AArch32 System register HCPTR bits [31:0] are architecturally mapped to AArch64 System register [CPTR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HCPTR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HCPTR is a 32-bit register.

## Field descriptions

The HCPTR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TCPACTAM		RES0								TTA		RES0		TASERES0		RES1		TCP11		TCP10		RES1									

### TCPAC, bit [31]

Traps Non-secure EL1 accesses to the [CPACR](#) to Hyp mode.

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 accesses to the <a href="#">CPACR</a> are trapped to Hyp mode.

### Note

The [CPACR](#) is not accessible at EL0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TAM, bit [30]****When FEAT\_AMUv1 is implemented:**

Trap Activity Monitor access. Traps Non-secure EL1 and EL0 accesses to all Activity Monitor registers to EL2.

TAM	Meaning
0b0	Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are not trapped.
0b1	Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are trapped to Hyp mode.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [29:21]**

Reserved, RES0.

**TTA, bit [20]**

Traps Non-secure System register accesses to all implemented trace registers to Hyp mode.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any Non-secure System register access to an implemented trace register is trapped to Hyp mode, unless the access is trapped to EL1 by a CPACR or NSACR control, or the access is from Non-secure EL0 and the definition of the register in the appropriate trace architecture specification indicates that the register is not accessible from EL0. A trapped instruction generates: <ul style="list-style-type: none"> <li>A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.</li> <li>An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.</li> </ul>

If the implementation does not include a PE trace unit, or does not include a System register interface to the PE trace unit registers, it is IMPLEMENTATION DEFINED whether this bit:

- Is RES0.
- Is RES1.
- Can be written from Hyp mode, and from Secure Monitor mode when SCR.NS is 1.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSTRCDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

**Note**

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT\_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and a resulting Undefined Instruction exception is higher priority than a HCPTR.TTA Hyp Trap exception.
- The architecture does not provide traps on trace register accesses through the optional memory-mapped debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Bits [19:16]**

Reserved, RES0.

**TASE, bit [15]**

Traps Non-secure execution of Advanced SIMD instructions to Hyp mode when the value of HCPTR.TCP10 is 0.

<b>TASE</b>	<b>Meaning</b>
0b0	This control does not cause any instructions to be trapped.
0b1	When the value of HCPTR.TCP10 is 0, any attempt to execute an Advanced SIMD instruction in Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a <a href="#">CPACR</a> or <a href="#">NSACR</a> control. A trapped instruction generates: <ul style="list-style-type: none"> <li>• A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.</li> <li>• An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.</li> </ul>

When the value of HCPTR.TCP10 is 1, the value of this field is ignored.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, then it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of [NSACR](#).NSASEDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Bit [14]**

Reserved, RES0.

**Bits [13:12]**

Reserved, RES1.

**TCP11, bit [11]**

The value of this field is ignored. If this field is programmed with a different value to the TCP10 bit then this field is UNKNOWN on a direct read of the HCPTR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of [NSACR](#).cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TCP10, bit [10]**

Trap Non-secure accesses to Advanced SIMD and floating-point functionality to Hyp mode:

<b>TCP10</b>	<b>Meaning</b>
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempted access to Advanced SIMD and floating-point functionality from Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a <a href="#">CPACR</a> or <a href="#">NSACR</a> control. A trapped instruction generates: <ul style="list-style-type: none"> <li>• A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1.</li> <li>• An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.</li> </ul>

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the [FPSCR](#), [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), or [FPEXC](#) System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of [NSACR](#).cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

## Bits [9:0]

Reserved, RES1.

## Accessing the HCPTR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then

# HCR, Hyp Configuration Register

The HCR characteristics are:

## Purpose

Provides configuration controls for virtualization, including defining whether various Non-secure operations are trapped to Hyp mode.

## Configuration

AArch32 System register HCR bits [31:0] are architecturally mapped to AArch64 System register [HCR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HCR is a 32-bit register.

## Field descriptions

The HCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4
RES0	TRVM	HCD	RES0	TGE	TVM	TTLB	TPU	TPC	TSW	TACT	TIDCPT	TSC	TID3	TID2	TID1	TID0	TWET	TWI	DCBSU	FB	VAVI	VFAMOI	MC				

### Bit [31]

Reserved, RES0.

### TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps Non-secure EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

The registers for which read accesses are trapped are as follows:

[SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIR0](#), [MAIR1](#), [AMAIRO](#), [AMAIR1](#), [CONTEXTIDR](#).

TRVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 read accesses to the specified Virtual Memory controls are trapped to EL2.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### HCD, bit [29]

#### When EL3 is not implemented:

HVC instruction disable. Disables Non-secure EL1 and EL2 execution of HVC instructions, when EL2 is enabled in the current Security state.

HCD	Meaning
0b0	HVC instruction execution is enabled at EL2 and EL1.
0b1	HVC instructions are UNDEFINED at EL2 and Non-secure EL1. The Undefined Instruction exception is taken to the Exception level at which the HVC instruction is executed.

**Note**

HVC instructions are always UNDEFINED at EL0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [28]**

Reserved, RES0.

**TGE, bit [27]**

Trap General Exceptions, from Non-secure EL0.

TGE	Meaning
0b0	This control has no effect on execution at EL0.
0b1	When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0. When EL2 is enabled in the current Security state, then: <ul style="list-style-type: none"> <li>All exceptions that would be routed to EL1 are routed to EL2.</li> <li>The <a href="#">SCTLR.M</a> bit is treated as being 0 for all purposes other than returning the result of a direct read of <a href="#">SCTLR</a>.</li> <li>The HCR.{FMO, IMO, AMO} bits are treated as being 1 for all purposes other than returning the result of a direct read of HCR.</li> <li>All virtual interrupts are disabled.</li> <li>Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled.</li> <li>An exception return to EL1 is treated as an illegal exception return.</li> <li>Monitor mode execution of an MSR or CPS instruction that changes <a href="#">PSTATE.M</a> to a Non-secure EL1 mode is an illegal change to <a href="#">PSTATE.M</a>. For more information see <a href="#">CPSR.M</a> to a Non-secure EL1 mode is an illegal change to <a href="#">PSTATE.M</a>. For more information see 'Illegal changes to <a href="#">PSTATE.M</a>'.</li> </ul>

Also, when HCR.TGE is 1:

- If EL3 is using AArch32, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing [SCR.NS](#) from 0 to 1 results in [SCR.NS](#) remaining as 0.
- The [HDCR](#).{TDRA, TDOSA, TDA, TDE} bits are ignored and treated as being 1 other than for the purpose of a direct read of [HDCR](#).

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TVM, bit [26]**

Trap Virtual Memory controls. Traps Non-secure EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

The registers for which write accesses are trapped are as follows:

[SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DEFSR](#), [IESR](#), [DFAR](#), [IFAR](#), [ADEFSR](#), [AIESR](#), [PRRR](#), [NMRR](#), [MAIR0](#), [MAIR1](#), [AMAIRO](#), [AMAIR1](#), [CONTEXTIDR](#).

TVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 write accesses to the specified virtual memory control registers are trapped to EL2.

On a Warm reset, in **In** a system where the PE resets into EL2 or EL3, this field resets to 0.

#### TTLB, bit [25]

Trap TLB maintenance instructions. Traps Non-secure EL1 execution of a TLBI instruction to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

[TLBIALLIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAAIS](#), [TLBIMVALIS](#), [TLBIMVAALIS](#), [ITLBIALL](#), [ITLBIMVA](#), [ITLBIASID](#), [DTLBIALL](#), [DTLBIMVA](#), [DTLBIASID](#), [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [TLBIMVAA](#), [TLBIMVAL](#), [TLBIMVAAL](#)

TTLB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 accesses to the specified TLB maintenance instructions are trapped to EL2.

On a Warm reset, in **In** a system where the PE resets into EL2 or EL3, this field resets to 0.

#### TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- [ICIMVAU](#), [ICIALLU](#), [ICIALUIS](#), [DCCMVAU](#).

#### Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TPU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

On a Warm reset, in **In** a system where the PE resets into EL2 or EL3, this field resets to 0.

#### TPC, bit [23]

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- [DCIMVAC](#), [DCCIMVAC](#), [DCCMVAC](#).

#### Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TPC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

## TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps Non-secure EL1 execution of those cache maintenance instructions by set/way to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- [DCISW](#), [DCCSW](#), [DCCISW](#).

### Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TSW	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

## TAC, bit [21]

Trap Auxiliary Control Registers. Traps Non-secure EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, from both Execution states.

This applies to the following register accesses:

[ACTLR](#) and, if implemented, [ACTLR2](#).

TAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 accesses to the specified registers are trapped to EL2.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

## TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps Non-secure EL1 accesses to the encodings for IMPLEMENTATION DEFINED System Registers to EL2, when EL2 is enabled in the current Security state.

MCR and MRC instructions accessing the following encodings:

- All coproc==p15, CRn==c9, Opcode1 = {0-7}, CRm == {c0-c2, c5-c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c10, Opcode1 == {0-7}, CRm == {c0, c1, c4, c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c11, Opcode1=={0-7}, CRm == {c0-c8, c15}, opcode2 == {0-7}.

When HCR.TIDCP is set to 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from Non-secure EL0 is trapped to EL2. Otherwise, it is UNDEFINED and the PE takes an Undefined Instruction exception to Non-secure Undefined mode.

TIDCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 accesses to the specified System register encodings for IMPLEMENTATION DEFINED functionality are trapped to EL2.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### TSC, bit [19]

Trap SMC instructions. Traps Non-secure EL1 execution of SMC instructions to Hyp mode.

TSC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute an SMC instruction at Non-secure EL1 is trapped to Hyp mode, regardless of the value of <a href="#">SCR.SCD</a> .

The Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

#### Note

- This trap is only implemented if the implementation includes EL3.
- SMC instructions are always UNDEFINED at PL0.
- This bit traps execution of the SMC instruction. It is not a routing control for the SMC exception. Hyp Trap exceptions and SMC exceptions have different preferred return addresses.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### TID3, bit [18]

Trap ID group 3. Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- VMRS access to [MVFR0](#), [MVFR1](#), and [MVFR2](#), reported using EC syndrome value 0x08, unless access is also trapped by [HCPTR](#) which takes priority.
- MRC access to the following registers are reported using EC syndrome value 0x03:
  - [ID\\_PFR0](#), [ID\\_PFR1](#), [ID\\_PFR2](#), [ID\\_DFR0](#), [ID\\_AFR0](#), [ID\\_MMFR0](#), [ID\\_MMFR1](#), [ID\\_MMFR2](#), [ID\\_MMFR3](#), [ID\\_ISAR0](#), [ID\\_ISAR1](#), [ID\\_ISAR2](#), [ID\\_ISAR3](#), [ID\\_ISAR4](#), and [ID\\_ISAR5](#).
  - If FEAT\_FGT is implemented:
    - [ID\\_MMFR4](#) and [ID\\_MMFR5](#) are trapped to EL2.
    - [ID\\_ISAR6](#) is trapped to EL2.
    - [ID\\_DFR1](#) is trapped to EL2.
    - This field traps all MRC accesses to registers in the following range that are not already mentioned in this field description: coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.
  - If FEAT\_FGT is not implemented:
    - [ID\\_MMFR4](#) and [ID\\_MMFR5](#) are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_MMFR4](#) or [ID\\_MMFR5](#) are trapped.
    - [ID\\_ISAR6](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_ISAR6](#) are trapped to EL2.
    - [ID\\_DFR1](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID\\_DFR1](#) are trapped to EL2.
    - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRC accesses to registers not already mentioned, with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

TID3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified Non-secure EL1 read accesses to ID group 3 registers are trapped to EL2.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

#### TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 and EL0 reads of the [CTR](#), [CCSIDR](#), [CCSIDR2](#), [CLIDR](#), and [CSSELR](#).
- Non-secure EL1 and EL0 writes to the [CSSELR](#).

TID2	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified Non-secure EL1 and EL0 accesses to ID group 2 registers are trapped to EL2.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

#### TID1, bit [16]

Trap ID group 1. Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state:

[TCMTR](#), [TLBTR](#), [REVIDR](#), [AIDR](#).

TID1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified Non-secure EL1 read accesses to ID group 1 registers are trapped to EL2.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

#### TID0, bit [15]

Trap ID group 0. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 reads of the [JIDR](#) and [FPSID](#).
- If the [JIDR](#) is RAZ from Non-secure EL0, Non-secure EL0 reads of the [JIDR](#).

##### Note

- It is IMPLEMENTATION DEFINED whether the [JIDR](#) is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then the Undefined Instruction exception takes precedence over this trap.
- The [FPSID](#) is not accessible at EL0.
- Writes to the [FPSID](#) are ignored, and not trapped by this control.

TID0	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified Non-secure EL1 read accesses to ID group 0 registers are trapped to EL2.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

#### TWE, bit [14]

Traps Non-secure EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by <a href="#">SCTLR.nTWE</a> .

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

---

**Note**

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

---

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TWI, bit [13]**

Traps Non-secure EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by <a href="#">SCTLR.nTWI</a> .

---

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

---

**Note**

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

---

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**DC, bit [12]**

Default Cacheability.

DC	Meaning
0b0	This control has no effect on the Non-secure EL1&0 translation regime.
0b1	In Non-secure state: <ul style="list-style-type: none"> <li>The <a href="#">SCTLR.M</a> field behaves as 0 for all purposes other than a direct read of the value of the field.</li> <li>The HCR.VM field behaves as 1 for all purposes other than a direct read of the value of the field.</li> <li>The memory type produced by the first stage of the EL1&amp;0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.</li> </ul>

---

This field has no effect on the EL2 and EL3 translation regimes.

This field is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**BSU, bits [11:10]**

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from Non-secure EL1 or Non-secure EL0:

BSU	Meaning
0b00	No effect.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

#### FB, bit [9]

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from Non-secure EL1:

[BPIALL](#), [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [DTLBIALL](#), [DTLBIMVA](#), [DTLBIASID](#), [ITLBIALL](#), [ITLBIMVA](#), [ITLBIASID](#), [TLBIMVAA](#), [ICIALLU](#), [TLBIMVAL](#), [TLBIMVAAL](#).

FB	Meaning
0b0	This field has no effect on the operation of the specified instructions.
0b1	When one of the specified instruction is executed at Non-secure EL1, the instruction is broadcast within the Inner Shareable shareability domain.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

#### VA, bit [8]

Virtual SError interrupt exception.

VA	Meaning
0b0	This mechanism is not making a virtual SError interrupt pending.
0b1	A virtual SError interrupt is pending because of this mechanism.

The virtual SError interrupt is enabled only when the value of HCR.{TGE, AMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

#### VI, bit [7]

Virtual IRQ exception.

VI	Meaning
0b0	This mechanism is not making a virtual IRQ pending.
0b1	A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of HCR.{TGE, IMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

#### VF, bit [6]

Virtual FIQ exception.

VF	Meaning
0b0	This mechanism is not making a virtual FIQ pending.
0b1	A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR.{TGE, FMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### AMO, bit [5]

Error interrupt Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.A, and enables virtual exception signaling by the VA bit. CPSR.A, and enables virtual exception signaling by the VA bit.

If the value of HCR.TGE is 0, then virtual SError interrupts are enabled in Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.AMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### IMO, bit [4]

IRQ Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.I, and enables virtual exception signaling by the VI bit. CPSR.I, and enables virtual exception signaling by the VI bit.

If the value of HCR.TGE is 0, then Virtual IRQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.IMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### FMO, bit [3]

FIQ Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.F, and enables virtual exception signaling by the VF bit. CPSR.F, and enables virtual exception signaling by the VF bit.

If the value of HCR.TGE is 0, then Virtual FIQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.FMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### PTW, bit [2]

Protected Table Walk. In the Non-secure PL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs then the value of this bit determines the behavior:

PTW	Meaning
0b0	The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.
0b1	The memory access generates a stage 2 Permission fault.

This field is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### SWIO, bit [1]

Set/Way Invalidation Override. Causes Non-secure EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way.

SWIO	Meaning
0b0	This control has no effect on the operation of data cache invalidate by set/way instructions.
0b1	Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When this bit is set to 1, [DCISW](#) performs the same invalidation as a [DCCISW](#) instruction.

As a result of changes to the behavior of [DCISW](#), this bit is redundant in Armv8. This bit can be implemented as RES1.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

## VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the Non-secure EL1&0 translation regime.

VM	Meaning
0b0	Non-secure EL1&0 stage 2 address translation disabled.
0b1	Non-secure EL1&0 stage 2 address translation enabled.

If the HCR.DC bit is set to 1, then the behavior of the PE when executing in a Non-secure mode other than Hyp mode is consistent with HCR.VM being 1, regardless of the actual value of HCR.VM, other than the value returned by an explicit read of HCR.VM.

When the value of this bit is 1, data cache invalidate instructions executed at Non-secure EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR.SWIO bit.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

## Accessing the HCR

Accesses to this register use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HCR;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HCR;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HCR = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HCR = R[t];

```

# HCR2, Hyp Configuration Register 2

The HCR2 characteristics are:

## Purpose

Provides additional configuration controls for virtualization.

## Configuration

AArch32 System register HCR2 bits [31:0] are architecturally mapped to AArch64 System register [HCR\\_EL2\[63:32\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HCR2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HCR2 is a 32-bit register.

## Field descriptions

The HCR2 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
									RES0	TTLBIS	RES0	TOC	RES0	TICAB	TID4										RES0			MIOCNC	TEA	TERR	RES0	IDCD

### Bits [31:23]

Reserved, RES0.

### TTLBIS, bit [22]

When FEAT\_EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of the following TLB maintenance instructions at EL1 to EL2:

[TLBIALLIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAAIS](#), [TLBIMVALIS](#), [TLBIMVAALIS](#)

TTLBIS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 execution of the specified TLB maintenance instructions is trapped to EL2.

When FEAT\_VHE and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

**Bit [21]**

Reserved, RES0.

**TOCU, bit [20]**

**When FEAT\_EVT is implemented:**

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions at EL1 or EL0 using AArch64, and at EL1 using AArch32, to EL2.

This applies to the following instructions:

- When Non-secure EL0 is using AArch64, [IC IVAU](#), [DC CVAU](#). However, if the value of [SCTLR\\_EL1](#).UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- When EL1 is using AArch64, [IC IVAU](#), [IC IALLU](#), [DC CVAU](#).
- When Non-secure EL1 is using AArch32, [ICIMVAU](#), [ICIALLU](#), [DCCMVAU](#).

**Note**

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- [IC IALLUIS](#) and [IC IALLU](#) are always UNDEFINED at EL0 using AArch64.
- [ICIMVAU](#), [ICIALLU](#), [ICIALLUIS](#), and [DCCMVAU](#) are always UNDEFINED at EL0 using AArch32.

TOCU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT\_VHE is implemented, and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

**Otherwise:**

Reserved, RES0.

**Bit [19]**

Reserved, RES0.

**TICAB, bit [18]**

**When FEAT\_EVT is implemented:**

Trap ICIALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2.

This applies to the following instructions:

[ICIALLUIS](#).

TICAB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT\_VHE and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

**Otherwise:**

Reserved, RES0.

**TID4, bit [17]**

**When FEAT\_EVT is implemented:**

Trap ID group 4. Traps the following register accesses to EL2:

- EL1 reads of [CCSIDR](#), [CCSIDR2](#), [CLIDR](#), and [CSSELR](#).
- EL1 writes to [CSSELR](#).

TID4	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified Non-secure EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.

When FEAT\_VHE is implemented and the value of [HCR\\_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

**Otherwise:**

Reserved, RES0.

**Bits [16:7]**

Reserved, RES0.

**MIOCNCNCE, bit [6]**

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the Non-secure PL1&0 translation regime.

MIOCNCNCE	Meaning
0b0	For the Non-secure PL1&0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.
0b1	For the Non-secure PL1&0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

For more information, see 'Mismatched memory attributes'.

This field can be implemented as RAZ/WI.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

**TEA, bit [5]****When FEAT\_RAS is implemented:**

Route synchronous External abort exceptions from EL0 and EL1 to EL2.

TEA	Meaning
0b0	Does not route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2.
0b1	Route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2, if not routed to EL3.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TERR, bit [4]****When FEAT\_RAS is implemented:**

Trap Error record accesses from EL1 to EL2. Trap accesses to the following registers from EL1 to EL2:

[ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#).

When FEAT\_RASv1p1 is implemented, [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), and [ERXMISC7](#).

TERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses to the specified registers from EL1 generate a Trap exception to EL2.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [3:2]**

Reserved, RES0.

**ID, bit [1]**

Stage 2 Instruction access cacheability disable. For the Non-secure PL1&0 translation regime, when [HCR.VM](#)==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

ID	Meaning
0b0	This control has no effect on stage 2 of the Non-secure PL1&0 translation regime.
0b1	For the Non-secure PL1&0 translation regime, forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2 translation regime.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**CD, bit [0]**

Stage 2 Data access cacheability disable. When [HCR.VM](#)==1, this forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable for the Non-secure PL1&0 translation regime.

CD	Meaning
0b0	This control has no effect on stage 2 of the Non-secure PL1&0 translation regime for data accesses and translation table walks.
0b1	For the Non-secure PL1&0 translation regime, forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2 translation regime.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Accessing the HCR2**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HCR2;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HCR2;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HCR2 = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HCR2 = R[t];

```

# HDCR, Hyp Debug Control Register

The HDCR characteristics are:

## Purpose

Controls the trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to functions provided by the debug and trace architectures and the Performance Monitors Extension.

## Configuration

AArch32 System register HDCR bits [31:0] are architecturally mapped to AArch64 System register [MDCR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HDCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3, and other than for a direct read of the register, the PE behaves as if `HDCR.HPMN == PMCR.N`.

## Attributes

HDCR is a 32-bit register.

## Field descriptions

The HDCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17
RES0	HPMFZ	OMTPME	MTMPMETDCC	TDCCHLP	HLPRES0	RES0	HCCD	HCCDRES0	RES0	TTRF	TTRFRES0	RES0	HPMD	HPMDRES0

### Bits [31:29]

### Bits [31:30]

Reserved, RES0.

### [HPMFZO](#), bit [29]

When [FEAT\\_PMUv3p7](#) is implemented and [FEAT\\_MTPMU](#) is not implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

<a href="#">HPMFZO</a>	Meaning
0b0	Do not freeze on overflow.
0b1	Event counters do not count when <a href="#">PMOVSr[(<a href="#">PMCR.N</a>-1):HDCR.HPMN]</a> is nonzero.

If `HDCR.HPMN` is less than [PMCR.N](#), this bit affects the operation of event counters in the range [`HDCR.HPMN .. (PMCR.N-1)`].

If `HDCR.HPMN` is equal to [PMCR.N](#), this bit has no effect.

This bit does not affect the operation of event counters in the range [`0 .. (HDCR.HPMN-1)`] and [PMCCNTR](#).

The operation of this bit ignores the values of [PMOVSr\[\(HDCR.HPMN-1\):0\]](#).

The operation of this bit applies even when EL2 is disabled in the current Security state.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### MTPME, bit [28]

When FEAT\_MTPMU is implemented and EL3 is not implemented:

Multi-threaded PMU Enable. Enables use of the [PMEVTYPER<n>](#).MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of <a href="#">PMEVTYPER&lt;n&gt;</a> .MT is zero.
0b1	<a href="#">PMEVTYPER&lt;n&gt;</a> .MT bits not affected by this bit.

If FEAT\_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is **0**, **0b0**.

On a Cold reset, in a system where the PE resets into EL2 or EL3, this field resets to 1.

Otherwise:

Reserved, RES0.

### TDCC, bit [27]

When FEAT\_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Hyp Trap exception, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

- [DBGDTRRXext](#), [DBGDTRTXext](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

The traps are reported with EC syndrome value:

- **0x05** for trapped MRC and MCR accesses with coproc == 0b1110.
- ~~0x05 for trapped MRC and MCR accesses with coproc == 0b1110.~~
- **0x06** for trapped LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).
- ~~0x06 for trapped LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).~~

When the PE is in Debug state, HDCR.TDCC does not trap any accesses to:

- [DBGDTRRXint](#) and [DBGDTRTXint](#).

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to **an architecturally UNKNOWN value**.

**Otherwise:**

Reserved, RES0.

**HLP, bit [26]****When FEAT\_PMUv3p5 is implemented:**

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

HLP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of <a href="#">PMEVCNTR&lt;n&gt;</a> [31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of <a href="#">PMEVCNTR&lt;n&gt;</a> [63:0].

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is read/write or RAZ/WI.

If HDCR.HPMN is less than PMCR.N, this bit affects the operation of event counters in the range [HDCR.HPMN..[\(PMCR.N-1\)](#)]. Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HDCR.HPMN field.

**Note**

[PMEVCNTR<n>](#)[63:32] cannot be accessed directly in AArch32 state.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to **an architecturally UNKNOWN value.**

**Otherwise:**

Reserved, RES0.

**Bits [25:24]**

Reserved, RES0.

**HCCD, bit [23]****When FEAT\_PMUv3p5 is implemented:**

Hypervisor Cycle Counter Disable. Prohibits [PMCCNTR](#) from counting at EL2.

HCCD	Meaning
0b0	Cycle counting by <a href="#">PMCCNTR</a> is not affected by this bit.
0b1	Cycle counting by <a href="#">PMCCNTR</a> is prohibited at EL2.

This bit does not affect the CPU\_CYCLES event or any other event that counts cycles.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [22:20]**

Reserved, RES0.

**TTRF, bit [19]****When FEAT\_TRF is implemented:**

Traps use of the Trace Filter Control registers at EL1 to EL2.

TTRF	Meaning
0b0	Accesses to <a href="#">TRFCR</a> at EL1 are not affected by this control bit.
0b1	Accesses to <a href="#">TRFCR</a> at EL1 generate a Hyp Trap exception.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [18]**

Reserved, RES0.

**HPMD, bit [17]****When FEAT\_PMUv3p1 is implemented:**

Guest Performance Monitors Disable. This control prohibits event counting at EL2.

HPMD	Meaning
0b0	Event counting allowed in Hyp mode.
0b1	Event counting prohibited in Hyp mode. If FEAT_Debugv8p2 is not implemented, event counting is prohibited unless enabled by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().

This control applies only to:

- The event counters in the range [0..(HDCR.HPMN-1)].
- If [PMCR](#).DP is set to 1, [PMCCNTR](#).

The other event counters are unaffected. When [PMCR](#).DP is set to 0, [PMCCNTR](#) is unaffected.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [16:12]**

Reserved, RES0.

**TDRA, bit [11]**

Trap Debug ROM Address register access. Traps Non-secure EL0 and EL1 System register accesses to the Debug ROM registers to Hyp mode.

TDRA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL0 and EL1 System register accesses to the <a href="#">DBGDRAR</a> or <a href="#">DBGDSAR</a> are trapped to Hyp mode, unless it is trapped by <a href="#">DBGDSCRext</a> .UDCCdis.

If [HCR](#).TGE or [HDCR](#).TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TDOSA, bit [10]**

**When FEAT\_DoubleLock is implemented:**

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:

- [DBGOSLSR](#), [DBGOSLAR](#), [DBGOSDLR](#), and [DBGPRCR](#).
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

**Note**

These registers are not accessible at EL0.

If [HCR](#).TGE or [HDCR](#).TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:

- [DBGOSLSR](#), [DBGOSLAR](#), and [DBGPRCR](#).
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to [DBGOSDLR](#) are trapped.

**Note**

These registers are not accessible at EL0.

If [HCR](#).TGE or [HDCR](#).TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### TDA, bit [9]

Trap debug access. Traps Non-secure EL0 and EL1 System register accesses to those debug System registers in the (coproc==0b1110) encoding space that are not trapped by either of the following:

- [HDCR.TDRA](#).
- [HDCR.TDOSA](#).

TDA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL0 or EL1 System register accesses to the debug registers, other than the registers trapped by <a href="#">HDCR.TDRA</a> and <a href="#">HDCR.TDOSA</a> , are trapped to Hyp mode, unless it is trapped by <a href="#">DBGDSCRExt.UDCCdis</a> .

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### TDE, bit [8]

Trap Debug exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL<sub>D</sub>.

TDE	Meaning
0b0	The debug target Exception level is EL1.
0b1	If EL2 is enabled for the current Effective value of <a href="#">SCR.NS</a> , the debug target Exception level is EL2, otherwise the debug target Exception level is EL1. The <a href="#">HDCR</a> .{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

For more information, see 'Routing debug exceptions'.

When [HCR.TGE](#) == 1, the PE behaves as if the value of this field is 1 for all purposes other than returning the value of a direct read of the register.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### HPME, bit [7]

When [FEAT\\_PMUv3](#) is implemented:

[[HDCR.HPMN](#)..([N](#)-1)] event counters enable.

HPME	Meaning
0b0	Event counters in the range [ <a href="#">HDCR.HPMN</a> ..( <a href="#">PMCR</a> . <a href="#">N</a> -1)] are disabled.
0b1	Event counters in the range [ <a href="#">HDCR.HPMN</a> ..( <a href="#">PMCR</a> . <a href="#">N</a> -1)] are enabled by <a href="#">PMCNTENSET</a> .

If [HDCR.HPMN](#) is less than [PMCR.N](#), the event counters in the range [[HDCR.HPMN](#)..([PMCR](#).[N](#)-1)], are enabled and disabled by this bit. Otherwise this bit has no effect on the operation of the event counters.

#### Note

The effect of [HDCR.HPMN](#) on the operation of this bit applies regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the [HPMN](#) field.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TPM, bit [6]****When FEAT\_PMUv3 is implemented:**

Trap Performance Monitors accesses. Traps Non-secure EL0 and EL1 accesses to all Performance Monitors registers to Hyp mode.

TPM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to Hyp mode.

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**TPMCR, bit [5]****When FEAT\_PMUv3 is implemented:**

Trap [PMCR](#) accesses. Traps Non-secure EL0 and EL1 accesses to the [PMCR](#) to Hyp mode.

TPMCR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL0 and EL1 accesses to the <a href="#">PMCR</a> are trapped to Hyp mode, unless it is trapped by <a href="#">PMUSERENR</a> .EN.

