is implemented and [SCR\\_EL3](#).FGTEn == 0b0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### Otherwise:

Reserved, RES0.

**ERXADDR\_EL1, bit [49]****When FEAT\_RAS is implemented:**

Trap MRS reads of [ERXADDR\\_EL1](#) at EL1 using AArch64 to EL2.

ERXADDR_EL1	Meaning
0b0	MRS reads of <a href="#">ERXADDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">ERXADDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXPFGCDN\_EL1, bit [48]****When FEAT\_RASv1p1 is implemented:**

Trap MRS reads of [ERXPFGCDN\\_EL1](#) at EL1 using AArch64 to EL2.

ERXPFGCDN_EL1	Meaning
0b0	MRS reads of <a href="#">ERXPFGCDN_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">ERXPFGCDN_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXPFGCTL\_EL1, bit [47]****When FEAT\_RASv1p1 is implemented:**

Trap MRS reads of [ERXPFGCTL\\_EL1](#) at EL1 using AArch64 to EL2.

ERXPFGCTL_EL1	Meaning
0b0	MRS reads of <a href="#">ERXPFGCTL_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">ERXPFGCTL_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXPFGF\_EL1, bit [46]****When FEAT\_RAS is implemented:**

Trap MRS reads of [ERXPFGF\\_EL1](#) at EL1 using AArch64 to EL2.

ERXPFGF_EL1	Meaning
0b0	MRS reads of <a href="#">ERXPFGF_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">ERXPFGF_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXMISCN\_EL1, bit [45]****When FEAT\_RAS is implemented:**

Trap MRS reads of [ERXMISCN\\_EL1](#) at EL1 using AArch64 to EL2.

ERXMISCN_EL1	Meaning
0b0	MRS reads of <a href="#">ERXMISCN_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">ERXMISCN_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXSTATUS\_EL1, bit [44]****When FEAT\_RAS is implemented:**

Trap MRS reads of [ERXSTATUS\\_EL1](#) at EL1 using AArch64 to EL2.

<b>ERXSTATUS_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">ERXSTATUS_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">ERXSTATUS_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXCTLR\_EL1, bit [43]**

**When FEAT\_RAS is implemented:**

Trap MRS reads of [ERXCTLR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>ERXCTLR_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">ERXCTLR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">ERXCTLR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXFR\_EL1, bit [42]**

**When FEAT\_RAS is implemented:**

Trap MRS reads of [ERXFR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>ERXFR_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">ERXFR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">ERXFR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERRSEL\_EL1, bit [41]****When FEAT\_RAS is implemented:**

Trap MRS reads of [ERRSEL\\_EL1](#) at EL1 using AArch64 to EL2.

<b>ERRSEL_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">ERRSEL_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">ERRSEL_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERRIDR\_EL1, bit [40]****When FEAT\_RAS is implemented:**

Trap MRS reads of [ERRIDR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>ERRIDR_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">ERRIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">ERRIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ICC\_IGRPENn\_EL1, bit [39]****When FEAT\_GICv3 is implemented:**

Trap MRS reads of ICC\_IGRPEN<n>\_EL1 at EL1 using AArch64 to EL2.

<b>ICC_IGRPENn_EL1</b>	<b>Meaning</b>
0b0	MRS reads of ICC_IGRPEN<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**VBAR\_EL1, bit [38]**

Trap MRS reads of [VBAR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>VBAR_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">VBAR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">VBAR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TTBR1\_EL1, bit [37]**

Trap MRS reads of [TTBR1\\_EL1](#) at EL1 using AArch64 to EL2.

<b>TTBR1_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">TTBR1_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">TTBR1_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TTBR0\_EL1, bit [36]**

Trap MRS reads of [TTBR0\\_EL1](#) at EL1 using AArch64 to EL2.

<b>TTBR0_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">TTBR0_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">TTBR0_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TPIDR\_EL0, bit [35]**

Trap MRS reads of [TPIDR\\_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [TPIDRURW](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDR_ELO	Meaning
0b0	MRS reads of <a href="#">TPIDR_ELO</a> at EL1 and EL0 using AArch64 and MRC reads of <a href="#">TPIDRURW</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of <a href="#">TPIDR_ELO</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of <a href="#">TPIDRURW</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TPIDRRO\_ELO, bit [34]

Trap MRS reads of [TPIDRRO\\_ELO](#) at EL1 and EL0 using AArch64 and MRC reads of [TPIDRURO](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDRRO_ELO	Meaning
0b0	MRS reads of <a href="#">TPIDRRO_ELO</a> at EL1 and EL0 using AArch64 and MRC reads of <a href="#">TPIDRURO</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> <li>MRS reads of <a href="#">TPIDRRO_ELO</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MRC reads of <a href="#">TPIDRURO</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TPIDR\_EL1, bit [33]

Trap MRS reads of [TPIDR\\_EL1](#) at EL1 using AArch64 to EL2.

TPIDR_EL1	Meaning
0b0	MRS reads of <a href="#">TPIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then MRS reads of <a href="#">TPIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TCR\_EL1, bit [32]

Trap MRS reads of [TCR\\_EL1](#) at EL1 using AArch64 to EL2.

TCR_EL1	Meaning
0b0	MRS reads of <a href="#">TCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then MRS reads of <a href="#">TCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### SCXTNUM\_EL0, bit [31]

When FEAT\_CSV2 is implemented:

Trap MRS reads of [SCXTNUM\\_EL0](#) at EL1 and EL0 using AArch64 to EL2.

SCXTNUM_EL0	Meaning
0b0	MRS reads of <a href="#">SCXTNUM_EL0</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then MRS reads of <a href="#">SCXTNUM_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### SCXTNUM\_EL1, bit [30]

When FEAT\_CSV2 is implemented:

Trap MRS reads of [SCXTNUM\\_EL1](#) at EL1 using AArch64 to EL2.

SCXTNUM_EL1	Meaning
0b0	MRS reads of <a href="#">SCXTNUM_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then MRS reads of <a href="#">SCXTNUM_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### SCTLR\_EL1, bit [29]

Trap MRS reads of [SCTLR\\_EL1](#) at EL1 using AArch64 to EL2.

SCTLR_EL1	Meaning
0b0	MRS reads of <a href="#">SCTLR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then MRS reads of <a href="#">SCTLR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**REVIDR\_EL1, bit [28]**

Trap MRS reads of [REVIDR\\_EL1](#) at EL1 using AArch64 to EL2.

REVIDR_EL1	Meaning
0b0	MRS reads of <a href="#">REVIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">REVIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**PAR\_EL1, bit [27]**

Trap MRS reads of [PAR\\_EL1](#) at EL1 using AArch64 to EL2.

PAR_EL1	Meaning
0b0	MRS reads of <a href="#">PAR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">PAR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**MPIDR\_EL1, bit [26]**

Trap MRS reads of [MPIDR\\_EL1](#) at EL1 using AArch64 to EL2.

MPIDR_EL1	Meaning
0b0	MRS reads of <a href="#">MPIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">MPIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**MIDR\_EL1, bit [25]**

Trap MRS reads of [MIDR\\_EL1](#) at EL1 using AArch64 to EL2.

MIDR_EL1	Meaning
0b0	MRS reads of <a href="#">MIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">MIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**MAIR\_EL1, bit [24]**

Trap MRS reads of [MAIR\\_EL1](#) at EL1 using AArch64 to EL2.

MAIR_EL1	Meaning
0b0	MRS reads of <a href="#">MAIR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">MAIR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### LORSA\_EL1, bit [23]

When FEAT\_LOR is implemented:

Trap MRS reads of [LORSA\\_EL1](#) at EL1 using AArch64 to EL2.

LORSA_EL1	Meaning
0b0	MRS reads of <a href="#">LORSA_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">LORSA_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### LORN\_EL1, bit [22]

When FEAT\_LOR is implemented:

Trap MRS reads of [LORN\\_EL1](#) at EL1 using AArch64 to EL2.

LORN_EL1	Meaning
0b0	MRS reads of <a href="#">LORN_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">LORN_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### LORID\_EL1, bit [21]

When FEAT\_LOR is implemented:

Trap MRS reads of [LORID\\_EL1](#) at EL1 using AArch64 to EL2.

<b>LORID_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">LORID_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">LORID_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**LOREA\_EL1, bit [20]**

**When FEAT\_LOR is implemented:**

Trap MRS reads of [LOREA\\_EL1](#) at EL1 using AArch64 to EL2.

<b>LOREA_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">LOREA_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">LOREA_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**LORC\_EL1, bit [19]**

**When FEAT\_LOR is implemented:**

Trap MRS reads of [LORC\\_EL1](#) at EL1 using AArch64 to EL2.

<b>LORC_EL1</b>	<b>Meaning</b>
0b0	MRS reads of <a href="#">LORC_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">LORC_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ISR\_EL1, bit [18]**

Trap MRS reads of [ISR\\_EL1](#) at EL1 using AArch64 to EL2.

ISR_EL1	Meaning
0b0	MRS reads of <a href="#">ISR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">ISR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### FAR\_EL1, bit [17]

Trap MRS reads of [FAR\\_EL1](#) at EL1 using AArch64 to EL2.

FAR_EL1	Meaning
0b0	MRS reads of <a href="#">FAR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">FAR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### ESR\_EL1, bit [16]

Trap MRS reads of [ESR\\_EL1](#) at EL1 using AArch64 to EL2.

ESR_EL1	Meaning
0b0	MRS reads of <a href="#">ESR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">ESR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### DCZID\_EL0, bit [15]

Trap MRS reads of [DCZID\\_EL0](#) at EL1 and EL0 using AArch64 to EL2.

DCZID_EL0	Meaning
0b0	MRS reads of <a href="#">DCZID_EL0</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">DCZID_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### CTR\_EL0, bit [14]

Trap MRS reads of [CTR\\_EL0](#) at EL1 and EL0 using AArch64 to EL2.

CTR_EL0	Meaning
0b0	MRS reads of <a href="#">CTR_EL0</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">CTR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### CSSELR\_EL1, bit [13]

Trap MRS reads of [CSSELR\\_EL1](#) at EL1 using AArch64 to EL2.

CSSELR_EL1	Meaning
0b0	MRS reads of <a href="#">CSSELR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">CSSELR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### CPACR\_EL1, bit [12]

Trap MRS reads of [CPACR\\_EL1](#) at EL1 using AArch64 to EL2.

CPACR_EL1	Meaning
0b0	MRS reads of <a href="#">CPACR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">CPACR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### CONTEXTIDR\_EL1, bit [11]

Trap MRS reads of [CONTEXTIDR\\_EL1](#) at EL1 using AArch64 to EL2.

CONTEXTIDR_EL1	Meaning
0b0	MRS reads of <a href="#">CONTEXTIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">CONTEXTIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### CLIDR\_EL1, bit [10]

Trap MRS reads of [CLIDR\\_EL1](#) at EL1 using AArch64 to EL2.

CLIDR_EL1	Meaning
0b0	MRS reads of <a href="#">CLIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">CLIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**CCSIDR\_EL1, bit [9]**

Trap MRS reads of [CCSIDR\\_EL1](#) at EL1 using AArch64 to EL2.

CCSIDR_EL1	Meaning
0b0	MRS reads of <a href="#">CCSIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">CCSIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**APIBKey, bit [8]**

When FEAT\_PAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIBKeyHi\\_EL1](#).
- [APIBKeyLo\\_EL1](#).

APIBKey	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**APIAKey, bit [7]**

When FEAT\_PAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIAKeyHi\\_EL1](#).
- [APIAKeyLo\\_EL1](#).

APIAKey	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

**APGAKey, bit [6]****When FEAT\_PAuth is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APGAKeyHi\\_EL1](#).
- [APGAKeyLo\\_EL1](#).

APGAKey	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**APDBKey, bit [5]****When FEAT\_PAuth is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDBKeyHi\\_EL1](#).
- [APDBKeyLo\\_EL1](#).

APDBKey	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**APDAKey, bit [4]****When FEAT\_PAuth is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDAKeyHi\\_EL1](#).
- [APDAKeyLo\\_EL1](#).

APDAKey	Meaning
0b0	MRS reads of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### AMAIR\_EL1, bit [3]

Trap MRS reads of [AMAIR\\_EL1](#) at EL1 using AArch64 to EL2.

AMAIR_EL1	Meaning
0b0	MRS reads of <a href="#">AMAIR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">AMAIR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### AIDR\_EL1, bit [2]

Trap MRS reads of [AIDR\\_EL1](#) at EL1 using AArch64 to EL2.

AIDR_EL1	Meaning
0b0	MRS reads of <a href="#">AIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">AIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### AFSR1\_EL1, bit [1]

Trap MRS reads of [AFSR1\\_EL1](#) at EL1 using AArch64 to EL2.

AFSR1_EL1	Meaning
0b0	MRS reads of <a href="#">AFSR1_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">AFSR1_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### AFSR0\_EL1, bit [0]

Trap MRS reads of [AFSR0\\_EL1](#) at EL1 using AArch64 to EL2.

AFSR0_EL1	Meaning
0b0	MRS reads of <a href="#">AFSR0_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MRS reads of <a href="#">AFSR0_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

## Accessing the HFGTR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, HFGTR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x1B8];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then

# HFGWTR\_EL2, Hypervisor Fine-Grained Write Trap Register

The HFGWTR\_EL2 characteristics are:

## Purpose

Provides controls for traps of MSR and MCR writes of System registers.

## Configuration

This register is present only when FEAT\_FGT is implemented. Otherwise, direct accesses to HFGWTR\_EL2 are UNDEFINED.

## Attributes

HFGWTR\_EL2 is a 64-bit register.

## Field descriptions

The HFGWTR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51
RES0												
SCXTNUM_EL0	SCXTNUM_EL1	SCTLR_EL1	RES0	PAR_EL1	RES0	MAIR_EL1	LORSA_EL1	LORN_EL1	RES0	LOREA_EL1	LORC	
31	30	29	28	27	26	25	24	23	22	21	20	19

### Bits [63:51]

Reserved, RES0.

### nACCDATA\_EL1, bit [50]

When FEAT\_LS64 is implemented:

Trap MSR writes of [ACCDATA\\_EL1](#) at EL1 using AArch64 to EL2.

nACCDATA_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state then MSR writes of <a href="#">ACCDATA_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of <a href="#">ACCDATA_EL1</a> are not affected by this bit.

This bit is ignored by the PE and treated as zero when EL3 is implemented and [SCR\\_EL3](#).FGTE<sub>n</sub> == 0b0.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### Otherwise:

Reserved, RES0.

**ERXADDR\_EL1, bit [49]****When FEAT\_RAS is implemented:**

Trap MSR writes of [ERXADDR\\_EL1](#) at EL1 using AArch64 to EL2.

ERXADDR_EL1	Meaning
0b0	MSR writes of <a href="#">ERXADDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">ERXADDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXPFGCDN\_EL1, bit [48]****When FEAT\_RASv1p1 is implemented:**

Trap MSR writes of [ERXPFGCDN\\_EL1](#) at EL1 using AArch64 to EL2.

ERXPFGCDN_EL1	Meaning
0b0	MSR writes of <a href="#">ERXPFGCDN_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">ERXPFGCDN_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXPFGCTL\_EL1, bit [47]****When FEAT\_RASv1p1 is implemented:**

Trap MSR writes of [ERXPFGCTL\\_EL1](#) at EL1 using AArch64 to EL2.

ERXPFGCTL_EL1	Meaning
0b0	MSR writes of <a href="#">ERXPFGCTL_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">ERXPFGCTL_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [46]**

Reserved, RES0.

**ERXMISCN\_EL1, bit [45]****When FEAT\_RAS is implemented:**

Trap MSR writes of ERXMISC<n>\_EL1 at EL1 using AArch64 to EL2.

ERXMISCN_EL1	Meaning
0b0	MSR writes of ERXMISC<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of ERXMISC<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXSTATUS\_EL1, bit [44]****When FEAT\_RAS is implemented:**

Trap MSR writes of [ERXSTATUS\\_EL1](#) at EL1 using AArch64 to EL2.

ERXSTATUS_EL1	Meaning
0b0	MSR writes of <a href="#">ERXSTATUS_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">ERXSTATUS_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**ERXCTLR\_EL1, bit [43]****When FEAT\_RAS is implemented:**

Trap MSR writes of [ERXCTLR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>ERXCTLR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">ERXCTLR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">ERXCTLR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [42]**

Reserved, RES0.

**ERRSELR\_EL1, bit [41]**

**When FEAT\_RAS is implemented:**

Trap MSR writes of [ERRSELR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>ERRSELR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">ERRSELR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">ERRSELR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [40]**

Reserved, RES0.

**ICC\_IGRPENn\_EL1, bit [39]**

**When FEAT\_GICv3 is implemented:**

Trap MSR writes of ICC\_IGRPEN<n>\_EL1 at EL1 using AArch64 to EL2.

<b>ICC_IGRPENn_EL1</b>	<b>Meaning</b>
0b0	MSR writes of ICC_IGRPEN<n>_EL1 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**VBAR\_EL1, bit [38]**

Trap MSR writes of [VBAR\\_EL1](#) at EL1 using AArch64 to EL2.

VBAR_EL1	Meaning
0b0	MSR writes of <a href="#">VBAR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">VBAR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TTBR1\_EL1, bit [37]**

Trap MSR writes of [TTBR1\\_EL1](#) at EL1 using AArch64 to EL2.

TTBR1_EL1	Meaning
0b0	MSR writes of <a href="#">TTBR1_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">TTBR1_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TTBR0\_EL1, bit [36]**

Trap MSR writes of [TTBR0\\_EL1](#) at EL1 using AArch64 to EL2.

TTBR0_EL1	Meaning
0b0	MSR writes of <a href="#">TTBR0_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">TTBR0_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**TPIDR\_EL0, bit [35]**

Trap MSR writes of [TPIDR\\_EL0](#) at EL1 and EL0 using AArch64 and MCR writes of [TPIDRURW](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDR_EL0	Meaning
0b0	MSR writes of <a href="#">TPIDR_EL0</a> at EL1 and EL0 using AArch64 and MCR writes of <a href="#">TPIDRURW</a> at EL0 using AArch32 are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, EL1 is using AArch64, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> <li>MSR writes of <a href="#">TPIDR_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18.</li> <li>MCR writes of <a href="#">TPIDRURW</a> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.</li> </ul>

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TPIDRRO\_EL0, bit [34]

Trap MSR writes of [TPIDRRO\\_EL0](#) at EL1 using AArch64 to EL2.

TPIDRRO_EL0	Meaning
0b0	MSR writes of <a href="#">TPIDRRO_EL0</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then MSR writes of <a href="#">TPIDRRO_EL0</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TPIDR\_EL1, bit [33]

Trap MSR writes of [TPIDR\\_EL1](#) at EL1 using AArch64 to EL2.

TPIDR_EL1	Meaning
0b0	MSR writes of <a href="#">TPIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then MSR writes of <a href="#">TPIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### TCR\_EL1, bit [32]

Trap MSR writes of [TCR\\_EL1](#) at EL1 using AArch64 to EL2.

TCR_EL1	Meaning
0b0	MSR writes of <a href="#">TCR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then MSR writes of <a href="#">TCR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**SCXTNUM\_EL0, bit [31]****When FEAT\_CSV2 is implemented:**

Trap MSR writes of [SCXTNUM\\_EL0](#) at EL1 and EL0 using AArch64 to EL2.

SCXTNUM_EL0	Meaning
0b0	MSR writes of <a href="#">SCXTNUM_EL0</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state, <a href="#">HCR_EL2</a> .{E2H,TGE} != {1,1}, and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then MSR writes of <a href="#">SCXTNUM_EL0</a> at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**SCXTNUM\_EL1, bit [30]****When FEAT\_CSV2 is implemented:**

Trap MSR writes of [SCXTNUM\\_EL1](#) at EL1 using AArch64 to EL2.

SCXTNUM_EL1	Meaning
0b0	MSR writes of <a href="#">SCXTNUM_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then MSR writes of <a href="#">SCXTNUM_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**SCTLR\_EL1, bit [29]**

Trap MSR writes of [SCTLR\\_EL1](#) at EL1 using AArch64 to EL2.

SCTLR_EL1	Meaning
0b0	MSR writes of <a href="#">SCTLR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3</a> .FGTEn == 0b1, then MSR writes of <a href="#">SCTLR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Bit [28]**

Reserved, RES0.

**PAR\_EL1, bit [27]**

Trap MSR writes of [PAR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>PAR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">PAR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">PAR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Bits [26:25]**

Reserved, RES0.

**MAIR\_EL1, bit [24]**

Trap MSR writes of [MAIR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>MAIR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">MAIR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">MAIR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**LORSA\_EL1, bit [23]****When FEAT\_LOR is implemented:**

Trap MSR writes of [LORSA\\_EL1](#) at EL1 using AArch64 to EL2.

<b>LORSA_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">LORSA_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">LORSA_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**LORN\_EL1, bit [22]****When FEAT\_LOR is implemented:**

Trap MSR writes of [LORN\\_EL1](#) at EL1 using AArch64 to EL2.

<b>LORN_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">LORN_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">LORN_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [21]**

Reserved, RES0.

**LOREA\_EL1, bit [20]**

**When FEAT\_LOR is implemented:**

Trap MSR writes of [LOREA\\_EL1](#) at EL1 using AArch64 to EL2.

<b>LOREA_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">LOREA_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">LOREA_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**LORC\_EL1, bit [19]**

**When FEAT\_LOR is implemented:**

Trap MSR writes of [LORC\\_EL1](#) at EL1 using AArch64 to EL2.

<b>LORC_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">LORC_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">LORC_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [18]**

Reserved, RES0.

**FAR\_EL1, bit [17]**

Trap MSR writes of [FAR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>FAR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">FAR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">FAR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**ESR\_EL1, bit [16]**

Trap MSR writes of [ESR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>ESR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">ESR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">ESR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Bits [15:14]**

Reserved, RES0.

**CSSELR\_EL1, bit [13]**

Trap MSR writes of [CSSELR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>CSSELR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">CSSELR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">CSSELR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**CPACR\_EL1, bit [12]**

Trap MSR writes of [CPACR\\_EL1](#) at EL1 using AArch64 to EL2.

<b>CPACR_EL1</b>	<b>Meaning</b>
0b0	MSR writes of <a href="#">CPACR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">CPACR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### CONTEXTIDR\_EL1, bit [11]

Trap MSR writes of [CONTEXTIDR\\_EL1](#) at EL1 using AArch64 to EL2.

CONTEXTIDR_EL1	Meaning
0b0	MSR writes of <a href="#">CONTEXTIDR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">CONTEXTIDR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

### Bits [10:9]

Reserved, RES0.

### APIBKey, bit [8]

When FEAT\_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIBKeyHi\\_EL1](#).
- [APIBKeyLo\\_EL1](#).

APIBKey	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

### APIAKey, bit [7]

When FEAT\_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIAKeyHi\\_EL1](#).
- [APIAKeyLo\\_EL1](#).

APIAKey	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

### APGAKey, bit [6]

#### When FEAT\_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APGAKeyHi\\_EL1](#).
- [APGAKeyLo\\_EL1](#).

APGAKey	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### Otherwise:

Reserved, RES0.

### APDBKey, bit [5]

#### When FEAT\_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDBKeyHi\\_EL1](#).
- [APDBKeyLo\\_EL1](#).

APDBKey	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**APDAKey, bit [4]****When FEAT\_PAuth is implemented:**

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDAKeyHi\\_EL1](#).
- [APDAKeyLo\\_EL1](#).

APDAKey	Meaning
0b0	MSR writes of the System registers listed above are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**AMAIR\_EL1, bit [3]**

Trap MSR writes of [AMAIR\\_EL1](#) at EL1 using AArch64 to EL2.

AMAIR_EL1	Meaning
0b0	MSR writes of <a href="#">AMAIR_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">AMAIR_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Bit [2]**

Reserved, RES0.

**AFSR1\_EL1, bit [1]**

Trap MSR writes of [AFSR1\\_EL1](#) at EL1 using AArch64 to EL2.

AFSR1_EL1	Meaning
0b0	MSR writes of <a href="#">AFSR1_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">AFSR1_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**AFSR0\_EL1, bit [0]**

Trap MSR writes of [AFSR0\\_EL1](#) at EL1 using AArch64 to EL2.

AFSR0_EL1	Meaning
0b0	MSR writes of <a href="#">AFSR0_EL1</a> are not affected by this bit.
0b1	If EL2 is implemented and enabled in the current Security state and either EL3 is not implemented or <a href="#">SCR_EL3.FGTEn</a> == 0b1, then MSR writes of <a href="#">AFSR0_EL1</a> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Accessing the HFGWTR\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, HFGWTR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b101

```

# HPFAR\_EL2, Hypervisor IPA Fault Address Register

The HPFAR\_EL2 characteristics are:

## Purpose

Holds the faulting IPA for some aborts on a stage 2 translation taken to EL2.

## Configuration

AArch64 System register HPFAR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HPFAR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

The HPFAR\_EL2 is written for:

- Translation or Access faults in the second stage of translation.
- An abort in the second stage of translation performed during the translation table walk of a first stage translation, caused by a Translation fault, an Access flag fault, or a Permission fault.
- A stage 2 Address size fault.

For all other exceptions taken to EL2, this register is UNKNOWN.

### Note

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores a mis-aligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

## Attributes

HPFAR\_EL2 is a 64-bit register.

## Field descriptions

The HPFAR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
NS	RES0																			FIPA															
																				FIPA												RES0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
																				RES0															

Execution at EL1 or EL0 makes HPFAR\_EL2 become UNKNOWN.

### NS, bit [63]

When FEAT\_SEL2 is implemented:

Faulting IPA address space.

NS	Meaning
0b0	Faulting IPA is from the Secure IPA space.
0b1	Faulting IPA is from the Non-secure IPA space.

For Data Aborts or Instruction Aborts taken to Non-secure EL2, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bits [62:44]

Reserved, RES0.

#### FIPA, bits [43:4]

### FIPA encoding when FEAT\_LPA is implemented

38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FIPA																																						

#### FIPA, bits [38:0]

Faulting Intermediate Physical Address.

When 52-bit addresses and a 64KB translation granule are in use for the stage 1 translation, HPFAR\_EL2.FIPA[38:35] forms the upper part of the address value.

For implementations or stage 1 translation granules with fewer than 52 physical address bits the HPFAR\_EL2.FIPA[38:35] is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### FIPA encoding when FEAT\_LPA is not implemented

38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
RES0				FIPA																																			

#### Bits [38:35]

Reserved, RES0.

#### FIPA, bits [34:0]

Faulting Intermediate Physical Address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [3:0]

Reserved, RES0.

## Accessing the HPFAR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, HPFAR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0110	0b0000	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HPFAR_EL2;
elsif PSTATE.EL == EL3 then
    return HPFAR_EL2;

```

MSR HPFAR\_EL2, <Xt>

# HSTR\_EL2, Hypervisor System Trap Register

The HSTR\_EL2 characteristics are:

## Purpose

Controls trapping to EL2 of EL1 or lower AArch32 accesses to the System register in the coproc == 0b1111 encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCRR or MRRC instruction, this is the CRm value used to access the register.

## Configuration

AArch64 System register HSTR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HSTR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

HSTR\_EL2 is a 64-bit register.

## Field descriptions

The HSTR\_EL2 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0

### Bits [63:16, 14, 4]

Reserved, RES0.

### T<n>, bit [n], for n = 15, 13 to 5, 3 to 0

The remaining fields control whether EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 0b1111 encoding space, are trapped to EL2 as follows:

- MCR or MRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x03, unless the access is UNDEFINED.
- MCRR or MRRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x04, unless the access is UNDEFINED.

T<n>	Meaning
0b0	This control has no effect on EL0 or EL1 accesses to System registers.
0b1	<p>System registers in the coproc == 0b1111 encoding space and CRn == &lt;n&gt; or CRm == &lt;n&gt; where T&lt;n&gt; is the name of this field, are trapped as follows:</p> <ul style="list-style-type: none"> <li>• An EL1 MCR or MRC access is trapped to EL2.</li> <li>• An EL0 MCR or MRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0.</li> <li>• An EL1 MCRR or MRRC access is trapped to EL2.</li> <li>• An EL0 MCRR or MRRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0.</li> </ul> <p>It is IMPLEMENTATION DEFINED whether an EL0 access using AArch32 is trapped to EL2, or is UNDEFINED.</p> <p>If the access is UNDEFINED, and generates an exception that is taken to EL1 or EL2 using AArch64, this is reported with EC syndrome value 0x00.</p>
<p><b>Note</b></p> <p>Arm expects that trapping to EL2 of EL0 accesses to these registers is unusual and used only when the hypervisor must virtualize EL0 operation. Arm recommends that, whenever possible, EL0 accesses to these registers behave as they would if the implementation did not include EL2. This means that, if the architecture does not support the EL0 access, then the register access instruction is treated as UNDEFINED and generates an exception that is taken to EL1.</p>	

For example, when HSTR\_EL2.T7 is 1, for instructions executed at EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to EL2.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to EL2.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Otherwise:

# IC IALLU, Instruction Cache Invalidate All to PoU

The IC IALLU characteristics are:

## Purpose

Invalidate all instruction caches to Point of Unification.

## Configuration

AArch64 System instruction IC IALLU performs the same function as AArch32 System instruction [ICIALLU](#).

## Attributes

IC IALLU is a 64-bit System instruction.

## Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

## Executing the IC IALLU instruction

When executing this instruction Xt should be encoded as 0b11111. If the Xt field is not set to 0b11111, it is CONstrained UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Xt field is set to 0b11111.

Accesses to this instruction use the following encodings:

IC IALLU{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0101	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TPU == '1' then

# IC IVAU, Instruction Cache line Invalidate by VA to PoU

The IC IVAU characteristics are:

## Purpose

Invalidate instruction cache by address to Point of Unification.

## Configuration

AArch64 System instruction IC IVAU performs the same function as AArch32 System instruction [ICIMVAU](#).

## Attributes

IC IVAU is a 64-bit System instruction.

## Field descriptions

The IC IVAU input value bit assignments are:

### Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

## Executing the IC IVAU instruction

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The instruction cache maintenance instruction (IC)'.

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it is IMPLEMENTATION DEFINED whether it generates a Permission Fault, see 'Permission fault'.