**Note**

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**HPMN, bits [4:0]****When FEAT\_PMUv3 is implemented:**

Defines the number of event counters that are accessible from Non-secure EL1 modes, and from Non-secure EL0 modes if unprivileged access is enabled.

If HPMN is less than [PMCR](#).N, HPMN divides the event counters into two ranges, [0..(HPMN-1)] and [HPMN..([PMCR](#).N-1)].

For an event counter in the range [0..(HPMN-1)]:

- The counter is accessible from EL1 and EL2, and from EL0 if unprivileged access to the counters is enabled.

- If FEAT\_PMUv3p5 is implemented, [PMCR.LP](#) determines whether the counter overflows at [PMEVCNTR<n>\[31:0\]](#) or [PMEVCNTR<n>\[63:0\]](#).
- [PMCR.E](#) enables the operation of counters in this range.

---

**Note**

If HPMN is equal to [PMCR.N](#), this applies to all event counters.

---

If HPMN is less than [PMCR.N](#), for an event counter in the range [HPMN..([PMCR.N](#)-1)]:

- The counter is accessible only from EL2 and from Secure state.
- If FEAT\_PMUv3p5 is implemented, [HDCR.HLP](#) determines whether the counter overflows at [PMEVCNTR<n>\[31:0\]](#) or [PMEVCNTR<n>\[63:0\]](#).
- [HDCR.HPME](#) enables the operation of counters in this range.

If this field is set to 0, or to a value larger than [PMCR.N](#), then the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of [HDCR.HPMN](#) is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 use. That is, the PE behaves as if [HDCR.HPMN](#) is set to an UNKNOWN non-zero value less than or equal to [PMCR.N](#).
  - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [PMCR.N](#).

**Otherwise:**

Reserved, RES0.

## Accessing the HDCR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b001

# HDFAR, Hyp Data Fault Address Register

The HDFAR characteristics are:

## Purpose

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception that is taken to Hyp mode.

## Configuration

AArch32 System register HDFAR bits [31:0] are architecturally mapped to AArch64 System register [FAR\\_EL2\[31:0\]](#).

AArch32 System register HDFAR bits [31:0] are architecturally mapped to AArch32 System register [DFAR\[31:0\] \(S\)](#) when EL2 is implemented, EL3 is implemented and the highest implemented Exception level is using AArch32 state.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HDFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HDFAR is a 32-bit register.

## Field descriptions

The HDFAR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA of faulting address of synchronous Data Abort exception taken to Hyp mode																															

### Bits [31:0]

VA of faulting address of synchronous Data Abort exception taken to Hyp mode.

On a Prefetch Abort exception, this register is UNKNOWN.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register UNKNOWN.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the HDFAR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T6 == '1' then

# HIFAR, Hyp Instruction Fault Address Register

The HIFAR characteristics are:

## Purpose

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception that is taken to Hyp mode.

## Configuration

AArch32 System register HIFAR bits [31:0] are architecturally mapped to AArch64 System register [FAR\\_EL2\[63:32\]](#).

AArch32 System register HIFAR bits [31:0] are architecturally mapped to AArch32 System register [IFAR\[31:0\] \(S\)](#) when EL2 is implemented, EL3 is implemented and the highest implemented Exception level is using AArch32 state.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HIFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HIFAR is a 32-bit register.

## Field descriptions

The HIFAR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA of faulting address of synchronous Prefetch Abort exception taken to Hyp mode																															

### Bits [31:0]

VA of faulting address of synchronous Prefetch Abort exception taken to Hyp mode.

On a Data Abort exception, this register is UNKNOWN.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register UNKNOWN.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the HIFAR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0000	0b010

```

# HMAIR0, Hyp Memory Attribute Indirection Register 0

The HMAIR0 characteristics are:

## Purpose

Along with [HMAIR1](#), provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:

- When AttrIndx[2] is 0, HMAIR0 is used.
- When AttrIndx[2] is 1, [HMAIR1](#) is used.

## Configuration

AArch32 System register HMAIR0 bits [31:0] are architecturally mapped to AArch64 System register [MAIR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HMAIR0 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HMAIR0 is a 32-bit register.

## Field descriptions

The HMAIR0 bit assignments are:

### When TTBCR.EAE == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">Attr3</a>								<a href="#">Attr2</a>								<a href="#">Attr1</a>								<a href="#">Attr0</a>							

**Attr<n>, bits [8n+7:8n], for n = 0 to 3**

**Attr<n>, bits [8n+7:8n], for n = 3 to 0**

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.
0b01RW, RW not0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Accessing the HMAIRO

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1010	0b0010	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T10 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T10 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then

# HMAIR1, Hyp Memory Attribute Indirection Register 1

The HMAIR1 characteristics are:

## Purpose

Along with [HMAIR0](#), provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:

- When AttrIndx[2] is 0, [HMAIR0](#) is used.
- When AttrIndx[2] is 1, HMAIR1 is used.

## Configuration

AArch32 System register HMAIR1 bits [31:0] are architecturally mapped to AArch64 System register [MAIR\\_EL2\[63:32\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HMAIR1 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HMAIR1 is a 32-bit register.

## Field descriptions

The HMAIR1 bit assignments are:

### When TTBCR.EAE == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">Attr7</a>								<a href="#">Attr6</a>								<a href="#">Attr5</a>								<a href="#">Attr4</a>							

**Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 4 to 7**

**Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 7 to 4**

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.
0b01RW, RW not0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Accessing the HMAIR1

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1010	0b0010	0b001

```

if PSTATE.EL == EL0 then

# HPFAR, Hyp IPA Fault Address Register

The HPFAR characteristics are:

## Purpose

Holds the faulting IPA for some aborts on a stage 2 translation taken to Hyp mode.

## Configuration

AArch32 System register HPFAR bits [31:0] are architecturally mapped to AArch64 System register [HPFAR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HPFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HPFAR is a 32-bit register.

## Field descriptions

The HPFAR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FIPA[39:12]																												RES0			

Execution in any Non-secure mode other than Hyp mode makes this register UNKNOWN.

### FIPA[39:12], bits [31:4]

Bits [39:12] of the faulting intermediate physical address.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [3:0]

Reserved, RES0.

## Accessing the HPFAR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0000	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;

# HRMR, Hyp Reset Management Register

The HRMR characteristics are:

## Purpose

If EL2 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

## Configuration

AArch32 System register HRMR bits [31:0] are architecturally mapped to AArch64 System register [RMR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HRMR are UNDEFINED.

Only implemented if EL2 is the highest implemented Exception level. In this case:

- If EL2 can use AArch32 and AArch64 then this register must be implemented.
- If EL2 cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

## Attributes

HRMR is a 32-bit register.

## Field descriptions

The HRMR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																RR		AA64													

### Bits [31:2]

Reserved, RES0.

### RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

On a Warm reset, this field resets to 0.

### AA64, bit [0]

When EL2 can use AArch64, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
0b0	AArch32.
0b1	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL2 cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.

## Accessing the HRMR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b0000	0b010

```
if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T12 ==
'1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
elsif PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && ELUsingAArch32(EL2) && HSTR.T12 ==
'1' then
    AArch32.TakeHypTrapException(0x03);
elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    return HRMR;
else
    UNDEFINED;
```

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b0000	0b010

```
if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T12 ==
'1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
elsif PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && ELUsingAArch32(EL2) && HSTR.T12 ==
'1' then
    AArch32.TakeHypTrapException(0x03);
elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    HRMR = R[t];
else
    UNDEFINED;
```

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# HSCTLR, Hyp System Control Register

The HSCTLR characteristics are:

## Purpose

Provides top level control of the system operation in Hyp mode.

## Configuration

AArch32 System register HSCTLR bits [31:0] are architecturally mapped to AArch64 System register [SCTLR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HSCTLR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HSCTLR is a 32-bit register.

## Field descriptions

The HSCTLR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3
DSSBS	TE	RES1	RES0	EE	RES0	RES1	RES0	WXN	RES1	RES0	RES1	RES0	I	RES1	RES0	SED	ITD	RES0	CP15	BEN	LSMAOE	n	TL					

### DSSBS, bit [31]

When FEAT\_SSBS is implemented:

### DSSBS, bit [31]

When FEAT\_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to Hyp mode.
0b1	PSTATE.SSBS is set to 1 on an exception to Hyp mode.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

### TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to EL2 are taken to A32 or T32 state:

TE	Meaning
0b0	Exceptions, including reset, taken to A32 state.
0b1	Exceptions, including reset, taken to T32 state.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

### Bits [29:28]

Reserved, RES1.

### Bits [27:26]

Reserved, RES0.

### EE, bit [25]

The value of the PSTATE.E bit on entry to Hyp mode, the endianness of stage 1 translation table walks in the EL2 translation regime, and the endianness of stage 2 translation table walks in the PL1&0 translation regime.

The possible values of this bit are:

EE	Meaning
0b0	Little-endian. PSTATE.E is cleared to 0 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&0 translation regime are little-endian.
0b1	Big-endian. PSTATE.E is set to 1 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception Levels higher than EL0, this bit is RES1.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an IMPLEMENTATION DEFINED value.

### Bit [24]

Reserved, RES0.

### Bits [23:22]

Reserved, RES1.

### Bits [21:20]

Reserved, RES0.

### WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL2 translation regime is forced to XN for accesses from software executing at EL2.

This bit applies only when HSCTLR.M bit is set.

The WXN bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**Bit [18]**

Reserved, RES1.

**Bit [17]**

Reserved, RES0.

**Bit [16]**

Reserved, RES1.

**Bits [15:13]**

Reserved, RES0.

**I, bit [12]**

Instruction access Cacheability control, for accesses at EL2:

<b>I</b>	<b>Meaning</b>
0b0	All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	All instruction access to Normal memory from EL2 can be cached at all levels of instruction and unified cache. If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the PL1&amp;0 translation regime.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

**Bit [11]**

Reserved, RES1.

**Bits [10:9]**

Reserved, RES0.

**SED, bit [8]**

SETEND instruction disable. Disables SETEND instructions at EL2.

<b>SED</b>	<b>Meaning</b>
0b0	SETEND instruction execution is enabled at EL2.
0b1	SETEND instructions are UNDEFINED at EL2.

If the implementation does not support mixed-endian operation at EL2, this bit is RES1.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

**ITD, bit [7]**

IT Disable. Disables some uses of IT instructions at EL2.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL2.
0b1	Any attempt at EL2 to execute any of the following is UNDEFINED: <ul style="list-style-type: none"> <li>All encodings of the IT instruction with hw1[3:0]≠1000.</li> <li>All encodings of the subsequent instruction with the following values for hw1: <ul style="list-style-type: none"> <li>11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.</li> <li>1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'.</li> <li>10100xxxxxxxxxxx: ADD Rd, PC, #imm</li> <li>01001xxxxxxxxxxx: LDR Rd, [PC, #imm]</li> <li>0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.</li> <li>010001xx1xxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.</li> </ul> </li> </ul> <p>These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.</p> <p>It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:</p> <ul style="list-style-type: none"> <li>A 16-bit instruction, that can only be followed by another 16-bit instruction.</li> <li>The first half of a 32-bit instruction.</li> </ul> <p>This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.</p>

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information, see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the HSCTLR. If it is not implemented then this bit is RAZ/WI.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

## Bit [6]

Reserved, RES0.

## CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL2:

CP15BEN	Meaning
0b0	EL2 execution of the <a href="#">CP15DMB</a> , <a href="#">CP15DSB</a> , and <a href="#">CP15ISB</a> instructions is UNDEFINED.
0b1	EL2 execution of the <a href="#">CP15DMB</a> , <a href="#">CP15DSB</a> , and <a href="#">CP15ISB</a> instructions is enabled.

CP15BEN is optional, but if it is implemented in the [SCTLR](#) then it must also be implemented in the HSCTLR. If it is not implemented then this bit is RAO/WI.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

## LSMAOE, bit [4]

When FEAT\_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL2, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL2 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 1.

#### Otherwise:

Reserved, RES1.

#### nTLSMD, bit [3]

When FEAT\_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 1.

#### Otherwise:

Reserved, RES1.

#### C, bit [2]

Cacheability control, for data accesses at EL2:

C	Meaning
0b0	All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, can be cached at all levels of data and unified cache.

This bit has no effect on the PL1&0 translation regime.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

#### A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

A	Meaning
0b0	Alignment fault checking disabled when executing at EL2. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element or data elements being accessed.
0b1	Alignment fault checking enabled when executing at EL2. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element or data elements being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

## M, bit [0]

MMU enable for EL2 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL2 stage 1 address translation disabled. See the HSCTLR.I field for the behavior of instruction accesses to Normal memory.
0b1	EL2 stage 1 address translation enabled.

On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

## Accessing the HSCTLR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HSCTLR;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HSCTLR;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HSCTLR = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HSCTLR = R[t];

```

# HSR, Hyp Syndrome Register

The HSR characteristics are:

## Purpose

Holds syndrome information for an exception taken to Hyp mode.

## Configuration

AArch32 System register HSR bits [31:0] are architecturally mapped to AArch64 System register [ESR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HSR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HSR is a 32-bit register.

## Field descriptions

The HSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EC						IL	ISS																								

Execution in any Non-secure PE mode other than Hyp mode makes this register UNKNOWN.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of HSR is UNKNOWN. The value written to HSR must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

### EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about. Possible values of this field are:

EC	Meaning	ISS
0b000000	Unknown reason.	<a href="#">ISS encoding for exceptions with an unknown reason</a>
0b000001	Trapped WFI or WFE instruction execution. Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.	<a href="#">ISS encoding for Exception from a WFI or WFE instruction</a>
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	<a href="#">ISS encoding for Exception from an MCR or MRC access</a>
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	<a href="#">ISS encoding for Exception from an MCRR or MRRC access</a>
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	<a href="#">ISS encoding for Exception from an MCR or MRC access</a>
0b000110	Trapped LDC or STC access. The only architected uses of these instructions are: <ul style="list-style-type: none"> <li>An STC to write data to memory from <a href="#">DBGDTRRXint</a>.</li> <li>An LDC to read data from memory to <a href="#">DBGDTRTXint</a>.</li> </ul>	<a href="#">ISS encoding for Exception from an LDC or STC instruction</a>
0b000111	Access to Advanced SIMD or floating-point functionality trapped by a <a href="#">HCPTR</a> .{TASE, TCP10} control. Excludes exceptions generated because Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000.	<a href="#">ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR</a>
0b001000	Trapped VMRS access, from ID group trap, that is not reported using EC 0b000111.	<a href="#">ISS encoding for Exception from an MCR or MRC access</a>
0b001100	Trapped MRRC access with (coproc==0b1110).	<a href="#">ISS encoding for Exception from an MCRR or MRRC access</a>
0b001110	Illegal exception return to AArch32 state.	<a href="#">ISS encoding for Exception from an Illegal state or PC alignment fault</a>
0b010001	Exception on SVC instruction execution in AArch32 state routed to EL2.	<a href="#">ISS encoding for Exception from HVC or SVC instruction execution</a>
0b010010	HVC instruction execution in AArch32 state, when HVC is not disabled.	<a href="#">ISS encoding for Exception from HVC or SVC instruction execution</a>
0b010011	Trapped execution of SMC instruction in AArch32 state.	<a href="#">ISS encoding for Exception from SMC instruction execution</a>
0b100000	Prefetch Abort from a lower Exception level.	<a href="#">ISS encoding for Exception from a Prefetch Abort</a>
0b100001	Prefetch Abort taken without a change in Exception level.	<a href="#">ISS encoding for Exception from a Prefetch Abort</a>
0b100010	PC alignment fault exception.	<a href="#">ISS encoding for Exception from an Illegal state or PC alignment fault</a>

0b100100	Data Abort from a lower Exception level.	<a href="#">ISS encoding for Exception from a Data Abort</a>
0b100101	Data Abort taken without a change in Exception level.	<a href="#">ISS encoding for Exception from a Data Abort</a>

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## IL, bit [25]

Instruction length bit. Indicates the size of the instruction that has been trapped to Hyp mode. When this bit is valid, possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped.

This field is RES1 and not valid for the following cases:

- When the EC field is 0b000000, indicating an exception with an unknown reason.
- Prefetch Aborts.
- Data Aborts for which the HSR.ISS.ISV field is 0.
- When the EC value is 0b001110, indicating an Illegal state exception.

### Note

This is a change from the behavior in Armv7, where the IL field is UNK/SBZP for the corresponding cases.

The IL field is not valid and is UNKNOWN on an exception from a PC alignment fault.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

### ISS encoding for exceptions with an unknown reason

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
													RES0											

### Bits [24:0]

Reserved, RES0.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or is not accessible in the current PE mode in the current Security state, including:
  - A read access using a System register encoding pattern that is not allocated for reads or that does not permit reads in the current PE mode and Security state.

- A write access using a System register encoding pattern that is not allocated for writes or that does not permit writes in the current PE mode and Security state.
- Instruction encodings that are unallocated.
- Instruction encodings for instructions not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- The attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by [HCR](#).HCD, [SCR](#).HCE, or [SCR\\_EL3](#).HCE.
  - An SMC instruction when disabled by [SCR](#).SCD or [SCR\\_EL3](#).SMD.
  - An HLT instruction when disabled by [EDSCR](#).HDE.
- An HVC instruction when disabled by [HCR](#).HCD, [SCR](#).HCE, or [SCR\\_EL3](#).HCE. An SMC instruction when disabled by [SCR](#).SCD or [SCR\\_EL3](#).SMD. An HLT instruction when disabled by [EDSCR](#).HDE.
- An exception generated because of the attempted execution of an MSR (Banked register) or MRS (Banked register) instruction that would access a Banked register that is not accessible from the Security state and PE mode at which the instruction was executed.

### Note

An exception is generated only if the `CONSTRAINED UNPREDICTABLE` behavior of the instruction is that it is `UNDEFINED`, see 'MSR (banked register) and MRS (banked register)'.

- Attempted execution, in Debug state, of:
  - A DCPS1 instruction in Non-secure state from EL0 when EL2 is using AArch32 and the value of [HCR](#).TGE is 1.
  - A DCPS2 instruction at EL1 or EL0 when EL2 is not implemented, or when EL3 is using AArch32 and the value of [SCR](#).NS is 0, or when EL3 is using AArch64 and the value of [SCR\\_EL3](#).NS is 0.
  - A DCPS3 instruction when EL3 is not implemented, or when the value of [EDSCR](#).SDD is 1.
- In Debug state when the value of [EDSCR](#).SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.

'Undefined Instruction exception, when the value of [HCR](#).TGE is 1' describes the configuration settings for a trap that returns an [HSR](#).EC value of `0b000000`.

## ISS encoding for Exception from a WFI or WFE instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			TI

### CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [19:1]

Reserved, RES0.

### TI, bit [0]

Trapped instruction. Possible values of this bit are:

TI	Meaning
0b0	WFI trapped.
0b1	WFE trapped.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

'Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions' describes the configuration settings for this trap.

## ISS encoding for Exception from an MCR or MRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc2		Opc1		CRn				RES0		Rt		CRm				Direction			

### CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **Opc2, bits [19:17]**

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **Opc1, bits [16:14]**

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **CRn, bits [13:10]**

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **Bit [9]**

Reserved, RES0.

### **Rt, bits [8:5]**

The Rt value from the issued instruction, the general-purpose register used for the transfer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### **CRm, bits [4:1]**

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for traps that are reported using EC value 0b000011:

- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the ID registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to lockdown, DMA, and TCM operations'.
- 'Traps to Hyp mode of Non-secure EL1 execution of cache maintenance instructions'.
- 'Traps to Hyp mode of Non-secure EL1 execution of TLB maintenance instructions'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to the Auxiliary Control Register'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Activity Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to the CPACR'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers'.
- 'General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the (coproc == 1111) encoding space'.

The following sections describe configuration settings for traps that are reported using EC value 0b000101:

- 'ID group 0, Primary device identification registers'.
- 'Traps to Hyp mode of Non-secure System register accesses to trace registers'.
- 'Trapping Non-secure System register accesses to Debug ROM registers'.
- 'Trapping Non-secure System register accesses to powerdown debug registers'.
- 'Trapping general Non-secure System register accesses to debug registers'.

The following sections describes configuration settings for traps that are reported using EC value 0b001000:

- 'ID group 0, Primary device identification registers'.
- 'ID group 3, Detailed feature identification registers'.

**ISS encoding for Exception from an MCRR or MRRC access**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					
CV	COND				Opc1				RES0				Rt2				RES0				Rt				CRm				Direction

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**COND, bits [23:20]**

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Opc1, bits [19:16]

The Opc1 value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [15:14]

Reserved, RES0.

### Rt2, bits [13:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [9]

Reserved, RES0.

### Rt, bits [8:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CRm, bits [4:1]

The CRm value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Direction, bit [0]

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for traps that are reported using EC value 0b000100:

- 'Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers'.

- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Activity Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the Generic Timer registers'.
- 'General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the (coproc == 1111) encoding space'.

The following sections describe configuration settings for traps that are reported using EC value 0b001100:

- 'Traps to Hyp mode of Non-secure System register accesses to trace registers'.
- 'Trapping Non-secure System register accesses to Debug ROM registers'.

## ISS encoding for Exception from an LDC or STC instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				imm8								RES0			Rn			Offset		AM		Direction	

### CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### imm8, bits [19:12]

The immediate value from the issued instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [11:9]

Reserved, RES0.

**Rn, bits [8:5]**

The Rn value from the issued instruction. Valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction.

When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Offset, bit [4]**

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**AM, bits [3:1]**

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	Literal unindexed. LDC instruction in A32 instruction set only. For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	Literal offset. LDC instruction only. For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Direction, bit [0]**

Indicates the direction of the trapped instruction. The possible values of this bit are:

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

'Trapping general Non-secure System register accesses to debug registers' describes the configuration settings for the trap that is reported using EC value 0b000110.

## ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0										TA		RES0		coproc					

Excludes exceptions that occur because Advanced SIMD and floating-point functionality is not implemented, or because the value of [HCR.TGE](#) or [HCR\\_EL2.TGE](#) is 1. These are reported with EC value 0b000000.

### CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

### Bits [19:6]

Reserved, RES0.

### TA, bit [5]

Indicates trapped use of Advanced SIMD functionality. The possible values of this bit are:

TA	Meaning
0b0	Exception was not caused by trapped use of Advanced SIMD functionality.
0b1	Exception was caused by trapped use of Advanced SIMD functionality.

Any use of an Advanced SIMD instruction that is not also a floating-point instruction that is trapped to Hyp mode because of a trap configured in the [HCPTR](#) sets this bit to 1.

For a list of these instructions, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**Bit [4]**

Reserved, RES0.

**coproc, bits [3:0]**

When the [HSR.TA](#) field returns the value 1, this field returns the value 0b1010. Otherwise, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- 'General trapping to Hyp mode of Non-secure accesses to the SIMD and floating-point registers'.
- 'Traps to Hyp mode of Non-secure accesses to Advanced SIMD functionality'.

**ISS encoding for Exception from HVC or SVC instruction execution**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										imm16														

**Bits [24:16]**

Reserved, RES0.

**imm16, bits [15:0]**

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, this is the value of the imm16 field of the issued instruction.

For an SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- For the T32 instruction, this field is zero-extended from the imm8 field of the instruction. For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

'Supervisor Call exception, when the value of HCR.TGE is 1' describes the configuration settings for the trap reported with EC value 0b010001.

**ISS encoding for Exception from SMC instruction execution**

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				CCKNOWNPASS								RES0											

**CV, bit [24]**

Condition code valid. Possible values of this bit are:

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

This field is **only** valid **only** if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is **only** valid **only** if CCKNOWNPASS is 1, otherwise it is RES0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Bits [18:0]

Reserved, RES0.

'Traps to Hyp mode of Non-secure EL1 execution of SMC instructions' describes the configuration settings for this trap, for instructions executed in Non-secure EL1.

## ISS encoding for Exception from a Prefetch Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0											FnV	EA	RES0	S1PTW	RES0	IFSC								

### Bits [24:11]

Reserved, RES0.

**FnV, bit [10]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	<a href="#">HIFAR</a> is valid.
0b1	<a href="#">HIFAR</a> is not valid, and holds an UNKNOWN value.

This field is **only** valid **only** if the IFSC code is 0b010000. It is RES0 for all other aborts.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**EA, bit [9]**

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bit [8]**

Reserved, RES0.

**S1PTW, bit [7]**

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bit [6]**

Reserved, RES0.

**IFSC, bits [5:0]**

Instruction Fault Status Code. Possible values of this field are:

IFSC	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100010	Debug exception.	
0b110000	TLB conflict abort.	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe cases where Prefetch Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100000:

- 'Abort exceptions, when the value of HCR.TGE is 1'.
- 'Routing debug exceptions to EL2 using AArch32'.

## ISS encoding for Exception from an Illegal state or PC alignment fault

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

### Bits [24:0]

Reserved, RES0.

For more information about the Illegal state exception, see:

- 'Illegal changes to PSTATE.M'.
- 'Illegal return events from AArch32 state'.
- 'Legal returns that set PSTATE.IL to 1'.
- 'The Illegal Execution state exception'.

For more information about the PC alignment fault exception, see 'Branching to an unaligned PC'.

## ISS encoding for Exception from a Data Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	SAS	SSE	RES0				SRT		RES0	AR	RES0	Bits[11:10]	AET	EAC	MS	1PTW	WnR							DFSC

### ISV, bit [24]

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults except Data Aborts generated by stage 2 address translations for which all the following apply to the instruction that generated the Data Abort exception:

- The instruction is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
- The instruction is not performing register writeback.
- The instruction is not using the PC as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, as described in 'Data Aborts in Memory access mode', and otherwise indicates whether ISS[23:14] hold a valid syndrome.

### Note

In the A32 instruction set, LDR\*T and STR\*T instructions always perform register writeback and therefore never return a valid instruction syndrome.

When **FEAT\_RAS** the RAS Extension is implemented, ISV is 0 for any synchronous External abort.

ISV is set to 0 on a stage 2 abort on a stage 1 translation table walk.

When **FEAT\_RAS** the RAS Extension is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**SSE, bit [21]**

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [20]**

Reserved, RES0.

**SRT, bits [19:16]**

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [15]**

Reserved, RES0.

**AR, bit [14]**

Acquire/Release. When ISV is 1, the possible values of this bit are:

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [13:12]**

Reserved, RES0.

**AET, bits [11:10]**

When FEAT\_RAS is implemented:

Asynchronous Error Type. When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception. The possible values of this field are:

AET	Meaning
0b00	Uncontainable (UC).
0b01	Unrecoverable state (UEU).
0b10	Restartable state (UEO).
0b11	Recoverable state (UER).

On a synchronous Data Abort, this field is RES0.

In the event of multiple errors taken as a single SError interrupt exception, the overall PE error state is reported.

---

#### Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

---

When **FEAT\_RAS**the RAS Extension is not implemented, or when DFSC is not 0b010001:

- Bit[11] is RES0.
  - Bit[10] forms the FnV field.
- 

#### Note

Armv8.2 requires the implementation of **FEAT\_RAS**the RAS Extension.

---

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	<a href="#">HDFAR</a> is valid.
0b1	<a href="#">HDFAR</a> is not valid, and holds an UNKNOWN value.

When **FEAT\_RAS**the RAS Extension is not implemented, this field is valid only if DFSC is 0b010000. It is RES0 for all other aborts.

When **FEAT\_RAS**the RAS Extension is implemented:

- If DFSC is 0b010000, this field is valid.
  - If DFSC is 0b010001, this bit forms part of the AET field, becoming AET[0].
  - This field is RES0 for all other aborts.
- 

#### Note

Armv8.2 requires the implementation of **FEAT\_RAS**the RAS Extension.

---

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### CM, bit [8]

Cache maintenance. For a synchronous fault, identifies fault that comes from a cache maintenance or address translation instruction. For synchronous faults, the possible values of this bit are:

CM	Meaning
0b0	Fault not generated by a cache maintenance or address translation instruction.
0b1	Fault generated by a cache maintenance or address translation instruction.

For an asynchronous Data Abort exception, this bit is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by a write instruction or a read instruction. The possible values of this bit are:

WnR	Meaning
0b0	Abort caused by a read instruction.
0b1	Abort caused by a write instruction.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

On an asynchronous Data Abort:

- When FEAT\_RAS is not implemented, this bit is UNKNOWN.
- When FEAT\_RAS is implemented, this bit is RES0.

#### Note

Armv8.2 requires the implementation of FEAT\_RAS.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### DFSC, bits [5:0]

Data Fault Status Code. Possible values of this field are:

DFSC	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010001	Asynchronous SError interrupt.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011001	Asynchronous SError interrupt, from a parity or ECC error on memory access.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Debug exception.	
0b110000	TLB conflict abort.	
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following describe cases where Data Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100100:

- 'Abort exceptions, when the value of HCR.TGE is 1'.
- 'Routing debug exceptions to EL2 using AArch32'.

The following describe cases that can cause a Data Abort exception that is taken to Hyp mode, and reported in the HSR with EC value of 0b100000 or 0b100100:

- 'Hyp mode control of Non-secure access permissions'.
- 'Memory fault reporting in Hyp mode'.

## Accessing the HSR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0101	0b0010	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T5 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);

# HSTR, Hyp System Trap Register

The HSTR characteristics are:

## Purpose

Controls trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to System registers in the coproc == 0b1111 encoding space:

- By the CRn value used to access the register using MCR or MRC instruction.
- By the CRm value used to access the register using MCRR or MRRC instruction.

## Configuration

AArch32 System register HSTR bits [31:0] are architecturally mapped to AArch64 System register [HSTR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HSTR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HSTR is a 32-bit register.

## Field descriptions

The HSTR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RES0																T15	RES0	T14	T13	T12	T11	T10	T9	T8	T7	T6	T5	RES0	T4	T3	T2	T1	T0

**Bits [31:16]**

**Bits [31:16, 14, 4]**

Reserved, RES0.

Fields T14 and T4 are RES0.

**T<n>, bit [n], for n = 15, 0 13 to 5, 3 to 0 15**

The remaining fields control whether Non-secure EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 0b1111 encoding space are trapped to Hyp mode:

T<n>	Meaning
0b0	This control has no effect on Non-secure EL0 or EL1 accesses to System registers.
0b1	Any Non-secure EL1 MCR or MRC access with coproc == 0b1111 and CRn == <n> is trapped to Hyp mode. A Non-secure EL0 MCR or MRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0. Any Non-secure EL1 MCRR or MRRC access with coproc == 0b1111 and CRm == <n> is trapped to Hyp mode. A Non-secure EL0 MCRR or MRRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0.

For example, when HSTR.T7 is 1, for instructions executed at Non-secure EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to Hyp mode.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to Hyp mode.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

## Accessing the HSTR

Accesses to this register use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b011

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HSTR;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HSTR;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

# HTCR, Hyp Translation Control Register

The HTCR characteristics are:

## Purpose

The control register for stage 1 of the EL2 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

## Configuration

AArch32 System register HTCR bits [31:0] are architecturally mapped to AArch64 System register [TCR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HTCR is a 32-bit register.

## Field descriptions

The HTCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
RES1	IMPLEMENTATION DEFINED	RES0	HWU62	HWU61	HWU60	HWU59	HPD	RES1	RES0				SH0	ORGN0	IRGN0	RES0	T0S													

Bit [31]

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [30]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

HWU62, bit [28]

When FEAT\_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU61, bit [27]**

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU60, bit [26]**

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU59, bit [25]**

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HPD, bit [24]****When FEAT\_AA32HPD is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the PL2 translation regime.

HPD	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [23]**

Reserved, RES1.

**Bits [22:14]**

Reserved, RES0.

**SH0, bits [13:12]**

Shareability attribute for memory associated with translation table walks using [HTTBR](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using [HTTBR](#).

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using [HTTBR](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [7:3]**

Reserved, RES0.

**T0SZ, bits [2:0]**

The size offset of the memory region addressed by [HTTBR](#). The region size is  $2^{(32-T0SZ)}$  bytes.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Accessing the HTCR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

# HTPIDR, Hyp Software Thread ID Register

The HTPIDR characteristics are:

## Purpose

Provides a location where software running in Hyp mode can store thread identifying information that is not visible to Non-secure software executing at EL0 or EL1, for hypervisor management purposes.

The PE makes no use of this register.

## Configuration

AArch32 System register HTPIDR bits [31:0] are architecturally mapped to AArch64 System register [TPIDR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HTPIDR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Note

The PE never updates this register.

## Attributes

HTPIDR is a 32-bit register.

## Field descriptions

The HTPIDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Thread ID																															

### Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the HTPIDR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1101	0b0000	0b010

```
if PSTATE.EL == EL0 then

-------	----------------	-------

# HTTBR, Hyp Translation Table Base Register

The HTTBR characteristics are:

## Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

## Configuration

AArch32 System register HTTBR bits [47:1] are architecturally mapped to AArch64 System register [TTBRO\\_EL2\[47:1\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HTTBR is a 64-bit register.