Accesses to this instruction use the following encodings:

IC IVAU{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0101	0b001

```

# ICC\_AP0R<n>\_EL1, Interrupt Controller Active Priorities Group 0 Registers, n = 0 - 3

The ICC\_AP0R<n>\_EL1 characteristics are:

## Purpose

Provides information about Group 0 active priorities.

## Configuration

AArch64 System register ICC\_AP0R<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICC\\_AP0R<n>\[31:0\]](#).

## Attributes

ICC\_AP0R<n>\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_AP0R<n>\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

## Accessing the ICC\_AP0R<n>\_EL1

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC\_AP0R1\_EL1 is only implemented in implementations that support 6 or more bits of priority. ICC\_AP0R2\_EL1 and ICC\_AP0R3\_EL1 are only implemented in implementations that support 7 or more bits of priority. Unimplemented registers are UNDEFINED.

### Note

The number of bits of preemption is indicated by [ICH\\_VTR\\_EL2.PREbits](#).

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICC\_AP0R<n>\_EL1.
- Secure [ICC\\_AP1R<n>\\_EL1](#).
- Non-secure [ICC\\_AP1R<n>\\_EL1](#).

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_AP0R<n>\_EL1

# ICC\_ASGI1R\_EL1, Interrupt Controller Alias Software Generated Interrupt Group 1 Register

The ICC\_ASGI1R\_EL1 characteristics are:

## Purpose

Generates Group 1 SGIs for the Security state that is not the current Security state.

## Configuration

AArch64 System register ICC\_ASGI1R\_EL1 performs the same function as AArch32 System register [ICC\\_ASGI1R](#).

Under certain conditions a write to ICC\_ASGI1R\_EL1 can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Attributes

ICC\_ASGI1R\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_ASGI1R\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								Aff3								RS				RES0		IRM	Aff2								
RES0				INTID				Aff1								TargetList															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:56]

Reserved, RES0.

### Aff3, bits [55:48]

The affinity 3 value of the affinity path of the luster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

### RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value  $((RS * 16) + n)$ .

When [ICC\\_CTLR\\_EL1](#).RSS==0, RS is RES0.

When [ICC\\_CTLR\\_EL1](#).RSS==1 and [GICD\\_TYPER](#).RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

**Bits [43:41]**

Reserved, RES0.

**IRM, bit [40]**

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

**Aff2, bits [39:32]**

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**Bits [31:28]**

Reserved, RES0.

**INTID, bits [27:24]**

The INTID of the SGI.

**Aff1, bits [23:16]**

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**TargetList, bits [15:0]**

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16. If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

**Accessing the ICC\_ASGI1R\_EL1**

This register allows software executing in a Secure state to generate Non-secure Group 1 SGIs. It will also allow software executing in a Non-secure state to generate Secure Group 1 SGIs, if permitted by the settings of [GICR\\_NSACR](#) in the Redistributor corresponding to the target PE.

When [GICD\\_CTLR.DS](#)==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the [GICR\\_NSACR](#) register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding'.

---

### Note

Accesses at EL3 are treated as Secure regardless of the value of SCR\_EL3.NS.

---

Accesses to this register use the following encodings:

MSR ICC\_ASGI1R\_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b110

```

```

# ICC\_BPR0\_EL1, Interrupt Controller Binary Point Register 0

The ICC\_BPR0\_EL1 characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

## Configuration

AArch64 System register ICC\_BPR0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICC\\_BPR0\[31:0\]](#).

Virtual accesses to this register update [ICH\\_VMCR\\_EL2.VBPR0](#).

## Attributes

ICC\_BPR0\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_BPR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:3]

Reserved, RES0.

### BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	ggggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.ssssssss

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ICC\_BPR0\_EL1

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by [ICC\\_CTLR\\_EL1.PRIBits](#) and [ICC\\_CTLR\\_EL3.PRIBits](#).

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_BPR0\_EL1

# ICC\_BPR1\_EL1, Interrupt Controller Binary Point Register 1

The ICC\_BPR1\_EL1 characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

## Configuration

AArch64 System register ICC\_BPR1\_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register [ICC\\_BPR1\[31:0\] \(S\)](#).

AArch64 System register ICC\_BPR1\_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register [ICC\\_BPR1\[31:0\] \(NS\)](#).

Virtual accesses to this register update [ICH\\_VMCR\\_EL2.VBPR1](#).

## Attributes

ICC\_BPR1\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_BPR1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BinaryPoint																															

### Bits [63:3]

Reserved, RES0.

### BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The minimum value of the Non-secure copy of this register is the minimum value of [ICC\\_BPR0\\_EL1](#) + 1. The minimum value of the Secure copy of this register is the minimum value of [ICC\\_BPR0\\_EL1](#).

If EL3 is implemented and [ICC\\_CTLR\\_EL3.CBPR\\_EL1S](#) is 1:

- When [SCR\\_EL3.EEL2](#) is 1 and [HCR\\_EL2.IMO](#) is 1, Secure accesses to this register at EL1 access the state of [ICV\\_BPR1\\_EL1](#).
- Otherwise, Secure accesses to this register at EL1 access the state of [ICC\\_BPR0\\_EL1](#).

If EL3 is implemented and [ICC\\_CTLR\\_EL3.CBPR\\_EL1NS](#) is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of [HCR\\_EL2.IMO](#) and [SCR\\_EL3.IRQ](#):

HCR_EL2.IMO	SCR_EL3.IRQ	Behavior
0b0	0b0	Non-secure EL1 and EL2 reads return <a href="#">ICC_BPR0_EL1</a> + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b0	0b1	Non-secure EL1 and EL2 accesses trap to EL3.
0b1	0b0	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return <a href="#">ICC_BPR0_EL1</a> + 1 saturated to 0b111. Non-secure EL2 writes are ignored.
0b1	0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 accesses trap to EL3.

If EL3 is not implemented and [ICC\\_CTLR\\_EL1](#).CBPR is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR\_EL2.IMO:

HCR_EL2.IMO	Behavior
0b0	Non-secure EL1 and EL2 reads return <a href="#">ICC_BPR0_EL1</a> + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return <a href="#">ICC_BPR0_EL1</a> + 1 saturated to 0b111. Non-secure EL2 writes are ignored.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ICC\_BPR1\_EL1

On a reset, the binary point field is UNKNOWN.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_BPR1\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b011

# ICC\_CTLR\_EL1, Interrupt Controller Control Register (EL1)

The ICC\_CTLR\_EL1 characteristics are:

## Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

## Configuration

AArch64 System register ICC\_CTLR\_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register [ICC\\_CTLR\[31:0\] \(S\)](#).

AArch64 System register ICC\_CTLR\_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register [ICC\\_CTLR\[31:0\] \(NS\)](#).

## Attributes

ICC\_CTLR\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_CTLR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0												ExtRange		RSS	RES0	A3V	SEIS	IDbits	PRIbits	RES0	PMHE	RES0		EOImode		CBPR					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:20]

Reserved, RES0.

### ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. <ul style="list-style-type: none"> <li>Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</li> </ul>
<b>Note</b> Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.	
0b1	CPU interface supports INTIDs in the range 1024..8191 <ul style="list-style-type: none"> <li>All INTIDs in the range 1024..8191 are treated as requiring deactivation.</li> </ul>

If EL3 is implemented, ICC\_CTLR\_EL1.ExtRange is an alias of [ICC\\_CTLR\\_EL3.ExtRange](#).

**RSS, bit [18]**

Range Selector Support. Possible values are:

<b>RSS</b>	<b>Meaning</b>
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

**Bits [17:16]**

Reserved, RES0.

**A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<b>A3V</b>	<b>Meaning</b>
0b0	The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

If EL3 is implemented, this bit is an alias of [ICC\\_CTLR\\_EL3.A3V](#).

**SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

<b>SEIS</b>	<b>Meaning</b>
0b0	The CPU interface logic does not support local generation of SEIs.
0b1	The CPU interface logic supports local generation of SEIs.

If EL3 is implemented, this bit is an alias of [ICC\\_CTLR\\_EL3.SEIS](#).

**IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

<b>IDbits</b>	<b>Meaning</b>
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is implemented, this field is an alias of [ICC\\_CTLR\\_EL3.IDbits](#).

**PRibits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

**Note**

This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of [GICD\\_CTLR.DS](#).

For physical accesses, this field determines the minimum value of [ICC\\_BPR0\\_EL1](#).

If EL3 is implemented, physical accesses return the value from [ICC\\_CTLR\\_EL3](#).PRIbits.

If EL3 is not implemented, physical accesses return the value from this field.

#### Bit [7]

Reserved, RES0.

#### PMHE, bit [6]

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

PMHE	Meaning
0b0	Disables use of <a href="#">ICC_PMR_EL1</a> as a hint for interrupt distribution.
0b1	Enables use of <a href="#">ICC_PMR_EL1</a> as a hint for interrupt distribution.

If EL3 is implemented, this bit is an alias of [ICC\\_CTLR\\_EL3](#).PMHE. Whether this bit can be written as part of an access to this register depends on the value of [GICD\\_CTLR](#).DS:

- If [GICD\\_CTLR](#).DS == 0, this bit is read-only.
- If [GICD\\_CTLR](#).DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

#### Bits [5:2]

Reserved, RES0.

#### EOImode, bit [1]

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

EOImode	Meaning
0b0	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICC_DIR_EL1</a> are UNPREDICTABLE.
0b1	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide priority drop functionality only. <a href="#">ICC_DIR_EL1</a> provides interrupt deactivation functionality.

The Secure [ICC\\_CTLR\\_EL1](#).EOImode is an alias of [ICC\\_CTLR\\_EL3](#).EOImode\_EL1S.

The Non-secure [ICC\\_CTLR\\_EL1](#).EOImode is an alias of [ICC\\_CTLR\\_EL3](#).EOImode\_EL1NS

#### CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	<a href="#">ICC_BPR0_EL1</a> determines the preemption group for Group 0 interrupts only. <a href="#">ICC_BPR1_EL1</a> determines the preemption group for Group 1 interrupts.
0b1	<a href="#">ICC_BPR0_EL1</a> determines the preemption group for both Group 0 and Group 1 interrupts.

If EL3 is implemented:

- This bit is an alias of [ICC\\_CTLR\\_EL3](#).CBPR\_EL1{S,NS} where S or NS corresponds to the current Security state.
- If [GICD\\_CTLR](#).DS == 0, this bit is read-only.
- If [GICD\\_CTLR](#).DS == 1, this bit is read/write.

If EL3 is not implemented, this bit is read/write.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ICC\_CTLR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_CTLR\_EL1

## ICC\_CTLR\_EL3, Interrupt Controller Control Register (EL3)

The ICC\_CTLR\_EL3 characteristics are:

## Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

## Configuration

AArch64 System register `ICC_CTLR_EL3` bits [31:0] can be mapped to AArch32 System register `ICC_MCTLR[31:0]`, but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to ICC\_CTLR\_EL3 are UNDEFINED.

## Attributes

ICC\_CTLR\_EL3 is a 64-bit register.

## Field descriptions

The ICC\_CTLR\_EL3 bit assignments are:

636261605958575655545352	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35
RES0																	
RES0	ExtRange	RSSn	DS	RES0	A3V	SEIS	IDbits	PRIdbits	RES0	PMHE	RM	EOImode	EL1NS	EOImode	EL1		
313029282726252423222120	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3

**Bits [63:20]**

Reserved, RES0.

### ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	<p>CPU interface does not support INTIDs in the range 1024..8191.</p> <ul style="list-style-type: none"> <li>Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</li> </ul> <hr/> <p><b>Note</b></p> <p>Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.</p> <hr/>
0b1	<p>CPU interface supports INTIDs in the range 1024..8191</p> <ul style="list-style-type: none"> <li>All INTIDs in the range 1024..8191 are treated as requiring deactivation.</li> </ul>

**RSS, bit [18]**

### Range Selector Support.

<b>RSS</b>	<b>Meaning</b>
0b0	Targeted SGIs with affinity level 0 values of 0-15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0-255 are supported.

This bit is read-only.

### **nDS, bit [17]**

Disable Security not supported. Read-only and writes are ignored.

<b>nDS</b>	<b>Meaning</b>
0b0	The CPU interface logic supports disabling of security.
0b1	The CPU interface logic does not support disabling of security, and requires that security is not disabled.

### **Bit [16]**

Reserved, RES0.

### **A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored.

<b>A3V</b>	<b>Meaning</b>
0b0	The CPU interface logic does not support non-zero values of the Aff3 field in SGI generation System registers.
0b1	The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers.

If EL3 is present, [ICC\\_CTLR\\_EL1](#).A3V is an alias of ICC\_CTLR\_EL3.A3V

### **SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs:

<b>SEIS</b>	<b>Meaning</b>
0b0	The CPU interface logic does not support generation of SEIs.
0b1	The CPU interface logic supports generation of SEIs.

If EL3 is present, [ICC\\_CTLR\\_EL1](#).SEIS is an alias of ICC\_CTLR\_EL3.SEIS

### **IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. Indicates the number of physical interrupt identifier bits supported.

<b>IDbits</b>	<b>Meaning</b>
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is present, [ICC\\_CTLR\\_EL1](#).IDbits is an alias of ICC\_CTLR\_EL3.IDbits

### **PRIbits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

**Note**

This field always returns the number of priority bits implemented, regardless of the value of SCR\_EL3.NS or the value of [GICD\\_CTLR.DS](#).

The division between group priority and subpriority is defined in the binary point registers [ICC\\_BPR0\\_EL1](#) and [ICC\\_BPR1\\_EL1](#).

This field determines the minimum value of ICC\_BPR0\_EL1.

**Bit [7]**

Reserved, RES0.

**PMHE, bit [6]**

Priority Mask Hint Enable.

PMHE	Meaning
0b0	Disables use of the priority mask register as a hint for interrupt distribution.
0b1	Enables use of the priority mask register as a hint for interrupt distribution.

Software must write [ICC\\_PMR\\_EL1](#) to 0xFF before clearing this field to 0.

- An implementation might choose to make this field RAO/WI if priority-based routing is always used
- An implementation might choose to make this field RAZ/WI if priority-based routing is never used

If EL3 is present, [ICC\\_CTLR\\_EL1](#).PMHE is an alias of ICC\_CTLR\_EL3.PMHE.

On a Warm reset, this field resets to 0.

**RM, bit [5]**

Routing Modifier. For legacy operation of EL1 software with [GICC\\_CTLR](#).FIQEn set to 1, this bit indicates whether interrupts can be acknowledged or observed as the Highest Priority Pending Interrupt, or whether a special INTID value is returned.

Possible values of this bit are:

RM	Meaning
0b0	Secure Group 0 and Non-secure Group 1 interrupts can be acknowledged and observed as the highest priority interrupt at the Secure Exception level where the interrupt is taken.
0b1	When accessed at EL3 in AArch64 state: <ul style="list-style-type: none"> <li>• Secure Group 0 interrupts return a special INTID value of 1020. This affects accesses to <a href="#">ICC_IAR0_EL1</a> and <a href="#">ICC_HPPIR0_EL1</a>.</li> <li>• Non-secure Group 1 interrupts return a special INTID value of 1021. This affects accesses to <a href="#">ICC_IAR1_EL1</a> and <a href="#">ICC_HPPIR1_EL1</a>.</li> </ul>

**Note**

The Routing Modifier bit is supported in AArch64 only. In systems without EL3 the behavior is as if the value is 0. Software must ensure this bit is 0 when the Secure copy of [ICC\\_SRE\\_EL1](#).SRE is 1, otherwise system behavior is UNPREDICTABLE. In systems without EL3 or where the Secure copy of [ICC\\_SRE\\_EL1](#).SRE is RAO/WI, this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EOImode\_EL1NS, bit [4]**

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1NS	Meaning
0b0	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICC_DIR_EL1</a> are UNPREDICTABLE.
0b1	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide priority drop functionality only. <a href="#">ICC_DIR_EL1</a> provides interrupt deactivation functionality.

If EL3 is present, [ICC\\_CTLR\\_EL1\(NS\)](#).EOImode is an alias of ICC\_CTLR\_EL3.EOImode\_EL1NS.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EOImode\_EL1S, bit [3]**

EOI mode for interrupts handled at Secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1S	Meaning
0b0	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICC_DIR_EL1</a> are UNPREDICTABLE.
0b1	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide priority drop functionality only. <a href="#">ICC_DIR_EL1</a> provides interrupt deactivation functionality.

If EL3 is present, [ICC\\_CTLR\\_EL1\(S\)](#).EOImode is an alias of ICC\_CTLR\_EL3.EOImode\_EL1S.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EOImode\_EL3, bit [2]**

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL3	Meaning
0b0	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICC_DIR_EL1</a> are UNPREDICTABLE.
0b1	<a href="#">ICC_EOIR0_EL1</a> and <a href="#">ICC_EOIR1_EL1</a> provide priority drop functionality only. <a href="#">ICC_DIR_EL1</a> provides interrupt deactivation functionality.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CBPR\_EL1NS, bit [1]**

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.

CBPR_EL1NS	Meaning
0b0	<a href="#">ICC_BPR0_EL1</a> determines the preemption group for Group 0 interrupts only. <a href="#">ICC_BPR1_EL1</a> determines the preemption group for Non-secure Group 1 interrupts.
0b1	<a href="#">ICC_BPR0_EL1</a> determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to <a href="#">GICC_BPR</a> and <a href="#">ICC_BPR1_EL1</a> access the state of <a href="#">ICC_BPR0_EL1</a> .

If EL3 is present, [ICC\\_CTLR\\_EL1\(NS\)](#).CBPR is an alias of ICC\_CTLR\_EL3.CBPR\_EL1NS.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CBPR\_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts at EL1 and EL2.

CBPR_EL1S	Meaning
0b0	<a href="#">ICC_BPR0_EL1</a> determines the preemption group for Group 0 interrupts only. <a href="#">ICC_BPR1_EL1</a> determines the preemption group for Secure Group 1 interrupts.
0b1	<a href="#">ICC_BPR0_EL1</a> determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 accesses to <a href="#">ICC_BPR1_EL1</a> access the state of <a href="#">ICC_BPR0_EL1</a> .

If EL3 is present, [ICC\\_CTLR\\_EL1\(S\)](#).CBPR is an alias of ICC\_CTLR\_EL3.CBPR\_EL1S.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ICC\_CTLR\_EL3

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_CTLR\_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICC_CTLR_EL3;

```

MSR ICC\_CTLR\_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;

    UNDEFINED;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        ICC_CTLR_EL3 = X[t];

```

# ICC\_DIR\_EL1, Interrupt Controller Deactivate Interrupt Register

The ICC\_DIR\_EL1 characteristics are:

## Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

## Configuration

AArch64 System register ICC\_DIR\_EL1 performs the same function as AArch32 System register [ICC\\_DIR](#).

## Attributes

ICC\_DIR\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_DIR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																INTID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:24]

Reserved, RES0.

### INTID, bits [23:0]

The INTID of the interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICC\\_CTLR\\_EL1.IDbits](#) and [ICC\\_CTLR\\_EL3.IDbits](#). If only 16 bits are implemented, bits [23:16] of this register are RES0.

## Accessing the ICC\_DIR\_EL1

There are two cases when writing to [ICC\\_DIR\\_EL1](#) that were UNPREDICTABLE for a corresponding GICv2 write to [GICC\\_DIR](#):

- When EOImode == 0. GICv3 implementations must ignore such writes. In systems supporting system error generation, an implementation might generate an SEI.
- When EOImode == 1 but no EOI has been issued. The interrupt will be de-activated by the Distributor, however the active priority in the CPU interface for the interrupt will remain set (because no EOI was issued).

Accesses to this register use the following encodings:

MSR ICC\_DIR\_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b001

```

if PSTATE.EL == EL0 then

# ICC\_EOIR0\_EL1, Interrupt Controller End Of Interrupt Register 0

The ICC\_EOIR0\_EL1 characteristics are:

## Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

## Configuration

AArch64 System register ICC\_EOIR0\_EL1 performs the same function as AArch32 System register [ICC\\_EOIR0](#).

## Attributes

ICC\_EOIR0\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_EOIR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0								INTID																							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:24]

Reserved, RES0.

### INTID, bits [23:0]

The INTID from the corresponding [ICC\\_IAR0\\_EL1](#) access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICC\\_CTLR\\_EL1](#).IDbits and [ICC\\_CTLR\\_EL3](#).IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to [ICC\\_DIR\\_EL1](#) to deactivate the interrupt.

The EOImode bit for the current Exception level and Security state is determined as follows:

- If EL3 is not implemented, the appropriate bit is [ICC\\_CTLR\\_EL1](#).EOImode.
- If EL3 is implemented and the software is executing at EL3, the appropriate bit is [ICC\\_CTLR\\_EL3](#).EOImode\_EL3.
- If EL3 is implemented and the software is not executing at EL3, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is [ICC\\_CTLR\\_EL3](#).EOImode\_EL1S.
  - If the software is executing in Non-secure state, the bit is [ICC\\_CTLR\\_EL3](#).EOImode\_EL1NS.

## Accessing the ICC\_EOIR0\_EL1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from [ICC\\_IAR0\\_EL1](#), otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings:

MSR ICC\_EOIR0\_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b001

```

# ICC\_EOIR1\_EL1, Interrupt Controller End Of Interrupt Register 1

The ICC\_EOIR1\_EL1 characteristics are:

## Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 1 interrupt.

## Configuration

AArch64 System register ICC\_EOIR1\_EL1 performs the same function as AArch32 System register [ICC\\_EOIR1](#).

## Attributes

ICC\_EOIR1\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_EOIR1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0								INTID																							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:24]

Reserved, RES0.

### INTID, bits [23:0]

The INTID from the corresponding [ICC\\_IAR1\\_EL1](#) access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICC\\_CTLR\\_EL1](#).IDbits and [ICC\\_CTLR\\_EL3](#).IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to [ICC\\_DIR\\_EL1](#) to deactivate the interrupt.

The EOImode bit for the current Exception level and Security state is determined as follows:

- If EL3 is not implemented, the appropriate bit is [ICC\\_CTLR\\_EL1](#).EOImode.
- If EL3 is implemented and the software is executing at EL3, the appropriate bit is [ICC\\_CTLR\\_EL3](#).EOImode\_EL3.
- If EL3 is implemented and the software is not executing at EL3, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is [ICC\\_CTLR\\_EL3](#).EOImode\_EL1S.
  - If the software is executing in Non-secure state, the bit is [ICC\\_CTLR\\_EL3](#).EOImode\_EL1NS.

## Accessing the ICC\_EOIR1\_EL1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from [ICC\\_IAR1\\_EL1](#), otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings:

# ICC\_IAR0\_EL1, Interrupt Controller Interrupt Acknowledge Register 0

The ICC\_IAR0\_EL1 characteristics are:

## Purpose

The PE reads this register to obtain the INTID of the signaled Group 0 interrupt. This read acts as an acknowledge for the interrupt.

## Configuration

AArch64 System register ICC\_IAR0\_EL1 performs the same function as AArch32 System register [ICC\\_IAR0](#).

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when  $PSTATE.\{I,F\} == \{0,0\}$ ). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers'.

## Attributes

ICC\_IAR0\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_IAR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# ICC\_IGRPEN0\_EL1, Interrupt Controller Interrupt Group 0 Enable register

The ICC\_IGRPEN0\_EL1 characteristics are:

## Purpose

Controls whether Group 0 interrupts are enabled or not.

## Configuration

AArch64 System register ICC\_IGRPEN0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICC\\_IGRPEN0\[31:0\]](#).

## Attributes

ICC\_IGRPEN0\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_IGRPEN0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															Enable
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:1]

Reserved, RES0.

### Enable, bit [0]

Enables Group 0 interrupts.

Enable	Meaning
0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

Virtual accesses to this register update [ICH\\_VMCR\\_EL2.VENG0](#).

If the highest priority pending interrupt for that PE is a Group 0 interrupt using 1 of N model, then the interrupt will be targeted to another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

# ICC\_IGRPEN1\_EL1, Interrupt Controller Interrupt Group 1 Enable register

The ICC\_IGRPEN1\_EL1 characteristics are:

## Purpose

Controls whether Group 1 interrupts are enabled for the current Security state.

## Configuration

AArch64 System register ICC\_IGRPEN1\_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register [ICC\\_IGRPEN1\[31:0\] \(S\)](#).

AArch64 System register ICC\_IGRPEN1\_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register [ICC\\_IGRPEN1\[31:0\] \(NS\)](#).

## Attributes

ICC\_IGRPEN1\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_IGRPEN1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															Enable
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:1]

Reserved, RES0.

### Enable, bit [0]

Enables Group 1 interrupts for the current Security state.

Enable	Meaning
0b0	Group 1 interrupts are disabled for the current Security state.
0b1	Group 1 interrupts are enabled for the current Security state.

Virtual accesses to this register update [ICH\\_VMCR\\_EL2.VENG1](#).

If EL3 is present:

- The Secure [ICC\\_IGRPEN1\\_EL1.Enable](#) bit is a read/write alias of the [ICC\\_IGRPEN1\\_EL3.EnableGrp1S](#) bit.
- The Non-secure [ICC\\_IGRPEN1\\_EL1.Enable](#) bit is a read/write alias of the [ICC\\_IGRPEN1\\_EL3.EnableGrp1NS](#) bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

## ICC\_IGRPEN1\_EL3, Interrupt Controller Interrupt Group 1 Enable register (EL3)

The ICC IGRPEN1 EL3 characteristics are:

## Purpose

Controls whether Group 1 interrupts are enabled or not.

## Configuration

AArch64 System register ICC\_IGRPEN1\_EL3 bits [31:0] can be mapped to AArch32 System register [ICC\\_MGRPEN1\[31:0\]](#), but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to ICC\_IGRPEN1\_EL3 are UNDEFINED.

## Attributes

ICC IGRPEN1 EL3 is a 64-bit register.

## Field descriptions

The ICC IGRPEN1 EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34		33		32								
RES0																																									
RES0																																EnableGrp1S						EnableGrp1NS			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2		1		0								

**Bits [63:2]**

Reserved, RES0.

### EnableGrp1S, bit [1]

Enables Group 1 interrupts for the Secure state.

EnableGrp1S	Meaning
0b0	Secure Group 1 interrupts are disabled.
0b1	Secure Group 1 interrupts are enabled.

The Secure [ICC\\_IGRPEN1\\_EL1.Enable](#) bit is a read/write alias of the ICC\_IGRPEN1\_EL3.EnableGrp1S bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

### EnableGrp1NS, bit [0]

Enables Group 1 interrupts for the Non-secure state.

EnableGrp1NS	Meaning
0b0	Non-secure Group 1 interrupts are disabled.
0b1	Non-secure Group 1 interrupts are enabled.

The Non-secure [ICC\\_IGRPEN1\\_EL1](#).Enable bit is a read/write alias of the ICC\_IGRPEN1\_EL3.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

## Accessing the ICC\_IGRPEN1\_EL3

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_IGRPEN1\_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b111

    else
        ICC_IGRPEN1_EL3 = X[t];

```

# ICC\_PMR\_EL1, Interrupt Controller Interrupt Priority Mask Register

The ICC\_PMR\_EL1 characteristics are:

## Purpose

- Provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.
- Writes to this register must be high performance and must ensure that no interrupt of lower priority than the written value occurs after the write, without requiring an ISB or an exception boundary.

## Configuration

- AArch64 System register ICC\_PMR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICC\\_PMR\[31:0\]](#).
- To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Attributes

ICC\_PMR\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_PMR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32					
																RES0																				
RES0																							Priority													
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					

### Bits [63:8]

Reserved, RES0.

### Priority, bits [7:0]

- The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.
- The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	0x00-0xFF (0-255), all values	256
[7:1]	0x00-0xFE (0-254), even values only	128
[7:2]	0x00-0xFC (0-252), in steps of 4	64
[7:3]	0x00-0xF8 (0-248), in steps of 8	32
[7:4]	0x00-0xF0 (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

On a Warm reset, this field resets to 0.

## Accessing the ICC\_PMR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_PMR\_EL1

# ICC\_RPR\_EL1, Interrupt Controller Running Priority Register

The ICC\_RPR\_EL1 characteristics are:

## Purpose

Indicates the Running priority of the CPU interface.

## Configuration

AArch64 System register ICC\_RPR\_EL1 performs the same function as AArch32 System register [ICC\\_RPR](#).

## Attributes

ICC\_RPR\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_RPR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																RES0															
RES0																Priority															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:8]

Reserved, RES0.

### Priority, bits [7:0]

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

#### Note

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

## Accessing the ICC\_RPR\_EL1

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_RPR\_EL1

op0	op1	CRn	CRm	op2
-----	-----	-----	-----	-----

0b11	0b000	0b1100	0b1011	0b011
------	-------	--------	--------	-------

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && SCR_EL3.<IRQ,FIQ> == '11' then
        UNDEFINED;
    elsif ICC_SRE_EL1.SRE == '0' then
        AArch64.SystemAccessTrap(EL1, 0x18);
    elsif EL2Enabled() && ICH_HCR_EL2.TC == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.FMO == '1' then
        return ICV_RPR_EL1;
    elsif EL2Enabled() && HCR_EL2.IMO == '1' then
        return ICV_RPR_EL1;
    elsif HaveEL(EL3) && SCR_EL3.<IRQ,FIQ> == '11' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
        else
            return ICC_RPR_EL1;

# ICC\_SGI0R\_EL1, Interrupt Controller Software Generated Interrupt Group 0 Register

The ICC\_SGI0R\_EL1 characteristics are:

## Purpose

Generates Secure Group 0 SGIs.

## Configuration

AArch64 System register ICC\_SGI0R\_EL1 performs the same function as AArch32 System register [ICC\\_SGI0R](#).

## Attributes

ICC\_SGI0R\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_SGI0R\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								Aff3								RS				RES0		IRM		Aff2							
RES0				INTID				Aff1								TargetList															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:56]

Reserved, RES0.

### Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

### RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value  $((RS * 16) + n)$ .

When [ICC\\_CTLR\\_EL1](#).RSS==0, RS is RES0.

When [ICC\\_CTLR\\_EL1](#).RSS==1 and [GICD\\_TYPER](#).RSS==0, writing this register with  $RS \neq 0$  is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

### Bits [43:41]

Reserved, RES0.

**IRM, bit [40]**

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

**Aff2, bits [39:32]**

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**Bits [31:28]**

Reserved, RES0.

**INTID, bits [27:24]**

The INTID of the SGI.

**Aff1, bits [23:16]**

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**TargetList, bits [15:0]**

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

**Note**

This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16.

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

**Accessing the ICC\_SGIOR\_EL1**

This register allows software executing in a Secure state to generate Group 0 SGIs. It will also allow software executing in a Non-secure state to generate Group 0 SGIs, if permitted by the settings of [GICR\\_NSACR](#) in the Redistributor corresponding to the target PE.

When [GICD\\_CTLR.DS](#)==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the [GICR\\_NSACR](#) register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

**Note**

---

Accesses at EL3 are treated as Secure regardless of the value of SCR\_EL3.NS.

---

Accesses to this register use the following encodings:

MSR ICC\_SGI0R\_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b111

```

# ICC\_SGI1R\_EL1, Interrupt Controller Software Generated Interrupt Group 1 Register

The ICC\_SGI1R\_EL1 characteristics are:

## Purpose

Generates Group 1 SGIs for the current Security state.

## Configuration

AArch64 System register ICC\_SGI1R\_EL1 performs the same function as AArch32 System register [ICC\\_SGI1R](#).

Under certain conditions a write to ICC\_SGI1R\_EL1 can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Attributes

ICC\_SGI1R\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_SGI1R\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								Aff3								RS				RES0		IRM	Aff2								
RES0				INTID				Aff1								TargetList															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:56]

Reserved, RES0.

### Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

### RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value  $((RS * 16) + n)$ .

When [ICC\\_CTLR\\_EL1](#).RSS==0, RS is RES0.

When [ICC\\_CTLR\\_EL1](#).RSS==1 and [GICD\\_TYPER](#).RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

**Bits [43:41]**

Reserved, RES0.

**IRM, bit [40]**

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

**Aff2, bits [39:32]**

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**Bits [31:28]**

Reserved, RES0.

**INTID, bits [27:24]**

The INTID of the SGI.

**Aff1, bits [23:16]**

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

**TargetList, bits [15:0]**

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

**Note**

This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16.

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

**Accessing the ICC\_SGI1R\_EL1****Note**

Accesses at EL3 are treated as Secure regardless of the value of SCR\_EL3.NS.

Accesses to this register use the following encodings:

MSR ICC\_SGI1R\_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b101

## ICC\_SRE\_EL1, Interrupt Controller System Register Enable register (EL1)

The ICC\_SRE\_EL1 characteristics are:

## Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL1.

## Configuration

AArch64 System register ICC\_SRE\_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register [ICC\\_SRE\[31:0\] \(S\)](#).

AArch64 System register ICC\_SRE\_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register [ICC\\_SRE\[31:0\] \(NS\)](#).

## Attributes

ICC\_SRE\_EL1 is a 64-bit register.

## Field descriptions

The ICC\_SRE\_EL1 bit assignments are:

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32

RES0

RES0

DIB DFB SRE

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

**Bits [63:3]**

Reserved, RES0.

**DIB, bit [2]**

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

If EL3 is implemented and `GICD_CTLR.DS == 0`, this field is a read-only alias of `ICC_SRE_EL3.DIB`.

If EL3 is implemented and `GICD_CTLR.DS == 1`, and EL2 is not implemented, this field is a read-write alias of `ICC_SRE_EL3.DIB`.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of [ICC\\_SRE\\_EL2.DIB](#).

If `GICD CTLR.DS == 1` and EL2 is implemented, this field is a read-only alias of `ICC SRE EL2.DIB`.

In systems that do not support IRQ bypass, this field is RAO/WI.

On a Warm reset, this field resets to 0.

**DFB, bit [1]**

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and [GICD\\_CTLR.DS](#) == 0, this field is a read-only alias of [ICC\\_SRE\\_EL3.DFB](#).

If EL3 is implemented and [GICD\\_CTLR.DS](#) == 1, and EL2 is not implemented, this field is a read-write alias of [ICC\\_SRE\\_EL3.DFB](#).

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of [ICC\\_SRE\\_EL2.DFB](#).

If [GICD\\_CTLR.DS](#) == 1 and EL2 is implemented, this field is a read-only alias of [ICC\\_SRE\\_EL2.DFB](#).

In systems that do not support FIQ bypass, this field is RAO/WI.

On a Warm reset, this field resets to 0.

**SRE, bit [0]**

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL1 to any ICC_* System register other than ICC_SRE_EL1 is trapped to EL1.
0b1	The System register interface for the current Security state is enabled.

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and [ICC\\_SRE\\_EL3.SRE](#)==0 the Secure copy of this bit is RAZ/WI. If [ICC\\_SRE\\_EL3.SRE](#) is changed from zero to one, the Secure copy of this bit becomes UNKNOWN.

If EL2 is implemented and [ICC\\_SRE\\_EL2.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI. If [ICC\\_SRE\\_EL2.SRE](#) is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

If EL3 is implemented and [ICC\\_SRE\\_EL3.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI. If [ICC\\_SRE\\_EL3.SRE](#) is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI. The following options are supported:

- The Non-secure copy of [ICC\\_SRE\\_EL1.SRE](#) can be RAO/WI if [ICC\\_SRE\\_EL2.SRE](#) is also RAO/WI. This means all Non-secure software, including VMs using only virtual interrupts, must access the GIC using System registers.
- The Secure copy of [ICC\\_SRE\\_EL1.SRE](#) can be RAO/WI if [ICC\\_SRE\\_EL3.SRE](#) and [ICC\\_SRE\\_EL2.SRE](#) are also RAO/WI. This means that all Secure software must access the GIC using System registers and all Non-secure accesses to registers for physical interrupts must use System registers.

**Note**

A VM using only virtual interrupts might still use memory-mapped access if the Non-secure copy of [ICC\\_SRE\\_EL1.SRE](#) is not RAO/WI.

On a Warm reset, this field resets to 0.

**Accessing the ICC\_SRE\_EL1**

Execution with [ICC\\_SRE\\_EL1.SRE](#) set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, ICC\_SRE\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b101

## ICC\_SRE\_EL2, Interrupt Controller System Register Enable register (EL2)

The ICC\_SRE\_EL2 characteristics are:

## Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL2.

## Configuration

AArch64 System register ICC\_SRE\_EL2 is architecturally mapped to AArch32 System register [ICC\\_HSRE](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICC\_SRE\_EL2 is a 64-bit register.

## Field descriptions

The ICC SRE EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
																RES0																					
RES0																		Enable																	DIB	DFB	SRE
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

**Bits [63:4]**

Reserved, RES0.

### Enable, bit [3]

Enable. Enables lower Exception level access to [ICC\\_SRE\\_EL1](#).

Enable	Meaning
0b0	When EL2 is implemented and enabled in the current Security state, EL1 accesses to <a href="#">ICC_SRE_EL1</a> trap to EL2.
0b1	EL1 accesses to <a href="#">ICC_SRE_EL1</a> do not trap to EL2.

If ICC\_SRE\_EL2.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC\_SRE\_EL2.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### DIB, bit [2]

Disable IRQ bypass.

<b>DIB</b>	<b>Meaning</b>
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

If EL3 is implemented and [GICD\\_CTLR.DS](#) is 0, this field is a read-only alias of [ICC\\_SRE\\_EL3.DIB](#).

If EL3 is implemented and [GICD\\_CTLR.DS](#) is 1, this field is a read-write alias of [ICC\\_SRE\\_EL3.DIB](#).

In systems that do not support IRQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

### DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and [GICD\\_CTLR.DS](#) is 0, this field is a read-only alias of [ICC\\_SRE\\_EL3.DFB](#).

If EL3 is implemented and [GICD\\_CTLR.DS](#) is 1, this field is a read-write alias of [ICC\\_SRE\\_EL3.DFB](#).

In systems that do not support FIQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

### SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL2 to any ICH_* or ICC_* register other than <a href="#">ICC_SRE_EL1</a> or <a href="#">ICC_SRE_EL2</a> , is trapped to EL2.
0b1	The System register interface to the ICH_* registers and the EL1 and EL2 ICC_* registers is enabled for EL2.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and [ICC\\_SRE\\_EL3.SRE](#)==0 this bit is RAZ/WI. If [ICC\\_SRE\\_EL3.SRE](#) is changed from zero to one, this bit becomes UNKNOWN.

FEAT\_GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI, but this is only allowed if [ICC\\_SRE\\_EL3.SRE](#) is also RAO/WI.

On a Warm reset, this field resets to 0.

## Accessing the ICC\_SRE\_EL2

Execution with [ICC\\_SRE\\_EL2.SRE](#) set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_SRE\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1001	0b101

    if !EL2Enabled() then
        UNDEFINED;
    else
        ICC_SRE_EL2 = X[t];

```

## ICC\_SRE\_EL3, Interrupt Controller System Register Enable register (EL3)

The ICC\_SRE\_EL3 characteristics are:

## Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

## Configuration

AArch64 System register ICC\_SRE\_EL3 bits [31:0] can be mapped to AArch32 System register [ICC\\_MSRE\[31:0\]](#), but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to ICC SRE EL3 are UNDEFINED.

## Attributes

ICC\_SRE\_EL3 is a 64-bit register.

## Field descriptions

The ICC SRE EL3 bit assignments are:

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32

RES0

RES0 Enable DIB DFB SRE

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

**Bits [63:4]**

Reserved, RES0.

### Enable, bit [3]

Enable. Enables lower Exception level access to [ICC\\_SRE\\_EL1](#) and [ICC\\_SRE\\_EL2](#).