## Field descriptions

The HTTBR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																BADDR															
																BADDR															CnP
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:48]

Reserved, RES0.

### BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [HTCR.T0SZ](#) as follows:

- If [HTCR.T0SZ](#) is 0 or 1,  $x = 5 - \text{HTCR.T0SZ}$ .
- If [HTCR.T0SZ](#) is greater than 1,  $x = 14 - \text{HTCR.T0SZ}$ .

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### CnP, bit [0]

When FEAT\_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by HTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by HTTBR are permitted to differ from corresponding entries for HTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of HTTBR.CnP on those other PEs.
0b1	The translation table entries pointed to by HTTBR are the same as the translation table entries pointed to by HTTBR on every other PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.

Note

If the value of the HTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those HTTBRs do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the HTTBR

Accesses to this register use the following encodings:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b0010	0b0100

```
if PSTATE.EL == EL0 then

# HVBAR, Hyp Vector Base Address Register

The HVBAR characteristics are:

## Purpose

Holds the vector base address for any exception that is taken to Hyp mode.

## Configuration

AArch32 System register HVBAR bits [31:0] are architecturally mapped to AArch64 System register [VBAR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HVBAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

HVBAR is a 32-bit register.

## Field descriptions

The HVBAR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Vector Base Address																											RES0				

### Bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Bits [4:0]

Reserved, RES0.

## Accessing the HVBAR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b0000	0b000

```

# ICC\_AP1R<n>, Interrupt Controller Active Priorities Group 1 Registers, n = 0 - 3

The ICC\_AP1R<n> characteristics are:

## Purpose

Provides information about Group 1 active priorities.

## Configuration

AArch32 System register ICC\_AP1R<n> bits [31:0] (S) are architecturally mapped to AArch64 System register [ICC\\_AP1R<n>\\_EL1\[31:0\] \(S\)](#).

AArch32 System register ICC\_AP1R<n> bits [31:0] (NS) are architecturally mapped to AArch64 System register [ICC\\_AP1R<n>\\_EL1\[31:0\] \(NS\)](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC\_AP1R<n> are UNDEFINED.

## Attributes

ICC\_AP1R<n> is a 32-bit register.

## Field descriptions

The ICC\_AP1R<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

## Accessing the ICC\_AP1R<n>

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC\_AP1R1 is only implemented in implementations that support 6 or more bits of preemption. ICC\_AP1R2 and ICC\_AP1R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

### Note

The number of bits of preemption is indicated by [ICH\\_VTR](#).PREbits.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- [ICC\\_AP0R<n>](#)
- Secure ICC\_AP1R<n>
- Non-secure ICC\_AP1R<n>

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<b>coproc</b>	<b>opc1</b>	<b>CRn</b>	<b>CRm</b>	<b>opc2</b>

# ICC\_BPR0, Interrupt Controller Binary Point Register 0

The ICC\_BPR0 characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

## Configuration

AArch32 System register ICC\_BPR0 bits [31:0] are architecturally mapped to AArch64 System register [ICC\\_BPR0\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC\_BPR0 are UNDEFINED.

## Attributes

ICC\_BPR0 is a 32-bit register.

## Field descriptions

The ICC\_BPR0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																		BinaryPoint													

### Bits [31:3]

Reserved, RES0.

### BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	ggggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.ssssssss

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ICC\_BPR0

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by [ICC\\_CTLR.PRIBits](#) and [ICC\\_MCTLR.PRIBits](#).

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<b>coproc</b>	<b>opc1</b>	<b>CRn</b>	<b>CRm</b>	<b>opc2</b>
0b1111	0b000	0b1100	0b1000	0b011

```

# ICC\_HSRE, Interrupt Controller Hyp System Register Enable register

The ICC\_HSRE characteristics are:

## Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL2.

## Configuration

AArch32 System register ICC\_HSRE bits [31:0] are architecturally mapped to AArch64 System register [ICC\\_SRE\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC\_HSRE are UNDEFINED.

## Attributes

ICC\_HSRE is a 32-bit register.

## Field descriptions

The ICC\_HSRE bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																		Enable		DIB	DFB	SRE									

### Bits [31:4]

Reserved, RES0.

### Enable, bit [3]

Enable. Enables lower Exception level access to [ICC\\_SRE](#).

Enable	Meaning
0b0	Non-secure EL1 accesses to <a href="#">ICC_SRE</a> trap to EL2.
0b1	Non-secure EL1 accesses to <a href="#">ICC_SRE</a> do not trap to EL2.

If ICC\_HSRE.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC\_HSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

If EL3 is implemented and [GICD\\_CTLR.DS](#) is 0, this field is a read-only alias of [ICC\\_MSRE.DIB](#).

If EL3 is implemented and [GICD\\_CTLR.DS](#) is 1, this field is a read-write alias of [ICC\\_MSRE.DIB](#).

In systems that do not support IRQ bypass, this bit is RAO/WI.

On a Warm reset, this **This** field resets to 0.

## DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and [GICD\\_CTLR.DS](#) is 0, this field is a read-only alias of [ICC\\_MSRE.DFB](#).

If EL3 is implemented and [GICD\\_CTLR.DS](#) is 1, this field is a read-write alias of [ICC\\_MSRE.DFB](#).

In systems that do not support FIQ bypass, this bit is RAO/WI.

On a Warm reset, this **This** field resets to 0.

## SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Accesses at EL2 or below to any ICH_* System register, or any EL1 or EL2 ICC_* register other than <a href="#">ICC_SRE</a> or ICC_HSRE, are UNDEFINED.
0b1	The System register interface to the ICH_* registers and the EL1 and EL2 ICC_* registers is enabled for EL2.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and using AArch64:

- When [ICC\\_SRE\\_EL3.SRE](#)==0 this bit is RAZ/WI.

If EL3 is implemented using AArch32:

- When [ICC\\_MSRE.SRE](#)==0 this bit is RAZ/WI.

On a Warm reset, this **This** field resets to 0.

## Accessing the ICC\_HSRE

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while [ICC\\_HSRE.SRE](#)==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1001	0b101

```

0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

Virtual accesses to this register update [ICH\\_VMCR.VENG0](#).

On a Warm reset, this field resets to 0.

## Accessing the ICC\_IGRPEN0

The lowest Exception level at which this register can be accessed is governed by the Exception level to which FIQ is routed. This routing depends on SCR.FIQ, SCR.NS and HCR.FMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings:

MRC{&lt;c&gt;}{&lt;q&gt;} &lt;coproc&gt;, {#}&lt;opc1&gt;, &lt;Rt&gt;, &lt;CRn&gt;, &lt;CRm&gt;{, {#}&lt;opc2&gt;}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b110

```

# ICC\_IGRPEN1, Interrupt Controller Interrupt Group 1 Enable register

The ICC\_IGRPEN1 characteristics are:

## Purpose

Controls whether Group 1 interrupts are enabled for the current Security state.

## Configuration

AArch32 System register ICC\_IGRPEN1 bits [31:0] (S) are architecturally mapped to AArch64 System register [ICC\\_IGRPEN1\\_EL1\[31:0\] \(S\)](#).

AArch32 System register ICC\_IGRPEN1 bits [31:0] (NS) are architecturally mapped to AArch64 System register [ICC\\_IGRPEN1\\_EL1\[31:0\] \(NS\)](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC\_IGRPEN1 are UNDEFINED.

## Attributes

ICC\_IGRPEN1 is a 32-bit register.

## Field descriptions

The ICC\_IGRPEN1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															Enable

### Bits [31:1]

Reserved, RES0.

### Enable, bit [0]

Enables Group 1 interrupts for the current Security state.

Enable	Meaning
0b0	Group 1 interrupts are disabled for the current Security state.
0b1	Group 1 interrupts are enabled for the current Security state.

Virtual accesses to this register update [ICH\\_VMCR.VENG1](#).

If EL3 is present:

- This bit is a read/write alias of [ICC\\_MGRPEN1.EnableGrp1{S, NS}](#) as appropriate if EL3 is using AArch32, or [ICC\\_IGRPEN1\\_EL3.EnableGrp1{S, NS}](#) as appropriate if EL3 is using AArch64.
- When this register is accessed at EL3, the copy of this register appropriate to the current setting of SCR.NS is accessed.

On a Warm reset, this field resets to 0.

## Accessing the ICC\_IGRPEN1

The lowest Exception level at which this register can be accessed is governed by the Exception level to which IRQ is routed. This routing depends on SCR.IRQ, SCR.NS and HCR.IMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

# ICC\_MCTLR, Interrupt Controller Monitor Control Register

The ICC\_MCTLR characteristics are:

## Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

## Configuration

AArch32 System register ICC\_MCTLR bits [31:0] can be mapped to AArch64 System register [ICC\\_CTLR\\_EL3\[31:0\]](#), but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC\_MCTLR are UNDEFINED.

## Attributes

ICC\_MCTLR is a 32-bit register.

## Field descriptions

The ICC\_MCTLR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3

### Bits [31:20]

Reserved, RES0.

### ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.
	<b>Note</b> Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191 All INTIDs in the range 1024..8191 are treated as requiring deactivation.

### RSS, bit [18]

Range Selector Support. Possible values are:

<b>RSS</b>	<b>Meaning</b>
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

### **nDS, bit [17]**

Disable Security not supported. Read-only and writes are ignored.

<b>nDS</b>	<b>Meaning</b>
0b0	The CPU interface logic supports disabling of security.
0b1	The CPU interface logic does not support disabling of security, and requires that security is not disabled.

### **Bit [16]**

Reserved, RES0.

### **A3V, bit [15]**

Affinity 3 Valid. Read-only and writes are ignored.

<b>A3V</b>	<b>Meaning</b>
0b0	The CPU interface logic does not support non-zero values of the Aff3 field in SGI generation System registers.
0b1	The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers.

If EL3 is present, [ICC\\_CTLR.A3V](#) is an alias of ICC\_MCTLR.A3V

### **SEIS, bit [14]**

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs.

<b>SEIS</b>	<b>Meaning</b>
0b0	The CPU interface logic does not support generation of SEIs.
0b1	The CPU interface logic supports generation of SEIs.

If EL3 is present, [ICC\\_CTLR.SEIS](#) is an alias of ICC\_MCTLR.SEIS

### **IDbits, bits [13:11]**

Identifier bits. Read-only and writes are ignored. Indicates the number of physical interrupt identifier bits supported.

<b>IDbits</b>	<b>Meaning</b>
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is present, [ICC\\_CTLR.IDbits](#) is an alias of ICC\_MCTLR.IDbits

### **PRIbits, bits [10:8]**

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

**Note**

This field always returns the number of priority bits implemented, regardless of the value of SCR.NS or the value of [GICD\\_CTLR.DS](#).

The division between group priority and subpriority is defined in the binary point registers [ICC\\_BPR0](#) and [ICC\\_BPR1](#).

This field determines the minimum value of ICC\_BPR0.

**Bit [7]**

Reserved, RES0.

**PMHE, bit [6]**

Priority Mask Hint Enable.

PMHE	Meaning
0b0	Disables use of the priority mask register as a hint for interrupt distribution.
0b1	Enables use of the priority mask register as a hint for interrupt distribution.

Software must write [ICC\\_PMR](#) to 0xFF before clearing this field to 0.

An implementation might choose to make this field RAO/WI.

If EL3 is present, [ICC\\_CTLR](#).PMHE is an alias of ICC\_MCTLR.PMHE.

On a Warm reset, this field resets to 0.

**RM, bit [5]**

SBZ.

The equivalent bit in AArch64 is the Routing Modifier bit. This feature is not supported when EL3 is using AArch32.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EOImode\_EL1NS, bit [4]**

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1NS	Meaning
0b0	<a href="#">ICC_EOIR0</a> and <a href="#">ICC_EOIR1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICC_DIR</a> are UNPREDICTABLE.
0b1	<a href="#">ICC_EOIR0</a> and <a href="#">ICC_EOIR1</a> provide priority drop functionality only. <a href="#">ICC_DIR</a> provides interrupt deactivation functionality.

If EL3 is present, [ICC\\_CTLR](#)(NS).EOImode is an alias of ICC\_MCTLR.EOImode\_EL1NS.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**EOImode\_EL1S, bit [3]**

EOI mode for interrupts handled at Secure EL1. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1S	Meaning
0b0	<a href="#">ICC_EOIR0</a> and <a href="#">ICC_EOIR1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICC_DIR</a> are UNPREDICTABLE.
0b1	<a href="#">ICC_EOIR0</a> and <a href="#">ICC_EOIR1</a> provide priority drop functionality only. <a href="#">ICC_DIR</a> provides interrupt deactivation functionality.

If EL3 is present, [ICC\\_CTLR](#)(S).EOImode is an alias of ICC\_MCTLR.EOImode\_EL1S.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### EOImode\_EL3, bit [2]

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL3	Meaning
0b0	<a href="#">ICC_EOIR0</a> and <a href="#">ICC_EOIR1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICC_DIR</a> are UNPREDICTABLE.
0b1	<a href="#">ICC_EOIR0</a> and <a href="#">ICC_EOIR1</a> provide priority drop functionality only. <a href="#">ICC_DIR</a> provides interrupt deactivation functionality.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### CBPR\_EL1NS, bit [1]

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.

CBPR_EL1NS	Meaning
0b0	<a href="#">ICC_BPR0</a> determines the preemption group for Group 0 interrupts only. <a href="#">ICC_BPR1</a> determines the preemption group for Non-secure Group 1 interrupts.
0b1	<a href="#">ICC_BPR0</a> determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to <a href="#">GICC_BPR</a> and <a href="#">ICC_BPR1</a> access the state of <a href="#">ICC_BPR0</a> .

If EL3 is present, [ICC\\_CTLR](#)(NS).CBPR is an alias of ICC\_MCTLR.CBPR\_EL1NS.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### CBPR\_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts in Secure non-Monitor modes.

CBPR_EL1S	Meaning
0b0	<a href="#">ICC_BPR0</a> determines the preemption group for Group 0 interrupts only. <a href="#">ICC_BPR1</a> determines the preemption group for Secure Group 1 interrupts.
0b1	<a href="#">ICC_BPR0</a> determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 accesses, or EL3 accesses when not in Monitor mode, to <a href="#">ICC_BPR1</a> access the state of <a href="#">ICC_BPR0</a> .

If EL3 is present, [ICC\\_CTLR](#)(S).CBPR is an alias of ICC\_MCTLR.CBPR\_EL1S.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

## Accessing the ICC\_MCTLR

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b110	0b1100	0b1100	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;

# ICC\_MGRPEN1, Interrupt Controller Monitor Interrupt Group 1 Enable register

The ICC\_MGRPEN1 characteristics are:

## Purpose

Controls whether Group 1 interrupts are enabled or not.

## Configuration

AArch32 System register ICC\_MGRPEN1 bits [31:0] can be mapped to AArch64 System register [ICC\\_IGRPEN1\\_EL3\[31:0\]](#), but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC\_MGRPEN1 are UNDEFINED.

## Attributes

ICC\_MGRPEN1 is a 32-bit register.

## Field descriptions

The ICC\_MGRPEN1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																EnableGrp1S		EnableGrp1NS													

### Bits [31:2]

Reserved, RES0.

### EnableGrp1S, bit [1]

Enables Group 1 interrupts for the Secure state.

EnableGrp1S	Meaning
0b0	Secure Group 1 interrupts are disabled.
0b1	Secure Group 1 interrupts are enabled.

The Secure [ICC\\_IGRPEN1](#).Enable bit is a read/write alias of the ICC\_MGRPEN1.EnableGrp1S bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this field resets to 0.

### EnableGrp1NS, bit [0]

Enables Group 1 interrupts for the Non-secure state.

EnableGrp1NS	Meaning
0b0	Non-secure Group 1 interrupts are disabled.
0b1	Non-secure Group 1 interrupts are enabled.

The Non-secure [ICC\\_IGRPEN1](#).Enable bit is a read/write alias of the ICC\_MGRPEN1.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

On a Warm reset, this ~~This~~ field resets to 0.

## Accessing the ICC\_MGRPEN1

If an interrupt is pending within the CPU interface when an Enable bit becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b110	0b1100	0b1100	0b111

```

if PSTATE.EL == EL0 then
    UNDEFINED;

    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    if ICC_MSRE.SRE == '0' then
        UNDEFINED;
    else
        return ICC_MGRPEN1;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b110	0b1100	0b1100	0b111

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    if ICC_MSRE.SRE == '0' then
        UNDEFINED;
    else
        ICC_MGRPEN1 = R[t];

```

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489ce15ad1565345720bed2a

-------	----------------	-------

**DIB, bit [2]**

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

In systems that do not support IRQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**DFB, bit [1]**

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

In systems that do not support FIQ bypass, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**SRE, bit [0]**

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Accesses at EL3 or below to any ICH_* System register, or any EL1, EL2, or EL3 ICC_* register other than <a href="#">ICC_SRE</a> , <a href="#">ICC_HSRE</a> , or ICC_MSRE, are UNDEFINED.
0b1	The System register interface to the ICH_* registers and the EL1, EL2, and EL3 ICC_* registers is enabled for EL3.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

On a Warm reset, this field resets to 0.

**Accessing the ICC\_MSRE**

This register is always System register accessible.

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC\_MSRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b110	0b1100	0b1100	0b101

```

if PSTATE.EL == EL0 then

# ICC\_PMR, Interrupt Controller Interrupt Priority Mask Register

The ICC\_PMR characteristics are:

## Purpose

Provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

## Configuration

AArch32 System register ICC\_PMR bits [31:0] are architecturally mapped to AArch64 System register [ICC\\_PMR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC\_PMR are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Attributes

ICC\_PMR is a 32-bit register.

## Field descriptions

The ICC\_PMR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								Priority							

### Bits [31:8]

Reserved, RES0.

### Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	0x00-0xFF (0-255), all values	256
[7:1]	0x00-0xFE (0-254), even values only	128
[7:2]	0x00-0xFC (0-252), in steps of 4	64
[7:3]	0x00-0xF8 (0-248), in steps of 8	32
[7:4]	0x00-0xF0 (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

On a Warm reset, thisThis field resets to 0.

## Accessing the ICC\_PMR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

# ICC\_SRE, Interrupt Controller System Register Enable register

The ICC\_SRE characteristics are:

## Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL0 and EL1.

## Configuration

AArch32 System register ICC\_SRE bits [31:0] (S) are architecturally mapped to AArch64 System register [ICC\\_SRE\\_EL1\[31:0\] \(S\)](#).

AArch32 System register ICC\_SRE bits [31:0] (NS) are architecturally mapped to AArch64 System register [ICC\\_SRE\\_EL1\[31:0\] \(NS\)](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICC\_SRE are UNDEFINED.

## Attributes

ICC\_SRE is a 32-bit register.

## Field descriptions

The ICC\_SRE bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																		DIB										DFB		SRE	

### Bits [31:3]

Reserved, RES0.

### DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

If EL3 is implemented and [GICD\\_CTLR](#).DS == 0, this field is a read-only alias of [ICC\\_MSRE](#).DIB.

If EL3 is implemented and [GICD\\_CTLR](#).DS == 1, and EL2 is not implemented, this field is a read-write alias of [ICC\\_MSRE](#).DIB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of [ICC\\_HSRE](#).DIB.

If [GICD\\_CTLR](#).DS == 1 and EL2 is implemented, this field is a read-only alias of [ICC\\_HSRE](#).DIB.

In systems that do not support IRQ bypass, this field is RAO/WI.

On a Warm reset, this field resets to 0.

**DFB, bit [1]**

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and [GICD\\_CTLR.DS](#) == 0, this field is a read-only alias of [ICC\\_MSRE.DFB](#).

If EL3 is implemented and [GICD\\_CTLR.DS](#) == 1, and EL2 is not implemented, this field is a read-write alias of [ICC\\_MSRE.DFB](#).

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of [ICC\\_HSRE.DFB](#).

If [GICD\\_CTLR.DS](#) == 1 and EL2 is implemented, this field is a read-only alias of [ICC\\_HSRE.DFB](#).

In systems that do not support FIQ bypass, this field is RAO/WI.

On a Warm reset, this field resets to 0.

**SRE, bit [0]**

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Accesses at EL1 to any ICC_* System register other than ICC_SRE are UNDEFINED.
0b1	The System register interface for the current Security state is enabled.

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and using AArch64:

- When [ICC\\_SRE\\_EL3.SRE](#)==0 the Secure copy of this bit is RAZ/WI.
- When [ICC\\_SRE\\_EL3.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI.

If EL3 is implemented and using AArch32:

- When [ICC\\_MSRE.SRE](#)==0 the Secure copy of this bit is RAZ/WI.
- When [ICC\\_MSRE.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch64:

- When [ICC\\_SRE\\_EL2.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch32:

- When [ICC\\_HSRE.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI.

On a Warm reset, this field resets to 0.

**Accessing the ICC\_SRE**

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while [ICC\\_SRE.SRE](#)==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b101

```

The ICH\_AP0R<n> characteristics are:

## Purpose

Provides information about Group 0 active priorities for EL2.

## Configuration

AArch32 System register ICH\_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register [ICH\\_AP0R<n> EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH\_AP0R<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

ICH\_AP0R<n> is a 32-bit register.

## Field descriptions

The ICH\_AP0R<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

**~~P<x>, bit [x], for x = 0 to 31~~**

**P<x>, bit [x], for x = 31 to 0**

Provides the access to the virtual active priorities for Group 0 interrupts. Possible values of each bit are:

<b>P&lt;x&gt;</b>	<b>Meaning</b>
0b0	There is no Group 0 interrupt active at the priority corresponding to that bit.
0b1	There is a Group 0 interrupt active at the priority corresponding to that bit.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH APOR0 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH\_AP0R0 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH\_AP0R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH\_AP0R0 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH\_AP0R1 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH\_AP0R2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH\_AP0R3 in the bits corresponding to 11:Priority[5:1].

#### Note

Having the bit corresponding to a priority set to 1 in both ICH\_AP0R<n> and [ICH\\_AP1R<n>](#) might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

On a Warm reset, this **This** field resets to 0.

## Accessing the ICH\_AP0R<n>

ICH\_AP0R1 is only implemented in implementations that support 6 or more bits of preemption. ICH\_AP0R2 and ICH\_AP0R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

#### Note

The number of bits of preemption is indicated by [ICH\\_VTR](#).PREbits

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICH\_AP0R<n>
- [ICH\\_AP1R<n>](#)

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1000	0b0:n[1:0]

```

# ICH\_AP1R<n>, Interrupt Controller Hyp Active Priorities Group 1 Registers, n = 0 - 3

The ICH\_AP1R<n> characteristics are:

## Purpose

Provides information about Group 1 active priorities for EL2.

## Configuration

AArch32 System register ICH\_AP1R<n> bits [31:0] are architecturally mapped to AArch64 System register [ICH\\_AP1R<n>\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH\_AP1R<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

ICH\_AP1R<n> is a 32-bit register.

## Field descriptions

The ICH\_AP1R<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

**P<x>, bit [x], for x = 0 to 31**

**P<x>, bit [x], for x = 31 to 0**

Group 1 interrupt active priorities. Possible values of each bit are:

P<x>	Meaning
0b0	There is no Group 1 interrupt active at the priority corresponding to that bit.
0b1	There is a Group 1 interrupt active at the priority corresponding to that bit.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH\_AP1R0 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH\_AP1R0 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH\_AP1R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH\_AP1R0 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH\_AP1R1 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH\_AP1R2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH\_AP1R3 in the bits corresponding to 11:Priority[5:1].

#### Note

Having the bit corresponding to a priority set to 1 in both [ICH\\_AP0R<n>](#) and ICH\_AP1R<n> might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

On a Warm reset, this **This** field resets to 0.

## Accessing the ICH\_AP1R<n>

ICH\_AP1R1 is only implemented in implementations that support 6 or more bits of preemption. ICH\_AP1R2 and ICH\_AP1R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

#### Note

The number of bits of preemption is indicated by [ICH\\_VTR.PREbits](#)

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- [ICH\\_AP0R<n>](#)
- ICH\_AP1R<n>

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1001	0b0:n[1:0]

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_HSRE.SRE == '0' then
        UNDEFINED;
    else
        return ICH_AP1R[UInt(opc2<1:0>)];
elsif PSTATE.EL == EL3 then
    if ICC_MSRE.SRE == '0' then
        UNDEFINED;
    else
        return ICH_AP1R[UInt(opc2<1:0>)];

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1001	0b0:n[1:0]

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);

# ICH\_EISR, Interrupt Controller End of Interrupt Status Register

The ICH\_EISR characteristics are:

## Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

## Configuration

AArch32 System register ICH\_EISR bits [31:0] are architecturally mapped to AArch64 System register [ICH\\_EISR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH\_EISR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

ICH\_EISR is a 32-bit register.

## Field descriptions

The ICH\_EISR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8
RES0																Status15 Status<n>, bit [n], for n = 0 to 15	Status14	Status13	Status12	Status11	Status10	Status9	Status8

### Bits [31:16]

Reserved, RES0.

### Status<n>, bit [n], for n = 15 to 0

EOI maintenance interrupt status bit for List register <n>:

Status<n>	Meaning
0b0	List register <n>, <a href="#">ICH_LR&lt;n&gt;</a> , does not have an EOI maintenance interrupt.
0b1	List register <n>, <a href="#">ICH_LR&lt;n&gt;</a> , has an EOI maintenance interrupt that has not been handled.

For any ICH\_LR<n>, the corresponding status bit is set to 1 if all of the following are true:

- [ICH\\_LRC<n>](#).State is 0b00.
- [ICH\\_LRC<n>](#).HW is 0.
- [ICH\\_LRC<n>](#).EOI (bit [9]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

On a Warm reset, this field resets to 0.

# ICH\_ELRSR, Interrupt Controller Empty List Register Status Register

The ICH\_ELRSR characteristics are:

## Purpose

Indicates which List registers contain valid interrupts.

## Configuration

AArch32 System register ICH\_ELRSR bits [31:0] are architecturally mapped to AArch64 System register [ICH\\_ELRSR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH\_ELRSR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

ICH\_ELRSR is a 32-bit register.

## Field descriptions

The ICH\_ELRSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8
RES0																Status15 bit [n], for n = 0 to 15	Status14	Status13	Status12	Status11	Status10	Status9	Status8

### Bits [31:16]

Reserved, RES0.

### Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>, [ICH\\_LR<n>](#):

Status<n>	Meaning
0b0	List register <a href="#">ICH_LR&lt;n&gt;</a> , if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.
0b1	List register <a href="#">ICH_LR&lt;n&gt;</a> does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.

For any List register <n>, the corresponding status bit is set to 1 if [ICH\\_LRC<n>](#).State is 0b00 and either [ICH\\_LRC<n>](#).HW is 1 or [ICH\\_LRC<n>](#).EOI (bit [9]) is 0.