Enable	Meaning
0b0	EL1 accesses to <a href="#">ICC_SRE_EL1</a> trap to EL3, unless these accesses are trapped to EL2 as a result of <code>ICC_SRE_EL2.Enable == 0</code> .
0b1	EL2 accesses to <a href="#">ICC_SRE_EL1</a> and <a href="#">ICC_SRE_EL2</a> trap to EL3. EL1 accesses to <a href="#">ICC_SRE_EL1</a> do not trap to EL3. EL2 accesses to <a href="#">ICC_SRE_EL1</a> and <a href="#">ICC_SRE_EL2</a> do not trap to EL3.

If ICC\_SRE\_EL3.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC\_SRE\_EL3.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DIB, bit [2]**

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

In systems that do not support IRQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

### DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

In systems that do not support FIQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

### SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL3 to any ICH_* or ICC_* register other than <a href="#">ICC_SRE_EL1</a> , <a href="#">ICC_SRE_EL2</a> , or ICC_SRE_EL3 is trapped to EL3
0b1	The System register interface to the ICH_* registers and the EL1, EL2, and EL3 ICC_* registers is enabled for EL3.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

FEAT\_GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI.

On a Warm reset, this field resets to 0.

## Accessing the ICC\_SRE\_EL3

This register is always System register accessible.

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_SRE\_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b101

```

# ICH\_AP0R<n>\_EL2, Interrupt Controller Hyp Active Priorities Group 0 Registers, n = 0 - 3

The ICH\_AP0R<n>\_EL2 characteristics are:

## Purpose

Provides information about Group 0 virtual active priorities for EL2.

## Configuration

AArch64 System register ICH\_AP0R<n>\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_AP0R<n>\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_AP0R<n>\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_AP0R<n>\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### P<x>, bit [x], for x = 31 to 0

Provides the access to the virtual active priorities for Group 0 interrupts. Possible values of each bit are:

P<x>	Meaning
0b0	There is no Group 0 interrupt active with this priority level, or all active Group 0 interrupts with this priority level have undergone priority-drop.
0b1	There is a Group 0 interrupt active with this priority level which has not undergone priority drop.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH\_AP0R0\_EL2 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH\_AP0R0\_EL2 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH\_AP0R1\_EL2 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH\_AP0R0\_EL2 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH\_AP0R1\_EL2 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH\_AP0R2\_EL2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH\_AP0R3\_EL2 in the bits corresponding to 11:Priority[5:1].

#### Note

Having the bit corresponding to a priority set to 1 in both ICH\_AP0R<n>\_EL2 and [ICH\\_AP1R<n>\\_EL2](#) might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

On a Warm reset, this field resets to 0.

Software must ensure that ICH\_AP0R<n>\_EL2 is 0 for legacy VMs otherwise behaviour is UNPREDICTABLE. For more information about support for legacy VMs, see 'Support for legacy operation of VMs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The active priorities for Group 0 and Group 1 interrupts for legacy VMs are held in [ICH\\_AP1R<n>\\_EL2](#) and reads and writes to GICV\_APR access [ICH\\_AP1R<n>\\_EL2](#). This means that ICH\_AP0R<n>\_EL2 is inaccessible to legacy VMs.

## Accessing the ICH\_AP0R<n>\_EL2

ICH\_AP0R1\_EL2 is only implemented in implementations that support 6 or more bits of preemption. ICH\_AP0R2\_EL2 and ICH\_AP0R3\_EL2 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

#### Note

The number of bits of preemption is indicated by [ICH\\_VTR\\_EL2](#).PREbits

Writing to these registers with any value other than the last read value of the register (or 0x00000000 for a newly set up virtual machine) can result in UNPREDICTABLE behavior of the virtual interrupt prioritization system allowing either:

- Virtual interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution at EL1 or EL0.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICH\_AP0R<n>\_EL2.
- [ICH\\_AP1R<n>\\_EL2](#).

Having the bit corresponding to a priority set in both ICH\_AP0R<n>\_EL2 and [ICH\\_AP1R<n>\\_EL2](#) can result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_AP0R<n>\_EL2

op0	op1	CRn	CRm	op2

### Bits [63:32]

Reserved, RES0.

### P<x>, bit [x], for x = 31 to 0

Group 1 interrupt active priorities. Possible values of each bit are:

P<x>	Meaning
0b0	There is no Group 1 interrupt active with this priority level, or all active Group 1 interrupts with this priority level have undergone priority-drop.
0b1	There is a Group 1 interrupt active with this priority level which has not undergone priority drop.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH\_AP1R0\_EL2 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH\_AP1R0\_EL2 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH\_AP1R1\_EL2 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH\_AP1R0\_EL2 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH\_AP1R1\_EL2 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH\_AP1R2\_EL2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH\_AP1R3\_EL2 in the bits corresponding to 11:Priority[5:1].

#### Note

Having the bit corresponding to a priority set to 1 in both [ICH\\_AP0R<n>\\_EL2](#) and ICH\_AP1R<n>\_EL2 might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

On a Warm reset, this field resets to 0.

This register is always used for legacy VMs, regardless of the group of the virtual interrupt. Reads and writes to [GICV\\_APR<n>](#) access [ICH\\_AP1R<n>\\_EL2](#). For more information about support for legacy VMs, see 'Support for legacy operation of VMs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Accessing the ICH\_AP1R<n>\_EL2

ICH\_AP1R1\_EL2 is only implemented in implementations that support 6 or more bits of preemption. ICH\_AP1R2\_EL2 and ICH\_AP1R3\_EL2 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

#### Note

The number of bits of preemption is indicated by [ICH\\_VTR\\_EL2](#).PREbits

Writing to these registers with any value other than the last read value of the register (or 0x00000000 for a newly set up virtual machine) can result in UNPREDICTABLE behavior of the virtual interrupt prioritization system allowing either:

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_AP1R<n>\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1001	0b0:n[1:0]

# ICH\_EISR\_EL2, Interrupt Controller End of Interrupt Status Register

The ICH\_EISR\_EL2 characteristics are:

## Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

## Configuration

AArch64 System register ICH\_EISR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_EISR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_EISR\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_EISR\_EL2 bit assignments are:

63626160595857565554535251504948	47	46	45	44	43	42	41	40	39	38
RES0										
RES0	Status15	Status14	Status13	Status12	Status11	Status10	Status9	Status8	Status7	Status6
31302928272625242322212019181716	15	14	13	12	11	10	9	8	7	6

### Bits [63:16]

Reserved, RES0.

### Status<n>, bit [n], for n = 15 to 0

EOI maintenance interrupt status bit for List register <n>:

Status<n>	Meaning
0b0	List register <n>, <a href="#">ICH_LR&lt;n&gt;_EL2</a> , does not have an EOI maintenance interrupt.
0b1	List register <n>, <a href="#">ICH_LR&lt;n&gt;_EL2</a> , has an EOI maintenance interrupt that has not been handled.

For any [ICH\\_LR<n>\\_EL2](#), the corresponding status bit is set to 1 if all of the following are true:

- [ICH\\_LR<n>\\_EL2](#).State is 0b00.
- [ICH\\_LR<n>\\_EL2](#).HW is 0.
- [ICH\\_LR<n>\\_EL2](#).EOI (bit [41]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

Otherwise the status bit takes the value 0.

## Accessing the ICH\_EISR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_EISR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b011

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_EISR_EL2;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_EISR_EL2;

```

# ICH\_ELRSR\_EL2, Interrupt Controller Empty List Register Status Register

The ICH\_ELRSR\_EL2 characteristics are:

## Purpose

These registers can be used to locate a usable List register when the hypervisor is delivering an interrupt to a VM.

## Configuration

AArch64 System register ICH\_ELRSR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_ELRSR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_ELRSR\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_ELRSR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16								
																RES0																																							
RES0																Status15	Status14	Status13	Status12	Status11	Status10	Status9	Status8	Status7	Status6	Status5	Status4	Status3	Status2	Status1	Status0

### Bits [63:16]

Reserved, RES0.

### Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>, [ICH\\_LR<n>\\_EL2](#):

Status<n>	Meaning
0b0	List register <a href="#">ICH_LR&lt;n&gt;_EL2</a> , if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.
0b1	List register <a href="#">ICH_LR&lt;n&gt;_EL2</a> does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.

For any List register <n>, the corresponding status bit is set to 1 if [ICH\\_LR<n>\\_EL2](#).State is 0b00 and either [ICH\\_LR<n>\\_EL2](#).HW is 1 or [ICH\\_LR<n>\\_EL2](#).EOI (bit [41]) is 0.

Otherwise the status bit takes the value 0.

## Accessing the ICH\_ELRSR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_ELRSR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_ELRSR_EL2;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_ELRSR_EL2;

```

# ICH\_HCR\_EL2, Interrupt Controller Hyp Control Register

The ICH\_HCR\_EL2 characteristics are:

## Purpose

Controls the environment for VMs.

## Configuration

AArch64 System register ICH\_HCR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_HCR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_HCR\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_HCR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37
RES0																										
EOIcount		RES0					DVIM	TDIR	TSEI	TALL1	TALL0	TC	RES0	vSGIEOICount	VGrp1DIE	VGrp1EIE	VGrp0DIE	VGrp0EIE								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5

### Bits [63:32]

Reserved, RES0.

### EOIcount, bits [31:27]

This field is incremented whenever a successful write to a virtual EOIR or DIR register would have resulted in a virtual interrupt deactivation. That is either:

- A virtual write to EOIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is zero and no List Register was found.
- A virtual write to DIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is one and no List Register was found.

This allows software to manage more active interrupts than there are implemented List Registers.

It is CONSTRAINED UNPREDICTABLE whether a virtual write to EOIR that does not clear a bit in the Active Priorities registers ([ICH\\_AP0R<n>\\_EL2](#)/[ICH\\_AP1R<n>\\_EL2](#)) increments EOIcount. Permitted behaviors are:

- Increment EOIcount.
- Leave EOIcount unchanged.

On a Warm reset, this field resets to 0.

### Bits [26:16]

Reserved, RES0.

### DVIM, bit [15]

When `ICH_VTR_EL2.DVIM == 1`:

Directly-injected Virtual Interrupt Mask.

DVIM	Meaning
0b0	This control has no effect on the signalling of virtual interrupts.
0b1	Virtual interrupts received via direct-injection are not presented to the virtual CPU interface and not considered when determining the highest priority pending virtual interrupt.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

### TDIR, bit [14]

Trap EL1 writes to [ICC\\_DIR\\_EL1](#) and [ICV\\_DIR\\_EL1](#).

TDIR	Meaning
0b0	EL1 writes of <a href="#">ICC_DIR_EL1</a> and <a href="#">ICV_DIR_EL1</a> are not trapped to EL2, unless trapped by other mechanisms.
0b1	EL1 writes of <a href="#">ICV_DIR_EL1</a> are trapped to EL2. It is IMPLEMENTATION DEFINED whether writes of <a href="#">ICC_DIR_EL1</a> are trapped. Not trapping <a href="#">ICC_DIR_EL1</a> writes is DEPRECATED.

Support for this bit is OPTIONAL, with support indicated by [ICH\\_VTR\\_EL2](#).

If the implementation does not support this trap, this bit is RES0.

Arm deprecates not including this trap bit.

On a Warm reset, this field resets to 0.

### TSEI, bit [13]

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at EL1.

TSEI	Meaning
0b0	Locally generated SEIs do not cause a trap to EL2.
0b1	Locally generated SEIs trap to EL2.

If [ICH\\_VTR\\_EL2](#).SEIS is 0, this bit is RES0.

On a Warm reset, this field resets to 0.

### TALL1, bit [12]

Trap all EL1 accesses to ICC\_\* and ICV\_\* System registers for Group 1 interrupts to EL2.

TALL1	Meaning
0b0	EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal.
0b1	EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2.

On a Warm reset, this field resets to 0.

**TALLO, bit [11]**

Trap all EL1 accesses to ICC\_\* and ICV\_\* System registers for Group 0 interrupts to EL2.

<b>TALLO</b>	<b>Meaning</b>
0b0	EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal.
0b1	EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2.

On a Warm reset, this field resets to 0.

**TC, bit [10]**

Trap all EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.

<b>TC</b>	<b>Meaning</b>
0b0	EL1 accesses to common registers proceed as normal.
0b1	EL1 accesses to common registers trap to EL2.

This affects accesses to [ICC\\_SGI0R\\_EL1](#), [ICC\\_SGI1R\\_EL1](#), [ICC\\_ASGI1R\\_EL1](#), [ICC\\_CTLR\\_EL1](#), [ICC\\_DIR\\_EL1](#), [ICC\\_PMR\\_EL1](#), [ICC\\_RPR\\_EL1](#), [ICV\\_CTLR\\_EL1](#), [ICV\\_DIR\\_EL1](#), [ICV\\_PMR\\_EL1](#), and [ICV\\_RPR\\_EL1](#).

On a Warm reset, this field resets to 0.

**Bit [9]**

Reserved, RES0.

**vSGIEOICount, bit [8]**

When FEAT\_GICv4p1 is implemented:

Controls whether deactivation of virtual SGIs can increment ICH\_HCR\_EL2.EOICount

<b>vSGIEOICount</b>	<b>Meaning</b>
0b0	Deactivation of virtual SGIs can increment ICH_HCR_EL2.EOICount.
0b1	Deactivation of virtual SGIs does not increment ICH_HCR_EL2.EOICount.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**VGrp1DIE, bit [7]**

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

<b>VGrp1DIE</b>	<b>Meaning</b>
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">ICH_VMCR_EL2.VENG1</a> is 0.

On a Warm reset, this field resets to 0.

**VGrp1EIE, bit [6]**

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:

<b>VGrp1EIE</b>	<b>Meaning</b>
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">ICH_VMCR_EL2.VENG1</a> is 1.

On a Warm reset, this field resets to 0.

#### **VGrp0DIE, bit [5]**

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

<b>VGrp0DIE</b>	<b>Meaning</b>
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">ICH_VMCR_EL2.VENG0</a> is 0.

On a Warm reset, this field resets to 0.

#### **VGrp0EIE, bit [4]**

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:

<b>VGrp0EIE</b>	<b>Meaning</b>
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">ICH_VMCR_EL2.VENG0</a> is 1.

On a Warm reset, this field resets to 0.

#### **NPIE, bit [3]**

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to 0b01 (pending):

<b>NPIE</b>	<b>Meaning</b>
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

On a Warm reset, this field resets to 0.

#### **LRENPIE, bit [2]**

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

<b>LRENPIE</b>	<b>Meaning</b>
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted while the EOICount field is not 0.

On a Warm reset, this field resets to 0.

#### **UIE, bit [1]**

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

<b>UIE</b>	<b>Meaning</b>
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.

On a Warm reset, this field resets to 0.

### En, bit [0]

Enable. Global enable bit for the virtual CPU interface:

En	Meaning
0b0	Virtual CPU interface operation disabled.
0b1	Virtual CPU interface operation enabled.

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of [ICV\\_IAR0\\_EL1](#), [ICV\\_IAR1\\_EL1](#), [GICV\\_IAR](#) or [GICV\\_AIAR](#) returns a spurious interrupt ID.

### Note

This field is RES0 when SCR\_EL3.{NS,EEL2}=={0,0}

On a Warm reset, this field resets to 0.

## Accessing the ICH\_HCR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_HCR\_EL2

# ICH\_LR<n>\_EL2, Interrupt Controller List Registers, n = 0 - 15

The ICH\_LR<n>\_EL2 characteristics are:

## Purpose

Provides interrupt context information for the virtual CPU interface.

## Configuration

AArch64 System register ICH\_LR<n>\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_LR<n>\[31:0\]](#).

AArch64 System register ICH\_LR<n>\_EL2 bits [63:32] are architecturally mapped to AArch32 System register [ICH\\_LRC<n>\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_LR<n>\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_LR<n>\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
State				HWGroup				RES0				Priority				RES0				pINTID											
vINTID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### State, bits [63:62]

The state of the interrupt:

State	Meaning
0b00	Invalid (Inactive).
0b01	Pending.
0b10	Active.
0b11	Pending and active.

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the invalid state are ignored, except for the purpose of generating virtual maintenance interrupts.

For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### HW, bit [61]

Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the ID that the pINTID field indicates.

HW	Meaning
0b0	The interrupt is triggered entirely by software. No notification is sent to the Distributor when the virtual interrupt is deactivated.
0b1	The interrupt maps directly to a hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using the pINTID field from this register to indicate the physical interrupt ID. If <a href="#">ICH_VMCR_EL2.VEOIM</a> is 0, this request corresponds to a write to <a href="#">ICC_FOIR0_EL1</a> or <a href="#">ICC_FOIR1_EL1</a> . Otherwise, it corresponds to a write to <a href="#">ICC_DIR_EL1</a> .

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Group, bit [60]

Indicates the group for this virtual interrupt.

Group	Meaning
0b0	This is a Group 0 virtual interrupt. <a href="#">ICH_VMCR_EL2.VFIQEn</a> determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and <a href="#">ICH_VMCR_EL2.VENG0</a> enables signaling of this interrupt to the virtual machine.
0b1	This is a Group 1 virtual interrupt, signaled as a virtual IRQ. <a href="#">ICH_VMCR_EL2.VENG1</a> enables the signalling of this interrupt to the virtual machine. If <a href="#">ICH_VMCR_EL2.VCBPR</a> is 0, then <a href="#">ICC_BPR1_EL1</a> determines if a pending Group 1 interrupt has sufficient priority to preempt current execution. Otherwise, <a href="#">ICH_LR&lt;n&gt;_EL2</a> determines preemption.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [59:56]

Reserved, RES0.

### Priority, bits [55:48]

The priority of this interrupt.

It is IMPLEMENTATION DEFINED how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit[48] up to bit[50]. The number of implemented bits can be discovered from [ICH\\_VTR\\_EL2.PRIBits](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [47:45]

Reserved, RES0.

### pINTID, bits [44:32]

Physical INTID, for hardware interrupts.

When ICH\_LR<n>\_EL2.HW is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[44:42] : RES0.
- Bit[41] : EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, a maintenance interrupt is asserted.

- Bits[40:32] : RES0.

When ICH\_LR<n>\_EL2.HW is 1 (there is a corresponding physical interrupt):

- This field indicates the physical INTID. This field is only required to implement enough bits to hold a valid value for the implemented INTID size. Any unused higher order bits are RES0.
- When [ICC\\_CTLR\\_EL1.ExtRange](#) is 0, then bits[44:42] of this field are RES0.
- If the value of pINTID is not a valid INTID, behavior is UNPREDICTABLE. If the value of pINTID indicates a PPI, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 13 bits of Physical INTID are required, regardless of the number specified by [ICC\\_CTLR\\_EL1.IDbits](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**vINTID, bits [31:0]**

Virtual INTID of the interrupt.

If the value of vINTID is 1020-1023 and ICH\_LR<n>\_EL2.State!=0b00 (Inactive), behavior is UNPREDICTABLE.

Behavior is UNPREDICTABLE if two or more List Registers specify the same vINTID when:

- ICH\_LR<n>\_EL2.State == 0b01.
- ICH\_LR<n>\_EL2.State == 0b10.
- ICH\_LR<n>\_EL2.State == 0b11.

It is IMPLEMENTATION DEFINED how many bits are implemented, though at least 16 bits must be implemented. Unimplemented bits are RES0. The number of implemented bits can be discovered from [ICH\\_VTR\\_EL2.IDbits](#).

When [ICC\\_SRE\\_EL1.SRE](#) == 0, specifying a vINTID in the LPI range is UNPREDICTABLE

**Note**

When a VM is using memory-mapped access to the GIC, software must ensure that the correct source PE ID is provided in bits[12:10].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ICH\_LR<n>\_EL2**

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_LR<n>\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b110:n[3]	n[2:0]

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x400+8*UInt(CRm<0>:op2<2:0>)];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then

# ICH\_MISR\_EL2, Interrupt Controller Maintenance Interrupt State Register

The ICH\_MISR\_EL2 characteristics are:

## Purpose

Indicates which maintenance interrupts are asserted.

## Configuration

AArch64 System register ICH\_MISR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_MISR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_MISR\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_MISR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0								VGrp1D		VGrp1E		VGrp0D		VGrp0E		NPLREN		U		EOI											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:8]

Reserved, RES0.

### VGrp1D, bit [7]

vPE Group 1 Disabled.

VGrp1D	Meaning
0b0	vPE Group 1 Disabled maintenance interrupt not asserted.
0b1	vPE Group 1 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR\\_EL2.VGrp1DIE](#)==1 and [ICH\\_VMCR\\_EL2.VENG1](#)==is 0.

On a Warm reset, this field resets to 0.

### VGrp1E, bit [6]

vPE Group 1 Enabled.

VGrp1E	Meaning
0b0	vPE Group 1 Enabled maintenance interrupt not asserted.
0b1	vPE Group 1 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR\\_EL2.VGrp1EIE](#)==1 and [ICH\\_VMCR\\_EL2.VENG1](#)==is 1.

On a Warm reset, this field resets to 0.

### VGrp0D, bit [5]

vPE Group 0 Disabled.

VGrp0D	Meaning
0b0	vPE Group 0 Disabled maintenance interrupt not asserted.
0b1	vPE Group 0 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR\\_EL2.VGrp0DIE==1](#) and [ICH\\_VMCR\\_EL2.VENG0==0](#).

On a Warm reset, this field resets to 0.

### VGrp0E, bit [4]

vPE Group 0 Enabled.

VGrp0E	Meaning
0b0	vPE Group 0 Enabled maintenance interrupt not asserted.
0b1	vPE Group 0 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR\\_EL2.VGrp0EIE==1](#) and [ICH\\_VMCR\\_EL2.VENG0==1](#).

On a Warm reset, this field resets to 0.

### NP, bit [3]

No Pending.

NP	Meaning
0b0	No Pending maintenance interrupt not asserted.
0b1	No Pending maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR\\_EL2.NPIE==1](#) and no List register is in pending state.

On a Warm reset, this field resets to 0.

### LRENPI, bit [2]

List Register Entry Not Present.

LRENPI	Meaning
0b0	List Register Entry Not Present maintenance interrupt not asserted.
0b1	List Register Entry Not Present maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR\\_EL2.LRENPIE==1](#) and [ICH\\_HCR\\_EL2.EOICount](#) is non-zero.

On a Warm reset, this field resets to 0.

### U, bit [1]

Underflow.

U	Meaning
0b0	Underflow maintenance interrupt not asserted.
0b1	Underflow maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR\\_EL2.UIE==1](#) and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding [ICH\\_LR<n>\\_EL2.State](#) bits do not equal 0x0.

On a Warm reset, this field resets to 0.

## EOI, bit [0]

End Of Interrupt.

EOI	Meaning
0b0	End Of Interrupt maintenance interrupt not asserted.
0b1	End Of Interrupt maintenance interrupt asserted.

This maintenance interrupt is asserted when at least one bit in [ICH\\_EISR\\_EL2](#) is 1.

On a Warm reset, this field resets to 0.

The U and NP bits do not include the status of any pending/active 'VSet (IRI)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069) packets because these bits control generation of interrupts that allow software management of the contents of the List Registers (which are not affected by 'VSet (IRI)' packets).

## Accessing the ICH\_MISR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_MISR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_MISR_EL2;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_MISR_EL2;

```

# ICH\_VMCR\_EL2, Interrupt Controller Virtual Machine Control Register

The ICH\_VMCR\_EL2 characteristics are:

## Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state.

## Configuration

AArch64 System register ICH\_VMCR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_VMCR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_VMCR\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_VMCR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32																				
RES0																																																			
VPMR								VBPR0				VBPR1				RES0								VEOIM				RES0				VCBPR				VFIQEn				VackCtl				VENG1				VENG0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																				

### Bits [63:32]

Reserved, RES0.

### VPMR, bits [31:24]

Virtual Priority Mask. The priority mask level for the virtual CPU interface. If the priority of a pending virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

This field is an alias of [ICV\\_PMR\\_EL1](#).Priority.

### VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if ICH\_VMCR\_EL2.VCBPR == 1.

This field is an alias of [ICV\\_BPR0\\_EL1](#).BinaryPoint.

The minimum value of this field is determined by [ICH\\_VTR\\_EL2](#).PREbits. An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

**VBPR1, bits [20:18]**

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption if [ICH\\_VMCR\\_EL2.VCBPR](#) == 0.

This field is an alias of [ICV\\_BPR1\\_EL1.BinaryPoint](#).

This field is always accessible to EL2 accesses, regardless of the setting of the [ICH\\_VMCR\\_EL2.VCBPR](#) field.

For Non-secure writes, the minimum value of this field is the minimum value of [ICH\\_VMCR\\_EL2.VBPR0](#) plus one.

For Secure writes, the minimum value of this field is the minimum value of [ICH\\_VMCR\\_EL2.VBPR0](#).

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

**Bits [17:10]**

Reserved, RES0.

**VEOIM, bit [9]**

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

VEOIM	Meaning
0b0	<a href="#">ICV_EOIR0_EL1</a> and <a href="#">ICV_EOIR1_EL1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICV_DIR_EL1</a> are UNPREDICTABLE.
0b1	<a href="#">ICV_EOIR0_EL1</a> and <a href="#">ICV_EOIR1_EL1</a> provide priority drop functionality only. <a href="#">ICV_DIR_EL1</a> provides interrupt deactivation functionality.

This bit is an alias of [ICV\\_CTLR\\_EL1.EOImode](#).

**Bits [8:5]**

Reserved, RES0.

**VCBPR, bit [4]**

Virtual Common Binary Point Register. Possible values of this bit are:

VCBPR	Meaning
0b0	<a href="#">ICV_BPR1_EL1</a> determines the preemption group for virtual Group 1 interrupts.
0b1	Reads of <a href="#">ICV_BPR1_EL1</a> return <a href="#">ICV_BPR0_EL1</a> plus one, saturated to 0b111. Writes to <a href="#">ICV_BPR1_EL1</a> are ignored.

This field is an alias of [ICV\\_CTLR\\_EL1.CBPR](#).

**VFIQEn, bit [3]**

Virtual FIQ enable. Possible values of this bit are:

VFIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

This bit is an alias of [GICV\\_CTLR.FIQEn](#).

In implementations where the Non-secure copy of [ICC\\_SRE\\_EL1](#).SRE is always 1, this bit is RES1.

## VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

VAckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of <a href="#">GICV_IAR</a> or <a href="#">GICV_HPPIR</a> returns an INTID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of <a href="#">GICV_IAR</a> or <a href="#">GICV_HPPIR</a> returns the INTID of the corresponding interrupt.

This bit is an alias of [GICV\\_CTLR](#).AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

In implementations where the Non-secure copy of [ICC\\_SRE\\_EL1](#).SRE is always 1, this bit is RES0.

## VENG1, bit [1]

Virtual Group 1 interrupt enable. Possible values of this bit are:

VENG1	Meaning
0b0	Virtual Group 1 interrupts are disabled.
0b1	Virtual Group 1 interrupts are enabled.

This bit is an alias of [ICV\\_IGRPEN1\\_EL1](#).Enable.

## VENG0, bit [0]

Virtual Group 0 interrupt enable. Possible values of this bit are:

VENG0	Meaning
0b0	Virtual Group 0 interrupts are disabled.
0b1	Virtual Group 0 interrupts are enabled.

This bit is an alias of [ICV\\_IGRPEN0\\_EL1](#).Enable.

# Accessing the ICH\_VMCR\_EL2

When EL2 is using System register access, EL1 using either System register or memory-mapped access must be supported.

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_VMCR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b111

```

if PSTATE.EL == EL0 then

# ICH\_VTR\_EL2, Interrupt Controller VGIC Type Register

The ICH\_VTR\_EL2 characteristics are:

## Purpose

Reports supported GIC virtualization features.

## Configuration

AArch64 System register ICH\_VTR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH\\_VTR\[31:0\]](#).

If EL2 is not implemented, all bits in this register are RES0 from EL3, except for nV4, which is RES1 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

ICH\_VTR\_EL2 is a 64-bit register.

## Field descriptions

The ICH\_VTR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																	RES0														
PRIbits				PREbits				IDbits				SEIS	A3V	nV4	TDS	DVIM	RES0														
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### PRIbits, bits [31:29]

Priority bits. The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

This field is an alias of [ICV\\_CTLR\\_EL1](#).PRIbits.

### PREbits, bits [28:26]

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH\_VTR\_EL2.PRIbits.

The maximum value of this field is 6, indicating 7 bits of preemption.

This field determines the minimum value of [ICH\\_VMCR\\_EL2](#).VBPR0.

### IDbits, bits [25:23]

The number of virtual interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

This field is an alias of [ICV\\_CTLR\\_EL1](#).IDbits.

### SEIS, bit [22]

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support generation of SEIs.
0b1	The virtual CPU interface logic supports generation of SEIs.

This bit is an alias of [ICV\\_CTLR\\_EL1](#).SEIS.

### A3V, bit [21]

Affinity 3 Valid. Possible values are:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

This bit is an alias of [ICV\\_CTLR\\_EL1](#).A3V.

### nV4, bit [20]

Direct injection of virtual interrupts not supported. Possible values are:

nV4	Meaning
0b0	The CPU interface logic supports direct injection of virtual interrupts.
0b1	The CPU interface logic does not support direct injection of virtual interrupts.

If FEAT\_GICv4 is not implemented, this bit is RES1.

### TDS, bit [19]

Separate trapping of EL1 writes to [ICV\\_DIR\\_EL1](#) supported.

TDS	Meaning
0b0	Implementation does not support <a href="#">ICH_HCR_EL2</a> .TDIR.
0b1	Implementation supports <a href="#">ICH_HCR_EL2</a> .TDIR.

### DVIM, bit [18]

Masking of directly-injected virtual interrupts.

DVIM	Meaning
0b0	Masking of Directly-injected Virtual Interrupts not supported.
0b1	Masking of Directly-injected Virtual Interrupts is supported.

### Bits [17:5]

Reserved, RES0.

### ListRegs, bits [4:0]

The number of implemented List registers, minus one. For example, a value of 0b01111 indicates that the maximum of 16 List registers are implemented.

## Accessing the ICH\_VTR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, ICH\_VTR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_VTR_EL2;
elseif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_VTR_EL2;

```

# ICV\_AP0R<n>\_EL1, Interrupt Controller Virtual Active Priorities Group 0 Registers, n = 0 - 3

The ICV\_AP0R<n>\_EL1 characteristics are:

## Purpose

Provides information about virtual Group 0 active priorities.

## Configuration

AArch64 System register ICV\_AP0R<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV\\_AP0R<n>\[31:0\]](#).

## Attributes

ICV\_AP0R<n>\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_AP0R<n>\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

## Accessing the ICV\_AP0R<n>\_EL1

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV\_AP0R1\_EL1 is only implemented in implementations that support 6 or more bits of priority. ICV\_AP0R2\_EL1 and ICV\_AP0R3\_EL1 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV\_AP0R<n>\_EL1.

- [ICV\\_AP1R<n>\\_EL1](#).

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_AP0R<n>\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b1:n[1:0]

# ICV\_BPR0\_EL1, Interrupt Controller Virtual Binary Point Register 0

The ICV\_BPR0\_EL1 characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 0 interrupt preemption.

## Configuration

AArch64 System register ICV\_BPR0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV\\_BPR0\[31:0\]](#).

## Attributes

ICV\_BPR0\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_BPR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:3]

Reserved, RES0.

### BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	ggggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.ssssssss

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ICV\_BPR0\_EL1

The minimum binary point value is derived from the number of implemented preemption bits, as shown in the following table:

Number of implemented preemption bits	Minimum value of BPR0
7	0
6	1
5	2

The number of implemented preemption bits is indicated by [ICH\\_VTR\\_EL2.PREbits](#).

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings:

# ICV\_BPR1\_EL1, Interrupt Controller Virtual Binary Point Register 1

The ICV\_BPR1\_EL1 characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 1 interrupt preemption.

## Configuration

AArch64 System register ICV\_BPR1\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV\\_BPR1\[31:0\]](#).

## Attributes

ICV\_BPR1\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_BPR1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
																RES0																	
RES0																																BinaryPoint	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### Bits [63:3]

Reserved, RES0.

### BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for virtual Group 0 and virtual Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	-	-	-
1	[7:1]	[0]	ggggggg.s
2	[7:2]	[1:0]	ggggggg.ss
3	[7:3]	[2:0]	ggggg.sss
4	[7:4]	[3:0]	gggg.ssss
5	[7:5]	[4:0]	ggg.sssss
6	[7:6]	[5:0]	gg.ssssss
7	[7]	[6:0]	g.ssssss

Writing 0 to this field will set this field to its reset value.

If [ICV\\_CTLR\\_EL1](#).CBPR is set to 1, Non-secure EL1 reads return [ICV\\_BPR0\\_EL1](#) + 1 saturated to 0b111. Non-secure EL1 writes are ignored.

If [ICV\\_CTLR\\_EL1](#).CBPR is set to 1, Secure EL1 reads return [ICV\\_BPR0\\_EL1](#). Secure EL1 writes modify [ICV\\_BPR0\\_EL1](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ICV\_BPR1\_EL1

For Non-secure writes, the minimum value of this field is the minimum value of [ICH\\_VMCR\\_EL2.VBPR0](#) plus one.

For Secure writes, the minimum value of this field is the minimum value of [ICH\\_VMCR\\_EL2.VBPR0](#).

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_BPR1\_EL1

op0	op1	CRn	CRm	op2

# ICV\_CTLR\_EL1, Interrupt Controller Virtual Control Register

The ICV\_CTLR\_EL1 characteristics are:

## Purpose

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

## Configuration

AArch64 System register ICV\_CTLR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV\\_CTLR\[31:0\]](#).

## Attributes

ICV\_CTLR\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_CTLR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0												ExtRange	RSS	RES0	A3V	SEIS	IDbits	PRIbits	RES0						EOImode	CBPR					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:20]

Reserved, RES0.

### ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	<p>CPU interface does not support INTIDs in the range 1024..8191.</p> <ul style="list-style-type: none"> <li>Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</li> </ul> <p><b>Note</b> Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.</p>
0b1	<p>CPU interface supports INTIDs in the range 1024..8191</p> <ul style="list-style-type: none"> <li>All INTIDs in the range 1024..8191 are treated as requiring deactivation.</li> </ul>

ICV\_CTLR\_EL1.ExtRange is an alias of [ICC\\_CTLR\\_EL1](#).ExtRange.

### RSS, bit [18]

Range Selector Support. Possible values are:

<b>RSS</b>	<b>Meaning</b>
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

#### Bits [17:16]

Reserved, RES0.

#### A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<b>A3V</b>	<b>Meaning</b>
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

#### SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

<b>SEIS</b>	<b>Meaning</b>
0b0	The virtual CPU interface logic does not support local generation of SEIs.
0b1	The virtual CPU interface logic supports local generation of SEIs.

#### IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

<b>IDbits</b>	<b>Meaning</b>
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

#### PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation must implement at least 32 levels of physical priority (5 priority bits).

#### Note

This field always returns the number of priority bits implemented.

The division between group priority and subpriority is defined in the binary point registers [ICV\\_BPR0\\_EL1](#) and [ICV\\_BPR1\\_EL1](#).

#### Bits [7:2]

Reserved, RES0.

#### EOImode, bit [1]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

EOImode	Meaning
0b0	<a href="#">ICV_EOIR0_EL1</a> and <a href="#">ICV_EOIR1_EL1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICV_DIR_EL1</a> are UNPREDICTABLE.
0b1	<a href="#">ICV_EOIR0_EL1</a> and <a href="#">ICV_EOIR1_EL1</a> provide priority drop functionality only. <a href="#">ICV_DIR_EL1</a> provides interrupt deactivation functionality.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

CBPR	Meaning
0b0	<a href="#">ICV_BPR1_EL1</a> determines the preemption group for virtual Group 1 interrupts.
0b1	Reads of <a href="#">ICV_BPR1_EL1</a> return <a href="#">ICV_BPR0_EL1</a> plus one, saturated to 0b111. Writes to <a href="#">ICV_BPR1_EL1</a> are ignored.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ICV\_CTLR\_EL1

# ICV\_DIR\_EL1, Interrupt Controller Deactivate Virtual Interrupt Register

The ICV\_DIR\_EL1 characteristics are:

## Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified virtual interrupt.

## Configuration

AArch64 System register ICV\_DIR\_EL1 bits [31:0] performs the same function as AArch32 System register [ICV\\_DIR\[31:0\]](#).

## Attributes

ICV\_DIR\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_DIR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																INTID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:24]

Reserved, RES0.

### INTID, bits [23:0]

The INTID of the virtual interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICV\\_CTLR\\_EL1](#).IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

## Accessing the ICV\_DIR\_EL1

When EOImode == 0, writes are ignored. In systems supporting system error generation, an implementation might generate an SEI.

Accesses to this register use the following encodings:

MSR ICC\_DIR\_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b001

```

# ICV\_EOIR0\_EL1, Interrupt Controller Virtual End Of Interrupt Register 0

The ICV\_EOIR0\_EL1 characteristics are:

## Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 0 interrupt.

## Configuration

AArch64 System register ICV\_EOIR0\_EL1 performs the same function as AArch32 System register [ICV\\_EOIR0](#).

## Attributes

ICV\_EOIR0\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_EOIR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0								INTID																							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:24]

Reserved, RES0.

### INTID, bits [23:0]

The INTID from the corresponding [ICV\\_IAR0\\_EL1](#) access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICV\\_CTLR\\_EL1](#).IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the [ICV\\_CTLR](#).EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the [ICV\\_CTLR](#).EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to [ICV\\_DIR\\_EL1](#) to deactivate the virtual interrupt.

## Accessing the ICV\_EOIR0\_EL1

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from [ICV\\_IAR0\\_EL1](#), otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings:

MSR ICC\_EOIR0\_EL1, <Xt>

op0	op1	CRn	CRm	op2
-----	-----	-----	-----	-----

0b11	0b000	0b1100	0b1000	0b001

# ICV\_IAR0\_EL1, Interrupt Controller Virtual Interrupt Acknowledge Register 0

The ICV\_IAR0\_EL1 characteristics are:

## Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 0 interrupt. This read acts as an acknowledge for the interrupt.

## Configuration

AArch64 System register ICV\_IAR0\_EL1 performs the same function as AArch32 System register [ICV\\_IAR0](#).

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when  $PSTATE.\{I,F\} == \{0,0\}$ ). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Attributes

ICV\_IAR0\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_IAR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

### Bits [63:24]

Reserved, RES0.

### INTID, bits [23:0]

The INTID of the signaled virtual interrupt.

This is the INTID of the highest priority pending virtual interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICV\\_CTLR\\_EL1](#).IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

# ICV\_IAR1\_EL1, Interrupt Controller Virtual Interrupt Acknowledge Register 1

The ICV\_IAR1\_EL1 characteristics are:

## Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 1 interrupt. This read acts as an acknowledge for the interrupt.

## Configuration

AArch64 System register ICV\_IAR1\_EL1 performs the same function as AArch32 System register [ICV\\_IAR1](#).

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when  $PSTATE.\{I,F\} == \{0,0\}$ ). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Attributes

ICV\_IAR1\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_IAR1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0

# ICV\_PMR\_EL1, Interrupt Controller Virtual Interrupt Priority Mask Register

The ICV\_PMR\_EL1 characteristics are:

## Purpose

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

## Configuration

AArch64 System register ICV\_PMR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV\\_PMR\[31:0\]](#).

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Attributes

ICV\_PMR\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_PMR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																								Priority							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								Priority							

### Bits [63:8]

Reserved, RES0.

### Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	0x00-0xFF (0-255), all values	256
[7:1]	0x00-0xFE (0-254), even values only	128
[7:2]	0x00-0xFC (0-252), in steps of 4	64
[7:3]	0x00-0xF8 (0-248), in steps of 8	32
[7:4]	0x00-0xF0 (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ICV\_PMR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ICC\_PMR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0110	0b000

```

# ICV\_RPR\_EL1, Interrupt Controller Virtual Running Priority Register

The ICV\_RPR\_EL1 characteristics are:

## Purpose

Indicates the Running priority of the virtual CPU interface.

## Configuration

AArch64 System register ICV\_RPR\_EL1 performs the same function as AArch32 System register [ICV\\_RPR](#).

## Attributes

ICV\_RPR\_EL1 is a 64-bit register.

## Field descriptions

The ICV\_RPR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																Priority															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:8]

Reserved, RES0.

### Priority, bits [7:0]

The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt.

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

#### Note

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

## Accessing the ICV\_RPR\_EL1

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, ICC\_RPR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b011

<a href="#">DebugVer</a>																															

### Bits [63:52]

Reserved, RES0.

### MTPMU, bits [51:48]

Multi-threaded PMU extension. Defined values are:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether <a href="#">PMEVTYPER&lt;n&gt;_EL0.MT</a> and <a href="#">PMEVTYPER&lt;n&gt;.MT</a> are read/write or RES0.
0b0001	FEAT_MTPMU and FEAT_PMUv3 implemented. <a href="#">PMEVTYPER&lt;n&gt;_EL0.MT</a> and <a href="#">PMEVTYPER&lt;n&gt;.MT</a> are read/write. When FEAT_MTPMU is disabled, the Effective values of <a href="#">PMEVTYPER&lt;n&gt;_EL0.MT</a> and <a href="#">PMEVTYPER&lt;n&gt;.MT</a> are 0.
0b1111	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, <a href="#">PMEVTYPER&lt;n&gt;_EL0.MT</a> and <a href="#">PMEVTYPER&lt;n&gt;.MT</a> are RES0.

All other values are reserved.

FEAT\_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT\_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT\_PMUv3, the value 0b0001 is not permitted.

**Bits [47:44]**

Reserved, RES0.

**TraceFilt, bits [43:40]**

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT\_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if an Embedded Trace Macrocell Architecture PE Trace Unit is implemented, the value 0b0000 is not permitted.

**DoubleLock, bits [39:36]**

OS Double Lock implemented. Defined values are:

DoubleLock	Meaning
0b0000	OS Double Lock implemented. <a href="#">OSDLR_EL1</a> is RW.
0b1111	OS Double Lock not implemented. <a href="#">OSDLR_EL1</a> is RAZ/WI.

All other values are reserved.

FEAT\_DoubleLock implements the functionality identified by the value 0b0000.

In Armv8.0, the only permitted value is 0b0000.

If FEAT\_Debugv8p2 is implemented and FEAT\_DoPD is not implemented, the permitted values are 0b0000 and 0b1111.

If FEAT\_DoPD is implemented, the only permitted value is 0b1111.

**PMSVer, bits [35:32]**

Statistical Profiling Extension version. Defined values are:

PMSVer	Meaning
0b0000	Statistical Profiling Extension not implemented.
0b0001	Statistical Profiling Extension implemented.
0b0010	As 0b0001, and adds: <ul style="list-style-type: none"> <li>Support for the Event packet Alignment flag.</li> <li>If FEAT_SVE is implemented, support for the Scalable Vector extensions to Statistical Profiling.</li> </ul>
0b0011	As 0b0010, and adds: <ul style="list-style-type: none"> <li>The last branch target Address packet.</li> <li>Discard mode.</li> <li>Extended event filtering, including the <a href="#">PMSNEVER_EL1</a> System register.</li> <li>If FEAT_PMUv3 is implemented, controls to freeze the PMU event counters after an SPE buffer management event occurs.</li> <li>If FEAT_PMUv3 is implemented, the <a href="#">SAMPLE_FEED_BR</a>, <a href="#">SAMPLE_FEED_EVENT</a>, <a href="#">SAMPLE_FEED_LAT</a>, <a href="#">SAMPLE_FEED_LD</a>, <a href="#">SAMPLE_FEED_OP</a>, and <a href="#">SAMPLE_FEED_ST</a> PMU events.</li> </ul>

All other values are reserved.

FEAT\_SPE implements the functionality identified by the value 0b0001.

FEAT\_SPEv1p1 implements the functionality identified by the value 0b0010.

FEAT\_SPEv1p2 implements the functionality identified by the value 0b0011.

In Armv8.5, if FEAT\_SPE is implemented, the value 0b0001 is not permitted.

From Armv8.7, if FEAT\_SPE is implemented, the value 0b0010 is not permitted.

### CTX\_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

### Bits [27:24]

Reserved, RES0.

### WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

### Bits [19:16]

Reserved, RES0.

### BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

### PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and also includes support for: <ul style="list-style-type: none"> <li>Extended 16-bit <a href="#">PMEVTYPER&lt;n&gt;_EL0</a>.evtCount field.</li> <li>If EL2 is implemented, the <a href="#">MDCR_EL2</a>.HPMD control bit.</li> </ul>
0b0101	PMUv3 for Armv8.4. As 0b0100, and also includes support for the <a href="#">PMMIR_EL1</a> register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and also includes support for: <ul style="list-style-type: none"> <li>64-bit event counters.</li> <li>If EL2 is implemented, the <a href="#">MDCR_EL2</a>.HCCD control bit.</li> <li>If EL3 is implemented, the <a href="#">MDCR_EL3</a>.SCCD control bit.</li> </ul>
0b0111	PMUv3 for Armv8.7. As 0b0110, and also includes support for: <ul style="list-style-type: none"> <li>The <a href="#">PMCR_EL0</a>.FZO and, if EL2 is implemented, <a href="#">MDCR_EL2</a>.HPMFZO control bits.</li> <li>If EL3 is implemented, the <a href="#">MDCR_EL3</a>.{MPMX,MCCD} control bits.</li> </ul>
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT\_PMUv3 implements the functionality identified by the value 0b0001.

FEAT\_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT\_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT\_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT\_PMUv3p7 implements the functionality identified by the value 0b0111.

In Armv8.1, if FEAT\_PMUv3 is implemented, the value 0b0001 is not permitted.

In Armv8.4, if FEAT\_PMUv3 is implemented, the value 0b0100 is not permitted.

In Armv8.5, if FEAT\_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT\_PMUv3 is implemented, the value 0b0110 is not permitted.

### TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

TraceVer	Meaning
0b0000	PE trace unit System registers not implemented.
0b0001	PE trace unit System registers implemented.

All other values are reserved.

See the ETM Architecture Specification for more information.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.

### DebugVer, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

DebugVer	Meaning
0b0110	Armv8 debug architecture.
0b0111	Armv8 debug architecture with Virtualization Host Extensions.
0b1000	Armv8.2 debug architecture.
0b1001	Armv8.4 debug architecture.

All other values are reserved.

FEAT\_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT\_Debugv8p4 adds the functionality identified by the value 0b1001.

In Armv8.1, the value 0b0110 is not permitted.

In Armv8.2, the value 0b0111 is not permitted.

From Armv8.4, the value 0b1000 is not permitted.

## Accessing the ID\_AA64DFR0\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_AA64DFR0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0101	0b000

```
if PSTATE.EL == EL0 then

# ID\_AA64DFR1\_EL1, AArch64 Debug Feature Register 1

The ID\_AA64DFR1\_EL1 characteristics are:

## Purpose

Reserved for future expansion of top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

There are no configuration notes.

## Attributes

ID\_AA64DFR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64DFR1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# ID\_AA64ISAR0\_EL1, AArch64 Instruction Set Attribute Register 0

The ID\_AA64ISAR0\_EL1 characteristics are:

## Purpose

Provides information about the instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

There are no configuration notes.

## Attributes

ID\_AA64ISAR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64ISAR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">RNDR</a>																															
<a href="#">RDM</a>																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### RNDR, bits [63:60]

Indicates support for Random Number instructions in AArch64 state. Defined values are:

RNDR	Meaning
0b0000	No Random Number instructions are implemented.
0b0001	<a href="#">RNDR</a> and <a href="#">RNDRRS</a> registers are implemented.

All other values are reserved.

FEAT\_RNG implements the functionality identified by the value 0b0001.

From Armv8.5, the permitted values are 0b0000 and 0b0001.

### TLB, bits [59:56]

Indicates support for Outer shareable and TLB range maintenance instructions. Defined values are:

TLB	Meaning
0b0000	Outer shareable and TLB range maintenance instructions are not implemented.
0b0001	Outer shareable TLB maintenance instructions are implemented.
0b0010	Outer shareable and TLB range maintenance instructions are implemented.

All other values are reserved.

FEAT\_TLBIOS implements the functionality identified by the values 0b0001 and 0b0010.

FEAT\_TLBIRANGE implements the functionality identified by the value 0b0010.

From Armv8.4, the only permitted value is 0b0010.

### TS, bits [55:52]

Indicates support for flag manipulation instructions. Defined values are:

TS	Meaning
0b0000	No flag manipulation instructions are implemented.
0b0001	CFINV, RMIF, SETF16, and SETF8 instructions are implemented.
0b0010	CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented.

All other values are reserved.

FEAT\_FlagM implements the functionality identified by the value 0b0001.

FEAT\_FlagM2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

In Armv8.4, the only permitted value is 0b0001.

From Armv8.5, the only permitted value is 0b0010.

### FHM, bits [51:48]

Indicates support for FMLAL and FMLSL instructions. Defined values are:

FHM	Meaning
0b0000	FMLAL and FMLSL instructions are not implemented.
0b0001	FMLAL and FMLSL instructions are implemented.

All other values are reserved.

FEAT\_FHM implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

### DP, bits [47:44]

Indicates support for Dot Product instructions in AArch64 state. Defined values are:

DP	Meaning
0b0000	No Dot Product instructions implemented.
0b0001	UDOT and SDOT instructions implemented.

All other values are reserved.

FEAT\_DotProd implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

### SM4, bits [43:40]

Indicates support for SM4 instructions in AArch64 state. Defined values are:

SM4	Meaning
0b0000	No SM4 instructions implemented.
0b0001	SM4E and SM4EKEY instructions implemented.

All other values are reserved.

If FEAT\_SM4 is not implemented, the value 0b0001 is reserved.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID\_AA64ISAR0\_EL1.SM3.

### SM3, bits [39:36]

Indicates support for SM3 instructions in AArch64 state. Defined values are:

SM3	Meaning
0b0000	No SM3 instructions implemented.
0b0001	SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 instructions implemented.

All other values are reserved.

If FEAT\_SM3 is not implemented, the value 0b0001 is reserved.

FEAT\_SM3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID\_AA64ISAR0\_EL1.SM4.

### SHA3, bits [35:32]

Indicates support for SHA3 instructions in AArch64 state. Defined values are:

SHA3	Meaning
0b0000	No SHA3 instructions implemented.
0b0001	EOR3, RAX1, XAR, and BCAX instructions implemented.

All other values are reserved.

If FEAT\_SHA3 is not implemented, the value 0b0001 is reserved.

FEAT\_SHA3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

If the value of ID\_AA64ISAR0\_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0001, ID\_AA64ISAR0\_EL1.SHA2 must have the value 0b0010.

### RDM, bits [31:28]

Indicates support for SQRDMLAH and SQRDMLSH instructions in AArch64 state. Defined values are:

RDM	Meaning
0b0000	No RDMA instructions implemented.
0b0001	SQRDMLAH and SQRDMLSH instructions implemented.

All other values are reserved.

FEAT\_RDM implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

### Bits [27:24]

Reserved, RES0.

### Atomic, bits [23:20]

Indicates support for Atomic instructions in AArch64 state. Defined values are:

Atomic	Meaning
0b0000	No Atomic instructions implemented.
0b0010	LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.

All other values are reserved.

FEAT\_LSE implements the functionality identified by the value 0b0010.

From Armv8.1, the only permitted value is 0b0010.

### CRC32, bits [19:16]

Indicates support for CRC32 instructions in AArch64 state. Defined values are:

CRC32	Meaning
0b0000	No CRC32 instructions implemented.
0b0001	CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

### SHA2, bits [15:12]

Indicates support for SHA2 instructions in AArch64 state. Defined values are:

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	Implements instructions: SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.
0b0010	Implements instructions: <ul style="list-style-type: none"> <li>SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.</li> <li>SHA512H, SHA512H2, SHA512SU0, and SHA512SU1.</li> </ul>

All other values are reserved.

FEAT\_SHA256 implements the functionality identified by the value 0b0001.

FEAT\_SHA512 implements the functionality identified by the value 0b0010.

In Armv8, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

If the value of ID\_AA64ISAR0\_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0010, ID\_AA64ISAR0\_EL1.SHA3 must have the value 0b0001.

### SHA1, bits [11:8]

Indicates support for SHA1 instructions in AArch64 state. Defined values are:

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented.

All other values are reserved.

FEAT\_SHA1 implements the functionality identified by the value 0b0001.

From Armv8, the permitted values are 0b0000 and 0b0001.

If the value of ID\_AA64ISAR0\_EL1.SHA2 is 0b0000, this field must have the value 0b0000.

### AES, bits [7:4]

Indicates support for AES instructions in AArch64 state. Defined values are:

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC instructions implemented.
0b0010	As for 0b0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.

FEAT\_AES implements the functionality identified by the value 0b0001.

FEAT\_PMULL implements the functionality identified by the value 0b0010.

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0010.

### Bits [3:0]

Reserved, RES0.

## Accessing the ID\_AA64ISAR0\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_AA64ISAR0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64ISAR0_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_AA64ISAR0_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_AA64ISAR0_EL1;

```

# ID\_AA64ISAR1\_EL1, AArch64 Instruction Set Attribute Register 1

The ID\_AA64ISAR1\_EL1 characteristics are:

## Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

If ID\_AA64ISAR1\_EL1.{API, APA} == {0000, 0000}, then:

- The [TCR\\_EL1](#).{TBID,TBID0}, [TCR\\_EL2](#).{TBID0,TBID1}, [TCR\\_EL2](#).TBID and [TCR\\_EL3](#).TBID bits are RES0.
- [APIAKeyHi\\_EL1](#), [APIAKeyLo\\_EL1](#), [APIBKeyHi\\_EL1](#), [APIBKeyLo\\_EL1](#), [APDAKeyHi\\_EL1](#), [APDAKeyLo\\_EL1](#), [APDBKeyHi\\_EL1](#), [APDBKeyLo\\_EL1](#) are not allocated.
- SCTLR\_ELx.EnIA, SCTLR\_ELx.EnIB, SCTLR\_ELx.EnDA, SCTLR\_ELx.EnDB are all RES0.

If ID\_AA64ISAR1\_EL1.{GPI, GPA, API, APA} == {0000, 0000, 0000, 0000}, then:

- [HCR\\_EL2](#).APK and [HCR\\_EL2](#).API are RES0.
- [SCR\\_EL3](#).APK and [SCR\\_EL3](#).API are RES0.

## Attributes

ID\_AA64ISAR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64ISAR1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">LS64</a>				<a href="#">XS</a>					<a href="#">I8MM</a>			<a href="#">DGH</a>				<a href="#">BF16</a>			<a href="#">SPECRES</a>			<a href="#">SB</a>					<a href="#">FRINTTS</a>				
	<a href="#">GPI</a>				<a href="#">GPA</a>				<a href="#">LRCPC</a>			<a href="#">FCMA</a>				<a href="#">JSCVT</a>				<a href="#">API</a>			<a href="#">APA</a>						<a href="#">DPB</a>		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### LS64, bits [63:60]

Indicates support for LD64B and ST64B\* instructions, and the [ACCDATA\\_EL1](#) register. Defined values of this field are:

LS64	Meaning
0b0000	The LD64B and ST64B* instructions, the <a href="#">ACCDATA_EL1</a> register, and associated traps are not supported.
0b0001	The LD64B and ST64B instructions are supported.
0b0010	The LD64B, ST64B, and ST64BV instructions, and their associated traps are supported.
0b0011	The LD64 and ST64B* instructions, the <a href="#">ACCDATA_EL1</a> register, and their associated traps are supported.

All other values are reserved.

FEAT\_LS64 implements the functionality identified by 0b0001.

FEAT\_LS64\_V implements the functionality identified by 0b0010.

FEAT\_LS64\_ACCDATA implements the functionality identified by 0b0011.

From Armv8.7, the permitted values are 0b0001, 0b0010, and 0b0011.

### XS, bits [59:56]

Indicates support for the XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the [HCRX\\_EL2](#).{FGTnXS, FnXS} fields in AArch64 state. Defined values are:

XS	Meaning
0b0000	The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the <a href="#">HCRX_EL2</a> .{FGTnXS, FnXS} fields are not supported.
0b0001	The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the <a href="#">HCRX_EL2</a> .{FGTnXS, FnXS} fields are supported.

All other values are reserved.

FEAT\_XS implements the functionality identified by 0b0001.

From Armv8.7, the only permitted value is 0b0001.

### I8MM, bits [55:52]

Indicates support for Advanced SIMD and Floating-point Int8 matrix multiplication instructions in AArch64 state. Defined values are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.

All other values are reserved.

FEAT\_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID\\_AA64ZFR0\\_EL1](#).I8MM.

From Armv8.6, the only permitted value is 0b0001.

### DGH, bits [51:48]

Indicates support for the Data Gathering Hint instruction. Defined values are:

DGH	Meaning
0b0000	Data Gathering Hint is not implemented.
0b0001	Data Gathering Hint is implemented.

All other values are reserved.

FEAT\_DGH implements the functionality identified by 0b0001.

From ARMv8.0, the permitted values are 0b0000 and 0b0001.

If the DGH instruction has no effect in preventing the merging of memory accesses, the value of this field is 0b0000.

### BF16, bits [47:44]

Indicates support for Advanced SIMD and Floating-point BFloat16 instructions in AArch64 state. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	BFCVT, BFCVTN, BFCVTN2, BFDOT, BFMLALB, BFMLALT, and BFMMMLA instructions are implemented.

All other values are reserved.

FEAT\_BF16 implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID\\_AA64ZFR0\\_EL1](#).BF16.

From Armv8.6, the only permitted value is 0b0001.

### SPECRES, bits [43:40]

Indicates support for prediction invalidation instructions in AArch64 state. Defined values are:

SPECRES	Meaning
0b0000	CFP RCTX, DVP RCTX, and CPP RCTX instructions are not implemented.
0b0001	CFP RCTX, DVP RCTX, and CPP RCTX instructions are implemented.

All other values are reserved.

FEAT\_SPECRES implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

### SB, bits [39:36]

Indicates support for SB instruction in AArch64 state. Defined values are:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

FEAT\_SB implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

### FRINTTS, bits [35:32]

Indicates support for the FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented. Defined values are:

FRINTTS	Meaning
0b0000	FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are not implemented.
0b0001	FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented.

All other values are reserved.

FEAT\_FRINTTS implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

### GPI, bits [31:28]

Indicates support for an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

<b>GPI</b>	<b>Meaning</b>
0b0000	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID\_AA64ISAR1\_EL1.GPA is non-zero, this field must have the value 0b0000.

#### **GPA, bits [27:24]**

Indicates whether QARMA or Architected algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

<b>GPA</b>	<b>Meaning</b>
0b0000	Generic Authentication using an Architected algorithm is not implemented.
0b0001	Generic Authentication using the QARMA algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID\_AA64ISAR1\_EL1.GPI is non-zero, this field must have the value 0b0000.

#### **LRCPC, bits [23:20]**

Indicates support for weaker release consistency, RCpc, based model. Defined values are:

<b>LRCPC</b>	<b>Meaning</b>
0b0000	The LDAPR*, LDAPUR*, and STLUR* instructions are not implemented.
0b0001	The LDAPR* instructions are implemented.
	The LDAPUR*, and STLUR* instructions are not implemented.
0b0010	The LDAPR*, LDAPUR*, and STLUR* instructions are implemented.

All other values are reserved.

FEAT\_LRCPC implements the functionality identified by the value 0b0001.

FEAT\_LRCPC2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

In Armv8.3, the permitted values are 0b0001 and 0b0010.

From Armv8.4, the only permitted value is 0b0010.

#### **FCMA, bits [19:16]**

Indicates support for complex number addition and multiplication, where numbers are stored in vectors. Defined values are:

<b>FCMA</b>	<b>Meaning</b>
0b0000	The FCMLA and FCADD instructions are not implemented.
0b0001	The FCMLA and FCADD instructions are implemented.

All other values are reserved.

FEAT\_FCMA implements the functionality identified by the value 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

### JSCVT, bits [15:12]

Indicates support for JavaScript conversion from double precision floating point values to integers in AArch64 state. Defined values are:

JSCVT	Meaning
0b0000	The FJCVTZS instruction is not implemented.
0b0001	The FJCVTZS instruction is implemented.

All other values are reserved.

FEAT\_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

### API, bits [11:8]

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

API	Meaning
0b0000	Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE, and the HaveEnhancedPAC2() function returning FALSE.
0b0011	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.
0b0100	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT\_PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

FEAT\_PAuth2 implements the functionality added by the value 0b0011.

FEAT\_FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID\_AA64ISAR1\_EL1.APA is non-zero, this field must have the value 0b0000.

**APA, bits [7:4]**

Indicates whether QARMA or Architected algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

APA	Meaning
0b0000	Address Authentication using an Architected algorithm is not implemented.
0b0001	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE.
0b0011	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0100	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101	Address Authentication using the QARMA algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT\_PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

FEAT\_PAuth2 implements the functionality added by the value 0b0011.

FEAT\_FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of the ID\_AA64ISAR1\_EL1.API is non-zero, this field must have the value 0b0000.

**DPB, bits [3:0]**

Data Persistence writeback. Indicates support for the [DC CVAP](#) and [DC CVADP](#) instructions in AArch64 state. Defined values are:

DPB	Meaning
0b0000	<a href="#">DC CVAP</a> not supported.
0b0001	<a href="#">DC CVAP</a> supported.
0b0010	<a href="#">DC CVAP</a> and <a href="#">DC CVADP</a> supported.

All other values are reserved.

FEAT\_DPB implements the functionality identified by the value 0b0001.

FEAT\_DPB2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0001 and 0b0010.

From Armv8.5, the only permitted value is 0b0010.

**Accessing the ID\_AA64ISAR1\_EL1**

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, ID\_AA64ISAR1\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64ISAR1_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_AA64ISAR1_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_AA64ISAR1_EL1;

```

# ID\_AA64ISAR2\_EL1, AArch64 Instruction Set Attribute Register 2

The ID\_AA64ISAR2\_EL1 characteristics are:

## Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see Principles of the ID scheme for fields in ID registers.

## Configuration

This register is present only from Armv8.7. Otherwise, direct accesses to ID\_AA64ISAR2\_EL1 are UNDEFINED.

## Attributes

ID\_AA64ISAR2\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64ISAR2\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																RPRES								WFxT							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:8]

Reserved, RES0.

### RPRES, bits [7:4]

When [FPCR.AH](#) is 1, indicates support for 12 bits of mantissa in reciprocal and reciprocal square root instructions in AArch64 state. Defined values are:

RPRES	Meaning
0b0000	Reciprocal and reciprocal square root estimates give 8 bits of mantissa.
0b0001	Reciprocal and reciprocal square root estimates give 12 bits of mantissa.

All other values are reserved.

FEAT\_RPRES implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

### WFxT, bits [3:0]

Indicates support for the WFET and WFIT instructions in AArch64 state. Defined values are:

WFxT	Meaning
0b0000	WFET and WFIT are not supported.
0b0001	WFET and WFIT are supported.

All other values are reserved.

FEAT\_WFxT implements the functionality identified by the value 0b0001.

From Armv8.7, the only permitted value is 0b0001.

## Accessing the ID\_AA64ISAR2\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_AA64ISAR2\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64ISAR2_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_AA64ISAR2_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_AA64ISAR2_EL1;

```

# ID\_AA64MMFR0\_EL1, AArch64 Memory Model Feature Register 0

The ID\_AA64MMFR0\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

There are no configuration notes.

## Attributes

ID\_AA64MMFR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64MMFR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ECV				FGT				RES0								ExS				TGran4_2				TGran64_2				TGran16_2			
TGran4				TGran64				TGran16				BigEndEL0				SNSMem				BigEnd				ASIDBits				PARange			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ECV, bits [63:60]

Indicates presence of Enhanced Counter Virtualization. Defined values are:

ECV	Meaning
0b0000	Enhanced Counter Virtualization is not implemented.
0b0001	Enhanced Counter Virtualization is implemented. Supports <a href="#">CNTHCTL_EL2</a> .{EL1TVT, EL1TVCT, EL1NVPCT, EL1NVVCT, EVNTIS}, <a href="#">CNTKCTL_EL1</a> .EVNTIS, <a href="#">CNTPCTSS_EL0</a> counter views, and <a href="#">CNTVCTSS_EL0</a> counter views. Extends the <a href="#">PMSCR_EL1</a> .PCT, <a href="#">PMSCR_EL2</a> .PCT, <a href="#">TRFCR_EL1</a> .TS, and <a href="#">TRFCR_EL2</a> .TS fields.
0b0010	As 0b0001, and also includes support for <a href="#">CNTHCTL_EL2</a> .ECV and <a href="#">CNTPOFF_EL2</a> .

All other values are reserved.

FEAT\_ECV implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.6, the only permitted values are 0b0001 and 0b0010.

### FGT, bits [59:56]

Indicates presence of the Fine-Grained Trap controls:

- If EL2 is implemented, the [HAFGRTR\\_EL2](#), [HDFGRTR\\_EL2](#), [HDFGWTR\\_EL2](#), [HFGTRTR\\_EL2](#), [HFGITR\\_EL2](#) and [HFGWTR\\_EL2](#) registers, and their associated traps.
- If EL2 is implemented, [MDCR\\_EL2](#).TDCC.
- If EL3 is implemented, [MDCR\\_EL3](#).TDCC.

- If both EL2 and EL3 are implemented, [SCR\\_EL3.FGTEn](#).

Defined values are:

FGT	Meaning
0b0000	The fine-grained trap controls are not implemented.
0b0001	The fine-grained trap controls are implemented.

All other values are reserved.

FEAT\_FGT implements the functionality identified by the value 0b0001.

From Armv8.6, the only permitted value is 0b0001.

#### Bits [55:48]

Reserved, RES0.

#### ExS, bits [47:44]

Indicates support for disabling context synchronizing exception entry and exit. Defined values are:

ExS	Meaning
0b0000	All exception entries and exits are context synchronization events.
0b0001	Non-context synchronizing exception entry and exit are supported.

All other values are reserved.

FEAT\_ExS implements the functionality identified by the value 0b0001.

#### TGran4\_2, bits [43:40]

Indicates support for 4KB memory granule size at stage 2. Defined values are:

TGran4_2	Meaning	Applies when
0b0000	Support for 4KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran4 field.	When FEAT_LPA2 is implemented
0b0001	4KB granule not supported at stage 2.	
0b0010	4KB granule supported at stage 2.	
0b0011	4KB granule at stage 2 supports 52-bit input and output addresses.	

All other values are reserved.

The 0b0000 value is deprecated.

#### TGran64\_2, bits [39:36]

Indicates support for 64KB memory granule size at stage 2. Defined values are:

TGran64_2	Meaning
0b0000	Support for 64KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran64 field.
0b0001	64KB granule not supported at stage 2.
0b0010	64KB granule supported at stage 2.

All other values are reserved.

The 0b0000 value is deprecated.

**TGran16\_2, bits [35:32]**

Indicates support for 16KB memory granule size at stage 2. Defined values are:

<b>TGran16_2</b>	<b>Meaning</b>	<b>Applies when</b>
0b0000	Support for 16KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran16 field.	When FEAT_LPA2 is implemented
0b0001	16KB granule not supported at stage 2.	
0b0010	16KB granule supported at stage 2.	
0b0011	16KB granule at stage 2 supports 52-bit input and output addresses.	

All other values are reserved.

The 0b0000 value is deprecated.

**TGran4, bits [31:28]**

Indicates support for 4KB memory translation granule size. Defined values are:

<b>TGran4</b>	<b>Meaning</b>	<b>Applies when</b>
0b0000	4KB granule supported.	When FEAT_LPA2 is implemented
0b0001	4KB granule supports 52-bit input and output addresses.	
0b1111	4KB granule not supported.	

All other values are reserved.

**TGran64, bits [27:24]**

Indicates support for 64KB memory translation granule size. Defined values are:

<b>TGran64</b>	<b>Meaning</b>
0b0000	64KB granule supported.
0b1111	64KB granule not supported.

All other values are reserved.

**TGran16, bits [23:20]**

Indicates support for 16KB memory translation granule size. Defined values are:

<b>TGran16</b>	<b>Meaning</b>	<b>Applies when</b>
0b0000	16KB granule not supported.	When FEAT_LPA2 is implemented
0b0001	16KB granule supported.	
0b0010	16KB granule supports 52-bit input and output addresses.	

All other values are reserved.

**BigEndEL0, bits [19:16]**

Indicates support for mixed-endian at EL0 only. Defined values are:

<b>BigEndEL0</b>	<b>Meaning</b>
0b0000	No mixed-endian support at EL0. The <a href="#">SCTLR_EL1.E0E</a> bit has a fixed value.
0b0001	Mixed-endian support at EL0. The <a href="#">SCTLR_EL1.E0E</a> bit can be configured.

All other values are reserved.

This field is invalid and is RES0 if ID\_AA64MMFR0\_EL1.BigEnd is not 0b0000.

### SNSMem, bits [15:12]

Indicates support for a distinction between Secure and Non-secure Memory. Defined values are:

SNSMem	Meaning
0b0000	Does not support a distinction between Secure and Non-secure Memory.
0b0001	Does support a distinction between Secure and Non-secure Memory.

#### Note

If EL3 is implemented, the value 0b0000 is not permitted.

All other values are reserved.