## Accessing the ICH\_ELRSR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1011	0b101

```

# ICH\_HCR, Interrupt Controller Hyp Control Register

The ICH\_HCR characteristics are:

## Purpose

Controls the environment for VMs.

## Configuration

AArch32 System register ICH\_HCR bits [31:0] are architecturally mapped to AArch64 System register [ICH\\_HCR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH\_HCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

ICH\_HCR is a 32-bit register.

## Field descriptions

The ICH\_HCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4
EOIcount																											

### EOIcount, bits [31:27]

This field is incremented whenever a successful write to a virtual EOIR or DIR register would have resulted in a virtual interrupt deactivation. That is either:

- A virtual write to EOIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is zero and no List Register was found.
- A virtual write to DIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is one and no List Register was found.

This allows software to manage more active interrupts than there are implemented List Registers.

It is CONSTRAINED UNPREDICTABLE whether a virtual write to EOIR that does not clear a bit in the Active Priorities registers ([ICH\\_AP0R<n>](#)/[ICH\\_AP1R<n>](#)) increments EOIcount. Permitted behaviors are:

- Increment EOIcount.
- Leave EOIcount unchanged.

On a Warm reset, this field resets to 0.

### Bits [26:15]

Reserved, RES0.

### TDIR, bit [14]

Trap Non-secure EL1 writes to [ICC\\_DIR](#) and [ICV\\_DIR](#).

<b>TDIR</b>	<b>Meaning</b>
0b0	Non-secure EL1 writes of <a href="#">ICC_DIR</a> and <a href="#">ICV_DIR</a> are not trapped to EL2, unless trapped by other mechanisms.
0b1	Non-secure EL1 writes of <a href="#">ICV_DIR</a> are trapped to EL2. It is IMPLEMENTATION DEFINED whether Non-secure writes of <a href="#">ICC_DIR</a> are trapped. Not trapping <a href="#">ICC_DIR</a> writes is DEPRECATED.

Support for this bit is OPTIONAL, with support indicated by [ICH\\_VTR](#).

If the implementation does not support this trap, this bit is RES0.

Arm deprecates not including this trap bit.

On a Warm reset, this [This](#) field resets to 0.

### TSEI, bit [13]

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at Non-secure EL1.

<b>TSEI</b>	<b>Meaning</b>
0b0	Locally generated SEIs do not cause a trap to EL2.
0b1	Locally generated SEIs trap to EL2.

If [ICH\\_VTR](#).SEIS is 0, this bit is RES0.

On a Warm reset, this [This](#) field resets to 0.

### TALL1, bit [12]

Trap all Non-secure EL1 accesses to ICC\_\* and ICV\_\* System registers for Group 1 interrupts to EL2.

<b>TALL1</b>	<b>Meaning</b>
0b0	Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal.
0b1	Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2.

On a Warm reset, this [This](#) field resets to 0.

### TALL0, bit [11]

Trap all Non-secure EL1 accesses to ICC\_\* and ICV\_\* System registers for Group 0 interrupts to EL2.

<b>TALL0</b>	<b>Meaning</b>
0b0	Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal.
0b1	Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2.

On a Warm reset, this [This](#) field resets to 0.

### TC, bit [10]

Trap all Non-secure EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.

<b>TC</b>	<b>Meaning</b>
0b0	Non-secure EL1 accesses to common registers proceed as normal.
0b1	Non-secure EL1 accesses to common registers trap to EL2.

This affects accesses to [ICC\\_SGI0R](#), [ICC\\_SGI1R](#), [ICC\\_ASGI1R](#), [ICC\\_CTLR](#), [ICC\\_DIR](#), [ICC\\_PMR](#), [ICC\\_RPR](#), [ICV\\_CTLR](#), [ICV\\_DIR](#), [ICV\\_PMR](#), and [ICV\\_RPR](#).

On a Warm reset, this [This](#) field resets to 0.

**Bit [9]**

Reserved, RES0.

**vSGIEOICount, bit [8]**

When FEAT\_GICv4p1 is implemented:

Controls whether deactivation of virtual SGIs can increment ICH\_HCR\_EL2.EOICount

vSGIEOICount	Meaning
0b0	Deactivation of virtual SGIs can increment ICH_HCR.EOICount.
0b1	Deactivation of virtual SGIs does not increment ICH_HCR.EOICount.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**VGrp1DIE, bit [7]**

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp1DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">ICH_VMCR.VENG1</a> is 0.

On a Warm reset, this field resets to 0.

**VGrp1EIE, bit [6]**

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp1EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">ICH_VMCR.VENG1</a> is 1.

On a Warm reset, this field resets to 0.

**VGrp0DIE, bit [5]**

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp0DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">ICH_VMCR.VENG0</a> is 0.

On a Warm reset, this field resets to 0.

**VGrp0EIE, bit [4]**

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp0EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">ICH_VMCR.VENG0</a> is 1.

On a Warm reset, this **This** field resets to 0.

### NPIE, bit [3]

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to 0b01 (pending):

NPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

On a Warm reset, this **This** field resets to 0.

### LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

LRENPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted while the EOICount field is not 0.

On a Warm reset, this **This** field resets to 0.

### UIE, bit [1]

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

UIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.

On a Warm reset, this **This** field resets to 0.

### En, bit [0]

Enable. Global enable bit for the virtual CPU interface:

En	Meaning
0b0	Virtual CPU interface operation disabled.
0b1	Virtual CPU interface operation enabled.

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of [ICV\\_IAR0](#), [ICV\\_IAR1](#), [GICV\\_IAR](#) or [GICV\\_AIAR](#) returns a spurious interrupt ID.

On a Warm reset, this **This** field resets to 0.

## Accessing the ICH\_HCR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1011	0b000

```

# ICH\_LRC<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH\_LRC<n> characteristics are:

## Purpose

Provides interrupt context information for the virtual CPU interface.

## Configuration

AArch32 System register ICH\_LRC<n> bits [31:0] are architecturally mapped to AArch64 System register [ICH\\_LR<n>\\_EL2\[63:32\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH\_LRC<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

## Attributes

ICH\_LRC<n> is a 32-bit register.

## Field descriptions

The ICH\_LRC<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
State	HW	Group					RES0				Priority					RES0															pINTID

### State, bits [31:30]

The state of the interrupt:

State	Meaning
0b00	Invalid (Inactive).
0b01	Pending.
0b10	Active.
0b11	Pending and active.

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the invalid state are ignored, except for the purpose of generating virtual maintenance interrupts.

For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

On a Warm reset, this field resets to 0.

### HW, bit [29]

Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the INTID that the pINTID field indicates.

HW	Meaning
0b0	The interrupt is triggered entirely by software. No notification is sent to the Distributor when the virtual interrupt is deactivated.
0b1	The interrupt maps directly to a hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using the pINTID field from this register to indicate the physical INTID. If <a href="#">ICH_VMCR.VEOIM</a> is 0, this request corresponds to a write to <a href="#">ICC_EOIR0</a> or <a href="#">ICC_EOIR1</a> . Otherwise, it corresponds to a write to <a href="#">ICC_DIR</a> .

On a Warm reset, this **This** field resets to 0.

## Group, bit [28]

Indicates the group for this virtual interrupt.

Group	Meaning
0b0	This is a Group 0 virtual interrupt. <a href="#">ICH_VMCR.VFIQEn</a> determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and <a href="#">ICH_VMCR.VENG0</a> enables signaling of this interrupt to the virtual machine.
0b1	This is a Group 1 virtual interrupt, signaled as a virtual IRQ. <a href="#">ICH_VMCR.VENG1</a> enables the signaling of this interrupt to the virtual machine. If <a href="#">ICH_VMCR.VCBPR</a> is 0, then <a href="#">ICC_BPR1</a> determines if a pending Group 1 interrupt has sufficient priority to preempt current execution. Otherwise, <a href="#">ICH_LR&lt;n&gt;</a> determines preemption.

On a Warm reset, this **This** field resets to 0.

## Bits [27:24]

Reserved, RES0.

## Priority, bits [23:16]

The priority of this interrupt.

It is IMPLEMENTATION DEFINED how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit[16] up to bit[18]. The number of implemented bits can be discovered from [ICH\\_VTR.PRIBits](#).

On a Warm reset, this **This** field resets to 0.

## Bits [15:13]

Reserved, RES0.

## pINTID, bits [12:0]

Physical INTID, for hardware interrupts.

When ICH\_LRC<n>.HW is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[12:10] : RES0.
- Bit[9] : EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits[8:0] : Reserved, RES0.

When ICH\_LRC<n>.HW is 1 (there is a corresponding physical interrupt):

- This field indicates the physical INTID. This field is only required to implement enough bits to hold a valid value for the implemented INTID size. Any unused higher order bits are RES0.

- When [ICC\\_CTLR\\_EL1](#).ExtRange is 0, then bits[44:42] of this field are RES0.
- If the value of pINTID is not a valid INTID, behavior is UNPREDICTABLE. If the value of pINTID indicates a PPI, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 13 bits of Physical INTID are required, regardless of the number specified by [ICC\\_CTLR](#).IDbits.

On a Warm reset, this field resets to 0.

## Accessing the ICH\_LRC<n>

[ICH\\_LR<n>](#) and ICH\_LRC<n> can be updated independently.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b111:n[3]	n[2:0]

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

# ICH\_LR<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH\_LR<n> characteristics are:

## Purpose

Provides interrupt context information for the virtual CPU interface.

## Configuration

AArch32 System register ICH\_LR<n> bits [31:0] are architecturally mapped to AArch64 System register [ICH\\_LR<n>\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH\_LR<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

## Attributes

ICH\_LR<n> is a 32-bit register.

## Field descriptions

The ICH\_LR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																vINTID															

### vINTID, bits [31:0]

Virtual INTID of the interrupt.

If the value of vINTID is 1020-1023 and [ICH\\_LRC<n>.State](#) != 0b00 (Inactive), behavior is UNPREDICTABLE.

Behavior is UNPREDICTABLE if two or more List Registers specify the same vINTID when:

- [ICH\\_LRC<n>.State](#) == 01.
- [ICH\\_LRC<n>.State](#) == 10.
- [ICH\\_LRC<n>.State](#) == 11.

It is IMPLEMENTATION DEFINED how many bits are implemented, though at least 16 bits must be implemented. Unimplemented bits are RES0. The number of implemented bits can be discovered from [ICH\\_VTR.IDbits](#).

### Note

When a VM is using memory-mapped access to the GIC, software must ensure that the correct source PE ID is provided in bits[12:10].

On a Warm reset, this field resets to 0.

## Accessing the ICH\_LR<n>

ICH\_LR<n> and [ICH\\_LRC<n>](#) can be updated independently.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b110:n[3]	n[2:0]

```

# ICH\_MISR, Interrupt Controller Maintenance Interrupt State Register

The ICH\_MISR characteristics are:

## Purpose

Indicates which maintenance interrupts are asserted.

## Configuration

AArch32 System register ICH\_MISR bits [31:0] are architecturally mapped to AArch64 System register [ICH\\_MISR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH\_MISR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

ICH\_MISR is a 32-bit register.

## Field descriptions

The ICH\_MISR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
											RES0											VGrp1D		VGrp1E	VGrp0D	VGrp0E	NP	LREN	NP	U	EOI		

### Bits [31:8]

Reserved, RES0.

### VGrp1D, bit [7]

vPE Group 1 Disabled.

VGrp1D	Meaning
0b0	vPE Group 1 Disabled maintenance interrupt not asserted.
0b1	vPE Group 1 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR.VGrp1DIE](#) is 1 and [ICH\\_VMCR.VENG0](#) is 0.

On a Warm reset, this field resets to 0.

### VGrp1E, bit [6]

vPE Group 1 Enabled.

VGrp1E	Meaning
0b0	vPE Group 1 Enabled maintenance interrupt not asserted.
0b1	vPE Group 1 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR.VGrp1EIE](#) is 1 and [ICH\\_VMCR.VENG1](#) is 1.

On a Warm reset, this **This** field resets to 0.

### VGrp0D, bit [5]

vPE Group 0 Disabled.

VGrp0D	Meaning
0b0	vPE Group 0 Disabled maintenance interrupt not asserted.
0b1	vPE Group 0 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR.VGrp0DIE](#) is 1 and [ICH\\_VMCR.VENG0](#) is 0.

On a Warm reset, this **This** field resets to 0.

### VGrp0E, bit [4]

vPE Group 0 Enabled.

VGrp0E	Meaning
0b0	vPE Group 0 Enabled maintenance interrupt not asserted.
0b1	vPE Group 0 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR.VGrp0EIE](#) is 1 and [ICH\\_VMCR.VENG0](#) is 1.

On a Warm reset, this **This** field resets to 0.

### NP, bit [3]

No Pending.

NP	Meaning
0b0	No Pending maintenance interrupt not asserted.
0b1	No Pending maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR.NPIE](#) is 1 and no List register is in pending state.

On a Warm reset, this **This** field resets to 0.

### LREN, bit [2]

List Register Entry Not Present.

LREN	Meaning
0b0	List Register Entry Not Present maintenance interrupt not asserted.
0b1	List Register Entry Not Present maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR.LRENPIE](#) is 1 and [ICH\\_HCR.EOIcount](#) is non-zero.

On a Warm reset, this **This** field resets to 0.

### U, bit [1]

Underflow.

U	Meaning
0b0	Underflow maintenance interrupt not asserted.
0b1	Underflow maintenance interrupt asserted.

This maintenance interrupt is asserted when [ICH\\_HCR.UIE](#) is 1 and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding [ICH\\_LRC<n>.State](#) bits do not equal 0x0.

On a Warm reset, this **This** field resets to 0.

EOI, bit [0]

End Of Interrupt.

EOI	Meaning
0b0	End Of Interrupt maintenance interrupt not asserted.
0b1	End Of Interrupt maintenance interrupt asserted.

This maintenance interrupt is asserted when at least one bit in [ICH\\_EISR](#) is 1.

On a Warm reset, this field resets to 0.

Accessing the ICH\_MISR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1011	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    if ICC_HSRE.SRE == '0' then
        UNDEFINED;
    else
        return ICH_MISR;
elseif PSTATE.EL == EL3 then
    if ICC_MSRE.SRE == '0' then
        UNDEFINED;
    else
        return ICH_MISR;

```

# ICH\_VMCR, Interrupt Controller Virtual Machine Control Register

The ICH\_VMCR characteristics are:

## Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state.

## Configuration

AArch32 System register ICH\_VMCR bits [31:0] are architecturally mapped to AArch64 System register [ICH\\_VMCR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH\_VMCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

ICH\_VMCR is a 32-bit register.

## Field descriptions

The ICH\_VMCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VPMR								VBPR0		VBPR1		RES0				VEOIM		RES0		VCBPR		VFIQEn		VackCt		VENG1		VENG0			

### VPMR, bits [31:24]

Virtual Priority Mask. The priority mask level for the virtual CPU interface. If the priority of a pending virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

This field is an alias of [ICV\\_PMR](#).Priority.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if ICH\_VMCR.VCBPR == 1.

This field is an alias of [ICV\\_BPR0](#).BinaryPoint.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption if [ICH\\_VMCR](#).VCBPR == 0.

This field is an alias of [ICV\\_BPR1](#).BinaryPoint.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Bits [17:10]

Reserved, RES0.

### VEOIM, bit [9]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

VEOIM	Meaning
0b0	<a href="#">ICV_EOIR0</a> and <a href="#">ICV_EOIR1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICV_DIR</a> are UNPREDICTABLE.
0b1	<a href="#">ICV_EOIR0</a> and <a href="#">ICV_EOIR1</a> provide priority drop functionality only. <a href="#">ICV_DIR</a> provides interrupt deactivation functionality.

This bit is an alias of [ICV\\_CTLR](#).EOImode.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Bits [8:5]

Reserved, RES0.

### VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

VCBPR	Meaning
0b0	<a href="#">ICV_BPR0</a> determines the preemption group for virtual Group 0 interrupts only. <a href="#">ICV_BPR1</a> determines the preemption group for virtual Group 1 interrupts.
0b1	<a href="#">ICV_BPR0</a> determines the preemption group for both virtual Group 0 and virtual Group 1 interrupts. Reads of <a href="#">ICV_BPR1</a> return <a href="#">ICV_BPR0</a> plus one, saturated to 0b111. Writes to <a href="#">ICV_BPR1</a> are ignored.

This field is an alias of [ICV\\_CTLR](#).CBPR.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

VFIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

This bit is an alias of [GICV\\_CTLR](#).FIQEn.

In implementations where the Non-secure copy of [ICC\\_SRE](#).SRE is always 1, this bit is RES1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

<b>VAckCtl</b>	<b>Meaning</b>
0b0	If the highest priority pending interrupt is Group 1, a read of <a href="#">GICV_IAR</a> or <a href="#">GICV_HPPIR</a> returns an INTID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of <a href="#">GICV_IAR</a> or <a href="#">GICV_HPPIR</a> returns the INTID of the corresponding interrupt.

This bit is an alias of [GICV\\_CTLR](#).AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

In implementations where the Non-secure copy of [ICC\\_SRE](#).SRE is always 1, this bit is RES0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### VENG1, bit [1]

Virtual Group 1 interrupt enable. Possible values of this bit are:

<b>VENG1</b>	<b>Meaning</b>
0b0	Virtual Group 1 interrupts are disabled.
0b1	Virtual Group 1 interrupts are enabled.

This bit is an alias of [ICV\\_IGRPEN1](#).Enable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### VENG0, bit [0]

Virtual Group 0 interrupt enable. Possible values of this bit are:

<b>VENG0</b>	<b>Meaning</b>
0b0	Virtual Group 0 interrupts are disabled.
0b1	Virtual Group 0 interrupts are enabled.

This bit is an alias of [ICV\\_IGRPEN0](#).Enable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Accessing the ICH\_VMCR

When EL2 is using System register access, EL1 using either System register or memory-mapped access must be supported.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<b>coproc</b>	<b>opc1</b>	<b>CRn</b>	<b>CRm</b>	<b>opc2</b>
0b1111	0b100	0b1100	0b1011	0b111

```

if PSTATE.EL == EL0 then

# ICH\_VTR, Interrupt Controller VGIC Type Register

The ICH\_VTR characteristics are:

## Purpose

Reports supported GIC virtualization~~virtualisation~~ features.

## Configuration

AArch32 System register ICH\_VTR bits [31:0] are architecturally mapped to AArch64 System register [ICH\\_VTR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICH\_VTR are UNDEFINED.

If EL2 is not implemented, all bits in this register are RES0 from EL3, except for nV4, which is RES1 from EL3.

## Attributes

ICH\_VTR is a 32-bit register.

## Field descriptions

The ICH\_VTR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PRIbits			PREbits			IDbits			SEIS			A3VnV4TDS		RES0												ListRegs					

### PRIbits, bits [31:29]

Priority bits. The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

This field is an alias of [ICV\\_CTLR](#).PRIbits.

### PREbits, bits [28:26]

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH\_VTR.PRIbits.

### IDbits, bits [25:23]

The number of virtual interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

This field is an alias of [ICV\\_CTLR](#).IDbits.

### SEIS, bit [22]

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support generation of SEIs.
0b1	The virtual CPU interface logic supports generation of SEIs.

This bit is an alias of [ICV\\_CTLR](#).SEIS.

### A3V, bit [21]

Affinity 3 Valid. Possible values are:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

This bit is an alias of [ICV\\_CTLR](#).A3V.

### nV4, bit [20]

Direct injection of virtual interrupts not supported. Possible values are:

nV4	Meaning
0b0	The CPU interface logic supports direct injection of virtual interrupts.
0b1	The CPU interface logic does not support direct injection of virtual interrupts.

If [FEAT\\_GICv4](#) is not implemented, this bit is RES1.

### TDS, bit [19]

Separate trapping of Non-secure EL1 writes to [ICV\\_DIR](#) supported.

TDS	Meaning
0b0	Implementation does not support <a href="#">ICH_HCR</a> .TDIR.
0b1	Implementation supports <a href="#">ICH_HCR</a> .TDIR.

### Bits [18:5]

Reserved, RES0.

### ListRegs, bits [4:0]

The number of implemented List registers, minus one. For example, a value of 0b01111 indicates that the maximum of 16 List registers are implemented.

## Accessing the ICH\_VTR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

# ICV\_AP1R<n>, Interrupt Controller Virtual Active Priorities Group 1 Registers, n = 0 - 3

The ICV\_AP1R<n> characteristics are:

## Purpose

Provides information about virtual Group 1 active priorities.

## Configuration

AArch32 System register ICV\_AP1R<n> bits [31:0] are architecturally mapped to AArch64 System register [ICV\\_AP1R<n>\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV\_AP1R<n> are UNDEFINED.

## Attributes

ICV\_AP1R<n> is a 32-bit register.

## Field descriptions

The ICV\_AP1R<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

## Accessing the ICV\_AP1R<n>

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV\_AP1R1 is only implemented in implementations that support 6 or more bits of priority. ICV\_AP1R2 and ICV\_AP1R3 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- [ICV\\_AP0R<n>](#).
- ICV\_AP1R<n>.

Accesses to this register use the following encodings:

MRC{&lt;c&gt;}{&lt;q&gt;} &lt;coproc&gt;, {#}&lt;opc1&gt;, &lt;Rt&gt;, &lt;CRn&gt;, &lt;CRm&gt;{, {#}&lt;opc2&gt;}

# ICV\_BPR0, Interrupt Controller Virtual Binary Point Register 0

The ICV\_BPR0 characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 0 interrupt preemption.

## Configuration

AArch32 System register ICV\_BPR0 bits [31:0] are architecturally mapped to AArch64 System register [ICV\\_BPR0\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV\_BPR0 are UNDEFINED.

## Attributes

ICV\_BPR0 is a 32-bit register.

## Field descriptions

The ICV\_BPR0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																		BinaryPoint													

### Bits [31:3]

Reserved, RES0.

### BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	ggggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.ssssssss

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ICV\_BPR0

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by [ICV\\_CTLR.PRIBits](#).

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1000	0b011

```

# ICV\_BPR1, Interrupt Controller Virtual Binary Point Register 1

The ICV\_BPR1 characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 1 interrupt preemption.

## Configuration

AArch32 System register ICV\_BPR1 bits [31:0] are architecturally mapped to AArch64 System register [ICV\\_BPR1\\_ELI\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV\_BPR1 are UNDEFINED.

## Attributes

ICV\_BPR1 is a 32-bit register.

## Field descriptions

The ICV\_BPR1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																		BinaryPoint													

### Bits [31:3]

Reserved, RES0.

### BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for virtual Group 0 and virtual Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	-	-	-
1	[7:1]	[0]	ggggggg.s
2	[7:2]	[1:0]	gggggg.ss
3	[7:3]	[2:0]	ggggg.sss
4	[7:4]	[3:0]	gggg.ssss
5	[7:5]	[4:0]	ggg.sssss
6	[7:6]	[5:0]	gg.ssssss
7	[7]	[6:0]	g.sssssss

Writing 0 to this field will set this field to its reset value.

If [ICV\\_CTLR](#).CBPR is set to 1, Non-secure EL1 reads return [ICV\\_BPR0](#) + 1 saturated to 0b111. Non-secure EL1 writes are ignored.

## Accessing the ICV\_BPR1

The reset value is IMPLEMENTATION DEFINED, but is equal to the minimum value of [ICV\\_BPR0](#) plus one.

An attempt to program the binary point field to a value less than the reset value sets the field to the reset value.

Accesses to this register use the following encodings:

`MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}`

<b>coproc</b>	<b>opc1</b>	<b>CRn</b>	<b>CRm</b>	<b>opc2</b>

```

OnThis a Warm reset, this field resets to an architecturally UNKNOWNIMPLEMENTATION DEFINED non-zero value.

## Accessing the ICV\_BPR1

The minimum value of this register is equal to the minimum value of [ICV\\_BPR0](#) plus one.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b011

# ICV\_CTLR, Interrupt Controller Virtual Control Register

The ICV\_CTLR characteristics are:

## Purpose

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

## Configuration

AArch32 System register ICV\_CTLR bits [31:0] are architecturally mapped to AArch64 System register [ICV\\_CTLR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV\_CTLR are UNDEFINED.

## Attributes

ICV\_CTLR is a 32-bit register.

## Field descriptions

The ICV\_CTLR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												ExtRange		RSS	RES0	A3V	SEIS	IDbits	PRibits	RES0							EOImode	CBPR			

### Bits [31:20]

Reserved, RES0.

### ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	<p>CPU interface does not support INTIDs in the range 1024..8191. Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</p> <p><b>Note</b> Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.</p>
0b1	<p>CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.</p>

ICV\_CTLR.ExtRange is an alias of [ICC\\_CTLR.ExtRange](#).

### RSS, bit [18]

Range Selector Support. Possible values are:

<b>RSS</b>	<b>Meaning</b>
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

#### Bits [17:16]

Reserved, RES0.

#### A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

<b>A3V</b>	<b>Meaning</b>
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

#### SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

<b>SEIS</b>	<b>Meaning</b>
0b0	The virtual CPU interface logic does not support local generation of SEIs.
0b1	The virtual CPU interface logic supports local generation of SEIs.

#### IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

<b>IDbits</b>	<b>Meaning</b>
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

#### PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation must implement at least 32 levels of physical priority (5 priority bits).

#### Note

This field always returns the number of priority bits implemented.

The division between group priority and subpriority is defined in the binary point registers [ICV\\_BPR0](#) and [ICV\\_BPR1](#).

#### Bits [7:2]

Reserved, RES0.

#### EOImode, bit [1]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

EOImode	Meaning
0b0	<a href="#">ICV_EOIR0</a> and <a href="#">ICV_EOIR1</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">ICV_DIR</a> are UNPREDICTABLE.
0b1	<a href="#">ICV_EOIR0</a> and <a href="#">ICV_EOIR1</a> provide priority drop functionality only. <a href="#">ICV_DIR</a> provides interrupt deactivation functionality.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

CBPR	Meaning
0b0	<a href="#">ICV_BPR0</a> determines the preemption group for virtual Group 0 interrupts only. <a href="#">ICV_BPR1</a> determines the preemption group for virtual Group 1 interrupts.
0b1	<a href="#">ICV_BPR0</a> determines the preemption group for both virtual Group 0 and virtual Group 1 interrupts. Reads of <a href="#">ICV_BPR1</a> return <a href="#">ICV_BPR0</a> plus one, saturated to 0b111. Writes to <a href="#">ICV_BPR1</a> are ignored.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

## Accessing the ICV\_CTLR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b100

```

-------	----------------	-------

The ICV\_IGRPEN0 characteristics are:

## Purpose

Controls whether virtual Group 0 interrupts are enabled or not.

## Configuration

AArch32 System register ICV\_IGRPEN0 bits [31:0] are architecturally mapped to AArch64 System register [ICV\\_IGRPEN0\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV\_IGRPEN0 are UNDEFINED.

## Attributes

ICV\_IGRPEN0 is a 32-bit register.

## Field descriptions

The ICV\_IGRPEN0 bit assignments are:

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

RES0 Enable

**Bits [31:1]**

Reserved, RES0.

### Enable, bit [0]

Enables virtual Group 0 interrupts.

Enable	Meaning
0b0	Virtual Group 0 interrupts are disabled.
0b1	Virtual Group 0 interrupts are enabled.

On a Warm reset, this field resets to 0.

## Accessing the ICV\_IGRPEN0

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<b>coproc</b>	<b>opc1</b>	<b>CRn</b>	<b>CRm</b>	<b>opc2</b>
0b1111	0b000	0b1100	0b1100	0b110

```

# ICV\_PMR, Interrupt Controller Virtual Interrupt Priority Mask Register

The ICV\_PMR characteristics are:

## Purpose

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

## Configuration

AArch32 System register ICV\_PMR bits [31:0] are architecturally mapped to AArch64 System register [ICV\\_PMR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ICV\_PMR are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Attributes

ICV\_PMR is a 32-bit register.

## Field descriptions

The ICV\_PMR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								Priority							

### Bits [31:8]

Reserved, RES0.

### Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	0x00-0xFF (0-255), all values	256
[7:1]	0x00-0xFE (0-254), even values only	128
[7:2]	0x00-0xFC (0-252), in steps of 4	64
[7:3]	0x00-0xF8 (0-248), in steps of 8	32
[7:4]	0x00-0xF0 (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

On a Warm reset, this field resets to 0.

## Accessing the ICV\_PMR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0100	0b0110	0b000

```

# ID\_DFR0, Debug Feature Register 0

The ID\_DFR0 characteristics are:

## Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch32 System register ID\_DFR0 bits [31:0] are architecturally mapped to AArch64 System register [ID\\_DFR0\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID\_DFR0 are UNDEFINED.

## Attributes

ID\_DFR0 is a 32-bit register.

## Field descriptions

The ID\_DFR0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">TraceFilt</a>				<a href="#">PerfMon</a>				<a href="#">MProfDbg</a>				<a href="#">MMapTrc</a>				<a href="#">CopTrc</a>				<a href="#">MMapDbg</a>				<a href="#">CopSDBG</a>				<a href="#">CopDbg</a>			

### TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT\_TRF implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

### PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'.

Defined values are:

PerfMon	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv1 implemented.
0b0010	Performance Monitors Extension, PMUv2 implemented.
0b0011	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0011, and also includes support for: <ul style="list-style-type: none"> <li>Extended 16-bit <a href="#">PMEVTYPER&lt;n&gt;.evtCount</a> field.</li> <li>If EL2 is implemented, the <a href="#">HDCR.HPMD</a> control bit.</li> </ul>
0b0101	PMUv3 for Armv8.4. As 0b0100, and also includes support for the <a href="#">PMMIR</a> register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and also includes support for: <ul style="list-style-type: none"> <li>64-bit event counters.</li> <li>If EL2 is implemented, the <a href="#">HDCR.HCCD</a> control bit.</li> <li>If EL3 is implemented, the <a href="#">SDCR.SCCD</a> control bit.</li> </ul>
0b0111	PMUv3 for Armv8.7. As 0b0110, and also includes support for: <ul style="list-style-type: none"> <li>The <a href="#">PMCR.FZO</a> and, if EL2 is implemented, <a href="#">HDCR.HPMFZO</a> control bits.</li> <li>If EL3 is implemented and using AArch64, the <a href="#">MDCR_EL3.{MPMX,MCCD}</a> control bits.</li> </ul>
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT\_PMUv3 implements the functionality identified by the value 0b0011.