### BigEnd, bits [11:8]

Indicates support for mixed-endian configuration. Defined values are:

BigEnd	Meaning
0b0000	No mixed-endian support. The 'SCTLR_ELx'.EE bits have a fixed value. See the BigEndEL0 field, bits[19:16], for whether EL0 supports mixed-endian.
0b0001	Mixed-endian support. The 'SCTLR_ELx'.EE and <a href="#">SCTLR_EL1.E0E</a> bits can be configured.

All other values are reserved.

### ASIDBits, bits [7:4]

Number of ASID bits. Defined values are:

ASIDBits	Meaning
0b0000	8 bits.
0b0010	16 bits.

All other values are reserved.

### PARange, bits [3:0]

Physical Address range supported. Defined values are:

PARange	Meaning
0b0000	32 bits, 4GB.
0b0001	36 bits, 64GB.
0b0010	40 bits, 1TB.
0b0011	42 bits, 4TB.
0b0100	44 bits, 16TB.
0b0101	48 bits, 256TB.
0b0110	52 bits, 4PB.

All other values are reserved.

The value 0b0110 is permitted only if the implementation includes FEAT\_LPA, otherwise it is reserved.

## Accessing the ID\_AA64MMFR0\_EL1

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, ID\_AA64MMFR0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64MMFR0_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_AA64MMFR0_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_AA64MMFR0_EL1;

```

# ID\_AA64MMFR1\_EL1, AArch64 Memory Model Feature Register 1

The ID\_AA64MMFR1\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

There are no configuration notes.

## Attributes

ID\_AA64MMFR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64MMFR1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																AFP				HCX				ETS				TWED			
XNX				SpecSEI				PAN				LO				HPDS				VH				VMIDBits				HAFDBS			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:48]

Reserved, RES0.

### AFP, bits [47:44]

Indicates support for [FPCR](#).{AH, FIZ, NEP}. Defined values are:

AFP	Meaning
0b0000	The <a href="#">FPCR</a> .{AH, FIZ, NEP} fields are not supported.
0b0001	The <a href="#">FPCR</a> .{AH, FIZ, NEP} fields are supported.

All other values are reserved.

FEAT\_AFP implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

### HCX, bits [43:40]

Indicates support for [HCRX\\_EL2](#) and its associated EL3 trap. Defined values are:

HCX	Meaning
0b0000	<a href="#">HCRX_EL2</a> and its associated EL3 trap are not supported.
0b0001	<a href="#">HCRX_EL2</a> and its associated EL3 trap are supported.

All other values are reserved.

FEAT\_HCX implements the functionality identified by the value 0b0001.

From Armv8.7, if EL2 is implemented, the only permitted value is 0b0001.

### ETS, bits [39:36]

Indicates support for Enhanced Translation Synchronization. Defined values are:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is supported.

All other values are reserved.

FEAT\_ETTS implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

### TWED, bits [35:32]

Indicates support for the configurable delayed trapping of WFE. Defined values are:

TWED	Meaning
0b0000	Configurable delayed trapping of WFE is not supported.
0b0001	Configurable delayed trapping of WFE is supported.

All other values are reserved.

FEAT\_TWED implements the functionality identified by the value 0b0001.

From Armv8.6, the permitted values are 0b0000 and 0b0001.

### XNX, bits [31:28]

Indicates support for execute-never control distinction by Exception level at stage 2. Defined values are:

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT\_XNX implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

### SpecSEI, bits [27:24]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

SpecSEI	Meaning
0b0000	The PE never generates an SError interrupt due to an External abort on a speculative read.
0b0001	The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

**PAN, bits [23:20]**

Privileged Access Never. Indicates support for the PAN bit in PSTATE, [SPSR\\_EL1](#), [SPSR\\_EL2](#), [SPSR\\_EL3](#), and [DSPSR\\_EL0](#). Defined values are:

PAN	Meaning
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and <a href="#">AT S1E1RP</a> and <a href="#">AT S1E1WP</a> instructions supported.
0b0011	PAN supported, <a href="#">AT S1E1RP</a> and <a href="#">AT S1E1WP</a> instructions supported, and <a href="#">SCTLR_EL1</a> .EPAN and <a href="#">SCTLR_EL2</a> .EPAN bits supported.

All other values are reserved.

FEAT\_PAN implements the functionality identified by the value 0b0001.

FEAT\_PAN2 implements the functionality added by the value 0b0010.

FEAT\_PAN3 implements the functionality added by the value 0b0011.

In Armv8.1, the permitted values are 0b0001 and 0b0011.

From Armv8.2, the permitted values are 0b0010 and 0b0011.

From Armv8.7, the only permitted value is 0b0011.

**LO, bits [19:16]**

LORegions. Indicates support for LORegions. Defined values are:

LO	Meaning
0b0000	LORegions not supported.
0b0001	LORegions supported.

All other values are reserved.

FEAT\_LOR implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

**HPDS, bits [15:12]**

Hierarchical Permission Disables. Indicates support for disabling hierarchical controls in translation tables. Defined values are:

HPDS	Meaning
0b0000	Disabling of hierarchical controls not supported.
0b0001	Disabling of hierarchical controls supported with the <a href="#">TCR_EL1</a> .{HPD1, HPD0}, <a href="#">TCR_EL2</a> .HPD or <a href="#">TCR_EL2</a> .{HPD1, HPD0}, and <a href="#">TCR_EL3</a> .HPD bits.
0b0010	As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

FEAT\_HPDS implements the functionality identified by the value 0b0001.

FEAT\_HPDS2 implements the functionality identified by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

**VH, bits [11:8]**

Virtualization Host Extensions. Defined values are:

<b>VH</b>	<b>Meaning</b>
0b0000	Virtualization Host Extensions not supported.
0b0001	Virtualization Host Extensions supported.

All other values are reserved.

FEAT\_VHE implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

### VMIDBits, bits [7:4]

Number of VMID bits. Defined values are:

<b>VMIDBits</b>	<b>Meaning</b>
0b0000	8 bits
0b0010	16 bits

All other values are reserved.

FEAT\_VMID16 implements the functionality identified by the value 0b0010.

From Armv8.1, the permitted values are 0b0000 and 0b0010.

### HAFDBS, bits [3:0]

Hardware updates to Access flag and Dirty state in translation tables. Defined values are:

<b>HAFDBS</b>	<b>Meaning</b>
0b0000	Hardware update of the Access flag and dirty state are not supported.
0b0001	Hardware update of the Access flag is supported.
0b0010	Hardware update of both the Access flag and dirty state is supported.

All other values are reserved.

FEAT\_HAFDBS implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.1, the permitted values are 0b0000, 0b0001, and 0b0010.

## Accessing the ID\_AA64MMFR1\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_AA64MMFR1\_EL1

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b11	0b000	0b0000	0b0111	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64MMFR1_EL1;
elseif PSTATE.EL == EL2 then
    return ID_AA64MMFR1_EL1;
elseif PSTATE.EL == EL3 then
    return ID_AA64MMFR1_EL1;

```

# ID\_AA64MMFR2\_EL1, AArch64 Memory Model Feature Register 2

The ID\_AA64MMFR2\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

### Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

## Attributes

ID\_AA64MMFR2\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64MMFR2\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
EOPD				EVT				BBM				TTL				RES0				FWB			IDS				AT				
ST				NV				CCIDX				VARange				IESB				LSM			UAO				CnP				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### EOPD, bits [63:60]

Indicates support for the EOPD mechanism. Defined values are:

EOPD	Meaning
0b0000	EOPDx mechanism is not implemented.
0b0001	EOPDx mechanism is implemented.

All other values are reserved.

FEAT\_EOPD implements the functionality identified by the value 0b0001.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT\_EOPD is implemented, FEAT\_CSV3 must be implemented.

### EVT, bits [59:56]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the [HCR\\_EL2](#).{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

<b>EVT</b>	<b>Meaning</b>
0b0000	<a href="#">HCR_EL2</a> .{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	<a href="#">HCR_EL2</a> .{TOCU, TICAB, TID4} traps are supported.
0b0010	<a href="#">HCR_EL2</a> .{TTLBOS, TTLBIS} traps are not supported.
0b0010	<a href="#">HCR_EL2</a> .{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

FEAT\_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

### BBM, bits [55:52]

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block size for a translation.

<b>BBM</b>	<b>Meaning</b>
0b0000	Level 0 support for changing block size is supported.
0b0001	Level 1 support for changing block size is supported.
0b0010	Level 2 support for changing block size is supported.

All other values are reserved.

FEAT\_BBM implements the functionality identified by the values 0b0000, 0b0001, and 0b0010.

From Armv8.4, the permitted values are 0b0000, 0b0001, and 0b0010.

### TTL, bits [51:48]

Indicates support for TTL field in address operations. Defined values are:

<b>TTL</b>	<b>Meaning</b>
0b0000	TLB maintenance instructions by address have bits[47:44] as RES0.
0b0001	TLB maintenance instructions by address have bits[47:44] holding the TTL field.

All other values are reserved.

FEAT\_TTL implements the functionality identified by the value 0b0001.

This field affects [TLBI IPAS2E1](#), [TLBI IPAS2E1IS](#), [TLBI IPAS2E1OS](#), [TLBI IPAS2LE1](#), [TLBI IPAS2LE1IS](#), [TLBI IPAS2LE1OS](#), [TLBI VAAE1](#), [TLBI VAAE1IS](#), [TLBI VAAE1OS](#), [TLBI VAAE1IS](#), [TLBI VAAE1OS](#), [TLBI VAE1](#), [TLBI VAE1IS](#), [TLBI VAE1OS](#), [TLBI VAE2](#), [TLBI VAE2IS](#), [TLBI VAE2OS](#), [TLBI VAE3](#), [TLBI VAE3IS](#), [TLBI VAE3OS](#), [TLBI VALE1](#), [TLBI VALE1IS](#), [TLBI VALE1OS](#), [TLBI VALE2](#), [TLBI VALE2IS](#), [TLBI VALE2OS](#), [TLBI VALE3](#), [TLBI VALE3IS](#), [TLBI VALE3OS](#).

From Armv8.4, the only permitted value is 0b0001.

### Bits [47:44]

Reserved, RES0.

### FWB, bits [43:40]

Indicates support for [HCR\\_EL2](#).FWB. Defined values are:

<b>FWB</b>	<b>Meaning</b>
0b0000	<a href="#">HCR_EL2</a> .FWB bit is not supported.
0b0001	<a href="#">HCR_EL2</a> .FWB is supported.

All other values reserved.

FEAT\_S2FWB implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

## IDS, bits [39:36]

Indicates the value of ESR\_ELx.EC that reports an exception generated by a read access to the feature ID space. Defined values are:

<b>IDS</b>	<b>Meaning</b>
0b0000	An exception which is generated by a read access to the feature ID space, other than a trap caused by <a href="#">HCR_EL2</a> .TIDx, <a href="#">SCTLR_EL1</a> .UCT, or <a href="#">SCTLR_EL2</a> .UCT, is reported by ESR_ELx.EC == 0x0.
0b0001	All exceptions generated by an AArch64 read access to the feature ID space are reported by ESR_ELx.EC == 0x18.

All other values are reserved.

The Feature ID space is defined as the System register space in AArch64 with op0==3, op1=={0, 1, 3}, CRn==0, CRm=={0-7}, op2=={0-7}.

FEAT\_IDST implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

## AT, bits [35:32]

Identifies support for unaligned single-copy atomicity and atomic functions. Defined values are:

<b>AT</b>	<b>Meaning</b>
0b0000	Unaligned single-copy atomicity and atomic functions are not supported.
0b0001	Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.

All other values are reserved.

FEAT\_LSE2 implements the functionality identified by the value 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

## ST, bits [31:28]

Identifies support for small translation tables. Defined values are:

<b>ST</b>	<b>Meaning</b>
0b0000	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 39.
0b0001	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.

All other values are reserved.

FEAT\_TTST implements the functionality identified by the value 0b0001.

If FEAT\_SEL2 is implemented, the only permitted value is 0b0001.

In an implementation which does not support FEAT\_SEL2, the permitted values are 0b0000 and 0b0001.

**NV, bits [27:24]**

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are:

NV	Meaning
0b0000	Nested virtualization is not supported.
0b0001	The HCR_EL2.NV, HCR_EL2.NV1, HCR_EL2.AT bits are implemented.
0b0010	The <a href="#">VNCR_EL2</a> register and the HCR_EL2.{AT, NV, NV1, NV2} bits are implemented.

All other values are reserved.

If EL2 is not implemented, the only permitted value is 0b0000.

FEAT\_NV implements the functionality identified by the value 0b0001.

FEAT\_NV2 implements the functionality identified by the value 0b0010.

In Armv8.3, if EL2 is implemented, the permitted values are 0b0000 and 0b0001.

From Armv8.4, if EL2 is implemented, the permitted values are 0b0000, 0b0001, and 0b0010.

**CCIDX, bits [23:20]**

Support for the use of revised [CCSIDR\\_EL1](#) register format. Defined values are:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR_EL1.
0b0001	64-bit format implemented for all levels of the CCSIDR_EL1.

All other values are reserved.

FEAT\_CCIDX implements the functionality identified by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

**VARange, bits [19:16]**

Indicates support for a larger virtual address. Defined values are:

VARange	Meaning
0b0000	VMSAv8-64 supports 48-bit VAs.
0b0001	VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The other translation granules support 48-bit VAs.

All other values are reserved.

FEAT\_LVA implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**IESB, bits [15:12]**

Indicates support for the IESB bit in the SCTLR\_ELx registers. Defined values are:

IESB	Meaning
0b0000	IESB bit in the SCTLR_ELx registers is not supported.
0b0001	IESB bit in the SCTLR_ELx registers is supported.

All other values are reserved.

FEAT\_IESB implements the functionality identified by the value 0b0001.

**LSM, bits [11:8]**

Indicates support for LSMAOE and nTLSMD bits in [SCTLR\\_EL1](#) and [SCTLR\\_EL2](#). Defined values are:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT\_LSMAOC implements the functionality identified by the value 0b0001.

**UAO, bits [7:4]**

User Access Override. Defined values are:

UAO	Meaning
0b0000	UAO not supported.
0b0001	UAO supported.

All other values are reserved.

FEAT\_UAO implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

**CnP, bits [3:0]**

Indicates support for Common not Private translations. Defined values are:

CnP	Meaning
0b0000	Common not Private translations not supported.
0b0001	Common not Private translations supported.

All other values are reserved.

FEAT\_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

**Accessing the ID\_AA64MMFR2\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, ID\_AA64MMFR2\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!IsZero(ID_AA64MMFR2_EL1) || boolean IMPLEMENTATION_DEFINED "ID_AA64MMFR2
trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64MMFR2_EL1;
elseif PSTATE.EL == EL2 then
    return ID_AA64MMFR2_EL1;
elseif PSTATE.EL == EL3 then
    return ID_AA64MMFR2_EL1;

```

# ID\_AA64PFR0\_EL1, AArch64 Processor Feature Register 0

The ID\_AA64PFR0\_EL1 characteristics are:

## Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

The external register [EDPFR](#) gives information from this register.

## Attributes

ID\_AA64PFR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64PFR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CSV3				CSV2				RES0				DIT				AMU				MPAM				SEL2				SVE			
RAS				GIC				AdvSIMD				FP				EL3				EL2				EL1				ELO			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CSV3, bits [63:60]

Speculative use of faulting data. Defined values are:

CSV3	Meaning
0b0000	This Device does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence
0b0001	Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence

All other values are reserved.

FEAT\_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT\_EOPD is implemented, FEAT\_CSV3 must be implemented.

### CSV2, bits [59:56]

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	This Device does not disclose whether branch targets trained in one hardware described context can affect speculative execution in a different hardware described context.
0b0001	Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way. Contexts do not include the SCXTNUM_ELx register contexts, and these registers are not supported.
0b0010	Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way. Contexts include the SCXTNUM_ELx register contexts, and these registers are supported.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

#### Bits [55:52]

Reserved, RES0.

#### DIT, bits [51:48]

Data Independent Timing. Defined values are:

DIT	Meaning
0b0000	AArch64 does not guarantee constant execution time of any instructions.
0b0001	AArch64 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT\_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

#### AMU, bits [47:44]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT\_AMUv1 implements the functionality identified by the value 0b0001.

FEAT\_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

#### MPAM, bits [43:40]

Indicates support for MPAM Extension. Defined values are:

MPAM	Meaning
0b0000	If <a href="#">ID_AA64PFR1_EL1</a> .MPAM_frac == 0b0000, MPAM Extension is not implemented.
	If <a href="#">ID_AA64PFR1_EL1</a> .MPAM_frac == 0b0001, MPAM Extension version 0.1 is implemented.
0b0001	If <a href="#">ID_AA64PFR1_EL1</a> .MPAM_frac == 0b0000, MPAM Extension version 1.0 is implemented.
	If <a href="#">ID_AA64PFR1_EL1</a> .MPAM_frac == 0b0001, MPAM Extension version 1.1 is implemented.

All other values are reserved.

## SEL2, bits [39:36]

Secure EL2. Defined values are:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

All other values are reserved.

FEAT\_SEL2 implements the functionality identified by the value 0b0001.

## SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

SVE	Meaning
0b0000	SVE architectural state and programmers' model are not implemented.
0b0001	SVE architectural state and programmers' model are implemented.

All other values are reserved.

If implemented, refer to [ID\\_AA64ZFR0\\_EL1](#) for information about which SVE instructions are available.

## RAS, bits [31:28]

RAS Extension version. Defined values are:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	RAS Extension present.
0b0010	FEAT_RASv1p1 present. As 0b0001, and adds support for: <ul style="list-style-type: none"> <li>If EL3 is implemented, FEAT_DoubleFault.</li> <li>Additional ERXMISC&lt;m&gt;_EL1 System registers.</li> <li>Additional System registers <a href="#">ERXPFPGCDN_EL1</a>, <a href="#">ERXPFPGCTL_EL1</a>, and <a href="#">ERXPFPGF_EL1</a>, and the <a href="#">SCR_EL3</a>.FIEN and <a href="#">HCR_EL2</a>.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension.</li> </ul> Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to <a href="#">ERR&lt;n&gt;STATUS</a> and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

FEAT\_RAS implements the functionality identified by the value 0b0001.

FEAT\_RASv1p1 and FEAT\_DoubleFault implement the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT\_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT\_DoubleFault is not implemented, and [ERRIDR\\_EL1](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

---

#### Note

When the value of this field is 0b0001, [ID\\_AA64PFR1\\_EL1](#).RAS\_frac indicates whether FEAT\_RASv1p1 is implemented.

---

### GIC, bits [27:24]

System register GIC CPU interface. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

### AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following SIMD and SIMD operations: <ul style="list-style-type: none"> <li>Integer byte, halfword, word and doubleword element operations.</li> <li>Single-precision and double-precision floating-point arithmetic.</li> <li>Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.</li> </ul>
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support that does not include the FEAT\_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support that includes the FEAT\_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

### FP, bits [19:16]

Floating-point. Defined values are:

FP	Meaning
0b0000	Floating-point is implemented, and includes support for: <ul style="list-style-type: none"> <li>Single-precision and double-precision floating-point types.</li> <li>Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.</li> </ul>
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support that does not include the FEAT\_FP16 extension.
- 0b0001 in an implementation with floating-point support that includes the FEAT\_FP16 extension.
- 0b1111 in an implementation without floating-point support.

### EL3, bits [15:12]

EL3 Exception level handling. Defined values are:

EL3	Meaning
0b0000	EL3 is not implemented.
0b0001	EL3 can be executed in AArch64 state only.
0b0010	EL3 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

### EL2, bits [11:8]

EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

### EL1, bits [7:4]

EL1 Exception level handling. Defined values are:

EL1	Meaning
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

### EL0, bits [3:0]

EL0 Exception level handling. Defined values are:

EL0	Meaning
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

## Accessing the ID\_AA64PFR0\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_AA64PFR0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then

# ID\_AA64PFR1\_EL1, AArch64 Processor Feature Register 1

The ID\_AA64PFR1\_EL1 characteristics are:

## Purpose

Reserved for future expansion of information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

There are no configuration notes.

## Attributes

ID\_AA64PFR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64PFR1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																																			
RES0																MPAM_frac				RAS_frac				MTE				SSBS				BT			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

### Bits [63:20]

Reserved, RES0.

### MPAM\_frac, bits [19:16]

MPAM Extension fractional field. Defined values are:

MPAM_frac	Meaning
0b0000	If <a href="#">ID_AA64PFR0_EL1</a> .MPAM == 0b0000, MPAM Extension not implemented.
	If <a href="#">ID_AA64PFR0_EL1</a> .MPAM == 0b0001, MPAM Extension v1.0 is implemented.
0b0001	If <a href="#">ID_AA64PFR0_EL1</a> .MPAM == 0b0000, implements MPAM v0.1, which is like v1.1 but reduces support for Secure PARTIDs.
	If <a href="#">ID_AA64PFR0_EL1</a> .MPAM == 0b0001, implements MPAM v1.1 and adds support for <a href="#">MPAM2_EL2</a> .TIDR to provide trapping of <a href="#">MPAMIDR_EL1</a> when <a href="#">MPAMHCR_EL2</a> is not present.

All other values are reserved.

### RAS\_frac, bits [15:12]

RAS Extension fractional field. Defined values are:

<b>RAS_frac</b>	<b>Meaning</b>
0b0000	If <a href="#">ID_AA64PFR0_EL1</a> .RAS == 0b0001, RAS Extension implemented.
0b0001	If <a href="#">ID_AA64PFR0_EL1</a> .RAS == 0b0001, as 0b0000 and adds support for: <ul style="list-style-type: none"> <li>Additional ERXMISC&lt;m&gt;_EL1 System registers.</li> <li>Additional System registers <a href="#">ERXPFgcdn_EL1</a>, <a href="#">ERXPFGCTL_EL1</a>, and <a href="#">ERXPFGF_EL1</a>, and the <a href="#">SCR_EL3</a>.FIEN and <a href="#">HCR_EL2</a>.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension.</li> </ul> Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to <a href="#">ERR&lt;n&gt;STATUS</a> , and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

FEAT\_RASv1p1 implements the functionality identified by the value 0b0001.

This field is valid only if [ID\\_AA64PFR0\\_EL1](#).RAS == 0b0001.

### MTE, bits [11:8]

Support for the Memory Tagging Extension. Defined values are:

<b>MTE</b>	<b>Meaning</b>
0b0000	Memory Tagging Extension is not implemented.
0b0001	Instruction-only Memory Tagging Extension is implemented.
0b0010	Full Memory Tagging Extension is implemented.
0b0011	Memory Tagging Extension is implemented with support for asymmetric Tag Check Fault handling.

All other values are reserved.

FEAT\_MTE implements the functionality identified by the value 0b0001.

FEAT\_MTE2 implements the functionality identified by the value 0b0010

FEAT\_MTE3 implements the functionality identified by the value 0b0011.

In Armv8.5, the permitted values are 0b0000, 0b0001 and 0b0010.

From Armv8.7, the value 0b0001 is not permitted

### SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

<b>SSBS</b>	<b>Meaning</b>
0b0000	AArch64 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.
0b0010	AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypassing Safe, and the MSR and MRS instructions to directly read and write the PSTATE.SSBS field.

All other values are reserved.

FEAT\_SSBS implements the functionality identified by the value 0b0001.

FEAT\_SSBS2 implements the functionality identified by the value 0b0010.

BT, bits [3:0]

Branch Target Identification mechanism support in AArch64 state. Defined values are:

BT	Meaning
0b0000	The Branch Target Identification mechanism is not implemented.
0b0001	The Branch Target Identification mechanism is implemented.

All other values are reserved.

FEAT\_BTI implements the functionality identified by the value 0b0001.

From Armv8.5, the only permitted value is 0b0001.

Accessing the ID\_AA64PFR1\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_AA64PFR1\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b001

```
if PSTATE.EL == EL0 then
  if IsFeatureImplemented(FEAT_IDST) then
    if EL2Enabled() && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.TID3 == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    return ID_AA64PFR1_EL1;
elsif PSTATE.EL == EL2 then
  return ID_AA64PFR1_EL1;
elsif PSTATE.EL == EL3 then
  return ID_AA64PFR1_EL1;
```

# ID\_AA64ZFR0\_EL1, SVE Feature ID register 0

The ID\_AA64ZFR0\_EL1 characteristics are:

## Purpose

Provides additional information about the implemented features of the AArch64 Scalable Vector Extension, when the [ID\\_AA64PFR0\\_EL1](#).SVE field is not zero.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

### Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

## Attributes

ID\_AA64ZFR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AA64ZFR0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0				F64MM				F32MM				RES0				I8MM				RES0

### Bits [63:60]

Reserved, RES0.

### F64MM, bits [59:56]

Indicates support for SVE FP64 double-precision floating-point matrix multiplication instructions. Defined values are:

F64MM	Meaning
0b0000	FP64 matrix multiplication and related instructions are not implemented.
0b0001	FP64 variant of the FMMLA instruction, and LD1RO* instructions are implemented. The 128-bit element variations of TRN1, TRN2, UZP1, UZP2, ZIP1, and ZIP2 are also implemented.

All other values are reserved.

FEAT\_F64MM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**F32MM, bits [55:52]**

Indicates support for the SVE FP32 single-precision floating-point matrix multiplication instruction. Defined values are:

<b>F32MM</b>	<b>Meaning</b>
0b0000	FP32 matrix multiplication instruction is not implemented.
0b0001	FP32 variant of the FMMLA instruction is implemented.

All other values are reserved.

FEAT\_F32MM implements the functionality identified by 0b0001.

From Arm v8.2, the permitted values are 0b0000 and 0b0001.

**Bits [51:48]**

Reserved, RES0.

**I8MM, bits [47:44]**

Indicates support for SVE Int8 matrix multiplication instructions. Defined values are:

<b>I8MM</b>	<b>Meaning</b>
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.

All other values are reserved.

FEAT\_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID\\_AA64ISAR1\\_EL1](#).I8MM.

From Armv8.6, the only permitted value is 0b0001.

**Bits [43:24]**

Reserved, RES0.

**BF16, bits [23:20]**

Indicates support for SVE BFloat16 instructions. Defined values are:

<b>BF16</b>	<b>Meaning</b>
0b0000	BFloat16 instructions are not implemented.
0b0001	BFCVT, BFCVTNT, BFDOT, BFMLALB, BFMLALT, and BFMMMLA instructions are implemented.

All other values are reserved.

FEAT\_BF16 implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID\\_AA64ISAR1\\_EL1](#).BF16.

From Armv8.6, the only permitted value is 0b0001.

**Bits [19:4]**

Reserved, RES0.

**SVEver, bits [3:0]**

Indicates support for SVE version 2. Defined values are:

SVEver	Meaning
0b0000	SVE instructions are implemented.

All other values are reserved. This field is valid only if the [ID\\_AA64PFR0\\_EL1](#).SVE field is not zero.

**Accessing the ID\_AA64ZFR0\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, ID\_AA64ZFR0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b100

# ID\_AFR0\_EL1, AArch32 Auxiliary Feature Register 0

The ID\_AFR0\_EL1 characteristics are:

## Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_AFR0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_AFR0\[31:0\]](#).

## Attributes

ID\_AFR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_AFR0\_EL1 bit assignments are:

# ID\_DFR0\_EL1, AArch32 Debug Feature Register 0

The ID\_DFR0\_EL1 characteristics are:

## Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_DFR0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_DFR0\[31:0\]](#).

## Attributes

ID\_DFR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_DFR0\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

### Bits [63:32]

Reserved, RES0.

### TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT\_TRF implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

### PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PerfMon	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv1 implemented.
0b0010	Performance Monitors Extension, PMUv2 implemented.
0b0011	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0011, and also includes support for: <ul style="list-style-type: none"> <li>Extended 16-bit <a href="#">PMEVTYPER&lt;n&gt;</a>.evtCount field.</li> <li>If EL2 is implemented, the <a href="#">HDCR</a>.HPMD control bit.</li> </ul>
0b0101	PMUv3 for Armv8.4. As 0b0100, and also includes support for the <a href="#">PMMIR</a> register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and also includes support for: <ul style="list-style-type: none"> <li>64-bit event counters.</li> <li>If EL2 is implemented, the <a href="#">HDCR</a>.HCCD control bit.</li> <li>If EL3 is implemented, the <a href="#">MDCR_EL3</a>.SCCD control bit.</li> </ul>
0b0111	PMUv3 for Armv8.7. As 0b0110, and also includes support for: <ul style="list-style-type: none"> <li>The <a href="#">PMCR</a>.FZO and, if EL2 is implemented, <a href="#">HDCR</a>.HPMFZO control bits.</li> <li>If EL3 is implemented, the <a href="#">MDCR_EL3</a>.{MPMX,MCCD} control bits.</li> </ul>
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT\_PMUv3 implements the functionality identified by the value 0b0011.

FEAT\_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT\_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT\_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT\_PMUv3p7 implements the functionality identified by the value 0b0111.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT\_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT\_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT\_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT\_PMUv3 is implemented, the value 0b0110 is not permitted.

#### Note

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

## MProfDbg, bits [23:20]

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

MProfDbg	Meaning
0b0000	Not supported.
0b0001	Support for M profile Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**MMapTrc, bits [19:16]**

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

<b>MMapTrc</b>	<b>Meaning</b>
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

**CopTrc, bits [15:12]**

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

<b>CopTrc</b>	<b>Meaning</b>
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with System registers access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

**MMapDbg, bits [11:8]**

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In Armv8-A, this field is RES0.

The optional memory map defined by Armv8 is not compatible with Armv7.

**CopSDBG, bits [7:4]**

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

**CopDbg, bits [3:0]**

Support for System registers-based debug model, using registers in the coproc == 0b1110 encoding space, for A and R profile processors. Defined values are:

CopDbg	Meaning
0b0000	Not supported.
0b0010	Support for Armv6, v6 Debug architecture, with System registers access.
0b0011	Support for Armv6, v6.1 Debug architecture, with System registers access.
0b0100	Support for Armv7, v7 Debug architecture, with System registers access.
0b0101	Support for Armv7, v7.1 Debug architecture, with System registers access.
0b0110	Support for Armv8 debug architecture, with System registers access.
0b0111	Support for Armv8 debug architecture, with System registers access, and Virtualization Host Extensions.
0b1000	Support for Armv8.2 debug architecture.
0b1001	Support for Armv8.4 debug architecture.

All other values are reserved.

FEAT\_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT\_Debugv8p4 adds the functionality identified by the value 0b1001.

In Armv8.0, the only permitted value is 0b0110.

In Armv8.1, the only permitted value is 0b0111.

In Armv8.2, the only permitted value is 0b1000.

From Armv8.4, the only permitted value is 0b1001.

## Otherwise:

# ID\_DFR1\_EL1, Debug Feature Register 1

The ID\_DFR1\_EL1 characteristics are:

## Purpose

Provides top level information about the debug system in AArch32.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_DFR1\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_DFR1\[31:0\]](#).

### Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

## Attributes

ID\_DFR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_DFR1\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:4]

Reserved, RES0.

### MTPMU, bits [3:0]

Multi-threaded PMU extension. Defined values are:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether <a href="#">PMEVTYPER&lt;n&gt;.MT</a> are read/write or RES0.
0b0001	FEAT_MTPMU and FEAT_PMUv3 implemented. <a href="#">PMEVTYPER&lt;n&gt;.MT</a> are read/write. When FEAT_MTPMU is disabled, the Effective values of <a href="#">PMEVTYPER&lt;n&gt;.MT</a> are 0.
0b1111	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, <a href="#">PMEVTYPER&lt;n&gt;.MT</a> are RES0.

All other values are reserved.

FEAT\_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT\_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT\_PMUv3, the value 0b0001 is not permitted.

## Otherwise:

# ID\_ISAR0\_EL1, AArch32 Instruction Set Attribute Register 0

The ID\_ISAR0\_EL1 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), [ID\\_ISAR4\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_ISAR0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_ISAR0\[31:0\]](#).

## Attributes

ID\_ISAR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_ISAR0\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0				Divide				Debug				Coprocc				CmpBranch				BitField				BitCount				Swap			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### Bits [63:28]

Reserved, RES0.

#### Divide, bits [27:24]

Indicates the implemented Divide instructions. Defined values are:

Divide	Meaning
0b0000	None implemented.
0b0001	Adds SDIV and UDIV in the T32 instruction set.
0b0010	As for 0b0001, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

#### Debug, bits [23:20]

Indicates the implemented Debug instructions. Defined values are:

<b>Debug</b>	<b>Meaning</b>
0b0000	None implemented.
0b0001	Adds BKPT.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Coproc, bits [19:16]

Indicates the implemented System register access instructions. Defined values are:

<b>Coproc</b>	<b>Meaning</b>
0b0000	None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.
0b0001	Adds generic CDP, LDC, MCR, MRC, and STC.
0b0010	As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.
0b0011	As for 0b0010, and adds generic MCRR and MRRC.
0b0100	As for 0b0011, and adds generic MCRR2 and MRRC2.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

<b>CmpBranch</b>	<b>Meaning</b>
0b0000	None implemented.
0b0001	Adds CBNZ and CBZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:

<b>BitField</b>	<b>Meaning</b>
0b0000	None implemented.
0b0001	Adds BFC, BFI, SBFX, and UBFX.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:

<b>BitCount</b>	<b>Meaning</b>
0b0000	None implemented.
0b0001	Adds CLZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

Swap	Meaning
0b0000	None implemented.
0b0001	Adds SWP and SWPB.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

## Otherwise:

        return ID_ISAR0_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_ISAR0_EL1;

```

# ID\_ISAR1\_EL1, AArch32 Instruction Set Attribute Register 1

The ID\_ISAR1\_EL1 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), [ID\\_ISAR4\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_ISAR1\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_ISAR1\[31:0\]](#).

## Attributes

ID\_ISAR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_ISAR1\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Jazelle				Interwork				Immediate				IfThen				Extend				Except_AR				Except				Endian			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions. Defined values are:

Jazelle	Meaning
0b0000	No support for Jazelle.
0b0001	Adds the BXJ instruction and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Interwork, bits [27:24]

Indicates the implemented Interworking instructions. Defined values are:

Interwork	Meaning
0b0000	None implemented.
0b0001	Adds the BX instruction, and the T bit in the PSR.
0b0010	As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.
0b0011	As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

### Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

Immediate	Meaning
0b0000	None implemented.
0b0001	Adds: <ul style="list-style-type: none"> <li>The MOVT instruction.</li> <li>The MOV instruction encodings with zero-extended 16-bit immediates.</li> <li>The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

IfThen	Meaning
0b0000	None implemented.
0b0001	Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

Extend	Meaning
0b0000	No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.
0b0001	Adds the SXTB, SXTH, UXTB, and UXTH instructions.
0b0010	As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

### Except\_AR, bits [11:8]

Indicates the implemented A and R profile exception-handling instructions. Defined values are:

Except_AR	Meaning
0b0000	None implemented.
0b0001	Adds the SRS and RFE instructions, and the A and R profile forms of the CPS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:

Except	Meaning
0b0000	Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.
0b0001	Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Endian, bits [3:0]

Indicates the implemented Endian instructions. Defined values are:

Endian	Meaning
0b0000	None implemented.
0b0001	Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

### Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# ID\_ISAR2\_EL1, AArch32 Instruction Set Attribute Register 2

The ID\_ISAR2\_EL1 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR3\\_EL1](#), [ID\\_ISAR4\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_ISAR2\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_ISAR2\[31:0\]](#).

## Attributes

ID\_ISAR2\_EL1 is a 64-bit register.

## Field descriptions

The ID\_ISAR2\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
<a href="#">Reversal</a>				<a href="#">PSR_AR</a>				<a href="#">MultU</a>				<a href="#">MultS</a>				<a href="#">Mult</a>				<a href="#">MultiAccessInt</a>				<a href="#">MemHint</a>				<a href="#">LoadStore</a>			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### Reversal, bits [31:28]

Indicates the implemented Reversal instructions. Defined values are:

Reversal	Meaning
0b0000	None implemented.
0b0001	Adds the REV, REV16, and REVSH instructions.
0b0010	As for 0b0001, and adds the RBIT instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

### PSR\_AR, bits [27:24]

Indicates the implemented A and R profile instructions to manipulate the PSR. Defined values are:

<b>PSR_AR</b>	<b>Meaning</b>
0b0000	None implemented.
0b0001	Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

### **MultU, bits [23:20]**

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

<b>MultU</b>	<b>Meaning</b>
0b0000	None implemented.
0b0001	Adds the UMULL and UMLAL instructions.
0b0010	As for 0b0001, and adds the UMAAL instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

### **MultS, bits [19:16]**

Indicates the implemented advanced signed Multiply instructions. Defined values are:

<b>MultS</b>	<b>Meaning</b>
0b0000	None implemented.
0b0001	Adds the SMULL and SMLAL instructions.
0b0010	As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
0b0011	As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLS LD, SMLS LD, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSD X instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

### **Mult, bits [15:12]**

Indicates the implemented additional Multiply instructions. Defined values are:

<b>Mult</b>	<b>Meaning</b>
0b0000	No additional instructions implemented. This means only MUL is implemented.
0b0001	Adds the MLA instruction.
0b0010	As for 0b0001, and adds the MLS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

### **MultiAccessInt, bits [11:8]**

Indicates the support for interruptible multi-access instructions. Defined values are:

MultiAccessInt	Meaning
0b0000	No support. This means the LDM and STM instructions are not interruptible.
0b0001	LDM and STM instructions are restartable.
0b0010	LDM and STM instructions are continuable.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:

MemHint	Meaning
0b0000	None implemented.
0b0001	Adds the PLD instruction.
0b0010	Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)
0b0011	As for 0b0001 (or 0b0010), and adds the PLI instruction.
0b0100	As for 0b0011, and adds the PLDW instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

### LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

LoadStore	Meaning
0b0000	No additional load/store instructions implemented.
0b0001	Adds the LDRD and STRD instructions.
0b0010	As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

## Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN

# ID\_ISAR3\_EL1, AArch32 Instruction Set Attribute Register 3

The ID\_ISAR3\_EL1 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR4\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_ISAR3\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_ISAR3\[31:0\]](#).

## Attributes

ID\_ISAR3\_EL1 is a 64-bit register.

## Field descriptions

The ID\_ISAR3\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
T32EE				TrueNOP				T32Copy				TabBranch				SynchPrim				SVC				SIMD				Saturate			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### T32EE, bits [31:28]

Indicates the implemented T32EE instructions. Defined values are:

T32EE	Meaning
0b0000	None implemented.
0b0001	Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions. Defined values are:

TrueNOP	Meaning
0b0000	None implemented. This means there are no NOP instructions that do not have any register dependencies.
0b0001	Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

T32Copy	Meaning
0b0000	Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.
0b0001	Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

TabBranch	Meaning
0b0000	None implemented.
0b0001	Adds the TBB and TBH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### SynchPrim, bits [15:12]

Used in conjunction with ID\_ISAR4.SynchPrim\_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

SynchPrim	Meaning
0b0000	If SynchPrim_frac == 0b0000, no Synchronization Primitives implemented.
0b0001	If SynchPrim_frac == 0b0000, adds the LDREX and STREX instructions.
	If SynchPrim_frac == 0b0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.
0b0010	If SynchPrim_frac == 0b0000, as for [0b0001, 0b0011] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim\_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

### SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

SVC	Meaning
0b0000	Not implemented.
0b0001	Adds the SVC instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:

SIMD	Meaning
0b0000	None implemented.
0b0001	Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
0b0011	As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports floating-point and Advanced SIMD instructions, [MVFR0](#), [MVFR1](#), and [MVFR2](#) give information about the implemented Advanced SIMD instructions.

### Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

Saturate	Meaning
0b0000	None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
0b0001	Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
														UNKNOWN																	
														UNKNOWN																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Reserved, UNKNOWN.

## Accessing the ID\_ISAR3\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_ISAR3\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b011

# ID\_ISAR4\_EL1, AArch32 Instruction Set Attribute Register 4

The ID\_ISAR4\_EL1 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_ISAR4\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_ISAR4\[31:0\]](#).

## Attributes

ID\_ISAR4\_EL1 is a 64-bit register.

## Field descriptions

The ID\_ISAR4\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
SWP_frac				PSR_M				SynchPrim_frac				Barrier				SMC				Writeback				WithShifts				Unpriv			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### SWP\_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

SWP_frac	Meaning
0b0000	SWP or SWPB instructions not implemented.
0b0001	SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if [ID\\_ISAR0](#).Swap is 0b0000.

In Armv8-A, the only permitted value is 0b0000.

**PSR\_M, bits [27:24]**

Indicates the implemented M profile instructions to modify the PSRs. Defined values are:

PSR_M	Meaning
0b0000	None implemented.
0b0001	Adds the M profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**SynchPrim\_frac, bits [23:20]**

Used in conjunction with [ID\\_ISAR3.SynchPrim](#) to indicate the implemented Synchronization Primitive instructions. Possible values are:

SynchPrim_frac	Meaning
0b0000	If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.
0b0011	If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim\_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

**Barrier, bits [19:16]**

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

Barrier	Meaning
0b0000	None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.
0b0001	Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**SMC, bits [15:12]**

Indicates the implemented SMC instructions. Defined values are:

SMC	Meaning
0b0000	None implemented.
0b0001	Adds the SMC instruction.

All other values are reserved.

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32, then this field has the value 0b0000.

**Writeback, bits [11:8]**

Indicates the support for Writeback addressing modes. Defined values are:

Writeback	Meaning
0b0000	Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.
0b0001	Adds support for all of the writeback addressing modes.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

WithShifts	Meaning
0b0000	Nonzero shifts supported only in MOV and shift instructions.
0b0001	Adds support for shifts of loads and stores over the range LSL 0-3.
0b0011	As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.
0b0100	As for 0b0011, and adds support for register-controlled shift options.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

### Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

Unpriv	Meaning
0b0000	None implemented. No T variant instructions are implemented.
0b0001	Adds the LDRBT, LDRT, STRBT, and STRT instructions.
0b0010	As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

### Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
UNKNOWN

# ID\_ISAR5\_EL1, AArch32 Instruction Set Attribute Register 5

The ID\_ISAR5\_EL1 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), and [ID\\_ISAR4\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_ISAR5\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_ISAR5\[31:0\]](#).

## Attributes

ID\_ISAR5\_EL1 is a 64-bit register.

## Field descriptions

The ID\_ISAR5\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

### Bits [63:32]

Reserved, RES0.

### VCMA, bits [31:28]

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

VCMA	Meaning
0b0000	The VCMLA and VCADD instructions are not implemented in AArch32.
0b0001	The VCMLA and VCADD instructions are implemented in AArch32.

All other values are reserved.

FEAT\_FCMA implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, the only permitted value is 0b0001.

**RDM, bits [27:24]**

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

<b>RDM</b>	<b>Meaning</b>
0b0000	No VQRDMLAH and VQRDMLSH instructions implemented.
0b0001	VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

FEAT\_RDM implements the functionality identified by the value 0b0001.

In Armv8.0, the only permitted value is 0b0000.

From Armv8.1, the only permitted value is 0b0001.

**Bits [23:20]**

Reserved, RES0.

**CRC32, bits [19:16]**

Indicates whether the CRC32 instructions are implemented in AArch32 state.

<b>CRC32</b>	<b>Meaning</b>
0b0000	No CRC32 instructions implemented.
0b0001	CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

**SHA2, bits [15:12]**

Indicates whether the SHA2 instructions are implemented in AArch32 state.

<b>SHA2</b>	<b>Meaning</b>
0b0000	No SHA2 instructions implemented.
0b0001	SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**SHA1, bits [11:8]**

Indicates whether the SHA1 instructions are implemented in AArch32 state.

<b>SHA1</b>	<b>Meaning</b>
0b0000	No SHA1 instructions implemented.
0b0001	SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

**AES, bits [7:4]**

Indicates whether the AES instructions are implemented in AArch32 state.

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC implemented.
0b0010	As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

### SEVL, bits [3:0]

Indicates whether the SEVL instruction is implemented in AArch32 state.

SEVL	Meaning
0b0000	SEVL is implemented as a NOP.
0b0001	SEVL is implemented as Send Event Local.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
														UNKNOWN																	
														UNKNOWN																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Reserved, UNKNOWN.

## Accessing the ID\_ISAR5\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, ID\_ISAR5\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b101

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_ISAR5_EL1;
elseif PSTATE.EL == EL2 then
    return ID_ISAR5_EL1;
elseif PSTATE.EL == EL3 then
    return ID_ISAR5_EL1;

```

# ID\_ISAR6\_EL1, AArch32 Instruction Set Attribute Register 6

The ID\_ISAR6\_EL1 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0\\_EL1](#), [ID\\_ISAR1\\_EL1](#), [ID\\_ISAR2\\_EL1](#), [ID\\_ISAR3\\_EL1](#), [ID\\_ISAR4\\_EL1](#) and [ID\\_ISAR5\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_ISAR6\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_ISAR6\[31:0\]](#).

### Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

## Attributes

ID\_ISAR6\_EL1 is a 64-bit register.

## Field descriptions

The ID\_ISAR6\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0				I8MM				BF16				SPECRES				SB				FHM				DP				JSCVT			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:28]

Reserved, RES0.

### I8MM, bits [27:24]

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values of this field are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.

All other values are reserved.

FEAT\_AA32I8MM implements the functionality identified by 0b0001.

### BF16, bits [23:20]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	VCVT, VCVTB, VCVTT, VDOT, VFMA, VFMA, and VMMLA instructions with BF16 operand or result types are implemented.

All other values are reserved.

FEAT\_AA32BF16 implements the functionality identified by 0b0001.

### SPECRES, bits [19:16]

Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:

SPECRES	Meaning
0b0000	Prediction invalidation instructions are not implemented.
0b0001	CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.

All other values are reserved.

FEAT\_SPECRES implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

### SB, bits [15:12]

Indicates support for the SB instruction in AArch32 state. Defined values are:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

FEAT\_SB implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

### FHM, bits [11:8]

Indicates support for Advanced SIMD and floating-point VFMA and VFMSL instructions in AArch32 state. Defined values are:

FHM	Meaning
0b0000	VFMA and VFMSL instructions are not implemented.
0b0001	VFMA and VFMSL instructions are implemented.

All other values are reserved.

FEAT\_FHM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

### DP, bits [7:4]

Indicates support for Advanced SIMD and floating-point VFMA and VFMSL instructions in AArch32 state. Defined values are:

DP	Meaning
0b0000	Dot product instructions are not implemented.
0b0001	UDOT and VSDOT instructions are implemented.

All other values are reserved.

FEAT\_DotProd implements the functionality identified by 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

### JSCVT, bits [3:0]

Indicates support for the VJCVT instruction in AArch32 state. Defined values are:

JSCVT	Meaning
0b0000	The VJCVT instruction is not implemented.
0b0001	The VJCVT instruction is implemented.

All other values are reserved.

FEAT\_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

### Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Reserved, UNKNOWN.

## Accessing the ID\_ISAR6\_EL1

Accesses to this register use the following encodings:

# ID\_MMFR0\_EL1, AArch32 Memory Model Feature Register 0

The ID\_MMFR0\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR1\\_EL1](#), [ID\\_MMFR2\\_EL1](#), [ID\\_MMFR3\\_EL1](#), and [ID\\_MMFR4\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_MMFR0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_MMFR0\[31:0\]](#).

## Attributes

ID\_MMFR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_MMFR0\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
InnerShr				FCSE				AuxReg				TCM				ShareLvl				OuterShr				PMSA				VMSA			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

InnerShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID\_MMFR0\_EL1.ShareLvl having the value 0b0001.

When ID\_MMFR0\_EL1.ShareLvl is zero, this field is UNKNOWN.

**FCSE, bits [27:24]**

Indicates whether the implementation includes the FCSE. Defined values are:

FCSE	Meaning
0b0000	Not supported.
0b0001	Support for FCSE.

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

**AuxReg, bits [23:20]**

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

AuxReg	Meaning
0b0000	None supported.
0b0001	Support for Auxiliary Control Register only.
0b0010	Support for Auxiliary Fault Status Registers ( <a href="#">AIFSR</a> and <a href="#">ADFSR</a> ) and Auxiliary Control Register.

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

**Note**

Accesses to unimplemented Auxiliary registers are UNDEFINED.

**TCM, bits [19:16]**

Indicates support for TCMs and associated DMAs. Defined values are:

TCM	Meaning
0b0000	Not supported.
0b0001	Support is IMPLEMENTATION DEFINED. Armv7 requires this setting.
0b0010	Support for TCM only, Armv6 implementation.
0b0011	Support for TCM and DMA, Armv6 implementation.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

**ShareLvl, bits [15:12]**

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

ShareLvl	Meaning
0b0000	One level of shareability implemented.
0b0001	Two levels of shareability implemented.

All other values are reserved.

From Armv8 the only permitted value is 0b0001.

**OuterShr, bits [11:8]**

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

OuterShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

#### PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

PMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED PMSA.
0b0010	Support for PMSAv6, with a Cache Type Register implemented.
0b0011	Support for PMSAv7, with support for memory subsections. Armv7-R profile.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

#### VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

VMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED VMSA.
0b0010	Support for VMSAv6, with Cache and TLB Type Registers implemented.
0b0011	Support for VMSAv7, with support for remapping and the Access flag. Armv7-A profile.
0b0100	As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
0b0101	As for 0b0100, and adds support for the Long-descriptor translation table format.

All other values are reserved.

In Armv8-A the only permitted value is 0b0101.

#### Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

### Bits [63:32]

Reserved, RES0.

### BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

<b>BPred</b>	<b>Meaning</b>
0b0000	No branch predictor, or no MMU present. Implies a fixed MPU configuration.
0b0001	Branch predictor requires flushing on: <ul style="list-style-type: none"> <li>• Enabling or disabling a stage of address translation.</li> <li>• Writing new data to instruction locations.</li> <li>• Writing new mappings to the translation tables.</li> <li>• Changes to the <a href="#">TTBR0</a>, <a href="#">TTBR1</a>, or <a href="#">TTBCR</a> registers.</li> <li>• Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.</li> </ul>
0b0010	Branch predictor requires flushing on: <ul style="list-style-type: none"> <li>• Enabling or disabling a stage of address translation.</li> <li>• Writing new data to instruction locations.</li> <li>• Writing new mappings to the translation tables.</li> <li>• Any change to the <a href="#">TTBR0</a>, <a href="#">TTBR1</a>, or <a href="#">TTBCR</a> registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.</li> </ul>
0b0011	Branch predictor requires flushing only on writing new data to instruction locations.
0b0100	For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In Armv8-A, the permitted values are 0b0010, 0b0011, and 0b0100. For values other than 0b0000 and 0b0100 the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

#### **L1TstCln, bits [27:24]**

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

<b>L1TstCln</b>	<b>Meaning</b>
0b0000	None supported.
0b0001	Supported Level 1 data cache test and clean operations are: <ul style="list-style-type: none"> <li>• Test and clean data cache.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Test, clean, and invalidate data cache.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

#### **L1Uni, bits [23:20]**

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

<b>L1Uni</b>	<b>Meaning</b>
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: <ul style="list-style-type: none"> <li>• Invalidate cache, including branch predictor if appropriate.</li> <li>• Invalidate branch predictor, if appropriate.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Clean cache, using a recursive model that uses the cache dirty status bit.</li> <li>• Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1Hvd, bits [19:16]**

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

<b>L1Hvd</b>	<b>Meaning</b>
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: <ul style="list-style-type: none"> <li>• Invalidate instruction cache, including branch predictor if appropriate.</li> <li>• Invalidate branch predictor, if appropriate.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Invalidate data cache.</li> <li>• Invalidate data cache and instruction cache, including branch predictor if appropriate.</li> </ul>
0b0011	As for 0b0010, and adds: <ul style="list-style-type: none"> <li>• Clean data cache, using a recursive model that uses the cache dirty status bit.</li> <li>• Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1UniSW, bits [15:12]**

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

<b>L1UniSW</b>	<b>Meaning</b>
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by set/way are: <ul style="list-style-type: none"> <li>• Clean cache line by set/way.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Clean and invalidate cache line by set/way.</li> </ul>
0b0011	As for 0b0010, and adds: <ul style="list-style-type: none"> <li>• Invalidate cache line by set/way.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1HvdSW, bits [11:8]**

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

<b>L1HvdSW</b>	<b>Meaning</b>
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by set/way are: <ul style="list-style-type: none"> <li>• Clean data cache line by set/way.</li> <li>• Clean and invalidate data cache line by set/way.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Invalidate data cache line by set/way.</li> </ul>
0b0011	As for 0b0010, and adds: <ul style="list-style-type: none"> <li>• Invalidate instruction cache line by set/way.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1UniVA, bits [7:4]**

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

<b>L1UniVA</b>	<b>Meaning</b>
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by VA are: <ul style="list-style-type: none"> <li>• Clean cache line by VA.</li> <li>• Invalidate cache line by VA.</li> <li>• Clean and invalidate cache line by VA.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Invalidate branch predictor by VA, if branch predictor is implemented.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**L1HvdVA, bits [3:0]**

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

<b>L1HvdVA</b>	<b>Meaning</b>
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by VA are: <ul style="list-style-type: none"> <li>• Clean data cache line by VA.</li> <li>• Invalidate data cache line by VA.</li> <li>• Clean and invalidate data cache line by VA.</li> <li>• Clean instruction cache line by VA.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Invalidate branch predictor by VA, if branch predictor is implemented.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

# ID\_MMFR2\_EL1, AArch32 Memory Model Feature Register 2

The ID\_MMFR2\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0\\_EL1](#), [ID\\_MMFR1\\_EL1](#), [ID\\_MMFR3\\_EL1](#), and [ID\\_MMFR4\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_MMFR2\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_MMFR2\[31:0\]](#).

## Attributes

ID\_MMFR2\_EL1 is a 64-bit register.

## Field descriptions

The ID\_MMFR2\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
<a href="#">HWAAccFlg</a>				<a href="#">WFIS Stall</a>				<a href="#">MemBarr</a>				<a href="#">UniTLB</a>				<a href="#">HvdTLB</a>				<a href="#">L1HvdRng</a>				<a href="#">L1HvdBG</a>				<a href="#">L1HvdFG</a>			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### Bits [63:32]

Reserved, RES0.

#### HWAAccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

HWAAccFlg	Meaning
0b0000	Not supported.
0b0001	Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

#### WFIS Stall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

WFIStall	Meaning
0b0000	Not supported.
0b0001	Support for WFI stalling.

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0001.

### MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==0b1111) encoding space:

MemBarr	Meaning
0b0000	None supported.
0b0001	Supported memory barrier System instructions are: <ul style="list-style-type: none"> <li>Data Synchronization Barrier (DSB).</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>Instruction Synchronization Barrier (ISB).</li> <li>Data Memory Barrier (DMB).</li> </ul>

All other values are reserved.

From Armv8, the only permitted value is 0b0010.

Arm deprecates the use of these operations. ID\_ISAR4.Barrier\_instrs indicates the level of support for the preferred barrier instructions.

### UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

UniTLB	Meaning
0b0000	Not supported.
0b0001	Supported unified TLB maintenance operations are: <ul style="list-style-type: none"> <li>Invalidate all entries in the TLB.</li> <li>Invalidate TLB entry by VA.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>Invalidate TLB entries by ASID match.</li> </ul>
0b0011	As for 0b0010, and adds: <ul style="list-style-type: none"> <li>Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.</li> </ul>
0b0100	As for 0b0011, and adds: <ul style="list-style-type: none"> <li>Invalidate Hyp mode unified TLB entry by VA.</li> <li>Invalidate entire Non-secure PL1&amp;0 unified TLB.</li> <li>Invalidate entire Hyp mode unified TLB.</li> </ul>
0b0101	As for 0b0100, and adds the following operations: <a href="#">TLBIMVALIS</a> , <a href="#">TLBIMVAALIS</a> , <a href="#">TLBIMVALHIS</a> , <a href="#">TLBIMVAL</a> , <a href="#">TLBIMVAAL</a> , <a href="#">TLBIMVALH</a> .
0b0110	As for 0b0101, and adds the following operations: <a href="#">TLBIIPAS2IS</a> , <a href="#">TLBIIPAS2LIS</a> , <a href="#">TLBIIPAS2</a> , <a href="#">TLBIIPAS2L</a> .

All other values are reserved.

In Armv8-A, the only permitted value is 0b0110.

### HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

### L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

L1HvdRng	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache maintenance range operations are: <ul style="list-style-type: none"> <li>• Invalidate data cache range by VA.</li> <li>• Invalidate instruction cache range by VA.</li> <li>• Clean data cache range by VA.</li> <li>• Clean and invalidate data cache range by VA.</li> </ul>

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

#### L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

L1HvdBG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache background fetch operations are: <ul style="list-style-type: none"> <li>• Fetch instruction cache range by VA.</li> <li>• Fetch data cache range by VA.</li> </ul>

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

#### L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

L1HvdFG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache foreground fetch operations are: <ul style="list-style-type: none"> <li>• Fetch instruction cache range by VA.</li> <li>• Fetch data cache range by VA.</li> </ul>

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

### Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN

# ID\_MMFR3\_EL1, AArch32 Memory Model Feature Register 3

The ID\_MMFR3\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0\\_EL1](#), [ID\\_MMFR1\\_EL1](#), [ID\\_MMFR2\\_EL1](#), and [ID\\_MMFR4\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_MMFR3\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_MMFR3\[31:0\]](#).

## Attributes

ID\_MMFR3\_EL1 is a 64-bit register.

## Field descriptions

The ID\_MMFR3\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Supersec				CMemSz				CohWalk				PAN				MaintBcst				BPMaint				CMaintSW				CMaintVA			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

Supersec	Meaning
0b0000	Supersections supported.
0b1111	Supersections not supported.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b1111.

### CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

<b>CMemSz</b>	<b>Meaning</b>
0b0000	4GB, corresponding to a 32-bit physical address range.
0b0001	64GB, corresponding to a 36-bit physical address range.
0b0010	1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b0010.

### **CohWalk, bits [23:20]**

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

<b>CohWalk</b>	<b>Meaning</b>
0b0000	Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.
0b0001	Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### **PAN, bits [19:16]**

Privileged Access Never. Indicates support for the PAN bit in [CPSR](#), [SPSR](#), and [DPSR](#) in AArch32 state. Defined values are:

<b>PAN</b>	<b>Meaning</b>
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and <a href="#">ATS1CPRP</a> and <a href="#">ATS1CPWP</a> instructions supported.

All other values are reserved.

FEAT\_PAN implements the functionality identified by the value 0b0001.

FEAT\_PAN2 implements the functionality added by the value 0b0010.

In Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the only permitted value is 0b0010.

### **MaintBcst, bits [15:12]**

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

<b>MaintBcst</b>	<b>Meaning</b>
0b0000	Cache, TLB, and branch predictor operations only affect local structures.
0b0001	Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.
0b0010	Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**BPMaint, bits [11:8]**

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

BPMaint	Meaning
0b0000	None supported.
0b0001	Supported branch predictor maintenance operations are: <ul style="list-style-type: none"> <li>• Invalidate all branch predictors.</li> </ul>
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> <li>• Invalidate branch predictors by VA.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

**CMaintSW, bits [7:4]**

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

CMaintSW	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance instructions by set/way are: <ul style="list-style-type: none"> <li>• Invalidate data cache by set/way.</li> <li>• Clean data cache by set/way.</li> <li>• Clean and invalidate data cache by set/way.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

**CMaintVA, bits [3:0]**

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

CMaintVA	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance operations by VA are: <ul style="list-style-type: none"> <li>• Invalidate data cache by VA.</li> <li>• Clean data cache by VA.</li> <li>• Clean and invalidate data cache by VA.</li> <li>• Invalidate instruction cache by VA.</li> <li>• Invalidate all instruction cache entries.</li> </ul>

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

**Otherwise:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# ID\_MMFR4\_EL1, AArch32 Memory Model Feature Register 4

The ID\_MMFR4\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

Must be interpreted with [ID\\_MMFR0\\_EL1](#), [ID\\_MMFR1\\_EL1](#), [ID\\_MMFR2\\_EL1](#), and [ID\\_MMFR3\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_MMFR4\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_MMFR4\[31:0\]](#).

## Attributes

ID\_MMFR4\_EL1 is a 64-bit register.

## Field descriptions

The ID\_MMFR4\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

### Bits [63:32]

Reserved, RES0.

### EVT, bits [31:28]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the [HCR2](#).{TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

EVT	Meaning
0b0000	<a href="#">HCR2</a> .{TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	<a href="#">HCR2</a> .{TOCU, TICAB, TID4} traps are supported.
	<a href="#">HCR2</a> .TTLBIS trap is not supported.
0b0010	<a href="#">HCR2</a> .{TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

FEAT\_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented supporting AArch32, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

### CCIDX, bits [27:24]

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.
0b0001	64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.

All other values are reserved.

FEAT\_CCIDX implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

### LSM, bits [23:20]

Indicates support for LSMAOE and nTLSMD bits in [HSCTLR](#) and [SCTLR](#). Defined values are:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT\_LSMAOC implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

### HPDS, bits [19:16]

Hierarchical permission disables bits in translation tables. Defined values are:

HPDS	Meaning
0b0000	Disabling of hierarchical controls not supported.
0b0001	Supports disabling of hierarchical controls using the <a href="#">TTBCR2</a> .HPD0, <a href="#">TTBCR2</a> .HPD1, and <a href="#">HTCR</a> .HPD bits.
0b0010	As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

FEAT\_AA32HPD implements the functionality identified by the value 0b0001.

FEAT\_HPDS2 implements the functionality added by the value 0b0010.

#### Note

The value 0b0000 implies that the encoding for [TTBCR2](#) is UNDEFINED.

### CnP, bits [15:12]

Common not Private translations. Defined values are:

CnP	Meaning
0b0000	Common not Private translations not supported.
0b0001	Common not Private translations supported.

All other values are reserved.

FEAT\_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2 the only permitted value is 0b0001.

### XNX, bits [11:8]

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT\_XNX implements the functionality identified by the value 0b0001.

When FEAT\_XNX is implemented:

- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of ID\_MMFR4\_EL1.XNX is 0b0000 or 0b0001:
  - [ID\\_AA64MMFR1\\_EL1.XNX](#) == 1.
  - EL2 cannot use AArch32.
  - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0b0001.

### AC2, bits [7:4]

Indicates the extension of the [ACTLR](#) and [HACTLR](#) registers using [ACTLR2](#) and [HACTLR2](#). Defined values are:

AC2	Meaning
0b0000	<a href="#">ACTLR2</a> and <a href="#">HACTLR2</a> are not implemented.
0b0001	<a href="#">ACTLR2</a> and <a href="#">HACTLR2</a> are implemented.

All other values are reserved.

In Armv8.0 and Armv8.1 the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

### SpecSEI, bits [3:0]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

SpecSEI	Meaning
0b0000	The PE never generates an SError interrupt due to an External abort on a speculative read.
0b0001	The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

### Otherwise:

# ID\_MMFR5\_EL1, AArch32 Memory Model Feature Register 5

The ID\_MMFR5\_EL1 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_MMFR5\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_MMFR5\[31:0\]](#).

## Attributes

ID\_MMFR5\_EL1 is a 64-bit register.

## Field descriptions

The ID\_MMFR5\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
																RES0

### Bits [63:4]

Reserved, RES0.

### ETS, bits [3:0]

Support for Enhanced Translation Synchronization. Defined values are:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is supported.

All other values are reserved.

FEAT\_ETTS implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# ID\_PFR0\_EL1, AArch32 Processor Feature Register 0

The ID\_PFR0\_EL1 characteristics are:

## Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with [ID\\_PFR1\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_PFR0\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_PFR0\[31:0\]](#).

## Attributes

ID\_PFR0\_EL1 is a 64-bit register.

## Field descriptions

The ID\_PFR0\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RAS				DIT				AMU				CSV2				State3				State2				State1				State0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### RAS, bits [31:28]

RAS Extension version. Defined values are:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	RAS Extension present.
0b0010	FEAT_RASv1p1 present. As 0b0001, and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to <a href="#">ERR&lt;n&gt;STATUS</a> and support for the optional RAS Timestamp Extension.

All other values are reserved.

FEAT\_RAS implements the functionality identified by the value 0b0001.

FEAT\_RASv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT\_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT\_DoubleFault is not implemented, and [ERRIDR\\_EL1.NUM](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

---

#### Note

When the value of this field is 0b0001, [ID\\_PFR2\\_EL1.RAS\\_frac](#) indicates whether FEAT\_RASv1p1 is implemented.

---

### DIT, bits [27:24]

Data Independent Timing. Defined values are:

DIT	Meaning
0b0000	AArch32 does not guarantee constant execution time of any instructions.
0b0001	AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT\_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

### AMU, bits [23:20]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT\_AMUv1 implements the functionality identified by the value 0b0001.

FEAT\_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

### CSV2, bits [19:16]

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	This Device does not disclose whether branch targets trained in one hardware described context can affect speculative execution in a different hardware described context.
0b0001	Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way.

All other values are reserved.

FEAT\_CSV2 implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

### State3, bits [15:12]

T32EE instruction set support. Defined values are:

State3	Meaning
0b0000	Not implemented.
0b0001	T32EE instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### State2, bits [11:8]

Jazelle extension support. Defined values are:

State2	Meaning
0b0000	Not implemented.
0b0001	Jazelle extension implemented, without clearing of <a href="#">JOSCR</a> .CV on exception entry.
0b0010	Jazelle extension implemented, with clearing of <a href="#">JOSCR</a> .CV on exception entry.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### State1, bits [7:4]

T32 instruction set support. Defined values are:

State1	Meaning
0b0000	T32 instruction set not implemented.
0b0001	T32 encodings before the introduction of Thumb-2 technology implemented: <ul style="list-style-type: none"> <li>• All instructions are 16-bit.</li> <li>• A BL or BLX is a pair of 16-bit instructions.</li> <li>• 32-bit instructions other than BL and BLX cannot be encoded.</li> </ul>
0b0011	T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

### State0, bits [3:0]

A32 instruction set support. Defined values are:

State0	Meaning
0b0000	A32 instruction set not implemented.
0b0001	A32 instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

**Otherwise:**

# ID\_PFR1\_EL1, AArch32 Processor Feature Register 1

The ID\_PFR1\_EL1 characteristics are:

## Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with [ID\\_PFR0\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_PFR1\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_PFR1\[31:0\]](#).

## Attributes

ID\_PFR1\_EL1 is a 64-bit register.

## Field descriptions

The ID\_PFR1\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
GIC				Virt_frac				Sec_frac				GenTimer				Virtualization				MProgMod				Security				ProgMod			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

### Virt\_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for features from the ARMv7 Virtualization Extensions. Defined values are:

<b>Virt_frac</b>	<b>Meaning</b>
0b0000	No features from the ARMv7 Virtualization Extensions are implemented.
0b0001	The following features of the ARMv7 Virtualization Extensions are implemented: <ul style="list-style-type: none"> <li>• The <a href="#">SCR</a>.SIF bit, if EL3 is implemented.</li> <li>• The modifications to the <a href="#">SCR</a>.AW and <a href="#">SCR</a>.FW bits described in the Virtualization Extensions, if EL3 is implemented.</li> <li>• The MSR (banked register) and MRS (banked register) instructions.</li> <li>• The ERET instruction.</li> </ul>

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is only valid when the value of ID\_PFR1\_EL1.Virtualization is 0, otherwise it holds the value 0b0000.

#### Note

The ID\_ISAR registers do not identify whether the instructions added by the ARMv7 Virtualization Extensions are implemented.

### Sec\_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for features from the ARMv7 Security Extensions. Defined values are:

<b>Sec_frac</b>	<b>Meaning</b>
0b0000	No features from the ARMv7 Security Extensions are implemented.
0b0001	The following features from the ARMv7 Security Extensions are implemented: <ul style="list-style-type: none"> <li>• The VBAR register.</li> <li>• The <a href="#">TTBCR</a>.PD0 and <a href="#">TTBCR</a>.PD1 bits.</li> </ul>
0b0010	As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is only valid when the value of ID\_PFR1\_EL1.Security is 0, otherwise it holds the value 0b0000.

### GenTimer, bits [19:16]

Generic Timer support. Defined values are:

<b>GenTimer</b>	<b>Meaning</b>
0b0000	Generic Timer is not implemented.
0b0001	Generic Timer is implemented.
0b0010	Generic Timer is implemented, and also includes support for <a href="#">CNTHCTL</a> .EVNTIS and <a href="#">CNTKCTL</a> .EVNTIS fields, and <a href="#">CNTPTCSS</a> and <a href="#">CNTVCTSS</a> counter views.

All other values are reserved.

FEAT\_ECV implements the functionality identified by the value 0b0010.

In Armv8.0, Armv8.1, Armv8.2, Armv8.3, Armv8.4, and Armv8.5, the only permitted value is 0b0001.

From Armv8.6, the only permitted value is 0b0010.

## Virtualization, bits [15:12]

Virtualization support. Defined values are:

Virtualization	Meaning
0b0000	EL2, Hyp mode, and the HVC instruction not implemented.
0b0001	EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

### Note

The ID\_ISARs do not identify whether the HVC instruction is implemented.

## MProgMod, bits [11:8]

M profile programmers' model support. Defined values are:

MProgMod	Meaning
0b0000	Not supported.
0b0010	Support for two-stack programmers' model.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

## Security, bits [7:4]

Security support. Defined values are:

Security	Meaning
0b0000	EL3, Monitor mode, and the SMC instruction not implemented.
0b0001	EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.
0b0010	As for 0b0001, and adds the ability to set the <a href="#">NSACR</a> .RFR bit. Not permitted in Armv8 as the <a href="#">NSACR</a> .RFR bit is RES0.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

**ProgMod, bits [3:0]**

Support for the standard programmers' model for Armv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

ProgMod	Meaning
0b0000	Not supported.
0b0001	Supported.

All other values are reserved.

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32 then this field has the value 0b0000.

**Otherwise:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN

elseif PSTATE.EL == EL3 then
    return ID_PFR1_EL1;

```

# ID\_PFR2\_EL1, AArch32 Processor Feature Register 2

The ID\_PFR2\_EL1 characteristics are:

## Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with [ID\\_PFR0\\_EL1](#) and [ID\\_PFR1\\_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch64 System register ID\_PFR2\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID\\_PFR2\[31:0\]](#).