FEAT\_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT\_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT\_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT\_PMUv3p7 implements the functionality identified by the value 0b0111.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT\_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT\_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT\_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT\_PMUv3 is implemented, the value 0b0110 is not permitted.

#### Note

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

### MProfDbg, bits [23:20]

M Profile Debug. Support for memory-mapped debug model for M profile processors. Defined values are:

MProfDbg	Meaning
0b0000	Not supported.
0b0001	Support for M profile Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

**MMapTrc, bits [19:16]**

Memory Mapped Trace. Support for memory-mapped trace model. Defined values are:

<b>MMapTrc</b>	<b>Meaning</b>
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

**CopTrc, bits [15:12]**

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

<b>CopTrc</b>	<b>Meaning</b>
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with System registers access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

See the ETM Architecture Specification for more information.

**MMapDbg, bits [11:8]**

Memory Mapped Debug. Support for v7 memory-mapped debug model, for A and R profile processors.

In Armv8-A, this field is RES0.

The optional memory map defined by Armv8 is not compatible with Armv7.

**CopSDBG, bits [7:4]**

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

**CopDbg, bits [3:0]**

Support for System registers-based debug model, using registers in the coproc == 0b1110 encoding space, for A and R profile processors. Defined values are:

CopDbg	Meaning
0b0000	Not supported.
0b0010	Support for Armv6, v6 Debug architecture, with System registers access.
0b0011	Support for Armv6, v6.1 Debug architecture, with System registers access.
0b0100	Support for Armv7, v7 Debug architecture, with System registers access.
0b0101	Support for Armv7, v7.1 Debug architecture, with System registers access.
0b0110	Support for Armv8 debug architecture, with System registers access.
0b0111	Support for Armv8 debug architecture, with System registers access, and Virtualization Host Extensions.
0b1000	Support for Armv8.2 debug architecture.
0b1001	Support for Armv8.4 debug architecture.

All other values are reserved.

FEAT\_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT\_Debugv8p4 adds the functionality identified by the value 0b1001.

In Armv8.0, the only permitted value is 0b0110.

In Armv8.1, the only permitted value is 0b0111.

In Armv8.2, the only permitted value is 0b1000.

From Armv8.4, the only permitted value is 0b1001.

## Accessing the ID\_DFR0

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b010

```

# ID\_DFR1, Debug Feature Register 1

The ID\_DFR1 characteristics are:

## Purpose

Provides top level information about the debug system in AArch32.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch32 System register ID\_DFR1 bits [31:0] are architecturally mapped to AArch64 System register [ID\\_DFR1\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID\_DFR1 are UNDEFINED.

### Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

## Attributes

ID\_DFR1 is a 32-bit register.

## Field descriptions

The ID\_DFR1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																												MTPMU			

### Bits [31:4]

Reserved, RES0.

### MTPMU, bits [3:0]

Multi-threaded PMU extension. Defined values are:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If <a href="#">FEAT_PMUv3</a> <del>PMUv3</del> is implemented, it is IMPLEMENTATION DEFINED whether <a href="#">PMEVTYPER&lt;n&gt;.MT</a> are read/write or RES0.
0b0001	FEAT_MTPMU <del>implemented</del> and <a href="#">FEAT_PMUv3</a> <a href="#">implemented</a> . <a href="#">PMEVTYPER&lt;n&gt;.MT</a> are read/write. When FEAT_MTPMU is disabled, the Effective values of <a href="#">PMEVTYPER&lt;n&gt;.MT</a> are 0.
0b1111	FEAT_MTPMU not implemented. If <a href="#">FEAT_PMUv3</a> <del>PMUv3</del> is implemented, <a href="#">PMEVTYPER&lt;n&gt;.MT</a> are RES0.

All other values are reserved.

FEAT\_MTPMU implements the functionality identified by the value 0b0001.

From In Armv8.6, an in Armv8.6-compliant an implementation that includes FEAT\_PMUv3PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT\_PMUv3PMUv3, the value 0b0001 is not permitted.

## Accessing the ID\_DFR1

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0011	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

# ID\_ISAR6, Instruction Set Attribute Register 6

The ID\_ISAR6 characteristics are:

## Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID\\_ISAR0](#), [ID\\_ISAR1](#), [ID\\_ISAR2](#), [ID\\_ISAR3](#), [ID\\_ISAR4](#), and [ID\\_ISAR5](#).

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch32 System register ID\_ISAR6 bits [31:0] are architecturally mapped to AArch64 System register [ID\\_ISAR6\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID\_ISAR6 are UNDEFINED.

### Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

## Attributes

ID\_ISAR6 is a 32-bit register.

## Field descriptions

The ID\_ISAR6 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				I8MM				BF16				SPECRES				SB				FHM				DP				JSCVT			

### Bits [31:28]

Reserved, RES0.

### I8MM, bits [27:24]

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.

All other values are reserved.

FEAT\_AA32I8MM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**BF16, bits [23:20]**

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

<b>BF16</b>	<b>Meaning</b>
0b0000	BFloat16 instructions are not implemented.
0b0001	VCVT, VCVTB, VCVTT, VDOT, VFMA, VFMA, VFMA, and VMMLA instructions with BF16 operand or result types are implemented.

All other values are reserved.

FEAT\_AA32BF16 implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

**SPECRES, bits [19:16]**

Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:

<b>SPECRES</b>	<b>Meaning</b>
0b0000	CFPRCTX, DVPRCTX, and CPPRCTX instructions are not implemented.
0b0001	CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

**SB, bits [15:12]**

Indicates support for SB instruction in AArch32 state. Defined values are:

<b>SB</b>	<b>Meaning</b>
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

**FHM, bits [11:8]**

Indicates support for Advanced SIMD and floating-point VFMA and VFMSL instructions in AArch32 state. Defined values are:

<b>FHM</b>	<b>Meaning</b>
0b0000	VFMA and VFMSL instructions not implemented.
0b0001	VFMA and VFMSL instructions implemented.

FEAT\_FHM implements the functionality identified by the value 0b0001.

**DP, bits [7:4]**

Indicates support for dot product instructions in AArch32 state. Defined values are:

<b>DP</b>	<b>Meaning</b>
0b0000	No dot product instructions implemented.
0b0001	VUDOT and VSDOT instructions implemented.

All other values are reserved.

FEAT\_DotProd implements the functionality identified by the value 0b0001.

**JSCVT, bits [3:0]**

Indicates support for the Javascript conversion instruction in AArch32 state. Defined values are:

JSCVT	Meaning
0b0000	The VJCVT instruction is not implemented.
0b0001	The VJCVT instruction is implemented.

All other values are reserved.

In Armv8.0, ~~Armv8.1 and Armv8.2~~ the only permitted value is 0b0000.

FEAT\_JSCVT implements the functionality identified by 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

**Accessing the ID\_ISAR6**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b111

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!IsZero(ID_ISAR6) || boolean
IMPLEMENTATION_DEFINED "ID_ISAR6 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && (!IsZero(ID_ISAR6) || boolean
IMPLEMENTATION_DEFINED "ID_ISAR6 trapped by HCR.TID3") && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_ISAR6;
elsif PSTATE.EL == EL2 then
    return ID_ISAR6;
elsif PSTATE.EL == EL3 then
    return ID_ISAR6;

```

# ID\_MMFR5, Memory Model Feature Register 5

The ID\_MMFR5 characteristics are:

## Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

AArch32 System register ID\_MMFR5 bits [31:0] are architecturally mapped to AArch64 System register [ID\\_MMFR5\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID\_MMFR5 are UNDEFINED.

## Attributes

ID\_MMFR5 is a 32-bit register.

## Field descriptions

The ID\_MMFR5 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																		ETS													

### Bits [31:4]

Reserved, RES0.

### ETS, bits [3:0]

Support for Enhanced Translation Synchronization. Defined values are:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is supported.

All other values are reserved.

FEAT\_ETC implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

## Accessing the ID\_MMFR5

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0011	0b110

```

# ID\_PFR0, Processor Feature Register 0

The ID\_PFR0 characteristics are:

## Purpose

Gives top-level information about the instruction sets and other features supported by the PE in AArch32 state.

Must be interpreted with [ID\\_PFR1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'

## Configuration

AArch32 System register ID\_PFR0 bits [31:0] are architecturally mapped to AArch64 System register [ID\\_PFR0\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ID\_PFR0 are UNDEFINED.

## Attributes

ID\_PFR0 is a 32-bit register.

## Field descriptions

The ID\_PFR0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RAS				DIT				AMU				CSV2				State3				State2				State1				State0			

### RAS, bits [31:28]

RAS Extension version. Defined values are:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	RAS Extension present.
0b0010	FEAT_RASv1p1 present. As 0b0001, and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to <a href="#">ERR&lt;n&gt;STATUS</a> and support for the optional RAS Timestamp Extension.

All other values are reserved.

~~In Armv8.1 and Armv8.0, the permitted values are 0b0000 and 0b0001.~~

~~In Armv8.2, the only permitted value is 0b0001.~~

~~From Armv8.4, when FEAT\_DoubleFault is not implemented, and [ERRIDR.NUM](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010. Otherwise, from Armv8.4, the only permitted value is 0b0010.~~

~~FEAT\_RAS~~FEAT\_RASv1p1 implements the functionality identified by the value ~~0b0001~~0b0010.

FEAT\_RASv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT\_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT\_DoubleFault is not implemented, and [ERRIDR.NUM](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

#### Note

When the value of this field is 0b0001, [ID\\_PFR2.RAS\\_frac](#) indicates whether FEAT\_RASv1p1 is implemented.

### DIT, bits [27:24]

Data Independent Timing. Defined values are:

DIT	Meaning
0b0000	AArch32 does not guarantee constant execution time of any instructions.
0b0001	AArch32 provides the <a href="#">PSTATE.DIT</a> <del>CPSR.DIT</del> mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT\_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

### AMU, bits [23:20]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT\_AMUv1 implements the functionality identified by the value 0b0001.

FEAT\_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

### CSV2, bits [19:16]

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	This Device does not disclose whether branch targets trained in one hardware described context can affect speculative execution in a different hardware described context.
0b0001	Branch targets trained in one hardware described context can only affect speculative execution in a different hardware described context in a hard-to-determine way.

All other values are reserved.

FEAT\_CSV2 implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

### State3, bits [15:12]

T32EE instruction set support. Defined values are:

State3	Meaning
0b0000	Not implemented.
0b0001	T32EE instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

### State2, bits [11:8]

Jazelle extension support. Defined values are:

State2	Meaning
0b0000	Not implemented.
0b0001	Jazelle extension implemented, without clearing of <a href="#">JOSCR.CV</a> on exception entry.
0b0010	Jazelle extension implemented, with clearing of <a href="#">JOSCR.CV</a> on exception entry.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

### State1, bits [7:4]

T32 instruction set support. Defined values are:

State1	Meaning
0b0000	T32 instruction set not implemented.
0b0001	T32 encodings before the introduction of Thumb-2 technology implemented: <ul style="list-style-type: none"> <li>• All instructions are 16-bit.</li> <li>• A BL or BLX is a pair of 16-bit instructions</li> <li>• 32-bit instructions other than BL and BLX cannot be encoded.</li> </ul>
0b0011	T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

### State0, bits [3:0]

A32 instruction set support. Defined values are:

State0	Meaning
0b0000	A32 instruction set not implemented.
0b0001	A32 instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

## Accessing the ID\_PFR0

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then

# IFAR, Instruction Fault Address Register

The IFAR characteristics are:

## Purpose

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception.

## Configuration

AArch32 System register IFAR bits [31:0] are architecturally mapped to AArch64 System register [FAR\\_EL1\[63:32\]](#).

AArch32 System register IFAR bits [31:0] (S) are architecturally mapped to AArch32 System register [HIFAR\[31:0\]](#) when EL2 is implemented, EL3 is implemented and the highest implemented Exception level is using AArch32 state.

AArch32 System register IFAR bits [31:0] (S) are architecturally mapped to AArch64 System register [FAR\\_EL2\[63:32\]](#) when EL2 is implemented.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to IFAR are UNDEFINED.

## Attributes

IFAR is a 32-bit register.

## Field descriptions

The IFAR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA of faulting address of synchronous Prefetch Abort exception																															

### Bits [31:0]

VA of faulting address of synchronous Prefetch Abort exception.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the IFAR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

# IFSR, Instruction Fault Status Register

The IFSR characteristics are:

## Purpose

Holds status information about the last instruction fault.

## Configuration

AArch32 System register IFSR bits [31:0] are architecturally mapped to AArch64 System register [IFSR32\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to IFSR are UNDEFINED.

The current translation table format determines which format of the register is used.

## Attributes

IFSR is a 32-bit register.

## Field descriptions

The IFSR bit assignments are:

### When TTBCR.EAE == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																FnV	RES0	ExT	RES0	FS[4]	LPAAE	RES0				FS[3:0]					

### Bits [31:17]

Reserved, RES0.

### FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	<a href="#">IFAR</a> is valid.
0b1	<a href="#">IFAR</a> is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [15:13]

Reserved, RES0.

### ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bit [11]

Reserved, RES0.

This field is bit[4] of FS[4:0].

#### FS, [4], bits [10, 3:0]

Fault Status bits. Bits [10] and [3:0] are interpreted together.

FS	Meaning	Applies when
0b00001	PC alignment fault.	
0b00010	Debug exception.	
0b00011	Access flag fault, level 1.	
0b00101	Translation fault, level 1.	
0b00110	Access flag fault, level 2.	
0b00111	Translation fault, level 2.	
0b01000	Synchronous External abort, not on translation table walk.	
0b01001	Domain fault, level 1.	
0b01011	Domain fault, level 2.	
0b01100	Synchronous External abort, on translation table walk, level 1.	
0b01101	Permission fault, level 1.	
0b01110	Synchronous External abort, on translation table walk, level 2.	
0b01111	Permission fault, level 2.	
0b10000	TLB conflict abort.	
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault).	
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b11100	Synchronous parity or ECC error on translation table walk, level 1.	When FEAT_RAS is not implemented
0b11110	Synchronous parity or ECC error on translation table walk, level 2.	When FEAT_RAS is not implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is IFSR[10].
- FS[3:0] is IFSR[3:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Bits [8:4]

Reserved, RES0.

#### **FS[3:0], bits [3:0]**

This field is bits[3:0] of FS[4:0].

See FS[4] for the field description.

#### When TTBCR.EAE == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0															FnV	RES0	ExT	RES0	LPAE	RES0	STATUS										

#### Bits [31:17]

Reserved, RES0.

#### **FnV, bit [16]**

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	IFAR is valid.
0b1	IFAR is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Bits [15:13]

Reserved, RES0.

#### **ExT, bit [12]**

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Bits [11:10]

Reserved, RES0.

#### **LPAE, bit [9]**

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Bits [8:6]

Reserved, RES0.

## STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

STATUS	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100001	PC alignment fault.	
0b100010	Debug exception.	
0b110000	TLB conflict abort.	

All other values are reserved.

When FEAT\_RAS is implemented, 0b011000, 0b011101, 0b011110, and 0b011111 are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the IFSR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0000	0b001

# ITLBIALL, Instruction TLB Invalidate All

The ITLBIALL characteristics are:

## Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the **current** Security state, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

## Configuration

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to ITLBIALL are UNDEFINED.

## Attributes

ITLBIALL is a 32-bit System instruction.

## Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

## Executing the ITLBIALL instruction

Accesses to this instruction use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0101	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then

# MAIR0, Memory Attribute Indirection Register 0

The MAIR0 characteristics are:

## Purpose

Along with [MAIR1](#), provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIdx[2] indicates the MAIR register to be used:

- When AttrIdx[2] is 0, MAIR0 is used.
- When AttrIdx[2] is 1, [MAIR1](#) is used.

## Configuration

AArch32 System register MAIR0 bits [31:0] are architecturally mapped to AArch64 System register [MAIR\\_EL1\[31:0\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR0 bits [31:0] are architecturally mapped to AArch32 System register [PRRR\[31:0\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR0 bits [31:0] (MAIR0\_NS) are architecturally mapped to AArch32 System register [PRRR\[31:0\] \(PRRR\\_NS\)](#) when EL3 is using AArch32.

AArch32 System register MAIR0 bits [31:0] (MAIR0\_S) are architecturally mapped to AArch32 System register [PRRR\[31:0\] \(PRRR\\_S\)](#) when EL3 is using AArch32.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MAIR0 are UNDEFINED.

MAIR0 and [PRRR](#) are the same register, with a different view depending on the value of [TTBCR.EAE](#):

- When it is set to 0, the register is as described in [PRRR](#).
- When it is set to 1, the register is as described in MAIR0.

When EL3 is using AArch32, write access to MAIR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

## Attributes

MAIR0 is a 32-bit register.

## Field descriptions

The MAIR0 bit assignments are:

### When TTBCR.EAE == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Attr3								Attr2								Attr1								Attr0							

**Attr<n>, bits [8n+7:8n], for n = 0 to 3**

**Attr<n>, bits [8n+7:8n], for n = 3 to 0**

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIdx[2:0] gives the value of <n> in Attr<n>.
- AttrIdx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.
0b01RW, RW not0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the MAIR0

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0010	0b000

# MAIR1, Memory Attribute Indirection Register 1

The MAIR1 characteristics are:

## Purpose

Along with [MAIRO](#), provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIndx[2] indicates the MAIR register to be used:

- When AttrIndx[2] is 0, [MAIRO](#) is used.
- When AttrIndx[2] is 1, MAIR1 is used.

## Configuration

AArch32 System register MAIR1 bits [31:0] are architecturally mapped to AArch64 System register [MAIR\\_EL1\[63:32\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR1 bits [31:0] are architecturally mapped to AArch32 System register [NMRR\[31:0\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR1 bits [31:0] (MAIR1\_NS) are architecturally mapped to AArch32 System register [NMRR\[31:0\] \(NMRR\\_NS\)](#) when EL3 is using AArch32.

AArch32 System register MAIR1 bits [31:0] (MAIR1\_S) are architecturally mapped to AArch32 System register [NMRR\[31:0\] \(NMRR\\_S\)](#) when EL3 is using AArch32.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to MAIR1 are UNDEFINED.

MAIR1 and [NMRR](#) are the same register, with a different view depending on the value of [TTBCR.EAE](#):

- When it is set to 0, the register is as described in [NMRR](#).
- When it is set to 1, the register is as described in MAIR1.

When EL3 is using AArch32, write access to MAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

## Attributes

MAIR1 is a 32-bit register.

## Field descriptions

The MAIR1 bit assignments are:

### When TTBCR.EAE == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Attr7								Attr6								Attr5								Attr4							

Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 4 to 7

Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 7 to 4

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIdx[2:0] gives the value of <n> in Attr<n>.
- AttrIdx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.
0b01RW, RW not0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the MAIR1

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0010	0b001

# NMRR, Normal Memory Remap Register

The NMRR characteristics are:

## Purpose

Provides additional mapping controls for memory regions that are mapped as Normal memory by their entry in the [PRRR](#).

Used in conjunction with the [PRRR](#).

## Configuration

AArch32 System register NMRR bits [31:0] are architecturally mapped to AArch64 System register [MAIR\\_EL1\[63:32\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register NMRR bits [31:0] are architecturally mapped to AArch32 System register [MAIR1\[31:0\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register NMRR bits [31:0] (NMRR\_S) are architecturally mapped to AArch32 System register [MAIR1\[31:0\] \(MAIR1\\_S\)](#) when EL3 is using AArch32.

AArch32 System register NMRR bits [31:0] (NMRR\_NS) are architecturally mapped to AArch32 System register [MAIR1\[31:0\] \(MAIR1\\_NS\)](#) when EL3 is using AArch32.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to NMRR are UNDEFINED.

[MAIR1](#) and NMRR are the same register, with a different view depending on the value of [TTBCR.EAE](#):

- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in [MAIR1](#).

## Attributes

NMRR is a 32-bit register.

## Field descriptions

The NMRR bit assignments are:

### When TTBCR.EAE == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">OR7</a>	<a href="#">OR6</a>	<a href="#">OR5</a>	<a href="#">OR4</a>	<a href="#">OR3</a>	<a href="#">OR2</a>	<a href="#">OR1</a>	<a href="#">OR0</a>	<a href="#">IR7</a>	<a href="#">IR6</a>	<a href="#">IR5</a>	<a href="#">IR4</a>	<a href="#">IR3</a>	<a href="#">IR2</a>	<a href="#">IR1</a>	<a href="#">IR0</a>																

**OR<n>, bits [2n+17:2n+16], for n = 0 to 7**

**OR<n>, bits [2n+17:2n+16], for n = 7 to 0**

Outer Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the [PRRR.TR<n>](#) entry. n is the value of the TEX[0], C, and B bits concatenated. The possible values of this field are:

OR<n>	Meaning
0b00	Region is Non-cacheable.
0b01	Region is Write-Back, Write-Allocate.
0b10	Region is Write-Through, no Write-Allocate.
0b11	Region is Write-Back, no Write-Allocate.

The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

IR<n>, bits [2n+1:2n], for n = 70 to 07

Inner Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the PRRR.TR<n> entry. n is the value of the TEX[0], C, and B bits concatenated. The possible values of this field are:

IR<n>	Meaning
0b00	Region is Non-cacheable.
0b01	Region is Write-Back, Write-Allocate.
0b10	Region is Write-Through, no Write-Allocate.
0b11	Region is Write-Back, no Write-Allocate.

The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

## Accessing the NMRR

Accesses to this register use the following encodings:

# NSACR, Non-Secure Access Control Register

The NSACR characteristics are:

## Purpose

When EL3 is implemented and can use AArch32, defines the Non-secure access permissions to Trace, Advanced SIMD and floating-point functionality. Also includes IMPLEMENTATION DEFINED bits that can define Non-secure access permissions for IMPLEMENTATION DEFINED functionality.

## Configuration

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to NSACR are UNDEFINED.

Note

In AArch64 state, the NSACR controls are replaced by controls in [CPTR\\_EL3](#).

## Attributes

NSACR is a 32-bit register.

## Field descriptions

The NSACR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0											NSTRCDIS	RES0	IMPLEMENTATION DEFINED		NSASEDIS	RES0	cp11	cp10	RES0												

If EL3 is implemented and is using AArch64 then:

- Any read of the NSACR from Non-secure EL2 or Non-secure EL1 returns a value of 0x00000C00.
- Any read or write to NSACR from Secure EL1 is trapped as an exception to EL3.

If EL3 is not implemented, then any read of the NSACR from EL2 or EL1 returns a value of 0x00000C00.

Bits [31:21]

Reserved, RES0.

NSTRCDIS, bit [20]

Disables Non-secure System register accesses to all implemented trace registers.

NSTRCDIS	Meaning
0b0	This control has no effect on: <ul style="list-style-type: none"> <li>System register access to implemented trace registers.</li> <li>The behavior of <a href="#">CPACR</a>.TRCDIS and <a href="#">HCPTR</a>.TTA.</li> </ul>
0b1	Non-secure System register accesses to all implemented trace registers are disabled, meaning: <ul style="list-style-type: none"> <li><a href="#">CPACR</a>.TRCDIS behaves as RAO/WI in Non-secure state, regardless of its actual value.</li> <li><a href="#">HCPTR</a>.TTA behaves as RAO/WI, regardless of its actual value.</li> </ul>

The implementation of this field must correspond to the implementation of the [CPACR](#).TRCDIS field:

- If [CPACR](#).TRCDIS is RAZ/WI, this field is RAZ/WI.
- If [CPACR](#).TRCDIS is RW, this field is RW.

#### Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT\_ETMv4, EL0 accesses to the trace registers are UNDEFINED.
- The architecture does not provide Non-secure access controls on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

#### Bit [19]

Reserved, RES0.

#### IMPLEMENTATION DEFINED, bits [18:16]

IMPLEMENTATION DEFINED.

#### NSASEDIS, bit [15]

Disables Non-secure access to the Advanced SIMD functionality.

NSASEDIS	Meaning
0b0	This control has no effect on: <ul style="list-style-type: none"> <li>Non-secure access to Advanced SIMD functionality.</li> <li>The behavior of <a href="#">CPACR</a>.ASEDIS and <a href="#">HCPTR</a>.TASE.</li> </ul>
0b1	Non-secure access to the Advanced SIMD functionality is disabled, meaning: <ul style="list-style-type: none"> <li><a href="#">CPACR</a>.ASEDIS behaves as RAO/WI in Non-secure state, regardless of its actual value.</li> <li><a href="#">HCPTR</a>.TASE behaves as RAO/WI, regardless of its actual value.</li> </ul>

The implementation of this field must correspond to the implementation of the [CPACR](#).ASEDIS field:

- If [CPACR](#).ASEDIS is RES0, this field is RES0. If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.
- If [CPACR](#).ASEDIS is RAZ/WI, this field is RAZ/WI.
- If [CPACR](#).ASEDIS is RW, this field is RW.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

#### Bits [14:12]

Reserved, RES0.

### cp11, bit [11]

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the NSACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

### cp10, bit [10]

Enable Non-secure access to the Advanced SIMD and floating-point features. Possible values of the fields are:

cp10	Meaning
0b0	Advanced SIMD and floating-point features can be accessed only from Secure state. Any attempt to access this functionality from Non-secure state is UNDEFINED. When the PE is in Non-secure state: <ul style="list-style-type: none"> <li>The CPACR.{cp11, cp10} fields ignore writes and read as 0b00, access denied.</li> <li>The HCPTR.{TCP11, TCP10} fields behave as RAO/WI, regardless of their actual values.</li> </ul>
0b1	Advanced SIMD and floating-point features can be accessed from both Security states.

If Non-secure access to the Advanced SIMD and floating-point functionality is enabled, the CPACR must be checked to determine the level of access that is permitted.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

### Bits [9:0]

Reserved, RES0.

## Accessing the NSACR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0001	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif !ELUsingAArch32(EL2) && SCR_EL3.<NS,EEL2> == '01' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif !ELUsingAArch32(EL3) && SCR_EL3.NS == '0' then
        AArch64.AArch32SystemAccessTrap(EL3, 0x03);
    elsif !HaveEL(EL3) || (!ELUsingAArch32(EL3) && SCR_EL3.NS == '1') then
        return Zeros(20):'1100':Zeros(8);
    else
        return NSACR;
elsif PSTATE.EL == EL2 then
    if !HaveEL(EL3) || (!ELUsingAArch32(EL3) && SCR_EL3.NS == '1') then
        return Zeros(20):'1100':Zeros(8);
    else
        return NSACR;
elsif PSTATE.EL == EL3 then
    return NSACR;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0001	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif !ELUsingAArch32(EL2) && SCR_EL3.<NS,EEL2> == '01' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif !ELUsingAArch32(EL3) && SCR_EL3.NS == '0' then
        AArch64.AArch32SystemAccessTrap(EL3, 0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' && CP15SDISABLE2 == HIGH then
        UNDEFINED;
    else
        NSACR = R[t];

```

# PAR, Physical Address Register

The PAR characteristics are:

## Purpose

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

## Configuration

AArch32 System register PAR bits [63:0] are architecturally mapped to AArch64 System register [PAR\\_EL1\[63:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to PAR are UNDEFINED.

PAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits[31:0] and do not modify bits[63:32].

The Configurations section specifies the cases where each PAR format is used.

PAR is accessed as a 32-bit value:

- When the PE is not in Hyp mode and is using the Short-descriptor translation table format.
- When the PE is in Hyp mode and executes an [ATS12NSOPR](#), [ATS12NSOPW](#), [ATS12NSOUR](#), or [ATS12NSOUW](#) instruction and the value of [HCR.VM](#) is 0 and the value of [TTBCR.EAE](#) is 0.

In these cases, PAR[63:32] is RES0.

Otherwise, the PAR is accessed as a 64-bit value, if any of the following is true:

- When using the Long-descriptor translation table format.
- If the stage 1 address translation is disabled and [TTBCR.EAE](#) is set to 1.
- In an implementation that includes EL2, for the result of an ATS1Cxx instruction performed from Hyp mode.

For PL1&0 stage 1 translations, [TTBCR.EAE](#) selects the translation table format.

## Attributes

The Configurations section specifies the cases where each PAR format is used.

PAR is a 64-bit register. register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits[31:0] and do not modify bits[63:32].

## Field descriptions

The PAR bit assignments are:

### When the instruction returned a 32-bit value to the PAR, PAR.F==0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32									
RES0																																								
PA																				LPA		E	N	O	S	N	S	IMPLEMENTATION DEFINED					SH	Inner[2:0]			Outer[1:0]		SS	F
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0									

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies to the NOS, SH, Inner, and Outer fields.
- See the NS bit description for constraints on the value it returns.

#### Bits [63:32]

Reserved, RES0.

#### PA, bits [31:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[31:12].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

LPAE	Meaning
0b0	Short-descriptor translation table format used. This means the PAR returned a 32-bit value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### NOS, bit [10]

Not Outer Shareable. When the returned value of PAR.SH is 1, indicates the Shareability attribute for the physical memory region:

NOS	Meaning
0b0	Memory region is Outer Shareable.
0b1	Memory region is Inner Shareable.

When the returned value of PAR.SH is 0 the value returned to this field is UNKNOWN.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### IMPLEMENTATION DEFINED, bit [8]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH, bit [7]**

Shareability. Indicates whether the physical memory region is Non-shareable:

SH	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is shareable, and PAR.NOS indicates whether the region is Outer Shareable or Inner Shareable.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Inner[2:0], bits [6:4]**

Inner cacheability attribute for the region. Permitted values are:

Inner[2:0]	Meaning
0b000	Non-cacheable.
0b001	Device-nGnRnE.
0b011	Device-nGnRE.
0b101	Write-Back, Write-Allocate.
0b110	Write-Through.
0b111	Write-Back, no Write-Allocate.

The values 0b010 and 0b100 are reserved.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Outer[1:0], bits [3:2]**

Outer cacheability attribute for the region. Permitted values are:

Outer[1:0]	Meaning
0b00	Non-cacheable.
0b01	Write-Back, Write-Allocate.
0b10	Write-Through, no Write-Allocate.
0b11	Write-Back, no Write-Allocate.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**SS, bit [1]**

Supersection. Used to indicate if the result is a Supersection:

SS	Meaning
0b0	Result is not a Supersection. PAR[31:12] contains OA[31:12].
0b1	Result is a Supersection, and: <ul style="list-style-type: none"> <li>PAR[31:24] contains OA[31:24].</li> <li>PAR[23:16] contains OA[39:32].</li> <li>PAR[15:12] contains 0b0000.</li> </ul> If an implementation supports less than 40 bits of physical address, the bits in the PAR field that correspond to physical address bits that are not implemented are UNKNOWN.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**When the instruction returned a 32-bit value to the PAR, PAR.F==1:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																RES0		LPAE		RES0		FS[5]		FS[4:0]				F			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

**Bits [63:32]**

Reserved, RES0.

**IMPLEMENTATION DEFINED, bits [31:16]**

IMPLEMENTATION DEFINED.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [15:12]**

Reserved, RES0.

**LPAE, bit [11]**

When updating the PAR with the result of the translation operation, this bit is set as follows:

LPAE	Meaning
0b0	Short-descriptor translation table format used. This means the PAR returned a 32-bit value.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [10:7]**

Reserved, RES0.

**FS[5], bit [6]**

Fault status bits, external abort type. Provides an IMPLEMENTATION DEFINED classification of an External abort. Values are as in in the [DESR.ExT](#) field when using the Short-descriptor translation table format.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**FS[4:0], bits [5:1]**

Fault status bits. Values are as in the [DESR.FS](#) field when using the Short-descriptor translation table format.

FS[4:0]	Meaning	Applies when
0b00001	Alignment fault.	
0b00011	Access flag fault, level 1.	
0b00100	Fault on instruction cache maintenance.	
0b00101	Translation fault, level 1.	
0b00110	Access flag fault, level 2.	
0b00111	Translation fault, level 2.	
0b01001	Domain fault, level 1.	
0b01011	Domain fault, level 2.	
0b01100	Synchronous External abort, on translation table walk, level 1.	
0b01101	Permission fault, level 1.	
0b01110	Synchronous External abort, on translation table walk, level 2.	
0b01111	Permission fault, level 2.	
0b10000	TLB conflict abort.	
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b11100	Synchronous parity or ECC error on translation table walk, level 1.	When FEAT_RAS is not implemented
0b11110	Synchronous parity or ECC error on translation table walk, level 2.	When FEAT_RAS is not implemented

On a Warm reset, this **This** field resets to an UNKNOWN value.

#### F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### When the instruction returned a 64-bit value to the PAR, PAR.F==0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ATTR								RES0																PA							
PA												LPAE	IMPLEMENTATION DEFINED				NS	SH	RES0						F						
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies to the ATTR and SH fields.
- See the NS bit description for constraints on the value it returns.

#### ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in [MAIRO](#) and [MAIR1](#).

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [55:40]**

Reserved, RES0.

**PA, bits [39:12]**

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[39:12].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**LPAE, bit [11]**

When updating the PAR with the result of the translation operation, this bit is set as follows:

LPAE	Meaning
0b1	Long-descriptor translation table format used. This means the PAR returned a 64-bit value.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IMPLEMENTATION DEFINED, bit [10]**

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NS, bit [9]**

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SH, bits [8:7]**

Shareability attribute, for the returned output address. Permitted values are:

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

The value 0b01 is reserved.

**Note**

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:1]**

Reserved, RES0.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**When the instruction returned a 64-bit value to the PAR, PAR.F==1:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32								
IMPLEMENTATION DEFINED								IMPLEMENTATION DEFINED								IMPLEMENTATION DEFINED								RES0															
RES0																LPAE		RES0		FSTAGE		S2WLK		RES0		FST				F									
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0								

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

**IMPLEMENTATION DEFINED, bits [63:56]**

IMPLEMENTATION DEFINED.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**IMPLEMENTATION DEFINED, bits [55:52]**

IMPLEMENTATION DEFINED.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**IMPLEMENTATION DEFINED, bits [51:48]**

IMPLEMENTATION DEFINED.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [47:12]**

Reserved, RES0.

**LPAE, bit [11]**

When updating the PAR with the result of the translation operation, this bit is set as follows:

LPAE	Meaning
0b1	Long-descriptor translation table format used. This means the PAR returned a 64-bit value.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bit [10]**

Reserved, RES0.

**FSTAGE, bit [9]**

Indicates the translation stage at which the translation aborted:

<b>FSTAGE</b>	<b>Meaning</b>
0b0	Translation aborted because of a fault in the stage 1 translation.
0b1	Translation aborted because of a fault in the stage 2 translation.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**S2WLK, bit [8]**

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bit [7]**

Reserved, RES0.

**FST, bits [6:1]**

Fault status field. Values are as in the [DFSR.STATUS](#) and [IFSR.STATUS](#) fields when using the Long-descriptor translation table format.

<b>FST</b>	<b>Meaning</b>	<b>Applies when</b>
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b110000	TLB conflict abort.	

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**F, bit [0]**

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# PMCCNTR, Performance Monitors Cycle Count Register

The PMCCNTR characteristics are:

## Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' for more information.

[PMCCFILTER](#) determines the modes and states in which the PMCCNTR can increment.

## Configuration

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to AArch64 System register [PMCCNTR\\_EL0\[63:0\]](#).

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to External register [PMCCNTR\\_EL0\[63:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR are UNDEFINED.

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

## Attributes

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

## Field descriptions

The PMCCNTR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																CCNT															
																CCNT															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CCNT, bits [63:0]

Cycle count. Depending on the values of [PMCR](#).{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR](#).C sets this field to 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMCCNTR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

# PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

## Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

### Note

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see 'The PMU event number space and common events'.

## Configuration

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID0\\_EL0\[31:0\]](#).

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to External register [PMCEID0\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0 are UNDEFINED.

## Attributes

PMCEID0 is a 32-bit register.

## Field descriptions

The PMCEID0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7
<a href="#">ID31</a>	<a href="#">ID30</a>	<a href="#">ID29</a>	<a href="#">ID28</a>	<a href="#">ID27</a>	<a href="#">ID26</a>	<a href="#">ID25</a>	<a href="#">ID24</a>	<a href="#">ID23</a>	<a href="#">ID22</a>	<a href="#">ID21</a>	<a href="#">ID20</a>	<a href="#">ID19</a>	<a href="#">ID18</a>	<a href="#">ID17</a>	<a href="#">ID16</a>	<a href="#">ID15</a>	<a href="#">ID14</a>	<a href="#">ID13</a>	<a href="#">ID12</a>	<a href="#">ID11</a>	<a href="#">ID10</a>	<a href="#">ID9</a>	<a href="#">ID8</a>	<a href="#">ID7</a>

**ID<n>, bit [n], for n = 0 to 31**

**ID<n>, bit [n], for n = 31 to 0**

ID[n] corresponds to common event n.

For each bit:

ID<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

---

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

---

## Accessing the PMCEID0

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b110

# PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

## Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

Note

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see 'The PMU event number space and common events'.

## Configuration

AArch32 System register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID0\\_EL0\[63:32\]](#).

AArch32 System register PMCEID2 bits [31:0] are architecturally mapped to External register [PMCEID2\[63:32\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are UNDEFINED.

## Attributes

PMCEID2 is a 32-bit register.

## Field descriptions

The PMCEID2 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IDhi31IDhi<n>, bit [n], for n = 0 to 31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16

IDhi<n>, bit [n], for n = 0 to 31

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:

IDhi<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

---

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

---

## Accessing the PMCEID2

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b100

```

# PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

## Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

Note

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see 'The PMU event number space and common events'.

## Configuration

AArch32 System register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID1\\_EL0\[63:32\]](#).

AArch32 System register PMCEID3 bits [31:0] are architecturally mapped to External register [PMCEID3\[63:32\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are UNDEFINED.

## Attributes

PMCEID3 is a 32-bit register.

## Field descriptions

The PMCEID3 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IDhi31IDhi<n>, bit [n], for n = 0 to 31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16

IDhi<n>, bit [n], for n = 0 to 31

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to common event (0x4020 + n).

For each bit:

IDhi<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

---

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

---

## Accessing the PMCEID3

# PMCNTENCLR, Performance Monitors Count Enable Clear register

The PMCNTENCLR characteristics are:

## Purpose

Disables the Cycle Count Register, [PMCCNTR](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

PMCNTENCLR is used in conjunction with the [PMCNTENSET](#) register.

## Configuration

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENCLR\\_EL0\[31:0\]](#).

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to External register [PMCNTENCLR\\_EL0\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR are UNDEFINED.

## Attributes

PMCNTENCLR is a 32-bit register.

## Field descriptions

The PMCNTENCLR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
C	P<n>, bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1

### C, bit [31]

[PMCCNTR](#) disable bit. Disables the cycle counter register.

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, disables the cycle counter.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### P<n>, bit [n], for n = 300 to 030

Event counter disable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

<b>P&lt;n&gt;</b>	<b>Meaning</b>
0b0	When read, means that <a href="#">PMEVCNTR&lt;n&gt;</a> is disabled. When written, has no effect.
0b1	When read, means that <a href="#">PMEVCNTR&lt;n&gt;</a> is enabled. When written, disables <a href="#">PMEVCNTR&lt;n&gt;</a> .

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMCNTENCLR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<b>coproc</b>	<b>opc1</b>	<b>CRn</b>	<b>CRm</b>	<b>opc2</b>
0b1111	0b000	0b1001	0b1100	0b010

# PMCNTENSET, Performance Monitors Count Enable Set register

The PMCNTENSET characteristics are:

## Purpose

Enables the Cycle Count Register, [PMCCNTR](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

PMCNTENSET is used in conjunction with the [PMCNTENCLR](#) register.

## Configuration

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENSET\\_EL0\[31:0\]](#).

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to External register [PMCNTENSET\\_EL0\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENSET are UNDEFINED.

## Attributes

PMCNTENSET is a 32-bit register.

## Field descriptions

The PMCNTENSET bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
C	P30P<n>, bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1

### C, bit [31]

[PMCCNTR](#) enable bit. Enables the cycle counter register.

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, enables the cycle counter.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### P<n>, bit [n], for n = 300 to 030

Event counter enable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

<b>P&lt;n&gt;</b>	<b>Meaning</b>
0b0	When read, means that <a href="#">PMEVCNTR&lt;n&gt;</a> is disabled. When written, has no effect.
0b1	When read, means that <a href="#">PMEVCNTR&lt;n&gt;</a> event counter is enabled. When written, enables <a href="#">PMEVCNTR&lt;n&gt;</a> .

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMCNTENSET

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<b>coproc</b>	<b>opc1</b>	<b>CRn</b>	<b>CRm</b>	<b>opc2</b>
0b1111	0b000	0b1001	0b1100	0b001

```

# PMCR, Performance Monitors Control Register

The PMCR characteristics are:

## Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

## Configuration

AArch32 System register PMCR bits [31:0] are architecturally mapped to AArch64 System register [PMCR\\_EL0\[31:0\]](#).

AArch32 System register PMCR bits [7:0] are architecturally mapped to External register [PMCR\\_EL0\[7:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMCR are UNDEFINED.

## Attributes

PMCR is a 32-bit register.

## Field descriptions

The PMCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMP								IDCODE								N		RES0	FZOLP	RES0	LC	LPDPL	LCX	DPDX	CDPCE	P	E				

**IMP, bits [31:24]**

**IMP, bits [31:24]**

**When FEAT\_PMUv3p7 is not implemented:**

Implementer code.

If this field is zero, then PMCR.IDCODE is RES0 and software must use [MIDR](#) to identify the PE.

Otherwise, this field and PMCR.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as [MIDR](#).Implementer.

Use of this field is deprecated.

This field reads as an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

**IDCODE, bits [23:16]**

**When PMCR.IMP != 0x00:**

**Otherwise:**

Reserved, RAZ.

**IDCODE, bits [23:16]**

**When PMCR.IMP != 0x00:**

Identification code. Use of this field is deprecated. This field has an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

Access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

**N, bits [15:11]**

Indicates the number of event counters implemented. This value is in the range of 0b000000-0b111111. If the value is 0b000000 then only **PMCCNTR** is implemented. If the value is 0b111111 **PMCCNTR** and 31 event counters are implemented.

In an implementation that includes EL2:

- If EL2 is using AArch32, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of **HDCR.HPMN**.
- If EL2 is using AArch64 and enabled in the current Security state, reads of this field from EL1 and EL0 return the value of **MDCR\_EL2.HPMN**.

Access to this field is **RO**.

**BitBits [10:8]**

Reserved, RES0.

**FZOLP, bit [97]**

When **FEAT\_PMUv3p7**/**FEAT\_PMUv3p5** is implemented:

Freeze-on-overflow. Stop event counters on overflow.

FZO	Meaning
0b0	Do not freeze on overflow.
0b1	Event counters do not count when <b>PMOVSr</b> [(N-1):0] is nonzero, where N is the value of <b>HDCR.HPMN</b> if EL2 is implemented, and <b>PMCR.N</b> otherwise.

If EL2 is implemented, then:

- This bit affects the operation of event counters in the range [0 .. (**HDCR.HPMN**-1)].
- If **HDCR.HPMN** is less than **PMCR.N**:
  - This bit does not affect the operation of event counters in the range [**HDCR.HPMN** .. (**PMCR.N**-1)].
  - The operation of this bit ignores the values of **PMOVSr**[(**PMCR.N**-1):**HDCR.HPMN**].
- This applies even when EL2 is disabled in the current Security state.

This bit does not affect the operation of **PMCCNTR**.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [8]**

Reserved, RES0.

**LP, bit [7]****When FEAT\_PMUv3p5 is implemented:**

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of <a href="#">PMEVCNTR&lt;n&gt;</a> [31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of <a href="#">PMEVCNTR&lt;n&gt;</a> [63:0].

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

If EL2 is implemented and [HDCR](#).HPMN or [MDCR\\_EL2](#).HPMN is less than PMCR.N, this bit does not affect the operation of event counters in the range [[HDCR](#).HPMN..(PMCR.N-1)] or [[MDCR\\_EL2](#).HPMN..(PMCR.N-1)].

[PMEVCNTR<n>](#)[63:32] cannot be accessed directly in AArch32 state.

**Note**

The effect of [HDCR](#).HPMN or [MDCR\\_EL2](#).HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of [HDCR](#).HPMN or [MDCR\\_EL2](#).HPMN.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**LC, bit [6]**

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of <a href="#">PMCCNTR</a> [31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of <a href="#">PMCCNTR</a> [63:0].

Arm deprecates use of [PMCR](#).LC = 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DP, bit [5]****When EL3 is implemented or (FEAT\_PMUv3p1 is implemented and EL2 is implemented):**

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by <a href="#">PMCCNTR</a> is not affected by this bit.
0b1	When event counting for counters in the range [0..( <a href="#">HDCR</a> .HPMN-1)] or [0..( <a href="#">MDCR_EL2</a> .HPMN-1)] is prohibited, cycle counting by <a href="#">PMCCNTR</a> is disabled.

For more information see 'Prohibiting event counting'

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**X, bit [4]**

**When the implementation includes [aan](#) PMU event export bus:**

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RAZ/WI.

**D, bit [3]**

Clock divider. The possible values of this bit are:

D	Meaning
0b0	When enabled, <a href="#">PMCCNTR</a> counts every clock cycle.
0b1	When enabled, <a href="#">PMCCNTR</a> counts once every 64 clock cycles.

If PMCR.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR.D = 1.

On a Warm reset, this field resets to 0.

**C, bit [2]**

Cycle counter reset. The effects of writing to this bit are:

C	Meaning
0b0	No action.
0b1	Reset <a href="#">PMCCNTR</a> to zero.

**This bit is always RAZ.**

**Note**

Resetting [PMCCNTR](#) does not change the cycle counter overflow bit.

The value of PMCR\_EL0.LC is ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

## P, bit [1]

Event counter reset. The effects of writing to this bit are:

P	Meaning
0b0	No action.
0b1	Reset all event counters accessible in the current Exception level, not including <a href="#">PMCCNTR</a> , to zero.

**This bit is always RAZ.**

In EL0 and EL1:

- If EL2 is implemented and enabled in the current Security state, and [HDCR](#).HPMN or [MDCR\\_EL2](#).HPMN is less than PMCR\_EL0.N, a write of 1 to this bit does not reset event counters in the range [[HDCR](#).HPMN..(PMCR.N-1)] or [[MDCR\\_EL2](#).HPMN..(PMCR.N-1)].
- If EL2 is not implemented, EL2 is disabled in the current Security state, or [HDCR](#).HPMN or [MDCR\\_EL2](#).HPMN is equal to PMCR\_EL0.N, a write of 1 to this bit resets all the event counters.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

### Note

Resetting the event counters does not change the event counter overflow bits.

If FEAT\_PMuV3p5 is implemented, the values of [HDCR](#).HLP and PMCR.LP are ignored and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

## E, bit [0]

Enable.

E	Meaning
0b0	All event counters in the range [0..(PMN-1)] and <a href="#">PMCCNTR</a> , are disabled.
0b1	All event counters in the range [0..(PMN-1)] and <a href="#">PMCCNTR</a> , are enabled by <a href="#">PMCNTENSET</a> .

If EL2 is implemented then:

- If EL2 is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is using AArch64, PMN is [MDCR\\_EL2](#).HPMN.
- If PMN is less than PMCR.N, this bit does not affect the operation of event counters in the range [PMN..(PMCR.N-1)].

If EL2 is not implemented, PMN is PMCR.N.

### Note

The effect of [MDCR\\_EL2](#).HPMN or [HDCR](#).HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, regardless of whether EL2 is enabled in the current Security state. For more information, see the description of [MDCR\\_EL2](#).HPMN or [HDCR](#).HPMN.

On a Warm reset, this field resets to 0.

## Accessing the PMCR

Accesses to this register use the following encodings:

# PMEVTYPEPER<n>, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n> characteristics are:

## Purpose

Configures event counter n, where n is 0 to 30.

## Configuration

AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to AArch64 System register [PMEVTYPER<n>\\_EL0\[31:0\]](#).

AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to External register [PMEVTYPER<n>\\_EL0\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n> are UNDEFINED.

## Attributes

PMEVTYPER<n> is a 32-bit register.

## Field descriptions

The PMEVTYPER<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P	U	NSK	NSU	NSH	RES0	MT	RES0								evtCount[15:10]						evtCount[9:0]										

### P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>.NSK bit.

P	Meaning
0b0	Count events in EL1.
0b1	Do not count events in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>.NSU bit.

U	Meaning
0b0	Count events in EL0.
0b1	Do not count events in EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMEVTYPER<n>.P, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of PMEVTYPER<n>.U, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 (Hyp mode) filtering bit. Controls counting in EL2.

NSH	Meaning
0b0	Do not count events in EL2.
0b1	Count events in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

MT, bit [25]

When **FEAT\_MTPMU** is implemented **and enabled** or an **IMPLEMENTATION DEFINED** multi-threaded PMU **extension** is implemented:

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

**Note**

- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT\_MTPMU is not implemented, this bit is RES0. See [ID\\_DFR1.MTPMU](#).

This bit is ignored by the PE and treated as zero when FEAT\_MTPMU is implemented and Disabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [24:16]**

Reserved, RES0.

**evtCount[15:10], bits [15:10]****When FEAT\_PMUv3p1 is implemented:**

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**evtCount[9:0], bits [9:0]**

Event to count. The event number of the event that is counted by event counter [PMEVCNTR<n>](#).

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

**Note**

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# Accessing the PMEVTYPER<n>

PMEVTYPER<n> can also be accessed by using [PMXEVTYPER](#) with [PMSELR](#).SEL set to n.

If FEAT\_FGT is implemented and <n> is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of [PMEVTYPER<n>](#) is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT\_FGT is not implemented and <n> is greater than or equal to the number of accessible counters, then reads and writes of [PMEVTYPER<n>](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

If <n> is greater than or equal to the number of accessible event counters, then reads and writes of PMEVTYPER<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

---

## Note

In EL0, an access is permitted if it is enabled by [PMUSERENR](#).EN or [PMUSERENR\\_EL0](#).EN.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, [HDCR](#).HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, [MDCR\\_EL2](#).HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented counters. See [HDCR](#).HPMN and [MDCR\\_EL2](#).HPMN for more details.

---

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b11:n[4:3]	n[2:0]

# PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

## Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR](#), and the event counters [PMEVCNTR<n>](#). Reading the register shows which overflow interrupt requests are enabled.

PMINTENCLR is used in conjunction with the [PMINTENSET](#) register.

## Configuration

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch64 System register [PMINTENCLR\\_EL1\[31:0\]](#).

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to External register [PMINTENCLR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR are UNDEFINED.

## Attributes

PMINTENCLR is a 32-bit register.

## Field descriptions

The PMINTENCLR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
C	P30P<n>, bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1

### C, bit [31]

[PMCCNTR](#) overflow interrupt request disable bit.

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### P<n>, bit [n], for n = 300 to 030

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in [MDCR\\_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

P<n>	Meaning
0b0	When read, means that the <a href="#">PMEVCNTR&lt;n&gt;</a> event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the <a href="#">PMEVCNTR&lt;n&gt;</a> event counter interrupt request is enabled. When written, disables the <a href="#">PMEVCNTR&lt;n&gt;</a> interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMINTENCLR

# PMINTENSET, Performance Monitors Interrupt Enable Set register

The PMINTENSET characteristics are:

## Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR](#), and the event counters [PMEVCNTR<n>](#). Reading the register shows which overflow interrupt requests are enabled.

PMINTENSET is used in conjunction with the [PMINTENCLR](#) register.

## Configuration

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to AArch64 System register [PMINTENSET\\_EL1\[31:0\]](#).

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to External register [PMINTENSET\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMINTENSET are UNDEFINED.

## Attributes

PMINTENSET is a 32-bit register.

## Field descriptions

The PMINTENSET bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
C	P30P<n>, bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1

### C, bit [31]

[PMCCNTR](#) overflow interrupt request enable bit.

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### P<n>, bit [n], for n = 300 to 030

Event counter overflow interrupt request enable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in [MDCR\\_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

P<n>	Meaning
0b0	When read, means that the <a href="#">PMEVCNTR&lt;n&gt;</a> event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the <a href="#">PMEVCNTR&lt;n&gt;</a> event counter interrupt request is enabled. When written, enables the <a href="#">PMEVCNTR&lt;n&gt;</a> interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMINTENSET

Accesses to this register use the following encodings:

# PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

## Purpose

Describes Performance Monitors parameters specific to the implementation to software.

## Configuration

This register is present only when AArch32 is supported at any Exception level and FEAT\_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are UNDEFINED.

## Attributes

PMMIR is a 32-bit register.

## Field descriptions

The PMMIR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												BUS WIDTHSLOTS				BUS SLOTS				SLOTS											

### Bits [31:8]

### Bits [31:20]

Reserved, RES0.

### BUS\_WIDTH, bits [19:16]

#### From Armv8.7:

Bus width. Indicates the number of bytes each BUS\_ACCESS event relates to. Encoded as  $\text{Log}_2(\text{number of bytes})$ , plus one. Defined values are:

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS\_ACCESS is at most BUS\_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS\_ACCESS counter by more than one.

**Otherwise:**

Reserved, RAZ.

**BUS\_SLOTS, bits [15:8]**

**From Armv8.7:**

Bus count. The largest value by which the BUS\_ACCESS event might increment by in a single BUS\_CYCLES cycle.

If the information is not available, this field will read as zero.

**Otherwise:**

Reserved, RAZ.

**SLOTS, bits [7:0]**

Operation width. The largest value by which the STALL\_SLOT event might increment by in a single cycle. If the STALL\_SLOT event is not implemented, this field might read as zero.

## Accessing the PMMIR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b110

```

# PMOVSr, Performance Monitors Overflow Flag Status Register

The PMOVSr characteristics are:

## Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

## Configuration

AArch32 System register PMOVSr bits [31:0] are architecturally mapped to AArch64 System register [PMOVSCLR\\_EL0\[31:0\]](#).

AArch32 System register PMOVSr bits [31:0] are architecturally mapped to External register [PMOVSCLR\\_EL0\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_PMuV3 is implemented. Otherwise, direct accesses to PMOVSr are UNDEFINED.

## Attributes

PMOVSr is a 32-bit register.

## Field descriptions

The PMOVSr bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
C	P30P<n>, bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1

### C, bit [31]

Cycle counter overflow clear bit. Possible values are:

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

[PMCR](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR](#)[31:0] or unsigned overflow of [PMCCNTR](#)[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 300 to 030**

Event counter overflow clear bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

<b>P&lt;n&gt;</b>	<b>Meaning</b>
0b0	When read, means that <a href="#">PMEVCNTR&lt;n&gt;</a> has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that <a href="#">PMEVCNTR&lt;n&gt;</a> has overflowed since this bit was last cleared. When written, clears the <a href="#">PMEVCNTR&lt;n&gt;</a> overflow bit to 0.

If FEAT\_PMuV3p5 is implemented, [MDCR\\_EL2.HLP](#), [HDCR.HLP](#), and [PMCR.LP](#) control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>](#)[31:0] or unsigned overflow of [PMEVCNTR<n>](#)[63:0]. [PMEVCNTR<n>](#)[63:32] cannot be accessed directly in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMOVSr

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<b>coproc</b>	<b>opc1</b>	<b>CRn</b>	<b>CRm</b>	<b>opc2</b>

# PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

## Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR](#), and each of the implemented event counters [PMEVCNTR<n>](#).

## Configuration

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to AArch64 System register [PMOVSSET\\_ELO\[31:0\]](#).

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to External register [PMOVSSET\\_ELO\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET are UNDEFINED.

## Attributes

PMOVSSET is a 32-bit register.

## Field descriptions

The PMOVSSET bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
C	P30P<n>, bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1

### C, bit [31]

Cycle counter overflow set bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

[PMCR](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR](#)[31:0] or unsigned overflow of [PMCCNTR](#)[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### P<n>, bit [n], for n = 300 to 030

Event counter overflow set bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

<b>P&lt;n&gt;</b>	<b>Meaning</b>
0b0	When read, means that <a href="#">PMEVCNTR&lt;n&gt;</a> has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that <a href="#">PMEVCNTR&lt;n&gt;</a> has overflowed since this bit was last . When written, sets the <a href="#">PMEVCNTR&lt;n&gt;</a> overflow bit to 1.

If FEAT\_PMUv3p5 is implemented, [MDCR\\_EL2.HLP](#), [HDCR.HLP](#), and [PMCR.LP](#) control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>](#)[31:0] or unsigned overflow of [PMEVCNTR<n>](#)[63:0]. [PMEVCNTR<n>](#)[63:32] cannot be accessed directly in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMOVSSET

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<b>coproc</b>	<b>opc1</b>	<b>CRn</b>	<b>CRm</b>	<b>opc2</b>
0b1111	0b000	0b1001	0b1110	0b011

```

if PSTATE.EL == EL0 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && !ELUsingAArch32(EL3) && MDCR_EL3.TPM == '1' then

# PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

## Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see [SW\\_INCR](#).

## Configuration

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to AArch64 System register [PMSWINC\\_EL0\[31:0\]](#).

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to External register [PMSWINC\\_EL0\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC are UNDEFINED.

## Attributes

PMSWINC is a 32-bit register.

## Field descriptions

The PMSWINC bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2
RES0	P30P<n> bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2

### Bit [31]

Reserved, RES0.

### P<n>, bit [n], for n = 300 to 030

Event counter software increment bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR\\_EL2](#).HPMN if EL2 is using AArch64, or in [HDCR](#).HPMN if EL2 is using AArch32. Otherwise, N is the value in [PMCR](#).N.

P<n>	Meaning
0b0	No action. The write to this bit is ignored.
0b1	If <a href="#">PMEVCNTR&lt;n&gt;</a> is enabled and configured to count the software increment event, increments <a href="#">PMEVCNTR&lt;n&gt;</a> by 1. If <a href="#">PMEVCNTR&lt;n&gt;</a> is disabled, or not configured to count the software increment event, the write to this bit is ignored.

## Accessing the PMSWINC

Accesses to this register use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<b>coproc</b>	<b>opc1</b>	<b>CRn</b>	<b>CRm</b>	<b>opc2</b>

# PRRR, Primary Region Remap Register

The PRRR characteristics are:

## Purpose

Controls the top level mapping of the TEX[0], C, and B memory region attributes.

## Configuration

AArch32 System register PRRR bits [31:0] are architecturally mapped to AArch64 System register [MAIR\\_EL1\[31:0\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register PRRR bits [31:0] are architecturally mapped to AArch32 System register [MAIRO\[31:0\]](#) when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register PRRR bits [31:0] (PRRR\_S) are architecturally mapped to AArch32 System register [MAIRO\[31:0\]](#) ([MAIRO\\_S](#)) when EL3 is using AArch32.

AArch32 System register PRRR bits [31:0] (PRRR\_NS) are architecturally mapped to AArch32 System register [MAIRO\[31:0\]](#) ([MAIRO\\_NS](#)) when EL3 is using AArch32.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to PRRR are UNDEFINED.

[MAIRO](#) and PRRR are the same register, with a different view depending on the value of [TTBCR.EAE](#):

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in [MAIRO](#).

## Attributes

PRRR is a 32-bit register.

## Field descriptions

The PRRR bit assignments are:

### When TTBCR.EAE == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">NOS7</a>	<a href="#">NOS6</a>	<a href="#">NOS5</a>	<a href="#">NOS4</a>	<a href="#">NOS3</a>	<a href="#">NOS2</a>	<a href="#">NOS1</a>	<a href="#">NOS0</a>	<a href="#">RES0</a>	<a href="#">NS1</a>	<a href="#">NS0</a>	<a href="#">DS1</a>	<a href="#">DS0</a>	<a href="#">TR7</a>	<a href="#">TR6</a>	<a href="#">TR5</a>	<a href="#">TR4</a>	<a href="#">TR3</a>	<a href="#">TR2</a>	<a href="#">TR1</a>	<a href="#">TR0</a>											

**NOS<n>, bit [n+24], for n = 0 to 7**

**NOS<n>, bit [n+24], for n = 7 to 0**

Not Outer Shareable. NOS<n> is the Outer Shareable property for memory attributes n, if the region is mapped as Normal memory that is not Inner Non-cacheable, Outer Non-cacheable, and the appropriate PRRR.{NS0, NS1} field identifies the region as shareable. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values of each NOS<n> field other than NOS6 are:

NOS<n>	Meaning
0b0	Memory region is Outer Shareable.
0b1	Memory region is Inner Shareable.