## Attributes

ID\_PFR2\_EL1 is a 64-bit register.

## Field descriptions

The ID\_PFR2\_EL1 bit assignments are:

### When AArch32 is supported at any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																RES0				RAS frac				SSBS				CSV3			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:12]

Reserved, RES0.

### RAS\_frac, bits [11:8]

RAS Extension fractional field. Defined values are:

RAS frac	Meaning
0b0000	If <a href="#">ID_PFR0_EL1</a> .RAS == 0b0001, RAS Extension implemented.
0b0001	If <a href="#">ID_PFR0_EL1</a> .RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to <a href="#">ERR&lt;n&gt;STATUS</a> and support for the optional RAS Timestamp Extension.

All other values are reserved.

This field is valid only if [ID\\_PFR0\\_EL1](#).RAS == 0b0001.

**SSBS, bits [7:4]**

Speculative Store Bypassing controls in AArch64 state. Defined values are:

SSBS	Meaning
0b0000	AArch32 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

**CSV3, bits [3:0]**

Speculative use of faulting data. Defined values are:

CSV3	Meaning
0b0000	This Device does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence
0b0001	Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by instructions newer than the load in the speculative sequence

All other values are reserved.

FEAT\_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT\_EOPD is implemented, FEAT\_CSV3 must be implemented.

**Otherwise:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

# IFSR32\_EL2, Instruction Fault Status Register (EL2)

The IFSR32\_EL2 characteristics are:

## Purpose

Allows access to the AArch32 [IFSR](#) register from AArch64 state only. Its value has no effect on execution in AArch64 state.

## Configuration

AArch64 System register IFSR32\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [IFSR\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to IFSR32\_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

## Attributes

IFSR32\_EL2 is a 64-bit register.

## Field descriptions

The IFSR32\_EL2 bit assignments are:

### When TTBCR.EAE == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
																RES0																			
RES0																FnV	RES0				ExT	RES0		FS[4]		LPAE		RES0				FS[3:0]			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

### Bits [63:17]

Reserved, RES0.

### FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	<a href="#">IFAR</a> is valid.
0b1	<a href="#">IFAR</a> is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [15:13]

Reserved, RES0.

**ExT, bit [12]**

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [11]**

Reserved, RES0.

**FS, bits [10, 3:0]**

Fault Status bits. Bits [10] and [3:0] are interpreted together.

FS	Meaning	Applies when
0b00001	PC alignment fault.	
0b00010	Debug exception.	
0b00011	Access flag fault, level 1.	
0b00101	Translation fault, level 1.	
0b00110	Access flag fault, level 2.	
0b00111	Translation fault, level 2.	
0b01000	Synchronous External abort, not on translation table walk.	
0b01001	Domain fault, level 1.	
0b01011	Domain fault, level 2.	
0b01100	Synchronous External abort, on translation table walk, level 1.	
0b01101	Permission fault, level 1.	
0b01110	Synchronous External abort, on translation table walk, level 2.	
0b01111	Permission fault, level 2.	
0b10000	TLB conflict abort.	
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault).	
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b11100	Synchronous parity or ECC error on translation table walk, level 1.	When FEAT_RAS is not implemented
0b11110	Synchronous parity or ECC error on translation table walk, level 2.	When FEAT_RAS is not implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is IFSR32\_EL2[10].
- FS[3:0] is IFSR32\_EL2[3:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [8:4]

Reserved, RES0.

### When TTBCR.EAE == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
																RES0																					
RES0																FnV	RES0				ExT	RES0		LPAE		RES0			STATUS								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

#### Bits [63:17]

Reserved, RES0.

#### FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	IFAR is valid.
0b1	IFAR is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [15:13]

Reserved, RES0.

#### ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [11:10]

Reserved, RES0.

#### LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [8:6]

Reserved, RES0.

### STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

STATUS	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100001	PC alignment fault.	
0b100010	Debug exception.	
0b110000	TLB conflict abort.	

All other values are reserved.

When FEAT\_RAS is implemented, 0b011000, 0b011101, 0b011110, and 0b011111 are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the IFSR32\_EL2

Accesses to this register use the following encodings:

# ISR\_EL1, Interrupt Status Register

The ISR\_EL1 characteristics are:

## Purpose

Shows the pending status of the IRQ, FIQ, or SError interrupt.

When executing at EL2, EL3 or Secure EL1 when [SCR\\_EL3.EEL2](#) == 0b0, this shows the pending status of the physical IRQ, FIQ, or SError interrupts.

When executing at either Non-secure EL1 or at Secure EL1 when [SCR\\_EL3.EEL2](#) == 0b1:

- If the [HCR\\_EL2](#).{IMO,FMO,AMO} bit has a value of 1, the corresponding ISR\_EL1.{I,F,A} bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the [HCR\\_EL2](#).{IMO,FMO,AMO} bit has a value of 0, the corresponding ISR\_EL1.{I,F,A} bit shows the pending status of the physical IRQ, FIQ, or SError.

## Configuration

AArch64 System register ISR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ISR\[31:0\]](#).

## Attributes

ISR\_EL1 is a 64-bit register.

## Field descriptions

The ISR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32					
																RES0																				
																								RES0			A	I	F		RES0

### Bits [63:9]

Reserved, RES0.

### A, bit [8]

SError interrupt pending bit.

A	Meaning
0b0	No pending SError.
0b1	An SError interrupt is pending.

If the SError interrupt is edge-triggered, this field is cleared to zero when the physical SError interrupt is taken.

### I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending:

I	Meaning
0b0	No pending IRQ.
0b1	An IRQ interrupt is pending.

**F, bit [6]**

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

<b>F</b>	<b>Meaning</b>
0b0	No pending FIQ.
0b1	An FIQ interrupt is pending.

**Bits [5:0]**

Reserved, RES0.

**Accessing the ISR\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, ISR\_EL1

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b11	0b000	0b1100	0b0001	0b000

```

if PSTATE.EL == EL0 then

# LORC\_EL1, LORegion Control (EL1)

The LORC\_EL1 characteristics are:

## Purpose

Enables and disables LORegions, and selects the current LORegion descriptor.

## Configuration

This register is present only when FEAT\_LOR is implemented. Otherwise, direct accesses to LORC\_EL1 are UNDEFINED.

If no LORegion descriptors are supported by the PE, then this register is RES0.

## Attributes

LORC\_EL1 is a 64-bit register.

## Field descriptions

The LORC\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																																	
RES0																					DS											RES0	EN
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### Bits [63:10]

Reserved, RES0.

### DS, bits [9:2]

Descriptor Select. Selects the current LORegion descriptor accessed by [LORSA\\_EL1](#), [LOREA\\_EL1](#), and [LORN\\_EL1](#).

The number of LORegion descriptors in IMPLEMENTATION DEFINED. The maximum number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are RES0, where M is  $\text{Log}_2(\text{Number of LORegion descriptors supported by the implementation})$ .

If this field points to an LORegion descriptor that is not supported by an implementation, then the registers [LORN\\_EL1](#), [LOREA\\_EL1](#), and [LORSA\\_EL1](#) are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [1]

Reserved, RES0.

### EN, bit [0]

Enable. Indicates whether LORegions are enabled.

EN	Meaning
0b0	Disabled. Memory accesses do not match any LORegions.
0b1	Enabled. Memory accesses may match a LORegion.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to 0.

## Accessing the LORC\_EL1

Accesses to this register use the following encodings:

# LOREA\_EL1, LORegion End Address (EL1)

The LOREA\_EL1 characteristics are:

## Purpose

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1](#).DS.

## Configuration

This register is present only when FEAT\_LOR is implemented. Otherwise, direct accesses to LOREA\_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC\\_EL1](#).DS points to a LORegion that is not supported by the PE.

## Attributes

LOREA\_EL1 is a 64-bit register.

## Field descriptions

The LOREA\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0												EA[51:48]				EA[47:16]															
EA[47:16]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Any of the fields in this register are permitted to be cached in a TLB.

### Bits [63:52]

Reserved, RES0.

### EA[51:48], bits [51:48]

When FEAT\_LPA is implemented:

Extension to EA[47:16]. See EA[47:16] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### EA[47:16], bits [47:16]

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by [LORC\\_EL1](#).DS. Bits[15:0] of this address are defined to be 0xFFFF. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT\_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, EA[51:48] form the upper part of the address value. Otherwise, for implementations with fewer than 52 physical address bits, EA[51:48] are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [15:0]

Reserved, RES0.

# LORID\_EL1, LORegionID (EL1)

The LORID\_EL1 characteristics are:

## Purpose

Indicates the number of LORegions and LORegion descriptors supported by the PE.

## Configuration

This register is present only when FEAT\_LOR is implemented. Otherwise, direct accesses to LORID\_EL1 are UNDEFINED.

If no LORegion descriptors are implemented, then the registers [LORC\\_EL1](#), [LORN\\_EL1](#), [LOREA\\_EL1](#), and [LORSA\\_EL1](#) are RES0.

## Attributes

LORID\_EL1 is a 64-bit register.

## Field descriptions

The LORID\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																RES0															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								LD								RES0								LR							

### Bits [63:24]

Reserved, RES0.

### LD, bits [23:16]

Number of LORegion descriptors supported by the PE. This is an 8-bit binary number.

### Bits [15:8]

Reserved, RES0.

### LR, bits [7:0]

Number of LORegions supported by the PE. This is an 8-bit binary number.

#### Note

If LORID\_EL1 indicates that no LORegions are implemented, then LoadLOAcquire and StoreLORelease will behave as LoadAcquire and StoreRelease.

## Accessing the LORID\_EL1

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, LORID\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b111

```

# LORN\_EL1, LORegion Number (EL1)

The LORN\_EL1 characteristics are:

## Purpose

Holds the number of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1](#).DS.

## Configuration

This register is present only when FEAT\_LOR is implemented. Otherwise, direct accesses to LORN\_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC\\_EL1](#).DS points to a LORegion that is not supported by the PE.

## Attributes

LORN\_EL1 is a 64-bit register.

## Field descriptions

The LORN\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
RES0																Num															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Any of the fields in this register are permitted to be cached in a TLB.

### Bits [63:8]

Reserved, RES0.

### Num, bits [7:0]

Number of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1](#).DS.

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are RES0, where N is (Log<sub>2</sub>(Number of LORegions supported by the PE)).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the LORN\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, LORN\_EL1

op0	op1	CRn	CRm	op2

# LORSA\_EL1, LORegion Start Address (EL1)

The LORSA\_EL1 characteristics are:

## Purpose

Indicates whether the current LORegion descriptor selected by [LORC\\_EL1](#).DS is enabled, and holds the physical address of the start of the LORegion.

## Configuration

This register is present only when FEAT\_LOR is implemented. Otherwise, direct accesses to LORSA\_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC\\_EL1](#).DS points to a LORegion that is not supported by the PE.

## Attributes

LORSA\_EL1 is a 64-bit register.

## Field descriptions

The LORSA\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

																Valid																

Any of the fields in this register are permitted to be cached in a TLB.

### Bits [63:52]

Reserved, RES0.

### SA, bits [51:16]

### SA encoding when FEAT\_LPA is implemented

35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SA																																			

### SA, bits [35:0]

The start physical address of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1](#).DS.

Bits[15:0] of this address are defined to be 0x0000.

When 52-bit addresses and a 64KB translation granule are in use, LORSA\_EL1.SA[35:32] forms the upper part of the address value.

For implementations with fewer than 52 physical address bits, LORSA\_EL1.SA[35:32] is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## SA encoding when FEAT\_LPA is not implemented

35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																SA																			

### Bits [35:32]

Reserved, RES0.

### SA, bits [31:0]

The start physical address of the LORegion described in the current LORegion descriptor selected by [LORC\\_EL1](#).DS.

Bits[15:0] of this address are defined to be 0x0000.

For implementations with fewer than 48 bits, the upper bits of this field are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [15:1]

Reserved, RES0.

### Valid, bit [0]

Indicates whether the current LORegion Descriptor is enabled.

Valid	Meaning
0b0	Disabled
0b1	Enabled

On a Warm reset, this field resets to 0.

## Accessing the LORSA\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, LORSA\_EL1

# MAIR\_EL1, Memory Attribute Indirection Register (EL1)

The MAIR\_EL1 characteristics are:

## Purpose

Provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

## Configuration

AArch64 System register MAIR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PRRR\[31:0\]](#) when TTBCR.EAE == 0.

AArch64 System register MAIR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MAIR0\[31:0\]](#) when TTBCR.EAE == 1.

AArch64 System register MAIR\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [NMRR\[31:0\]](#) when TTBCR.EAE == 0.

AArch64 System register MAIR\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [MAIR1\[31:0\]](#) when TTBCR.EAE == 1.

## Attributes

MAIR\_EL1 is a 64-bit register.

## Field descriptions

The MAIR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">Attr7</a>								<a href="#">Attr6</a>								<a href="#">Attr5</a>								<a href="#">Attr4</a>							
<a href="#">Attr3</a>								<a href="#">Attr2</a>								<a href="#">Attr1</a>								<a href="#">Attr0</a>							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MAIR\_EL1 is permitted to be cached in a TLB.

### Attr<n>, bits [8n+7:8n], for n = 7 to 0

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where AttrIdx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

<b>Attr</b>	<b>Meaning</b>
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0boooooiii, (oooo != 0000 and iiii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b01000000	If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000	If FEAT_MTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111)	UNPREDICTABLE.

'dd' is encoded as follows:

<b>dd</b>	<b>Meaning</b>
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

<b>'oooo'</b>	<b>Meaning</b>
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

<b>'iiii'</b>	<b>Meaning</b>
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the MAIR\_EL1

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic MAIR\_EL1 or MAIR\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

MRS <Xt>, MAIR\_EL1

# MAIR\_EL2, Memory Attribute Indirection Register (EL2)

The MAIR\_EL2 characteristics are:

## Purpose

Provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

## Configuration

AArch64 System register MAIR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HMAIR0\[31:0\]](#).

AArch64 System register MAIR\_EL2 bits [63:32] are architecturally mapped to AArch32 System register [HMAIR1\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MAIR\_EL2 is a 64-bit register.

## Field descriptions

The MAIR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Attr7								Attr6								Attr5								Attr4							
Attr3								Attr2								Attr1								Attr0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MAIR\_EL2 is permitted to be cached in a TLB.

### Attr<n>, bits [8n+7:8n], for n = 7 to 0

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where AttrIdx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

<b>Attr</b>	<b>Meaning</b>
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0b0000iiii, (oooo != 0000 and iiii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b01000000	If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000	If FEAT_MTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111)	UNPREDICTABLE.

'dd' is encoded as follows:

<b>dd</b>	<b>Meaning</b>
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

<b>'oooo'</b>	<b>Meaning</b>
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

<b>'iiii'</b>	<b>Meaning</b>
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the MAIR\_EL2

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic MAIR\_EL2 or MAIR\_EL1 is not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings:

# MAIR\_EL3, Memory Attribute Indirection Register (EL3)

The MAIR\_EL3 characteristics are:

## Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL3.

## Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to MAIR\_EL3 are UNDEFINED.

## Attributes

MAIR\_EL3 is a 64-bit register.

## Field descriptions

The MAIR\_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Attr7								Attr6								Attr5								Attr4							
Attr3								Attr2								Attr1								Attr0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MAIR\_EL3 is permitted to be cached in a TLB.

### Attr<n>, bits [8n+7:8n], for n = 7 to 0

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where AttrIndx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

<b>Attr</b>	<b>Meaning</b>
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0boooooiii, (oooo != 0000 and iiii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b01000000	If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000	If FEAT_MTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111)	UNPREDICTABLE.

'dd' is encoded as follows:

<b>dd</b>	<b>Meaning</b>
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

<b>'oooo'</b>	<b>Meaning</b>
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

<b>'iiii'</b>	<b>Meaning</b>
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the MAIR\_EL3

Accesses to this register use the following encodings:

MRS <Xt>, MAIR\_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MAIR_EL3;
```

MSR MAIR\_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MAIR_EL3 = X[t];
```

# MDCCINT\_EL1, Monitor DCC Interrupt Enable Register

The MDCCINT\_EL1 characteristics are:

## Purpose

Enables interrupt requests to be signaled based on the DCC status flags.

## Configuration

AArch64 System register MDCCINT\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGDCCINTI31:0I](#).

## Attributes

MDCCINT\_EL1 is a 64-bit register.

## Field descriptions

The MDCCINT\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0	RX	TX	RES0																												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:31]

Reserved, RES0.

### RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

RX	Meaning
0b0	No interrupt request generated by DTRRX.
0b1	Interrupt request will be generated on RXfull == 1.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

On a Warm reset, this field resets to 0.

### TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

TX	Meaning
0b0	No interrupt request generated by DTRTX.
0b1	Interrupt request will be generated on TXfull == 0.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

On a Warm reset, this field resets to 0.

**Bits [28:0]**

Reserved, RES0.

**Accessing the MDCCINT\_EL1**

Accesses to this register use the following encodings:

MRS &lt;Xt&gt;, MDCCINT\_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0010	0b000

# MDCR\_EL2, Monitor Debug Configuration Register (EL2)

The MDCR\_EL2 characteristics are:

## Purpose

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

## Configuration

AArch64 System register MDCR\_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HDCR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MDCR\_EL2 is a 64-bit register.

## Field descriptions

The MDCR\_EL2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38
RES0																									
RES0	HPMFZO	MTPME	TDCC	HLP	RES0	HCCD	RES0	TTRF	RES0	HPMD	RES0	TPMS	E2PB	TDRA	TDOSA	TDAT	TDE	HPME	TPMT	TPM	TPM	TPM	TPM	TPM	TPM
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6

### Bits [63:37]

Reserved, RES0.

### HPMFZS, bit [36]

When FEAT\_SPEv1p2 is implemented:

Hyp Performance Monitors Freeze-on-SPE event. Stop counters when [PMBLIMITR\\_EL1](#).{PMFZ, E} == {1, 1} and [PMBSR\\_EL1](#).S == 0b1.

HPMFZS	Meaning
0b0	Do not freeze on Statistical Profiling Buffer Management event.
0b1	Event counters do not count following a Statistical Profiling Buffer Management event.

If MDCR\_EL2.HPMN is less than [PMCR\\_EL0](#).N, this bit affects the operation of event counters in the range [MDCR\_EL2.HPMN .. ([PMCR\\_EL0](#).N-1)].

If MDCR\_EL2.HPMN is equal to [PMCR\\_EL0](#).N, this bit has no effect.

This bit does not affect the operation of event counters in the range [0 .. (MDCR\_EL2.HPMN-1)] and [PMCCNTR\\_EL0](#).

The operation of this bit applies even when EL2 is disabled in the current Security state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [35:30]**

Reserved, RES0.

**HPMFZO, bit [29]****When FEAT\_PMUv3p7 is implemented:**

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

HPMFZO	Meaning
0b0	Do not freeze on overflow.
0b1	Event counters do not count when <a href="#">PMOVSLR_EL0</a> [( <a href="#">PMCR_EL0</a> .N-1):MDCR_EL2.HPMN] is nonzero.

If MDCR\_EL2.HPMN is less than [PMCR\\_EL0](#).N, this bit affects the operation of event counters in the range [MDCR\_EL2.HPMN .. ([PMCR\\_EL0](#).N-1)].

If MDCR\_EL2.HPMN is equal to [PMCR\\_EL0](#).N, this bit has no effect.

This bit does not affect the operation of event counters in the range [0 .. (MDCR\_EL2.HPMN-1)] and [PMCCNTR\\_EL0](#).

The operation of this bit ignores the values of [PMOVSLR\\_EL0](#)[(MDCR\_EL2.HPMN-1):0].

The operation of this bit applies even when EL2 is disabled in the current Security state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**MTPME, bit [28]****When FEAT\_MTPMU is implemented and EL3 is not implemented:**

Multi-threaded PMU Enable. Enables use of the [PMEVTYPER<n>\\_EL0](#).MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of <a href="#">PMEVTYPER&lt;n&gt;_EL0</a> .MT is zero.
0b1	<a href="#">PMEVTYPER&lt;n&gt;_EL0</a> .MT bits not affected by this bit.

If FEAT\_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0b0.

On a Cold reset, this field resets to 1.

**Otherwise:**

Reserved, RES0.

**TDCC, bit [27]****When FEAT\_FGT is implemented:**

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Trap exception to EL2, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: [OSDTRRX\\_EL1](#), [OSDTRTX\\_EL1](#), [MDCCSR\\_EL0](#), [MDCCINT\\_EL1](#), and, when the PE is in Non-debug state, [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#).

AArch32: [DBGDTRRXext](#), [DBGDTRTXext](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR\_EL2.TDCC does not trap any accesses to:

AArch64: [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#).

AArch32: [DBGDTRRXint](#) and [DBGDTRTXint](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### HLP, bit [26]

##### When FEAT\_PMUv3p5 is implemented:

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

HLP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> [31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> [63:0].

If MDCR\_EL2.HPMN is less than [PMCR\\_EL0](#).N or [PMCR](#).N, this bit affects the operation of event counters in the range [MDCR\_EL2.HPMN..([PMCR\\_EL0](#).N-1)] or [MDCR\_EL2.HPMN..([PMCR](#).N-1)]. Otherwise this bit has no effect on the operation of the event counters.

#### Note

The effect of MDCR\_EL2.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the MDCR\_EL2.HPMN field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

**Bits [25:24]**

Reserved, RES0.

**HCCD, bit [23]**

**When FEAT\_PMUv3p5 is implemented:**

Hypervisor Cycle Counter Disable. Prohibits [PMCCNTR\\_EL0](#) from counting at EL2.

HCCD	Meaning
0b0	Cycle counting by <a href="#">PMCCNTR_EL0</a> is not affected by this bit.
0b1	Cycle counting by <a href="#">PMCCNTR_EL0</a> is prohibited at EL2.

This bit does not affect the CPU\_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [22:20]**

Reserved, RES0.

**TTRF, bit [19]**

**When FEAT\_TRF is implemented:**

Traps use of the Trace Filter Control registers at EL1 to EL2, as follows:

- Access to [TRFCR\\_EL1](#) is trapped to EL2, reported using EC syndrome value 0x18.
- Access to [TRFCR](#) is trapped to EL2, reported using EC syndrome value 0x03.

TTRF	Meaning
0b0	Accesses to <a href="#">TRFCR_EL1</a> and <a href="#">TRFCR</a> at EL1 are not affected by this control.
0b1	Accesses to <a href="#">TRFCR_EL1</a> and <a href="#">TRFCR</a> at EL1 generate a trap exception to EL2 when EL2 is enabled in the current Security state.

**Otherwise:**

Reserved, RES0.

**Bit [18]**

Reserved, RES0.

**HPMD, bit [17]**

**When FEAT\_PMUv3p1 is implemented:**

Guest Performance Monitors Disable. This control prohibits event counting at EL2.

HPMD	Meaning
0b0	Event counting allowed at EL2.
0b1	Event counting prohibited at EL2. If FEAT_Debugv8p2 is not implemented, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().

This control applies only to:

- The event counters in the range [0..(MDCR\_EL2.HPMN-1)].
- If [PMCR\\_EL0.DP](#) is set to 1, [PMCCNTR\\_EL0](#).

The other event counters are unaffected, and when [PMCR\\_EL0.DP](#) is set to 0, [PMCCNTR\\_EL0](#) is unaffected.

On a Warm reset, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### Bits [16:15]

Reserved, RES0.

#### TPMS, bit [14]

##### When FEAT\_SPE is implemented:

Trap Performance Monitor Sampling. If EL2 is implemented and enabled in the current Security state, controls access to Statistical Profiling control registers from EL1.

TPMS	Meaning
0b0	Do not trap Statistical Profiling controls to EL2.
0b1	If EL2 is implemented and enabled in the current Security state, accesses to Statistical Profiling control registers at EL1 generate a Trap exception to EL2.

The Statistical Profiling control registers trapped by this control are:

- [PMSCR\\_EL1](#), [PMSEVFR\\_EL1](#), [PMSFCR\\_EL1](#), [PMSICR\\_EL1](#), [PMSIDR\\_EL1](#), [PMSIRR\\_EL1](#), and [PMSLATFR\\_EL1](#).
- If FEAT\_SPEv1p2 is implemented, [PMSNEVFR\\_EL1](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### E2PB, bits [13:12]

##### When FEAT\_SPE is implemented:

EL2 Profiling Buffer. If EL2 is implemented and enabled in the Profiling Buffer owning Security state, this field controls the owning translation regime. If EL2 is implemented and enabled in the current Security state, this field controls access to Profiling Buffer control registers from EL1.

<b>E2PB</b>	<b>Meaning</b>
0b00	If EL2 is implemented and enabled in the Profiling Buffer owning Security state, the Profiling Buffer uses the EL2 or EL2&0 stage 1 translation regime. Otherwise the Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.
0b10	Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.
0b11	Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer control registers at EL1 are not trapped to EL2.

All other values are reserved.

The Profiling Buffer control registers trapped by this control are: [PMBLIMITR\\_EL1](#), [PMBPTR\\_EL1](#), and [PMBSR\\_EL1](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### TDRA, bit [11]

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to [MDRAR\\_EL1](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 or EL1 is using AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05 and MRRC or MCRR accesses are trapped to EL2, reported using EC syndrome value 0x0C:
  - [DBGDRAR](#), [DBGDSAR](#).

<b>TDRA</b>	<b>Meaning</b>
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by <a href="#">DBGDSCRext</a> .UDCCdis or <a href="#">MDSCR_EL1</a> .TDCC.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR\\_EL2](#).TDE == 1.
- [HCR\\_EL2](#).TGE == 1.

#### Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### TDOSA, bit [10]

##### When FEAT\_DoubleLock is implemented:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - [OSLAR\\_EL1](#), [OSLSR\\_EL1](#), [OSDLR\\_EL1](#), and [DBGPRCR\\_EL1](#).
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
  - [DBGOSLSR](#), [DBGOSLAR](#), [DBGOSDLR](#), and [DBGPRCR](#).
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

#### Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR\\_EL2](#).TDE == 1.
- [HCR\\_EL2](#).TGE == 1.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - [OSLAR\\_EL1](#), [OSLSR\\_EL1](#), and [DBGPRCR\\_EL1](#).
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
  - [DBGOSLSR](#), [DBGOSLAR](#), and [DBGPRCR](#).
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to [OSDLR\\_EL1](#) are trapped.

It is IMPLEMENTATION DEFINED whether accesses to [DBGOSDLR](#) are trapped.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

#### Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR\\_EL2.TDE](#) == 1.
- [HCR\\_EL2.TGE](#) == 1.

**Note**

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDA, bit [9]**

Trap Debug Access. Traps EL0 and EL1 System register accesses to debug System registers that are not trapped by MDCR\_EL2.TDRA or MDCR\_EL2.TDOSA, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x18:
  - [MDCCSR\\_EL0](#), [MDCCINT\\_EL1](#), [OSDTRRX\\_EL1](#), [MDSCR\\_EL1](#), [OSDTRTX\\_EL1](#), [OSECCR\\_EL1](#), [DBGBVR<n>\\_EL1](#), [DBGBCR<n>\\_EL1](#), [DBGWVR<n>\\_EL1](#), [DBGWCR<n>\\_EL1](#), [DBGCLAIMSET\\_EL1](#), [DBGCLAIMCLR\\_EL1](#), [DBGAUTHSTATUS\\_EL1](#).
  - When not in Debug state, [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), [DBGDTRTX\\_EL0](#).
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05.
  - [DBGDIDR](#), [DBGDSCRint](#), [DBGDCCINT](#), [DBGWFAR](#), [DBGVCR](#), [DBGDSCRext](#), [DBGDTRTXext](#), [DBGDTRRXext](#), [DBGBVR<n>](#), [DBGBCR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#), [DBGCLAIMSET](#), [DBGCLAIMCLR](#), [DBGAUTHSTATUS](#), [DBGDEVID](#), [DBGDEVID1](#), [DBGDEVID2](#), [DBGOSECCR](#).
  - When not in Debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).
- In AArch32 state, STC accesses to [DBGDTRRXint](#) and LDC accesses to [DBGDTRTXint](#) are trapped to EL2, reported using EC syndrome value 0x06.

TDA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 or EL1 System register accesses to the debug registers are trapped from both Execution states to EL2 when EL2 is enabled in the current Security state, unless the access generates a higher priority exception.

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

Traps of AArch64 accesses to [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#) are ignored in Debug state.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR\\_EL2.TDE](#) == 1
- [HCR\\_EL2.TGE](#) == 1

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDE, bit [8]**

Trap Debug Exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL<sub>D</sub>.

TDE	Meaning
0b0	The debug target Exception level is EL1.
0b1	If EL2 is enabled for the current Effective value of <a href="#">SCR_EL3.NS</a> , the debug target Exception level is EL2, otherwise the debug target Exception level is EL1. The MDCR_EL2.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

For more information, see 'Routing debug exceptions'.

This field is treated as being 1 for all purposes other than a direct read when [HCR\\_EL2.TGE](#) == 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## HPME, bit [7]

When FEAT\_PMUv3 is implemented:

[MDCR\_EL2.HPMN..(N-1)] event counters enable.

HPME	Meaning
0b0	Event counters in the range [MDCR_EL2.HPMN.. <a href="#">PMCR_EL0.N-1</a> ] are disabled.
0b1	Event counters in the range [MDCR_EL2.HPMN.. <a href="#">PMCR_EL0.N-1</a> ] are enabled by <a href="#">PMCNTENSET_EL0</a> .

If MDCR\_EL2.HPMN is less than [PMCR\\_EL0.N](#) or [PMCR.N](#), the event counters in the range [MDCR\_EL2.HPMN..[PMCR\\_EL0.N-1](#)] or [HDCR.HPMN..[PMCR.N-1](#)], are enabled and disabled by this bit. Otherwise this bit has no effect on the operation of the event counters.

### Note

The effect of MDCR\_EL2.HPMN on the operation of this bit applies regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HPMN field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

## TPM, bit [6]

When FEAT\_PMUv3 is implemented:

Trap Performance Monitors accesses. Traps EL0 and EL1 accesses to all Performance Monitor registers to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - [PMCR\\_EL0](#), [PMCNTENSET\\_EL0](#), [PMCNTENCLR\\_EL0](#), [PMOVSCCLR\\_EL0](#), [PMSWINC\\_EL0](#), [PMSELR\\_EL0](#), [PMCEID0\\_EL0](#), [PMCEID1\\_EL0](#), [PMCCNTR\\_EL0](#), [PMXEVTYPER\\_EL0](#), [PMXVCNTR\\_EL0](#), [PMUSERENR\\_EL0](#), [PMINTENSET\\_EL1](#), [PMINTENCLR\\_EL1](#), [PMOVSSET\\_EL0](#), [PMEVCNTR<n>\\_EL0](#), [PMEVTYPER<n>\\_EL0](#), [PMCCFILTR\\_EL0](#).
  - If FEAT\_PMUv3p4 is implemented, [PMMIR\\_EL1](#)
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, MRRC or MCRR accesses are trapped to EL2 and reported using EC syndrome value 0x04:
  - [PMCR](#), [PMCNTENSET](#), [PMCNTENCLR](#), [PMOVSCLR](#), [PMSWINC](#), [PMSELR](#), [PMCEID0](#), [PMCEID1](#), [PMCCNTR](#), [PMXEVTYPER](#), [PMXVCNTR](#), [PMUSERENR](#), [PMINTENSET](#), [PMINTENCLR](#), [PMOVSSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMCCFILTR](#).
  - If FEAT\_PMUv3p4 is implemented, [PMMIR](#).
  - If FEAT\_PMUv3p1 is implemented, [PMCEID2](#), and [PMCEID3](#).

TPM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 accesses to all Performance Monitor registers are trapped to EL2 when EL2 is enabled in the current Security state.

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TPMCR, bit [5]****When FEAT\_PMUv3 is implemented:**

Trap [PMCR\\_ELO](#) or [PMCR](#) accesses. Traps EL0 and EL1 accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [PMCR\\_ELO](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, accesses to [PMCR](#) are trapped to EL2, reported using EC syndrome value 0x03.

TPMCR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 accesses to the <a href="#">PMCR_ELO</a> or <a href="#">PMCR</a> are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by <a href="#">PMUSERENR</a> .EN or <a href="#">PMUSERENR_ELO</a> .EN.

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HPMN, bits [4:0]****When FEAT\_PMUv3 is implemented:**

Defines the number of event counters that are accessible from EL3, EL2, EL1, and from EL0 if permitted.

If HPMN is less than [PMCR\\_ELO](#).N, HPMN divides the Performance Monitors into two ranges: [0..(HPMN-1)] and [HPMN..([PMCR\\_ELO](#).N-1)].

For an event counter in the range [0..(HPMN-1)]:

- The counter is accessible from EL3, EL2, and EL1, and from EL0 if permitted by [PMUSERENR\\_ELO](#) or [PMUSERENR](#).
- If FEAT\_PMUv3p5 is implemented, [PMCR\\_ELO](#).LP or [PMCR](#).LP determines whether the counter overflow flag is set on unsigned overflow of [PMEVCNTR<n>\\_ELO](#)[31:0] or [PMEVCNTR<n>\\_ELO](#)[63:0].
- The counter is enabled by [PMCR\\_ELO](#).E or [PMCR](#).E and bit <n> of [PMCNTENSET\\_ELO](#).

**Note**

If HPMN is equal to [PMCR\\_ELO](#).N, this applies to all event counters.

If HPMN is less than [PMCR\\_ELO](#).N, for an event counter in the range [HPMN..([PMCR\\_ELO](#).N-1)]:

- The counter is accessible from EL2 and EL3.
- If FEAT\_SEL2 is disabled or is not implemented, the counter is also accessible from Secure EL1, and from Secure EL0 if permitted by [PMUSERENR\\_EL0](#).
- If FEAT\_PMUv3p5 is implemented, MDCR\_EL2.HLP or [HDCR](#).HLP determines whether the counter overflow flag is set on unsigned overflow of [PMEVCNTR<n>\\_EL0](#)[31:0] or [PMEVCNTR<n>\\_EL0](#)[63:0].
- The counter is enabled by MDCR\_EL2.HPME or [HDCR](#).HPME and bit <n> of [PMCNTENSET\\_EL0](#).

If this field is set to 0, or to a value larger than [PMCR\\_EL0](#).N, then the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of MDCR\_EL2.HPMN is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 and EL3 use. That is, the PE behaves as if MDCR\_EL2.HPMN is set to an UNKNOWN non-zero value less than or equal to [PMCR\\_EL0](#).N.
  - All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.