The value of this bit is ignored if the region is:

- Device memory
- Normal memory that is at least one of:
  - Inner Non-cacheable, Outer Non-cacheable.
  - Identified by the appropriate PRRR.{NS0, NS1} field as Non-shareable.

The meaning of the NOS6 field is IMPLEMENTATION DEFINED.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bits [23:20]

Reserved, RES0.

## NS1, bit [19]

Mapping of S = 1 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 1.

The possible values of this bit are:

NS1	Meaning
0b0	Region is Non-shareable.
0b1	Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## NS0, bit [18]

Mapping of S = 0 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 0.

The possible values of this bit are:

NS0	Meaning
0b0	Region is Non-shareable.
0b1	Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## DS1, bit [17]

Mapping of S = 1 attribute for Device memory. From Armv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## DS0, bit [16]

Mapping of S = 0 attribute for Device memory. From Armv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**TR<n>, bits [2n+1:2n], for n = 70 to 07**

TR<n> is the primary TEX mapping for memory attributes n, and defines the mapped memory type for a region with attributes n. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values for each field other than TR6 are:

TR<n>	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Normal memory

The value 0b11 is reserved. The effect of programming a field to 0b11 is CONSTRAINED UNPREDICTABLE.

The meaning of the TR6 field is IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PRRR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0010	0b000

```

# RMR, Reset Management Register

The RMR characteristics are:

## Purpose

If EL1 or EL3 is the highest implemented Exception level and this register is implemented:

- A write to the register at the highest implemented Exception level can request a Warm reset.
- If the highest implemented Exception level can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

## Configuration

AArch32 System register RMR bits [31:0] are architecturally mapped to AArch64 System register [RMR\\_EL1\[31:0\]](#) when the highest implemented Exception level is EL1.

AArch32 System register RMR bits [31:0] are architecturally mapped to AArch64 System register [RMR\\_EL3\[31:0\]](#) when EL3 is implemented.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to RMR are UNDEFINED.

Only implemented if EL1 or EL3 is the highest implemented Exception level. In this case:

- If the highest implemented Exception level can use AArch32 and AArch64 then this register must be implemented.
- If the highest implemented Exception level cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

## Attributes

RMR is a 32-bit register.

## Field descriptions

The RMR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																RR		AA64													

### Bits [31:2]

Reserved, RES0.

### RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

On a Warm reset, this field resets to 0.

### AA64, bit [0]

When the highest implemented Exception level can use AArch64, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
0b0	AArch32.
0b1	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If the highest implemented Exception level cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.

## Accessing the RMR

When EL3 is implemented, Arm deprecates accessing this register from any PE mode other than Monitor mode.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0000	0b010

```
if PSTATE.EL IN {EL1, EL3} && IsHighestEL(PSTATE.EL) then
    return RMR;
else
    UNDEFINED;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0000	0b010

```
if PSTATE.EL IN {EL1, EL3} && IsHighestEL(PSTATE.EL) then
    RMR = R[t];
else
    UNDEFINED;
```

# SCR, Secure Configuration Register

The SCR characteristics are:

## Purpose

When EL3 is implemented and can use AArch32, defines the configuration of the current Security state. It specifies:

- The Security state, either Secure or Non-secure.
- What mode the PE branches to if an IRQ, FIQ, or External abort occurs.
- Whether the `PSTATE.FCPSR.F` or `PSTATE.ACPSR.A` bits can be modified when `SCR.NS==1`.

## Configuration

AArch32 System register SCR bits [31:0] can be mapped to AArch64 System register [SCR\\_EL3\[31:0\]](#), but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SCR are UNDEFINED.

## Attributes

SCR is a 32-bit register.

## Field descriptions

The SCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																TERR	RES0	TWE	TWI	RES0	SIF	HCE	SCD	nET	AW	FW	EA	FIQ	IRQ	NS	

### Bits [31:16]

Reserved, RES0.

### TERR, bit [15]

When FEAT\_RAS is implemented:

Trap Error record accesses. Generate a Monitor Trap exception on accesses to the following registers from modes other than Monitor mode:

[ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#). When FEAT\_RASv1p1 is implemented, [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), [ERXMISC7](#).

TERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses to the specified registers from modes other than Monitor mode generate a Monitor Trap exception.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

**Bit [14]**

Reserved, RES0.

**TWE, bit [13]**

Traps WFE instructions to Monitor mode.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by <a href="#">SCTLR.nTWE</a> or <a href="#">HCR.TWE</a> . Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**TWI, bit [12]**

Traps WFI instructions to Monitor mode.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by <a href="#">SCTLR.nTWI</a> or <a href="#">HCR.TWI</a> . Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

**Note**

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Bits [11:10]**

Reserved, RES0.

**SIF, bit [9]**

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory. The possible values for this bit are:

SIF	Meaning
0b0	Secure state instruction fetches from Non-secure memory are permitted.
0b1	Secure state instruction fetches from Non-secure memory are not permitted.

This bit is permitted to be cached in a TLB.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**HCE, bit [8]**

Hypervisor Call instruction enable. If EL2 is implemented, enables execution of HVC instructions at Non-secure EL1 and EL2.

HCE	Meaning
0b0	HVC instructions are: <ul style="list-style-type: none"> <li>UNDEFINED at Non-secure EL1. The Undefined Instruction exception is taken from PL1 to PL1.</li> <li>UNPREDICTABLE at EL2. Behavior is one of the following: <ul style="list-style-type: none"> <li>The instruction is UNDEFINED.</li> <li>The instruction executes as a NOP.</li> </ul> </li> </ul>
0b1	HVC instructions are enabled at Non-secure EL1 and EL2.

**Note**

HVC instructions are always UNDEFINED at EL0 and in Secure state.

If EL2 is not implemented, this bit is RES0 and HVC is UNDEFINED.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**SCD, bit [7]**

Secure Monitor Call disable. Disables SMC instructions.

SCD	Meaning
0b0	SMC instructions are enabled.
0b1	In Non-secure state, SMC instructions are UNDEFINED. The Undefined Instruction exception is taken from the current Exception level to the current Exception level. In Secure state, behavior is one of the following: <ul style="list-style-type: none"> <li>The instruction is UNDEFINED.</li> <li>The instruction executes as a NOP.</li> </ul>

**Note**

SMC instructions are always UNDEFINED at PL0.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**nET, bit [6]**

Not Early Termination. This bit disables early termination. The possible values of this bit are:

nET	Meaning
0b0	Early termination permitted. Execution time of data operations can depend on the data values.
0b1	Disable early termination. The number of cycles required for data operations is forced to be independent of the data values.

This IMPLEMENTATION DEFINED mechanism can disable data dependent timing optimizations from multiplies and data operations. It can provide system support against information leakage that might be exploited by timing correlation types of attack.

On implementations that do not support early termination or do not support disabling early termination, this bit is RES0.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

#### AW, bit [5]

When the value of SCR.EA is 1 and the value of HCR.AMO is 0, this bit controls whether PSTATE.A masks an External abort taken from Non-secure state. CPSR.A masks an External abort taken from Non-secure state, and the possible values of this bit are:

AW	Meaning
0b0	External aborts taken from Non-secure state are not masked by PSTATE.A, and are taken to EL3. CPSR.A, and are taken to EL3. External aborts taken from Secure state are masked by PSTATE.A. CPSR.A.
0b1	External aborts taken from either Security state are masked by PSTATE.A. When PSTATE.A is 0, the abort is taken to EL3. CPSR.A. When CPSR.A is 0, the abort is taken to EL3.

When SCR.EA is 0 or HCR.AMO is 1, this bit has no effect.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

#### FW, bit [4]

When the value of SCR.FIQ is 1 and the value of HCR.FMO is 0, this bit controls whether PSTATE.F masks an FIQ interrupt taken from Non-secure state. CPSR.F masks an FIQ interrupt taken from Non-secure state, and the possible values of this bit are:

FW	Meaning
0b0	An FIQ taken from Non-secure state is not masked by PSTATE.F. CPSR.F, and is taken to EL3.
0b1	An FIQ taken from Secure state is masked by PSTATE.F. CPSR.F. An FIQ taken from either Security state is masked by PSTATE.F. When PSTATE.F is 0, the FIQ is taken to EL3. CPSR.F. When CPSR.F is 0, the FIQ is taken to EL3.

When SCR.FIQ is 0 or HCR.FMO is 1, this bit has no effect.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

#### EA, bit [3]

External Abort handler. This bit controls which mode takes External aborts. and The SError possible interrupt values exceptions. of this bit are:

EA	Meaning
0b0	External aborts taken to Abort mode.
0b1	External aborts taken to Monitor mode.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

#### FIQ, bit [2]

FIQ handler. This bit controls which mode takes FIQ exceptions. The possible values of this bit are:

FIQ	Meaning
0b0	FIQs taken to FIQ mode.
0b1	FIQs taken to Monitor mode.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**IRQ, bit [1]**

IRQ handler. This bit controls which mode takes IRQ exceptions. ~~The possible values of this bit are:~~

IRQ	Meaning
0b0	IRQs taken to IRQ mode.
0b1	IRQs taken to Monitor mode.

On a Warm reset, in ~~In~~ a system where the PE resets into EL3, this field resets to 0.

**NS, bit [0]**

Non-secure bit. Except when the PE is in Monitor mode, this bit determines the Security state of the PE:

NS	Meaning
0b0	PE is in Secure state.
0b1	PE is in Non-secure state.

If the [HCR.TGE](#) bit is set, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing the SCR.NS bit from 0 to 1 results in the SCR.NS bit remaining as 0.

On a Warm reset, in ~~In~~ a system where the PE resets into EL3, this field resets to 0.

**Accessing the SCR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0001	0b000

```

# SCTLR, System Control Register

The SCTLR characteristics are:

## Purpose

Provides the top level control of the system, including its memory system.

## Configuration

AArch32 System register SCTLR bits [31:0] are architecturally mapped to AArch64 System register [SCTLR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SCTLR are UNDEFINED.

Some bits in the register are read-only. These bits relate to non-configurable features of an implementation, and are provided for compatibility with previous versions of the architecture.

## Attributes

SCTLR is a 32-bit register.

## Field descriptions

The SCTLR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6
DSSBS	TEA	FE	TRE	RES0	EE	RES0	SPAN	RES1	RES0	UWXN	WXN	nTWE	RES0	nTWI	RES0	V	I	RES1	EnRCTX	RES0	SED	ITD	UNK		

### DSSBS, bit [31]

When FEAT\_SSBS is implemented:

### DSSBS, bit [31]

When FEAT\_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to any mode in this security state except Hyp mode
0b1	PSTATE.SSBS is set to 1 on an exception to any mode in this security state except Hyp mode

### Note

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

### Otherwise:

Reserved, RES0.

**TE, bit [30]**

T32 Exception Enable. This bit controls whether exceptions to an Exception Level that is executing at PL1 are taken to A32 or T32 state:

TE	Meaning
0b0	Exceptions, including reset, taken to A32 state.
0b1	Exceptions, including reset, taken to T32 state.

On a Warm reset, this ~~This~~ field resets to an IMPLEMENTATION DEFINED value. ~~choice between:~~

- 0.
- ~~A value determined by an input configuration signal.~~

**AFE, bit [29]**

Access Flag Enable. When using the Short-descriptor translation table format for the PL1&0 translation regime, this bit enables use of the AP[0] bit in the translation descriptors as the Access flag, and restricts access permissions in the translation descriptors to the simplified model. The possible values of this bit are:

AFE	Meaning
0b0	In the translation table descriptors, AP[0] is an access permissions bit. The full range of access permissions is supported. No Access flag is implemented.
0b1	In the translation table descriptors, AP[0] is the Access flag. Only the simplified model for access permissions is supported.

When using the Long-descriptor translation table format, the VMSA behaves as if this bit is set to 1, regardless of the value of this bit.

The AFE bit is permitted to be cached in a TLB.

On a Warm reset, this ~~This~~ field resets to 0.

**TRE, bit [28]**

TEX remap enable. This bit enables remapping of the TEX[2:1] bits in the PL1&0 translation regime for use as two translation table bits that can be managed by the operating system. Enabling this remapping also changes the scheme used to describe the memory region attributes in the VMSA. The possible values of this bit are:

TRE	Meaning
0b0	TEX remap disabled. TEX[2:0] are used, with the C and B bits, to describe the memory region attributes.
0b1	TEX remap enabled. TEX[2:1] are reassigned for use as bits managed by the operating system. The TEX[0], C, and B bits are used to describe the memory region attributes, with the MMU remap registers.

When the value of [TTBCR](#).EAE is 1, this bit is RES1.

The TRE bit is permitted to be cached in a TLB.

On a Warm reset, this ~~This~~ field resets to 0.

**Bits [27:26]**

Reserved, RES0.

**EE, bit [25]**

The value of the PSTATE.E bit on branch to an exception vector or coming out of reset, and the endianness of stage 1 translation table walks in the PL1&0 translation regime.

The possible values of this bit are:

EE	Meaning
0b0	Little-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are little-endian.
0b1	Big-endian. PSTATE.E is set to 1 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support for data accesses at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support for data accesses at Exception Levels higher than EL0, this bit is RES1.

On a Warm reset, this This field resets to an IMPLEMENTATION DEFINED value, choice between:

- 0.
- A value determined by an input configuration signal.

#### Bit [24]

Reserved, RES0.

#### SPAN, bit [23]

When FEAT\_PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1 from either Secure or Non-secure state, or to EL3 from Secure state when EL3 is using AArch32.

SPAN	Meaning
0b0	<del>CPSR</del> PSTATE.PAN is set to 1 in the following situations: <ul style="list-style-type: none"> <li>• In Non-secure state, on taking an exception to EL1.</li> <li>• In Secure state, when EL3 is using AArch64, on taking an exception to EL1.</li> <li>• In Secure state, when EL3 is using AArch32, on taking an exception to EL3.</li> </ul>
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL1. <del>CPSR.PAN is left unchanged on taking an exception to EL1.</del>

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

#### Bit [22]

Reserved, RES1.

#### Bit [21]

Reserved, RES0.

#### UWXN, bit [20]

Unprivileged write permission implies PL1 XN (Execute-never). This bit can force all memory regions that are writable at PL0 to be treated as XN for accesses from software executing at PL1. The possible values of this bit are:

UWXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable at PL0 forced to XN for accesses from software executing at PL1.

The UWXN bit is permitted to be cached in a TLB.

On a Warm reset, this **This** field resets to 0.

### WXN, bit [19]

Write permission implies XN (Execute-never). For the PL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the PL1&0 translation regime is forced to XN for accesses from software executing at PL1 or PL0.

This bit applies only when SCTLR.M bit is set.

The WXN bit is permitted to be cached in a TLB.

On a Warm reset, this **This** field resets to 0.

### nTWE, bit [18]

Traps EL0 execution of WFE instructions to Undefined mode.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

#### Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

On a Warm reset, this **This** field resets to 1.

### Bit [17]

Reserved, RES0.

### nTWI, bit [16]

Traps EL0 execution of WFI instructions to Undefined mode.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

#### Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or

WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

On a Warm reset, this ~~This~~ field resets to 1.

#### Bits [15:14]

Reserved, RES0.

#### V, bit [13]

Vectors bit. This bit selects the base address of the exception vectors for exceptions taken to a PE mode other than Monitor mode or Hyp mode:

V	Meaning
0b0	Normal exception vectors. Base address is held in <a href="#">VBAR</a> .
0b1	High exception vectors (Hivecs), base address 0xFFFF0000. This base address cannot be remapped.

On a Warm reset, this ~~This~~ field resets to an IMPLEMENTATION DEFINED ~~value.~~~~choice between:~~

- ~~0.~~
- ~~A value determined by an input configuration signal.~~

#### I, bit [12]

Instruction access Cacheability control, for accesses at EL1 and EL0:

I	Meaning
0b0	All instruction access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	All instruction access to Normal memory from PL1 and PL0 can be cached at all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

Instruction accesses to Normal memory from EL1 and EL0 are Cacheable regardless of the value of the SCTLR.I bit if either:

- EL2 is using AArch32 and the value of [HCR.DC](#) is 1.
- EL2 is using AArch64 and the value of [HCR\\_EL2.DC](#) is 1.

On a Warm reset, this ~~This~~ field resets to 0.

#### Bit [11]

Reserved, RES1.

#### EnRCTX, bit [10]

When FEAT\_CSV2 is implemented:

Enable EL0 Access to the AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions. The defined values are:

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL1.
0b1	EL0 access to these instructions is enabled.

**Note**

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [9]**

Reserved, RES0.

**SED, bit [8]**

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.

SED	Meaning
0b0	SETEND instruction execution is enabled at PL0 and PL1.
0b1	SETEND instructions are UNDEFINED at PL0 and PL1.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

On a Warm reset, this field resets to 0.

**ITD, bit [7]**

IT Disable. Disables some uses of IT instructions at PL1 and PL0.

ITD	Meaning
0b0	All IT instruction functionality is enabled at PL1 and PL0.
0b1	Any attempt at PL1 or PL0 to execute any of the following is UNDEFINED: <ul style="list-style-type: none"> <li>All encodings of the IT instruction with hw1[3:0]≠1000.</li> <li>All encodings of the subsequent instruction with the following values for hw1: <ul style="list-style-type: none"> <li>11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.</li> <li>1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'.</li> <li>10100xxxxxxxxxxx: ADD Rd, PC, #imm</li> <li>01001xxxxxxxxxxx: LDR Rd, [PC, #imm]</li> <li>0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.</li> <li>010001xx1xxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.</li> </ul> </li> </ul>

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the [SCTLR\\_EL1](#). If it is not implemented then this bit is RAZ/WI.

On a Warm reset, this ~~This~~ field resets to 0.

#### UNK, bit [6]

Writes to this bit are IGNORED. Reads of this bit return an UNKNOWN value.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

#### CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from PL1 and PL0:

CP15BEN	Meaning
0b0	PL0 and PL1 execution of the <a href="#">CP15DMB</a> , <a href="#">CP15DSB</a> , and <a href="#">CP15ISB</a> instructions is UNDEFINED.
0b1	PL0 and PL1 execution of the <a href="#">CP15DMB</a> , <a href="#">CP15DSB</a> , and <a href="#">CP15ISB</a> instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the [SCTLR\\_EL1](#). If it is not implemented then this bit is RAO/WI.

On a Warm reset, this ~~This~~ field resets to 1.

#### LSMAOE, bit [4]

When FEAT\_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL1 or EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

On a Warm reset, this ~~This~~ field resets to 1.

Otherwise:

Reserved, RES1.

#### nTLSMD, bit [3]

When FEAT\_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

<b>nTLSMD</b>	<b>Meaning</b>
0b0	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

On a Warm reset, this field resets to 1.

#### Otherwise:

Reserved, RES1.

#### C, bit [2]

Cacheability control, for data accesses at EL1 and EL0:

<b>C</b>	<b>Meaning</b>
0b0	All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, can be cached at all levels of data and unified cache.

The PE ignores SCTLR.C for Non-secure state and data accesses to Normal memory from EL1 and EL0 are Cacheable if either:

- EL2 is using AArch32 and the value of [HCR.DC](#) is 1.
- EL2 is using AArch64 and the value of [HCR\\_EL2.DC](#) is 1.

On a Warm reset, this field resets to 0.

#### A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

<b>A</b>	<b>Meaning</b>
0b0	Alignment fault checking disabled when executing at PL1 or PL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at PL1 or PL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

On a Warm reset, this field resets to 0.

#### M, bit [0]

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL1 and EL0 stage 1 address translation disabled. See the SCTLR.I field for the behavior of instruction accesses to Normal memory.
0b1	EL1 and EL0 stage 1 address translation enabled.

In the Non-secure state the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of the field if either:

- EL2 is using AArch32 and the value of [HCR](#).{DC, TGE} is not {0, 0}.
- EL2 is using AArch64 and the value of [HCR\\_EL2](#).{DC, TGE} is not {0, 0}.

On a Warm reset, this ~~This~~ field resets to 0.

## Accessing the SCTLR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elseif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TRVM == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TRVM == '1' then
        AArch32.TakeHypTrapException(0x03);
    elseif HaveEL(EL3) && ELUsingAArch32(EL3) then
        return SCTLR_NS;
    else
        return SCTLR;
elseif PSTATE.EL == EL2 then
    if HaveEL(EL3) && ELUsingAArch32(EL3) then
        return SCTLR_NS;
    else
        return SCTLR;
elseif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        return SCTLR_S;
    else
        return SCTLR_NS;

```

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;

# SDCR, Secure Debug Control Register

The SDCR characteristics are:

## Purpose

Provides EL3 configuration options for self-hosted debug, trace, and the Performance Monitors Extension.

## Configuration

AArch32 System register SDCR bits [31:0] can be mapped to AArch64 System register [MDCR\\_EL3\[31:0\]](#), but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SDCR are UNDEFINED.

## Attributes

SDCR is a 32-bit register.

## Field descriptions

The SDCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	MTPME	TDCC	RES0	SCCD	RES0	EPMA	EDAD	TTRF	STE	SPME	RES0	SPD	RES0																		

### Bits [31:29]

Reserved, RES0.

### MTPME, bit [28]

When FEAT\_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the [PMEVTYPER<n>](#).MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of <a href="#">PMEVTYPER&lt;n&gt;</a> .MT is zero.
0b1	<a href="#">PMEVTYPER&lt;n&gt;</a> .MT bits not affected by this bit.

If FEAT\_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0. 0b0.

On a Cold reset, in a system where the PE resets into EL3, this field resets to 1.

Otherwise:

Reserved, RES0.

**TDCC, bit [27]****When FEAT\_FGT is implemented:**

Trap DCC. Traps use of the Debug Comms Channel in modes other than Monitor mode to Monitor mode.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	Accesses to the DCC registers in modes other than Monitor mode generate a Monitor Trap exception, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

- [DBGDTRRXext](#), [DBGDTRTXext](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

When the PE is in Debug state, SDCR.TDCC does not trap any accesses to:

- [DBGDTRRXint](#) and [DBGDTRTXint](#).

On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bits [26:24]**

Reserved, RES0.

**SCCD, bit [23]****When FEAT\_PMUv3p5 is implemented:**

Secure Cycle Counter Disable. Prohibits [PMCCNTR](#) from counting in Secure state.

SCCD	Meaning
0b0	Cycle counting by <a href="#">PMCCNTR</a> is not affected by this bit.
0b1	Cycle counting by <a href="#">PMCCNTR</a> is prohibited in Secure state.

This bit does not affect the CPU\_CYCLES event or any other event that counts cycles.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [22]**

Reserved, RES0.

**EPMAD, bit [21]****When FEAT\_Debugv8p4 is implemented and FEAT\_PMUv3 is implemented:**

External Performance Monitors Non-secure access disable. Controls Non-secure access to Performance Monitors registers by an external debugger.

EPMAD	Meaning
0b0	Non-secure access to the Performance Monitors registers from an external debugger is permitted.
0b1	Non-secure access to the Performance Monitors registers from an external debugger is not permitted.

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of [SCR.NS](#) is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

#### When FEAT\_PMuV3 is implemented:

External Performance Monitors access disable. Controls access to Performance Monitors registers by an external debugger.

EPMAD	Meaning
0b0	Access to Performance Monitors registers from an external debugger is permitted.
0b1	Access to Performance Monitors registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of [SCR.NS](#) is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### EDAD, bit [20]

##### When FEAT\_Debugv8p4 is implemented:

External debug Non-secure access disable. Controls Non-secure access to breakpoint, watchpoint, and [OSLAR\\_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Non-secure access to debug registers from an external debugger is permitted.
0b1	Non-secure access to breakpoint registers, watchpoint registers, and <a href="#">OSLAR_EL1</a> from an external debugger is not permitted.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

##### When FEAT\_Debugv8p2 is implemented:

External debug access disable. Controls access to breakpoint, watchpoint, and [OSLAR\\_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers from an external debugger is permitted.
0b1	Access to breakpoint registers, watchpoint registers and <a href="#">OSLAR_EL1</a> from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

#### Otherwise:

External debug access disable. Controls access to breakpoint, watchpoint, and optionally [OSLAR\\_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers from an external debugger is permitted.
0b1	Access to breakpoint registers and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the <a href="#">OSLAR_EL1</a> register from an external debugger is permitted or not permitted.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0b0, then the Effective value of this field is 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

#### TTRF, bit [19]

##### When FEAT\_TRF is implemented:

Trap Trace Filter controls. Controls whether accesses at EL2 and EL1 to the trace filter control registers are trapped to EL3.

TTRF	Meaning
0b0	Accesses to <a href="#">HTRFCR</a> and <a href="#">TRFCR</a> registers are not affected by this control bit.
0b1	When not in Monitor mode, accesses to <a href="#">HTRFCR</a> and <a href="#">TRFCR</a> registers generate a Monitor Trap exception, unless the access generates a higher priority exception.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### STE, bit [18]

##### When FEAT\_TRF is implemented:

Secure Trace Enable. This bit enables tracing in Secure state and controls the level of authentication required by an external debugger to enable external tracing.

STE	Meaning
0b0	Trace is prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Secure state is not affected by this bit.

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0b0, the PE behaves as if this bit is set to 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**SPME, bit [17]**

**When FEAT\_Debugv8p2 is implemented and FEAT\_PMUv3 is implemented:**

Secure Performance Monitors enable. This allows event counting in Secure state.

SPME	Meaning
0b0	Event counting prohibited in Secure state.
0b1	Event counting allowed in Secure state.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**When FEAT\_PMUv3 is implemented:**

Secure Performance Monitors enable. This allows event counting in Secure state.

SPME	Meaning
0b0	Event counting prohibited in Secure state, unless ExternalSecureNoninvasiveDebugEnabled() is TRUE.
0b1	Event counting allowed in Secure state.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0b0, then the Effective value of this bit is 0b1.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bit [16]**

Reserved, RES0.

**SPD, bits [15:14]**

AArch32 Secure self-hosted Privileged Debug. Enables or disables debug exceptions from EL3, other than Breakpoint Instruction exceptions

SPD	Meaning
0b00	Legacy mode. Debug exceptions from EL3 are enabled by the authentication interface.
0b10	Secure privileged debug disabled. Debug exceptions from EL3 are disabled.
0b11	Secure privileged debug enabled. Debug exceptions from EL3 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored in Non-secure state.

If debug exceptions from EL3 are enabled, then debug exceptions from Secure EL0 are also enabled.

Otherwise, debug exceptions from Secure EL0 are enabled only if the value of [SDER.SUIDEN](#) is 0b1.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0b0, then the Effective value of this field is 0b11.

On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

## Bits [13:0]

Reserved, RES0.

## Accessing the SDCR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0011	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;

The SPSR characteristics are:

## Purpose

Holds the saved process state for the current mode.

## Configuration

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR are UNDEFINED.

## Attributes

SPSR is a 32-bit register.

## Field descriptions

The SPSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PANDIT	IL	GE				IT[7:2]				E	A	I	F	T	M[4:0]								

**N, bit [31]**

**Negative Condition flag.** Set to the value of PSTATE.N on taking an exception to the current mode, and copied to PSTATE.N on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

**Zero Condition flag.** Set to the value of PSTATE.Z on taking an exception to the current mode, and copied to PSTATE.Z on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

**Carry Condition flag.** Set to the value of PSTATE.C on taking an exception to the current mode, and copied to PSTATE.C on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

**Overflow Condition flag.** Set to the value of PSTATE.V on taking an exception to the current mode, and copied to PSTATE.V on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

**Overflow or saturation flag.** Set to the value of PSTATE.Q on taking an exception to the current mode, and copied to PSTATE.Q on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

**If-Then-IT** Set to state the bits value for of PSTATE.IT[1:0] on taking an exception to the current T32 mode, IT and (If-Then) copied instruction. to See PSTATE.ITIT[17:02] on for executing explanation and of exception this return operation in the current mode. field.

On executing an exception return operation in the current mode SPSR.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. ~~Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.~~

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

~~Speculative Store Bypass Safe. This bit is set to the value of PSTATE.SSBS on taking an exception to the current mode, and copied to PSTATE.SSBS on executing an exception return operation in the current mode.~~

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to the current mode, and copied to PSTATE.SSBS on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. ~~Set This bit is set~~ to the value of PSTATE.PAN on taking an exception to the current mode, and copied to PSTATE.PAN on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

DIT, bit [21]

When FEAT\_DIT is implemented:

Data Independent Timing. Set This bit is set to the value of PSTATE.DIT on taking an exception to the current mode, and copied to PSTATE.DIT on executing an exception return operation in the current mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. state Set bit. to Shows the value of PSTATE.IL on immediately taking before an exception to the current mode, and copied to PSTATE.IL on executing an exception return was operation in the current mode. taken.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. flags, Set for to parallel the addition value of PSTATE.GE on taking an exception to the current mode, and copied to PSTATE.GE on executing an exception return operation in the current mode. subtraction.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. IT Set block to state the bits value for of PSTATE.IT[7:2] on taking an exception to the current T32 mode, IT and (If-Then) copied instruction. to This PSTATE.IT[7:2] field on must executing be an interpreted exception return operation in the two current mode. parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

SPSR.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Endianness Set state to bit. the Controls value of PSTATE.E on taking an exception to the current load mode, and copied store to endianness PSTATE.E for on data executing an exception return operation in the current mode. accesses.

E	Meaning
0b0	Little-endian operation
0b1	Big-endian operation.

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

If the implementation does not support big-endian operation, SPSR.E is RES0. If the implementation does not support little-endian operation, SPSR.E is RES1. On executing an exception return operation in the current mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### A, bit [8]

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to the current mode, and copied to PSTATE.A on executing an exception return operation in the current mode.