On a Warm reset, this field resets to the value in [PMCR\\_EL0](#).N.

#### Otherwise:

Reserved, RES0.

## Accessing the MDCR\_EL2

Accesses to this register use the following encodings:

MRS <Xt>, MDCR\_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elsif HaveEL(EL3) && MDCR_EL3.TDA == '1' then

# MDCR\_EL3, Monitor Debug Configuration Register (EL3)

The MDCR\_EL3 characteristics are:

## Purpose

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

## Configuration

AArch64 System register MDCR\_EL3 bits [31:0] can be mapped to AArch32 System register [SDCR\[31:0\]](#), but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to MDCR\_EL3 are UNDEFINED.

## Attributes

MDCR\_EL3 is a 64-bit register.

## Field descriptions

The MDCR\_EL3 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	
RES0																												EnPM
RES0	MTPME	TDCC	RES0	SCCD	RES0	EPMA	EDAD	TTRF	STE	SPME	SDD	SPD32	NSPB	RES0	TDOSA	TDARES0	TPM											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	

### Bits [63:37]

Reserved, RES0.

### EnPMSN, bit [36]

When FEAT\_SPEv1p2 is implemented:

Trap accesses to [PMSNEVFR\\_EL1](#). Controls access to Statistical Profiling [PMSNEVFR\\_EL1](#) System register from EL2 and EL1.

EnPMSN	Meaning
0b0	Accesses to <a href="#">PMSNEVFR_EL1</a> at EL2 and EL1 generate a Trap exception to EL3.
0b1	Do not trap <a href="#">PMSNEVFR_EL1</a> to EL3.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

**MPMX, bit [35]****When FEAT\_PMUv3p7 is implemented:**

Monitor Performance Monitors Extended control. In conjunction with MDCR\_EL3.SPME, controls when event counters are disabled at EL3 and in other Secure Exception levels.

MPMX	Meaning
0b0	Event counting is not affected by this bit.
0b1	Event counting by some or all event counters is prohibited at EL3.

If EL2 is implemented, MDCR\_EL3.SPME == 0b1, and [MDCR\\_EL2.HPMN](#) is less than [PMCR\\_EL0.N](#) then all the following are true:

- This bit affects the operation of event counters in the range [0 .. ([MDCR\\_EL2.HPMN](#)-1)].
- This bit does not affect the operation of event counters in the range [[MDCR\\_EL2.HPMN](#) .. ([PMCR\\_EL0.N](#)-1)].
- This applies even when EL2 is disabled in Secure state.

If EL2 is not implemented, MDCR\_EL3.SPME == 0b0, or [MDCR\\_EL2.HPMN](#) is equal to [PMCR\\_EL0.N](#) then this bit affects the operation of all event counters.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**MCCD, bit [34]****When FEAT\_PMUv3p7 is implemented:**

Monitor Cycle Counter Disable. Prohibits the Cycle Counter, [PMCCNTR\\_EL0](#), from counting at EL3.

MCCD	Meaning
0b0	Cycle counting by <a href="#">PMCCNTR_EL0</a> is not affected by this bit.
0b1	Cycle counting by <a href="#">PMCCNTR_EL0</a> is prohibited at EL3.

This bit does not affect the CPU\_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [33:29]**

Reserved, RES0.

**MTPME, bit [28]****When FEAT\_MTPMU is implemented:**

Multi-threaded PMU Enable. Enables use of the [PMEVTYPER<n>\\_EL0](#).MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of <a href="#">PMEVTYPER&lt;n&gt;_EL0</a> .MT is zero.
0b1	<a href="#">PMEVTYPER&lt;n&gt;_EL0</a> .MT bits not affected by this bit.

If FEAT\_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0b0.

On a Cold reset, this field resets to 1.

**Otherwise:**

Reserved, RES0.

**TDCC, bit [27]****When FEAT\_FGT is implemented:**

Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: [OSDTRRX\\_EL1](#), [OSDTRTX\\_EL1](#), [MDCCSR\\_EL0](#), [MDCCINT\\_EL1](#), and, when the PE is in Non-debug state, [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#).

AArch32: [DBGDTRRXext](#), [DBGDTRTXext](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR\_EL3.TDCC does not trap any accesses to:

AArch64: [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#).

AArch32: [DBGDTRRXint](#) and [DBGDTRTXint](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [26:24]**

Reserved, RES0.

**SCCD, bit [23]****When FEAT\_PMUv3p5 is implemented:**

Secure Cycle Counter Disable. Prohibits [PMCCNTR\\_EL0](#) from counting in Secure state.

SCCD	Meaning
0b0	Cycle counting by <a href="#">PMCCNTR_EL0</a> is not affected by this bit.
0b1	Cycle counting by <a href="#">PMCCNTR_EL0</a> is prohibited in Secure state.

This bit does not affect the CPU\_CYCLES event or any other event that counts cycles.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [22]**

Reserved, RES0.

**EPMAD, bit [21]****When FEAT\_Debugv8p4 is implemented and FEAT\_PMUv3 is implemented:**

External Performance Monitors Non-secure Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

EPMAD	Meaning
0b0	Non-secure access to Performance Monitor registers from external debugger is permitted.
0b1	Non-secure access to Performance Monitor registers from external debugger is not permitted.

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

**When FEAT\_PMUv3 is implemented:**

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

EPMAD	Meaning
0b0	Access to Performance Monitor registers from external debugger is permitted.
0b1	Access to Performance Monitor registers from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**EDAD, bit [20]****When FEAT\_Debugv8p4 is implemented:**

External Debug Non-secure Access Disable. Controls Non-secure access to breakpoint, watchpoint, and [OSLAR\\_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Non-secure access to debug registers from external debugger is permitted.
0b1	Non-secure access to breakpoint and watchpoint registers, and <a href="#">OSLAR_EL1</a> from external debugger is not permitted.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, this field resets to 0.

**When FEAT\_Debugv8p2 is implemented:**

External Debug Access Disable. Controls access to breakpoint, watchpoint, and [OSLAR\\_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers, and to <a href="#">OSLAR_EL1</a> from external debugger is permitted.
0b1	Access to breakpoint and watchpoint registers, and to <a href="#">OSLAR_EL1</a> from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, this field resets to 0.

**Otherwise:**

External Debug Access disable. Controls access to breakpoint, watchpoint, and optionally [OSLAR\\_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers from external debugger is permitted.
0b1	Access to breakpoint and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the <a href="#">OSLAR_EL1</a> register from an external debugger is permitted or not permitted.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, this field resets to 0.

**TTRF, bit [19]**

**When FEAT\_TRF is implemented:**

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

The Trace Filter registers trapped by this control are:

- [TRFCR\\_EL2](#), TRFCR\_EL12, [TRFCR\\_EL1](#), reported using EC syndrome value 0x18.
- [HTRFCR](#) and [TRFCR](#), reported using EC syndrome value 0x03.

TTRF	Meaning
0b0	Accesses to Trace Filter registers at EL2 and EL1 are not affected by this bit.
0b1	Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception.

**Otherwise:**

Reserved, RES0.

**STE, bit [18]**

**When FEAT\_TRF is implemented:**

Secure Trace enable. Enables tracing in Secure state.

STE	Meaning
0b0	Trace prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Secure state is not affected by this bit.

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**SPME, bit [17]****When FEAT\_PMUv3 is implemented and FEAT\_PMUv3p7 is implemented:**

Secure Performance Monitors Enable.

Controls event counting in Secure state and EL3.

When MDCR\_EL3.MPMX == 0b1, this bit affects the operation of event counters at EL3 only. See MDCR\_EL3.MPMX for more information.

SPME	Meaning
0b0	When MDCR_EL3.MPMX == 0b0: Event counting prohibited in Secure state.
0b1	When MDCR_EL3.MPMX == 0b0: Event counting in Secure state not affected by this bit.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

**When FEAT\_PMUv3 is implemented and FEAT\_Debugv8p2 is implemented:**

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
0b0	Event counting prohibited in Secure state.
0b1	Event counting in Secure state not affected by this bit.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

**When FEAT\_PMUv3 is implemented:**

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
0b0	Event counting prohibited in Secure state, unless ExternalSecureNoninvasiveDebugEnabled() is TRUE.
0b1	Event counting in Secure state not affected by this bit.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**SDD, bit [16]**

AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

SDD	Meaning
0b0	Debug exceptions in Secure state are not affected by this bit.
0b1	Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of [SCR\\_EL3.RW](#) is 0b1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SPD32, bits [15:14]**

**When EL1 is capable of using AArch32:**

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

SPD32	Meaning
0b00	Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.
0b10	Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.
0b11	Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored if the PE is either:

- In Non-secure state.
- In Secure state and Secure EL1 is using AArch64.

If Secure EL1 is using AArch32 then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of [SDER32\\_EL3.SUIDEN](#) is 0b1.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, then the Effective value of this field is 0b11.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**NSPB, bits [13:12]****When FEAT\_SPE is implemented:**

Non-secure Profiling Buffer. Controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

NSPB	Meaning
0b00	Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in both Security states generate Trap exceptions to EL3.
0b01	Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.
0b10	Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in both Security states generate Trap exceptions to EL3.
0b11	Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.

The Statistical Profiling and Profiling Buffer control registers trapped by this control are:

- [PMBLIMTR\\_EL1](#), [PMBPTR\\_EL1](#), [PMBSR\\_EL1](#), [PMSCR\\_EL1](#), [PMSCR\\_EL2](#), [PMSCR\\_EL12](#), [PMSEVFR\\_EL1](#), [PMSFCR\\_EL1](#), [PMSICR\\_EL1](#), [PMSIDR\\_EL1](#), [PMSIRR\\_EL1](#), and [PMSLATFR\\_EL1](#).
- If FEAT\_SPEv1p2 is implemented, [PMSNEVFR\\_EL1](#).

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b1, the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of [SCR\\_EL3.NS](#) is 0b0, the Effective value of this field is 0b01.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [11]**

Reserved, RES0.

**TDOSA, bit [10]****When FEAT\_DoubleLock is implemented:**

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:

- Accesses from AArch64 state, [OSLAR\\_EL1](#), [OSLSR\\_EL1](#), [OSDLR\\_EL1](#), [DBGPRCR\\_EL1](#) and any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit, are trapped to EL3 and reported using EC syndrome value 0x18.
- Accesses using MCR or MRC to [DBGOSLAR](#), [DBGOSLSR](#), [DBGOSDLR](#), and [DBGPRCR](#), are trapped to EL3 and reported using EC syndrome value 0x05.
- Accesses to any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by <a href="#">HDCR.TDOSA</a> or <a href="#">MDCR_EL2.TDOSA</a> .

**Note**

The powerdown debug registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:

- AArch64: [OSLAR\\_EL1](#), [OSLSR\\_EL1](#), and [DBGPRCR\\_EL1](#).
- AArch32: [DBGOSLAR](#), [DBGOSLSR](#), and [DBGPRCR](#).
- AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- It is IMPLEMENTATION DEFINED whether accesses to [OSDLR\\_EL1](#) and [DBGOSDLR](#) are trapped.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by <a href="#">HDCR.TDOSA</a> or <a href="#">MDCR_EL2.TDOSA</a> .

**Note**

The powerdown debug registers are not accessible at EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDA, bit [9]**

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the MDCR\_EL3.TDOSA field.

Accesses to the debug registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported using EC syndrome value 0x18:
  - [DBGBVR<n>\\_EL1](#), [DBGBCR<n>\\_EL1](#), [DBGWVR<n>\\_EL1](#), [DBGWCR<n>\\_EL1](#), [DBGCLAIMSET\\_EL1](#), [DBGCLAIMCLR\\_EL1](#), [DBGAUTHSTATUS\\_EL1](#), [DBGVCR32\\_EL2](#).
  - AArch64: [MDCR\\_EL2](#), [MDRAR\\_EL1](#), [MDCCSR\\_EL0](#), [MDCCINT\\_EL1](#), [MDSCR\\_EL1](#), [OSDTRRX\\_EL1](#), [OSDTRTX\\_EL1](#), [OSECCR\\_EL1](#).
- In AArch32 state, [SDER](#) is trapped to EL3 and reported using EC syndrome value 0x03.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x05, accesses using MCRR or MRRC are reported using EC syndrome value 0x0C:
  - [HDCR](#), [DBGDRAR](#), [DBGDSAR](#), [BGDIDR](#), [DBGDCCINT](#), [DBGWFAR](#), [DBGVCR](#), [DBGBVR<n>](#), [DBGBCR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#).
  - [DBGCLAIMSET](#), [DBGCLAIMCLR](#), [DBGAUTHSTATUS](#), [DBGDEVID](#), [DBGDEVID1](#), [DBGDEVID2](#), [DBGOSECCR](#).
- In AArch32 state, STC accesses to [DBGDTRRXint](#) and LDC accesses to [DBGDTRTXint](#) are reported using EC syndrome value 0x06.
- When not in Debug state, the following registers are also trapped to EL3:
  - AArch64 accesses to [DBGDTR\\_EL0](#), [DBGDTRRX\\_EL0](#), and [DBGDTRTX\\_EL0](#), reported using EC syndrome value 0x18.
  - AArch32 accesses using MCR or MRC to [DBGDTRRXint](#) and [DBGDTRTXint](#), reported using EC syndrome value 0x05.

TDA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by MDCR_EL3.TDOSA, are trapped to EL3, from both Security states and both Execution states, unless it is trapped by <a href="#">DBGDSCRExt.UDCCdis</a> , <a href="#">MDCR_EL1.TDCC</a> , <a href="#">HDCR.TDA</a> or <a href="#">MDCR_EL2.TDA</a> .

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [8:7]

Reserved, RES0.

#### TPM, bit [6]

When FEAT\_PMuV3 is implemented:

Trap Performance Monitor register accesses. Accesses to all Performance Monitor registers from EL0, EL1 and EL2 to EL3, from both Security states and both Execution states are trapped as follows:

- In AArch64 state, accesses to the following registers are trapped to EL3 and are reported using EC syndrome value 0x18:
  - [PMCR\\_EL0](#), [PMCNTENSET\\_EL0](#), [PMCNTENCLR\\_EL0](#), [PMOVSLR\\_EL0](#), [PMSWINC\\_EL0](#), [PMSELR\\_EL0](#), [PMCEID0\\_EL0](#), [PMCEID1\\_EL0](#), [PMCCNTR\\_EL0](#), [PMXEVTYPER\\_EL0](#), [PMXVCNTR\\_EL0](#), [PMUSERENR\\_EL0](#), [PMINTENSET\\_EL1](#), [PMINTENCLR\\_EL1](#), [PMOVSSET\\_EL0](#), [PMEVCNTR<n>\\_EL0](#), [PMEVTYPER<n>\\_EL0](#), [PMCCFILTR\\_EL0](#).
  - If FEAT\_PMuV3p4 is implemented, [PMMIR\\_EL1](#)
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses using MCRR or MRRC are reported using EC syndrome value 0x04:
  - [PMCR](#), [PMCNTENSET](#), [PMCNTENCLR](#), [PMOVSr](#), [PMSWINC](#), [PMSELR](#), [PMCEID0](#), [PMCEID1](#), [PMCCNTR](#), [PMXEVTYPER](#), [PMXVCNTR](#), [PMUSERENR](#), [PMINTENSET](#), [PMINTENCLR](#), [PMOVSSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMCCFILTR](#).
  - If FEAT\_PMuV3p1 is implemented, [PMCEID2](#), and [PMCEID3](#).
  - If FEAT\_PMuV3p4 is implemented, [PMMIR](#).

TPM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2, EL1, and EL0 System register accesses to all Performance Monitor registers are trapped to EL3, unless it is trapped by <a href="#">HDCR.TPM</a> or <a href="#">MDCR_EL2.TPM</a> .

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bits [5:0]

Reserved, RES0.

## Accessing the MDCR\_EL3

Accesses to this register use the following encodings:

MRS <Xt>, MDCR\_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0011	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MDCR_EL3;

```

MSR MDCR\_EL3, <Xt>

<b>op0</b>	<b>op1</b>	<b>CRn</b>	<b>CRm</b>	<b>op2</b>
0b11	0b110	0b0001	0b0011	0b001

# MDRAR\_EL1, Monitor Debug ROM Address Register

The MDRAR\_EL1 characteristics are:

## Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

## Configuration

AArch64 System register MDRAR\_EL1 bits [63:0] are architecturally mapped to AArch32 System register [DBGDRAR\[63:0\]](#).

## Attributes

MDRAR\_EL1 is a 64-bit register.

## Field descriptions

The MDRAR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
RES0												ROMADDR																									
ROMADDR																		RES0														Valid					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

### Bits [63:52]

Reserved, RES0.

### ROMADDR, bits [51:12]

### ROMADDR encoding when FEAT\_LPA is implemented

39	38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ROMADDR																																							

### ROMADDR, bits [39:0]

The ROM table physical address.

Bits [11:0] of the ROM table physical address are defined to be zero.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

If MDRAR\_EL1.Valid == 0b00, then this field is UNKNOWN.

The upper part of the address value.

If the physical address size in bits (PAsize) is less than 52, then the register bits corresponding to ROMADDR [39:PAsize] are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## ROMADDR encoding when FEAT\_LPA is not implemented or AArch32 is supported at any Exception level

39	38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RES0				ROMADDR																																					

### Bits [39:36]

Reserved, RES0.

### ROMADDR, bits [35:0]

The ROM table physical address.

Bits [11:0] of the ROM table physical address are defined to be zero.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

If MDRAR\_EL1.Valid == 0b00, then this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [11:2]

Reserved, RES0.

### Valid, bits [1:0]

This field indicates whether the ROM Table address is valid.

Valid	Meaning
0b00	ROM Table address is not valid. Software must ignore ROMADDR.
0b11	ROM Table address is valid.

Other values are reserved.

## Accessing the MDRAR\_EL1

Accesses to this register use the following encodings:

MRS <Xt>, MDRAR\_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

# MDSCR\_EL1, Monitor Debug System Control Register

The MDSCR\_EL1 characteristics are:

## Purpose

Main control register for the debug implementation.

## Configuration

AArch64 System register MDSCR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGDSCRext\[31:0\]](#).

## Attributes

MDSCR\_EL1 is a 64-bit register.

## Field descriptions

The MDSCR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TFO	RXfull	TXfull	RES0	RX0	TX0	RES0	INTdis	TDARE	RES0	SC2	RAZ/WI	MDE	HDE	KDE	TDCC	RES0	ERR	RES0	SS												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### TFO, bit [31]

When FEAT\_TRF is implemented:

Trace Filter override. Used for save/restore of [EDSCR.TFO](#).

When [OSLSR\\_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.TFO](#). Reads and writes of this bit are indirect accesses to [EDSCR.TFO](#).

Accessing this field has the following behavior:

- When [OSLSR\\_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR\\_EL1.OSLK](#) == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

### RXfull, bit [30]

Used for save/restore of [EDSCR.RXfull](#).

When [OSLSR\\_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.RXfull](#). Reads and writes of this bit are indirect accesses to [EDSCR.RXfull](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR\\_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR\\_EL1.OSLK](#) == 0, access to this field is **RO**.

### **TXfull, bit [29]**

Used for save/restore of [EDSCR.TXfull](#).

When [OSLSR\\_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.TXfull](#). Reads and writes of this bit are indirect accesses to [EDSCR.TXfull](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR\\_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR\\_EL1.OSLK](#) == 0, access to this field is **RO**.

### **Bit [28]**

Reserved, RES0.

### **RXO, bit [27]**

Used for save/restore of [EDSCR.RXO](#).

When [OSLSR\\_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.RXO](#). Reads and writes of this bit are indirect accesses to [EDSCR.RXO](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR\\_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR\\_EL1.OSLK](#) == 0, access to this field is **RO**.

### **TXU, bit [26]**

Used for save/restore of [EDSCR.TXU](#).

When [OSLSR\\_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.TXU](#). Reads and writes of this bit are indirect accesses to [EDSCR.TXU](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR\\_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR\\_EL1.OSLK](#) == 0, access to this field is **RO**.

### **Bits [25:24]**

Reserved, RES0.

**INTdis, bits [23:22]**

Used for save/restore of [EDSCR](#).INTdis.

When [OSLSR\\_EL1](#).OSLK == 0, and software must treat this bit as UNK/SBZP.

When [OSLSR\\_EL1](#).OSLK == 1, this field holds the value of [EDSCR](#).INTdis. Reads and writes of this field are indirect accesses to [EDSCR](#).INTdis.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR\\_EL1](#).OSLK == 1, access to this field is **RW**.
- When [OSLSR\\_EL1](#).OSLK == 0, access to this field is **RO**.

**TDA, bit [21]**

Used for save/restore of [EDSCR](#).TDA.

When [OSLSR\\_EL1](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [OSLSR\\_EL1](#).OSLK == 1, this bit holds the value of [EDSCR](#).TDA. Reads and writes of this bit are indirect accesses to [EDSCR](#).TDA.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR\\_EL1](#).OSLK == 1, access to this field is **RW**.
- When [OSLSR\\_EL1](#).OSLK == 0, access to this field is **RO**.

**Bit [20]**

Reserved, RES0.

**SC2, bit [19]**

**When FEAT\_PCSRv8 is implemented, FEAT\_VHE is implemented and FEAT\_PCSRv8p2 is not implemented:**

Used for save/restore of [EDSCR](#).SC2.

When [OSLSR\\_EL1](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [OSLSR\\_EL1](#).OSLK == 1, this bit holds the value of [EDSCR](#).SC2. Reads and writes of this bit are indirect accesses to [EDSCR](#).SC2.

Accessing this field has the following behavior:

- When [OSLSR\\_EL1](#).OSLK == 1, access to this field is **RW**.
- When [OSLSR\\_EL1](#).OSLK == 0, access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

**Bits [18:16]**

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

**MDE, bit [15]**

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

MDE	Meaning
0b0	Breakpoint, Watchpoint, and Vector Catch exceptions disabled.
0b1	Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**HDE, bit [14]**

Used for save/restore of [EDSCR.HDE](#).

When [OSLSR\\_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.HDE](#). Reads and writes of this bit are indirect accesses to [EDSCR.HDE](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR\\_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR\\_EL1.OSLK](#) == 0, access to this field is **RO**.

**KDE, bit [13]**

Local (kernel) debug enable. If  $EL_D$  is using AArch64, enable debug exceptions within  $EL_D$ . Permitted values are:

KDE	Meaning
0b0	Debug exceptions, other than Breakpoint Instruction exceptions, disabled within $EL_D$ .
0b1	All debug exceptions enabled within $EL_D$ .

RES0 if  $EL_D$  is using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**TDCC, bit [12]**

Traps EL0 accesses to the Debug Communication Channel (DCC) registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR\\_EL2.TGE](#) is 1, from both Execution states, as follows:

- In AArch64 state, MRS or MSR accesses to the following DCC registers are trapped, reported using EC syndrome value 0x18:
  - [MDCCSR\\_EL0](#).
  - If not in Debug state, [DBGDTR\\_EL0](#), [DBGDTRTX\\_EL0](#), and [DBGDTRRX\\_EL0](#).
- In AArch32 state, MRC or MCR accesses to the following registers are trapped, reported using EC syndrome value 0x05.
  - [DBGDSCRint](#), [DBGDIDR](#), [DBGDSAR](#), [DBGDRAR](#).
  - If not in Debug state, [DBGDTRRXint](#), and [DBGDTRTXint](#).
- In AArch32 state, LDC access to [DBGDTRRXint](#) and STC access to [DBGDTRTXint](#) are trapped, reported using EC syndrome value 0x06.
- In AArch32 state, MRRC accesses to [DBGDSAR](#) and [DBGDRAR](#) are trapped, reported using EC syndrome value 0x0C.

TDCC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 using AArch64: EL0 accesses to the AArch64 DCC registers are trapped. EL0 using AArch32: EL0 accesses to the AArch32 DCC registers are trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [11:7]**

Reserved, RES0.

**ERR, bit [6]**

Used for save/restore of [EDSCR.ERR](#).

When [OSLSR\\_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR\\_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.ERR](#). Reads and writes of this bit are indirect accesses to [EDSCR.ERR](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR\\_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR\\_EL1.OSLK](#) == 0, access to this field is **RO**.

**Bits [5:1]**

Reserved, RES0.

**SS, bit [0]**

Software step control bit. If  $EL_D$  is using AArch64, enable Software step. Permitted values are:

SS	Meaning
0b0	Software step disabled
0b1	Software step enabled.

RES0 if  $EL_D$  is using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the MDSCR\_EL1**

Individual fields within this register might have restricted accessibility when [OSLSR\\_EL1.OSLK](#) == 0 (the OS lock is unlocked). See the field descriptions for more detail.

Accesses to this register use the following encodings:

MRS <Xt>, MDSCR\_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0010	0b010

# MIDR\_EL1, Main ID Register

The MIDR\_EL1 characteristics are:

## Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

## Configuration

AArch64 System register MIDR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MIDR\[31:0\]](#).

AArch64 System register MIDR\_EL1 bits [31:0] are architecturally mapped to External register [MIDR\\_EL1\[31:0\]](#).

## Attributes

MIDR\_EL1 is a 64-bit register.

## Field descriptions

The MIDR\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Implementer								Variant				Architecture				PartNum												Revision			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

Hex representation	Implementer
0x00	Reserved for software use
0xC0	Ampere Computing
0x41	Arm Limited
0x42	Broadcom Corporation
0x43	Cavium Inc.
0x44	Digital Equipment Corporation
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation
0x50	Applied Micro Circuits Corporation
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

**Architecture, bits [19:16]**

Architecture version. For A-profile, the defined values are:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers, see 'ID registers'.

All other values are reserved.

**PartNum, bits [15:4]**

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the device.

**Accessing the MIDR\_EL1**

Accesses to this register use the following encodings:

MRS <Xt>, MIDR\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.MIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() then
        return VPIDR_EL2;
    else
        return MIDR_EL1;
elseif PSTATE.EL == EL2 then
    return MIDR_EL1;
elseif PSTATE.EL == EL3 then
    return MIDR_EL1;

```

# MPAM0\_EL1, MPAM0 Register (EL1)

The MPAM0\_EL1 characteristics are:

## Purpose

Holds information to generate MPAM labels for memory requests when executing at EL0. When EL2 is present and enabled, the MPAM virtualization option is present, [MPAMHCR\\_EL2](#).GSTAPP\_PLK == 1 and [HCR\\_EL2](#).TGE == 0, [MPAM1\\_EL1](#) is used instead of MPAM0\_EL1 to generate MPAM information to label memory requests.

If EL2 is present and enabled, and [HCR\\_EL2](#).E2H == 0 or [HCR\\_EL2](#).TGE == 0, the MPAM virtualization option is present and [MPAMHCR\\_EL2](#).ELO\_VPMEN == 1, then MPAM PARTIDs in MPAM0\_EL1 are virtual and mapped into physical PARTIDs for the current Security state.

## Configuration

This register is present only when FEAT\_MPAM is implemented. Otherwise, direct accesses to MPAM0\_EL1 are UNDEFINED.

## Attributes

MPAM0\_EL1 is a 64-bit register.

## Field descriptions

The MPAM0\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																PMG_D								PMG_I							
PARTID_D																PARTID_I															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:48]

Reserved, RES0.

### PMG\_D, bits [47:40]

Performance monitoring group property for PARTID\_D.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PMG\_I, bits [39:32]

Performance monitoring group property for PARTID\_I.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PARTID\_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PARTID\_I, bits [15:0]

Partition ID for instruction accesses made from EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the MPAM0\_EL1

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

MRS <Xt>, MPAM0\_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0101	0b001

```

# MPAM1\_EL1, MPAM1 Register (EL1)

The MPAM1\_EL1 characteristics are:

## Purpose

Holds information to generate MPAM labels for memory requests when executing at EL1.

When EL2 is present and enabled, the MPAM virtualization option is present, [MPAMHCR\\_EL2.GSTAPP\\_PLK](#) == 1 and [HCR\\_EL2.TGE](#) == 0, MPAM1\_EL1 is used instead of [MPAM0\\_EL1](#) to generate MPAM labels for memory requests when executing at EL0.

MPAM1\_EL1 is an alias for [MPAM2\\_EL2](#) when executing at EL2 with [HCR\\_EL2.E2H](#) == 1.

MPAM1\_EL12 is an alias for MPAM1\_EL1 when executing at EL2 or EL3 with [HCR\\_EL2.E2H](#) == 1.

If EL2 is present and enabled, the MPAM virtualization option is present and [MPAMHCR\\_EL2.EL1\\_VPMEN](#) == 1, MPAM PARTIDs in MPAM1\_EL1 are virtual and mapped into physical PARTIDs for the current Security state. This mapping of MPAM1\_EL1 virtual PARTIDs to physical PARTIDs when EL1\_VPMEN is 1 also applies when MPAM1\_EL1 is used at EL0 due to [MPAMHCR\\_EL2.GSTAPP\\_PLK](#).

## Configuration

AArch64 System register MPAM1\_EL1 bit [63] is architecturally mapped to AArch64 System register [MPAM3\\_EL3\[63\]](#) when EL3 is implemented.

AArch64 System register MPAM1\_EL1 bit [63] is architecturally mapped to AArch64 System register [MPAM2\\_EL2\[63\]](#) when EL3 is not implemented and EL2 is implemented.

This register is present only when FEAT\_MPAM is implemented. Otherwise, direct accesses to MPAM1\_EL1 are UNDEFINED.

## Attributes

MPAM1\_EL1 is a 64-bit register.

## Field descriptions

The MPAM1\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
<a href="#">MPAMEN</a>	<a href="#">RES0</a>	<a href="#">FORCED_NS</a>								<a href="#">RES0</a>									<a href="#">PMG_D</a>												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

If neither EL3 nor EL2 is implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write bit [MPAM3\\_EL3.MPAMEN](#).

If EL3 is not implemented and EL2 is implemented, this field is read-only and reads the current value of the read/write bit [MPAM2\\_EL2.MPAMEN](#).

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When EL3 is not implemented and EL2 is not implemented, access to this field is **RW**.
- Otherwise, access to this field is **RO**.

#### Bits [62:61]

Reserved, RES0.

#### FORCED\_NS, bit [60]

When FEAT\_MPAMv0p1 is implemented:

In the Secure state, FORCED\_NS indicates the state of [MPAM3\\_EL3.FORCE\\_NS](#).

FORCED_NS	Meaning
0b0	In the Non-secure state, always reads as 0. In the Secure state, indicates that <a href="#">MPAM3_EL3.FORCE_NS</a> == 0.
0b1	In the Secure state, indicates that <a href="#">MPAM3_EL3.FORCE_NS</a> == 1.

Always reads as 0 in the Non-secure state.

Writes are ignored.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

#### Bits [59:48]

Reserved, RES0.

#### PMG\_D, bits [47:40]

Performance monitoring group property for PARTID\_D.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### PMG\_I, bits [39:32]

Performance monitoring group property for PARTID\_I.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### PARTID\_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### PARTID\_I, bits [15:0]

Partition ID for instruction accesses made from EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the MPAM1\_EL1

When [HCR\\_EL2.E2H](#) is 1, without explicit synchronization, accesses from EL3 using the mnemonic MPAM1\_EL1 or MPAM1\_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings:

MRS <Xt>, MPAM1\_EL1

op0	op1	CRn	CRm	op2

# MPAM2\_EL2, MPAM2 Register (EL2)

The MPAM2\_EL2 characteristics are:

## Purpose

Holds information to generate MPAM labels for memory requests when executing at EL2.

## Configuration

AArch64 System register MPAM2\_EL2 bit [63] is architecturally mapped to AArch64 System register [MPAM3\\_EL3\[63\]](#) when EL3 is implemented.

AArch64 System register MPAM2\_EL2 bit [63] is architecturally mapped to AArch64 System register [MPAM1\\_EL1\[63\]](#).

This register is present only when FEAT\_MPAM is implemented. Otherwise, direct accesses to MPAM2\_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

## Attributes

MPAM2\_EL2 is a 64-bit register.

## Field descriptions

The MPAM2\_EL2 bit assignments are:

63	62616059	58	5756555453525150	49	48	47464544434241403938373635343332					
MPAMEN	RES0	TIDR	RES0	TRAPMPAM0EL1	TRAPMPAM1EL1	PMG_D	PMG_I				
PARTID_D						PARTID_I					
31	30292827	26	2524232221201918	17	16	1514131211109876543210					

### MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information from all Exception levels.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

If EL3 is not implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write [MPAM3\\_EL3](#).MPAMEN bit.

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When EL3 is not implemented, access to this field is **RW**.
- Otherwise, access to this field is **RO**.

### Bits [62:59]

Reserved, RES0.

**TIDR, bit [58]**

When (FEAT\_MPAMv0p1 is implemented or FEAT\_MPAMv1p1 is implemented) and MPAMIDR\_EL1.HAS\_TIDR == 1:

TIDR traps accesses to [MPAMIDR\\_EL1](#) from EL1 to EL2.

TIDR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Trap accesses to <a href="#">MPAMIDR_EL1</a> from EL1 to EL2.

[MPAMHCR\\_EL2](#).TRAP\_MPAMIDR\_EL1 == 1 also traps [MPAMIDR\\_EL1](#) accesses from EL1 to EL2. If either TIDR or TRAP\_MPAMIDR\_EL1 are 1, accesses are trapped.

**Otherwise:**

Reserved, RES0.

**Bits [57:50]**

Reserved, RES0.

**TRAPMPAM0EL1, bit [49]**

TRAPMPAM0EL1: Trap accesses from EL1 to the [MPAM0\\_EL1](#) register trap to EL2.

TRAPMPAM0EL1	Meaning
0b0	Accesses to <a href="#">MPAM0_EL1</a> from EL1 are not trapped.
0b1	Accesses to <a href="#">MPAM0_EL1</a> from EL1 are trapped to EL2.

On a Warm reset, when EL3 is not implemented, this field resets to 1.

On a Warm reset, when EL3 is implemented, this field resets to an architecturally UNKNOWN value.

**TRAPMPAM1EL1, bit [48]**

TRAPMPAM1EL1: Trap accesses from EL1 to the [MPAM1\\_EL1](#) register trap to EL2.

TRAPMPAM1EL1	Meaning
0b0	Accesses to <a href="#">MPAM1_EL1</a> from EL1 are not trapped.
0b1	Accesses to <a href="#">MPAM1_EL1</a> from EL1 are trapped to EL2.

On a Warm reset, when EL3 is not implemented, this field resets to 1.

On a Warm reset, when EL3 is implemented, this field resets to an architecturally UNKNOWN value.

**PMG\_D, bits [47:40]**

Performance monitoring group for data accesses.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PMG\_I, bits [39:32]**

Performance monitoring group for instruction accesses.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**PARTID\_D, bits [31:16]**

Partition ID for data accesses, including load and store accesses, made from EL2.