A	Meaning
0b0	Exception not masked.
0b1	Exception masked.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to the current mode, and copied to PSTATE.I on executing an exception return operation in the current mode.

I	Meaning
0b0	Exception not masked.
0b1	Exception masked.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to the current mode, and copied to PSTATE.F on executing an exception return operation in the current mode.

F	Meaning
0b0	Exception not masked.
0b1	Exception masked.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### T, bit [5]

T32 Instruction set state. Determines the value of PSTATE.T set on state taking an exception to the current mode, and copied to PSTATE.T on executing an exception return operation in the current mode.

T	Meaning
0b0	Taken from A32 state.
0b1	Taken from T32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to the current mode, and copied to PSTATE.M[4:0] on executing an exception return operation in the current mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10110	Monitor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

M[4:0]	Meaning	Applies when
0b10000	User.	
0b10001	FIQ.	
0b10010	IRQ.	
0b10011	Supervisor.	
0b10110	Monitor.	When EL3 is capable of using AArch32
0b10111	Abort.	
0b11010	Hyp.	When EL2 is capable of using AArch32
0b11011	Undefined.	
0b11111	System.	

Other values are reserved. If `SPSR.M[4:0]` has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in the current mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the SPSR

SPSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bcd2a

**(new)**

The SPSR\_abt characteristics are:

## Purpose

Holds the saved process state when an exception is taken to Abort mode.

## Configuration

AArch32 System register SPSR\_abt bits [31:0] are architecturally mapped to AArch64 System register [SPSR\\_abt\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR\_abt are UNDEFINED.

## Attributes

SPSR\_abt is a 32-bit register.

## Field descriptions

The SPSR\_abt bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBSPANDIT	IL					GE						IT[7:2]				E	A	I	F	T			M[4:0]	

**N, bit [31]**

**Negative Condition flag.** Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Abort mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Abort mode.

On executing an exception return operation in Abort mode SPSR\_abt.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [21]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Abort mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Abort mode.

SPSR\_abt.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR\_abt.E is RES0. If the implementation does not support little-endian operation, SPSR\_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR\_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR\_abt.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

(old)	htmldiff from-	(new)
-------	----------------	-------

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

Other values are reserved. If `SPSR_abt.M[4:0]` has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

SPSR abt is accessible in all modes other than User mode and Abort mode.

Accesses to this register use the following encodings:

R	M	M1
0b1	0b1	0b0100

<b>R</b>	<b>M</b>	<b>M1</b>
0b1	0b1	0b0100

# SPSR\_fiq, Saved Program Status Register (FIQ mode)

The SPSR\_fiq characteristics are:

## Purpose

Holds the saved process state when an exception is taken to FIQ mode.

## Configuration

AArch32 System register SPSR\_fiq bits [31:0] are architecturally mapped to AArch64 System register [SPSR\\_fiq\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR\_fiq are UNDEFINED.

## Attributes

SPSR\_fiq is a 32-bit register.

## Field descriptions

The SPSR\_fiq bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL		GE			IT[7:2]			E	A	I	F	T			M[4:0]						

### N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to FIQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in FIQ mode.

On executing an exception return operation in FIQ mode SPSR\_fiq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [21]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to FIQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in FIQ mode.

SPSR\_fiq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR\_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR\_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR\_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR\_fiq.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# SPSR\_hyp, Saved Program Status Register (Hyp mode)

The SPSR\_hyp characteristics are:

## Purpose

Holds the saved process state when an exception is taken to Hyp mode.

## Configuration

AArch32 System register SPSR\_hyp bits [31:0] are architecturally mapped to AArch64 System register [SPSR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR\_hyp are UNDEFINED.

## Attributes

SPSR\_hyp is a 32-bit register.

## Field descriptions

The SPSR\_hyp bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSB	PAN	DIT	IL		GE		IT[7:2]		E	A	I	F	T		M[4:0]									

### N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Hyp mode, and copied to PSTATE.N on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Hyp mode, and copied to PSTATE.Z on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Hyp mode, and copied to PSTATE.C on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Hyp mode, and copied to PSTATE.V on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Hyp mode, and copied to PSTATE.Q on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Hyp mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Hyp mode.

On executing an exception return operation in Hyp mode SPSR\_hyp.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Hyp mode, and copied to PSTATE.SSBS on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Hyp mode, and copied to PSTATE.PAN on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [21]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Hyp mode, and copied to PSTATE.DIT on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Hyp mode, and copied to PSTATE.IL on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Hyp mode, and copied to PSTATE.GE on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Hyp mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Hyp mode.

SPSR\_hyp.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Hyp mode, and copied to PSTATE.E on executing an exception return operation in Hyp mode.

If the implementation does not support big-endian operation, SPSR\_hyp.E is RES0. If the implementation does not support little-endian operation, SPSR\_hyp.E is RES1. On executing an exception return operation in Hyp mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR\_hyp.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR\_hyp.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to Hyp mode, and copied to PSTATE.A on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Hyp mode, and copied to PSTATE.I on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Hyp mode, and copied to PSTATE.F on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Hyp mode, and copied to PSTATE.T on executing an exception return operation in Hyp mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Hyp mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Hyp mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR\_hyp.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Hyp mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the SPSR\_hyp**

SPSR\_hyp is accessible only in Monitor mode.

Accesses to this register use the following encodings:

MRS{<c>}{<q>} <Rd>, SPSR\_hyp

R	M	M1
0b1	0b1	0b1110

MSR{<c>}{<q>} SPSR\_hyp, <Rn>

R	M	M1
0b1	0b1	0b1110

# SPSR\_irq, Saved Program Status Register (IRQ mode)

The SPSR\_irq characteristics are:

## Purpose

Holds the saved process state when an exception is taken to IRQ mode.

## Configuration

AArch32 System register SPSR\_irq bits [31:0] are architecturally mapped to AArch64 System register [SPSR\\_irq\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR\_irq are UNDEFINED.

## Attributes

SPSR\_irq is a 32-bit register.

## Field descriptions

The SPSR\_irq bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL		GE		IT[7:2]		E	A	I	F	T		M[4:0]									

### N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to IRQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode SPSR\_irq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [21]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to IRQ mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in IRQ mode.

SPSR\_irq.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR\_irq.E is RES0. If the implementation does not support little-endian operation, SPSR\_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR\_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR\_irq.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Mode. Set to the

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# SPSR\_mon, Saved Program Status Register (Monitor mode)

The SPSR\_mon characteristics are:

## Purpose

Holds the saved process state when an exception is taken to Monitor mode.

## Configuration

AArch32 System register SPSR\_mon bits [31:0] can be mapped to AArch64 System register [SPSR\\_EL3\[31:0\]](#), but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR\_mon are UNDEFINED.

## Attributes

SPSR\_mon is a 32-bit register.

## Field descriptions

The SPSR\_mon bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL		GE		IT[7:2]		E	A	I	F	T		M[4:0]									

### N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Monitor mode, and copied to PSTATE.N on executing an exception return operation in Monitor mode.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Monitor mode, and copied to PSTATE.Z on executing an exception return operation in Monitor mode.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Monitor mode, and copied to PSTATE.C on executing an exception return operation in Monitor mode.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Monitor mode, and copied to PSTATE.V on executing an exception return operation in Monitor mode.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Monitor mode, and copied to PSTATE.Q on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Monitor mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Monitor mode.

On executing an exception return operation in Monitor mode SPSR\_mon.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Monitor mode, and copied to PSTATE.SSBS on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Monitor mode, and copied to PSTATE.PAN on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [21]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Monitor mode, and copied to PSTATE.DIT on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Monitor mode, and copied to PSTATE.IL on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Monitor mode, and copied to PSTATE.GE on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Monitor mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Monitor mode.

SPSR\_mon.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Monitor mode, and copied to PSTATE.E on executing an exception return operation in Monitor mode.

If the implementation does not support big-endian operation, SPSR\_mon.E is RES0. If the implementation does not support little-endian operation, SPSR\_mon.E is RES1. On executing an exception return operation in Monitor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR\_mon.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR\_mon.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to Monitor mode, and copied to PSTATE.A on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Monitor mode, and copied to PSTATE.I on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Monitor mode, and copied to PSTATE.F on executing an exception return operation in Monitor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Monitor mode, and copied to PSTATE.T on executing an exception return operation in Monitor mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Monitor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Monitor mode.

<b>M[4:0]</b>	<b>Meaning</b>
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10110	Monitor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR\_mon.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Monitor mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the SPSR\_mon

SPSR mon is only accessible in EL3 modes other than Monitor mode.

Accesses to this register use the following encodings:

# SPSR\_svc, Saved Program Status Register (Supervisor mode)

The SPSR\_svc characteristics are:

## Purpose

Holds the saved process state when an exception is taken to Supervisor mode.

## Configuration

AArch32 System register SPSR\_svc bits [31:0] are architecturally mapped to AArch64 System register [SPSR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR\_svc are UNDEFINED.

## Attributes

SPSR\_svc is a 32-bit register.

## Field descriptions

The SPSR\_svc bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL		GE							IT[7:2]			E	A	I	F	T			M[4:0]		

### N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Supervisor mode, and copied to PSTATE.N on executing an exception return operation in Supervisor mode.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Supervisor mode, and copied to PSTATE.Z on executing an exception return operation in Supervisor mode.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Supervisor mode, and copied to PSTATE.C on executing an exception return operation in Supervisor mode.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Supervisor mode, and copied to PSTATE.V on executing an exception return operation in Supervisor mode.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Supervisor mode, and copied to PSTATE.Q on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Supervisor mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Supervisor mode.

On executing an exception return operation in Supervisor mode SPSR\_svc.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Supervisor mode, and copied to PSTATE.SSBS on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Supervisor mode, and copied to PSTATE.PAN on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [21]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Supervisor mode, and copied to PSTATE.DIT on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Supervisor mode, and copied to PSTATE.IL on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Supervisor mode, and copied to PSTATE.GE on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Supervisor mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Supervisor mode.

SPSR\_svc.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Supervisor mode, and copied to PSTATE.E on executing an exception return operation in Supervisor mode.

If the implementation does not support big-endian operation, SPSR\_svc.E is RES0. If the implementation does not support little-endian operation, SPSR\_svc.E is RES1. On executing an exception return operation in Supervisor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR\_svc.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR\_svc.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to Supervisor mode, and copied to PSTATE.A on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Supervisor mode, and copied to PSTATE.I on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Supervisor mode, and copied to PSTATE.F on executing an exception return operation in Supervisor mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The SPSR\_and characteristics are:

## Purpose

Holds the saved process state when an exception is taken to Undefined mode.

## Configuration

AArch32 System register SPSR\_und bits [31:0] are architecturally mapped to AArch64 System register [SPSR\\_und\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR\_und are UNDEFINED.

## Attributes

SPSR\_und is a 32-bit register.

## Field descriptions

The SPSR\_und bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBSP	AND	IT	IL			GE					IT[7:2]				E	A	I	F	T			M[4:0]		

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[1:0], bits [26:25]**

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Undefined mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode SPSR\_und.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**J, bit [24]**

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

**SSBS, bit [23]****When FEAT\_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**PAN, bit [22]****When FEAT\_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DIT, bit [21]****When FEAT\_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**IL, bit [20]**

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**GE, bits [19:16]**

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**IT[7:2], bits [15:10]**

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Undefined mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Undefined mode.

SPSR\_und.IT must contain a value that is valid for the instruction being returned to.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR\_und.E is RES0. If the implementation does not support little-endian operation, SPSR\_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR\_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR\_und.E is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**A, bit [8]**

Error interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

## Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

## Configuration

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIMVA are UNDEFINED.

## Attributes

TLBIMVA is a 32-bit System instruction.

## Field descriptions

The TLBIMVA input value bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA												RES0				ASID															

### VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this **System instruction**.

### Bits [11:8]

Reserved, RES0.

### ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

## Executing the TLBIMVA instruction

Accesses to this instruction use the following encodings:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b001

```

# TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

## Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

## Configuration

AArch32 System register TPIDRPRW bits [31:0] are architecturally mapped to AArch64 System register [TPIDR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TPIDRPRW are UNDEFINED.

### Note

The PE never updates this register.

## Attributes

TPIDRPRW is a 32-bit register.

## Field descriptions

The TPIDRPRW bit assignments are:

### Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the TPIDRPRW

Accesses to this register use the following encodings:

# TRFCR, Trace Filter Control Register

The TRFCR characteristics are:

## Purpose

Provides EL1 controls for Trace.

## Configuration

AArch32 System register TRFCR bits [31:0] are architecturally mapped to AArch64 System register [TRFCR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level and FEAT\_TRF is implemented. Otherwise, direct accesses to TRFCR are UNDEFINED.

## Attributes

TRFCR is a 32-bit register.

## Field descriptions

The TRFCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																										TS	RES0	E1TRE	E0TRE		

### Bits [31:7]

Reserved, RES0.

### TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

TS	Meaning	Applies when
0b01	Virtual timestamp. The traced timestamp is the physical counter value, minus the value of <a href="#">CNTVOFF</a> .	
0b10	Guest <del>physical</del> <b>Physical</b> timestamp. The traced timestamp is the physical counter value, minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of <a href="#">CNTPOFF_EL2</a> : <ul style="list-style-type: none"> <li>EL3 is implemented and is using AArch32.</li> <li>EL3 is implemented, using AArch64, and <a href="#">SCR_EL3.ECVEn</a> == 0b0.</li> <li>EL2 is using AArch32.</li> <li>EL2 is using AArch64 and <a href="#">CNTHCTL_EL2.ECV</a> == 0b0.</li> </ul>	When FEAT_ECV is implemented
0b11	Physical timestamp. The traced timestamp is the physical counter value.	

All other values are reserved.

This field is ignored by the PE when if any of the following are true:

- EL2 is implemented and HTRECR.TS != 0b00.
- SelfHostedTraceEnabled() == FALSE.
- HTRECR.TS is not 0b00.

If FEAT\_ECV is implemented, the physical counter uses a fixed physical offset of zero if any of the following are true:

- When EL2 is implemented and enabled in the current Security state and is using AArch32.
- CNTHCTL\_EL2.ECV is 0.
- SCR\_EL3.ECVEn is 0.
- HCR\_EL2.{E2H, TGE} is {1, 1}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [4:2]

Reserved, RES0.

#### E1TRE, bit [1]

EL1 Trace Enable.

E1TRE	Meaning
0b0	Tracing is prohibited in PL1 modes.
0b1	Tracing is allowed in PL1 modes.

This field is ignored if SelfHostedTraceEnabled() == FALSE.

On a Warm reset, this field resets to 0.

#### E0TRE, bit [0]

EL0 Trace Enable.

E0TRE	Meaning
0b0	Tracing is prohibited at EL0.
0b1	Tracing is allowed at EL0.

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and enabled in the current security state and HCR.TGE == 1.

On a Warm reset, this field resets to 0.

## Accessing the TRFCR

# TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

## Purpose

The control register for stage 1 of the PL1&0 translation regime. Its controls include:

- Where the VA range is split between addresses translated using [TTBR0](#) and addresses translated using [TTBR1](#).
- The translation table format used by this stage of translation.

From Armv8.2, when the value of TTBCR.{EAE, T2E} is {1, 1}, TTBCR is used with [TTBCR2](#).

## Configuration

AArch32 System register TTBCR bits [31:0] are architecturally mapped to AArch64 System register [TCR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TTBCR are UNDEFINED.

The current translation table format determines which format of the register is used.

Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

## Attributes

TTBCR is a 32-bit register.

## Field descriptions

The TTBCR bit assignments are:

### When TTBCR.EAE == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EAE	RES0														PD1		PD0	RES0	N												

### EAE, bit [31]

Extended Address Enable.

EAE	Meaning
0b0	Use the VMSAv8-32 translation system with the Short-descriptor translation table format.

On a Warm reset, this field resets to 0.

### Bits [30:6]

Reserved, RES0.

**PD1, bit [5]**

Translation table walk disable for translations using [TTBR1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1](#).

PD1	Meaning
0b0	Perform translation table walks using <a href="#">TTBR1</a> .
0b1	A TLB miss on an address that is translated using <a href="#">TTBR1</a> generates a Translation fault. No translation table walk is performed.

On a Warm reset, this [This](#) field resets to 0.

**PD0, bit [4]**

Translation table walk disable for translations using [TTBR0](#). This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using [TTBR0](#).

PD0	Meaning
0b0	Perform translation table walks using <a href="#">TTBR0</a> .
0b1	A TLB miss on an address that is translated using <a href="#">TTBR0</a> generates a Translation fault. No translation table walk is performed.

On a Warm reset, this [This](#) field resets to 0.

**Bit [3]**

Reserved, RES0.

**N, bits [2:0]**

Indicate the width of the base address held in [TTBR0](#). In [TTBR0](#), the base address field is bits[31:14-N]. The value of N also determines:

- Whether [TTBR0](#) or [TTBR1](#) is used as the base address for translation table walks.
- The size of the translation table pointed to by [TTBR0](#).

N can take any value from 0 to 7, that is, from 0b000 to 0b111.

When N has its reset value of 0, the translation table base is compatible with Armv5 and Armv6.

On a Warm reset, this [This](#) field resets to 0.

**When TTBCR.EAE == 1:**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EAE	IMPLEMENTATION DEFINED		SH1	ORGN1	IRGN1	EPD1	A1	RES0	T1SZ	RES0	SH0	ORGN0	IRGN0	EPD0	T2E	RES0	T0SZ														

**EAE, bit [31]**

Extended Address Enable.

EAE	Meaning
0b1	Use the VMSAv8-32 translation system with the Long-descriptor translation table format.

On a Warm reset, this [This](#) field resets to 0.

**IMPLEMENTATION DEFINED, bit [30]**

IMPLEMENTATION DEFINED.

On a Warm reset, this **This** field resets to 0.

### SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1](#).

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this **This** field resets to 0.

### ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1](#).

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to 0.

### IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1](#).

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to 0.

### EPD1, bit [23]

Translation table walk disable for translations using [TTBR1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1](#).

EPD1	Meaning
0b0	Perform translation table walks using <a href="#">TTBR1</a> .
0b1	A TLB miss on an address that is translated using <a href="#">TTBR1</a> generates a Translation fault. No translation table walk is performed.

On a Warm reset, this **This** field resets to 0.

### A1, bit [22]

Selects whether [TTBR0](#) or [TTBR1](#) defines the ASID.

A1	Meaning
0b0	<a href="#">TTBR0</a> .ASID defines the ASID.
0b1	<a href="#">TTBR1</a> .ASID defines the ASID.

On a Warm reset, this **This** field resets to 0.

#### Bits [21:19]

Reserved, RES0.

#### T1SZ, bits [18:16]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using [TTBR0](#) and [TTBR1](#).

On a Warm reset, this **This** field resets to 0.

#### Bits [15:14]

Reserved, RES0.

#### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0](#).

SH0	Meaning
0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this **This** field resets to 0.

#### ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0](#).

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to 0.

#### IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, thisThis field resets to 0.

EPD0, bit [7]

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0.

EPD0	Meaning
0b0	Perform translation table walks using TTBR0.
0b1	A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

On a Warm reset, thisThis field resets to 0.

T2E, bit [6]

When FEAT\_AA32HPD is implemented:

TTBCR2 Enable.

T2E	Meaning
0b0	TTBCR2 is disabled. The contents of TTBCR2 are treated as 0 for all purposes other than reading or writing the register.
0b1	TTBCR2 is enabled.

If TTBCR.EAE==0, then the behavior is as if the bit is 0.

Otherwise:

Reserved, RES0.

Bits [5:3]

Reserved, RES0.

T0SZ, bits [2:0]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

On a Warm reset, thisThis field resets to 0.

Accessing the TTBCR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0010	0b0000	0b010

```

-------	----------------	-------

The TTBCR2 characteristics are:

## Purpose

The second control register for stage 1 of the PL1&0 translation regime.

If FEAT\_AA32HPD is not implemented then this register is not implemented and its encoding is UNDEFINED. Otherwise:

- When the value of [TTBCR](#).{EAE, T2E} is not {1, 1} the contents of TTBCR2 are treated as zero for all purposes other than reading or writing the register.
- When the value of [TTBCR](#).{EAE, T2E} is {1, 1} TTBCR2 is used with [TTBCR](#).

## Configuration

AArch32 System register TTBCR2 bits [31:0] are architecturally mapped to AArch64 System register [TCR\\_EL1\[63:32\]](#)

This register is present only when AArch32 is supported at any Exception level and FEAT\_AA32HPD is implemented. Otherwise, direct accesses to TTBCR2 are UNDEFINED.

## Attributes

TTBCR2 is a 32-bit register.

## Field descriptions

The TTBCR2 bit assignments are:

31302928272625242322212019	18	17	16	15	14	13	12	11	10	9	87654

**Bits [31:19]**

Reserved, RES0.

### HWU162, bit [18]

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

HWU162	Meaning
0b0	For translations using <a href="#">TTBR1</a> , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR1</a> , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR.T2E](#) is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU161, bit [17]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

HWU161	Meaning
0b0	For translations using <a href="#">TTBR1</a> , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR1</a> , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR](#).T2E is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU160, bit [16]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

HWU160	Meaning
0b0	For translations using <a href="#">TTBR1</a> , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR1</a> , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR](#).T2E is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU159, bit [15]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

HWU159	Meaning
0b0	For translations using <a href="#">TTBR1</a> , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR1</a> , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR.T2E](#) is 0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### HWU062, bit [14]

#### When FEAT\_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

HWU062	Meaning
0b0	For translations using <a href="#">TTBR0</a> , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR0</a> , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR.T2E](#) is 0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### HWU061, bit [13]

#### When FEAT\_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

HWU061	Meaning
0b0	For translations using <a href="#">TTBR0</a> , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR0</a> , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR.T2E](#) is 0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

**HWU060, bit [12]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

HWU060	Meaning
0b0	For translations using <a href="#">TTBR0</a> , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR0</a> , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR.T2E](#) is 0.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU059, bit [11]****When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

HWU059	Meaning
0b0	For translations using <a href="#">TTBR0</a> , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using <a href="#">TTBR0</a> , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR.T2E](#) is 0.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HPD1, bit [10]**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by [TTBR1](#).

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled if <a href="#">TTBCR.T2E</a> == 1.

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of [TTBCR.T2E](#) is 0.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**HPD0, bit [9]**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by [TTBR0](#).

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled if <a href="#">TTBCR.T2E</a> == 1.

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of [TTBCR.T2E](#) is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [8:0]**

Reserved, RES0.

**Accessing the TTBCR2**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0010	0b0000	0b011

# TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

## Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the PL1&0 translation regime, and other information for this translation regime.

## Configuration

AArch32 System register TTBR0 bits [63:0] are architecturally mapped to AArch64 System register [TTBR0\\_EL1\[63:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TTBR0 are UNDEFINED.

TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

[TTBCR](#).EAE determines which TTBR0 format is used:

- [TTBCR](#).EAE == 0b0: 32-bit format is used. TTBR0[63:32] are ignored.
- [TTBCR](#).EAE == 0b1: 64-bit format is used.

When EL3 is using AArch32, write access to TTBR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Used in conjunction with the [TTBCR](#). When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the [TTBCR](#), not in TTBR0.

## Attributes

TTBR0 is a 64-bit register. register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

## Field descriptions

The TTBR0 bit assignments are:

### When TTBCR.EAE == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																																			
TTB0																								IRGN[0]		NOS		RGN		IMP		S		IRGN[1]	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

### Bits [63:32]

Reserved, RES0.

### TTB0, bits [31:7]

Translation table base address, bits[31:x], where x is 14-(TTBCR.N). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.

- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

This field is bit[0] of IRGN[1:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IRGN, bit [0, 6]

Inner region bits. Bits [0,6] of this register together indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

IRGN	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Cacheable.
0b11	Normal memory, Inner Write-Back no Write-Allocate Cacheable.

#### Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[0] is TTBR0[6].
- IRGN[1] is TTBR0[0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### NOS, bit [5]

Not Outer Shareable. When the value of TTBR0.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

NOS	Meaning
0b0	Memory is Outer Shareable.
0b1	Memory is Inner Shareable.

This bit is ignored when the value of TTBR0.S is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

RGN	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Cacheable.
0b11	Normal memory, Outer Write-Back no Write-Allocate Cacheable.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**S, bit [1]**

Shareable. Indicates whether the memory associated with the translation table walks is Non-shareable:

S	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is shareable. The TTBR0.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

**IRGN[1], bit [0]**

This field is bit[1] of IRGN[1:0].

See IRGN[0] for the field description.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When TTBCR.EAE == 1:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								ASID								BADDR															
BADDR																CnP															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:56]**

Reserved, RES0.

**ASID, bits [55:48]**

An ASID for the translation table base address. The [TTBCR.A1](#) field selects either TTBR0.ASID or [TTBR1.ASID](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**BADDR, bits [47:1]**

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [TTBCR.T0SZ](#) as follows:

- If [TTBCR.T0SZ](#) is 0 or 1,  $x = 5 - \text{TTBCR.T0SZ}$ .
- If [TTBCR.T0SZ](#) is greater than 1,  $x = 14 - \text{TTBCR.T0SZ}$ .

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CnP, bit [0]****When FEAT\_TTCNP is implemented:**

Common not Private. When [TTBCR.EAE](#) == 1, this bit indicates whether each entry that is pointed to by TTBR0 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1.

CnP	Meaning
0b0	<p>The translation table entries pointed to by this instance of TTBR0, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR0 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> <li>• The value of TTBR0.CnP on those other PEs.</li> <li>• The value of <a href="#">TTBCR.EAE</a> on those other PEs.</li> <li>• The value of the current ASID or, for the Non-secure instance of TTBR0, the value of the current VMID.</li> </ul>
0b1	<p>The translation table entries pointed to by this instance of TTBR0 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1 for this instance of TTBR0 and all of the following apply:</p> <ul style="list-style-type: none"> <li>• The translation table entries are pointed to by this instance of TTBR0.</li> <li>• The value of the applicable <a href="#">TTBCR.EAE</a> field is 1.</li> <li>• The ASID is the same as the current ASID.</li> <li>• For the Non-secure instance of TTBR0, the VMID is the same as the current VMID.</li> </ul>

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

#### Note

If the value of the TTBR0.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

# TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

## Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the PL1&0 translation regime, and other information for this translation regime.

## Configuration

AArch32 System register TTBR1 bits [63:0] are architecturally mapped to AArch64 System register [TTBR1\\_EL1\[63:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TTBR1 are UNDEFINED.

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

[TTBCR](#).EAE determines which TTBR1 format is used:

- [TTBCR](#).EAE == 0b0: 32-bit format is used. TTBR1[63:32] are ignored.
- [TTBCR](#).EAE == 0b1: 64-bit format is used.

Used in conjunction with the [TTBCR](#). When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the [TTBCR](#), not in TTBR1.

## Attributes

TTBR1 is a 64-bit register. ~~register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].~~

## Field descriptions

The TTBR1 bit assignments are:

### When TTBCR.EAE == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39		38		37	36	35	34	33		32
RES0																																		
TTB1																								IRGN[1]		NOS	RGN		IMP	S	IRGN[0]			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7		6		5	4	3	2	1		0

### Bits [63:32]

Reserved, RES0.

### TTB1, bits [31:7]

Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.

- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

This field is bit[1] of IRGN[1:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IRGN, bit [6, 0]

Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

IRGN	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Cacheable.
0b11	Normal memory, Inner Write-Back no Write-Allocate Cacheable.

#### Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for Armv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[1] is TTBR1[6].
- IRGN[0] is TTBR1[0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### NOS, bit [5]

Not Outer Shareable. When the value of TTBR1.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

NOS	Meaning
0b0	Memory is Outer Shareable.
0b1	Memory is Inner Shareable.

This bit is ignored when the value of TTBR1.S is 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

RGN	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Cacheable.
0b11	Normal memory, Outer Write-Back no Write-Allocate Cacheable.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**S, bit [1]**

Shareable. Indicates whether the memory associated with the translation table walks is Non-shareable:

S	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is shareable. The TTBR1.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

**IRGN[0], bit [0]**

This field is bit[0] of IRGN[1:0].

See IRGN[1] for the field description.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**When TTBCR.EAE == 1:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								ASID								BADDR															
BADDR																CnP															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**Bits [63:56]**

Reserved, RES0.

**ASID, bits [55:48]**

An ASID for the translation table base address. The [TTBCR.A1](#) field selects either [TTBR0.ASID](#) or TTBR1.ASID.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**BADDR, bits [47:1]**

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [TTBCR.T1SZ](#) as follows:

- If [TTBCR.T1SZ](#) is 0 or 1,  $x = 5 - \text{TTBCR.T1SZ}$ .
- If [TTBCR.T1SZ](#) is greater than 1,  $x = 14 - \text{TTBCR.T1SZ}$ .

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**CnP, bit [0]****When FEAT\_TTCNP is implemented:**

Common not Private. When [TTBCR.EAE](#) == 1, this bit indicates whether each entry that is pointed to by TTBR1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1.

CnP	Meaning
0b0	<p>The translation table entries pointed to by this instance of TTBR1, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR1 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> <li>• The value of TTBR1.CnP on those other PEs.</li> <li>• The value of <a href="#">TTBCR.EAE</a> on those other PEs.</li> <li>• The value of the current ASID or, for the Non-secure instance of TTBR1, the value of the current VMID.</li> </ul>
0b1	<p>The translation table entries pointed to by this instance of TTBR1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1 for this instance of TTBR1 and all of the following apply:</p> <ul style="list-style-type: none"> <li>• The translation table entries are pointed to by this instance of TTBR1.</li> <li>• The value of the applicable <a href="#">TTBCR.EAE</a> field is 1.</li> <li>• The ASID is the same as the current ASID.</li> <li>• For the Non-secure instance of TTBR1, the VMID is the same as the current VMID.</li> </ul>

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

### Note

If the value of the TTBR1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Otherwise:

Reserved, RES0.

# VBAR, Vector Base Address Register

The VBAR characteristics are:

## Purpose

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

## Configuration

AArch32 System register VBAR bits [31:0] are architecturally mapped to AArch64 System register [VBAR\\_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VBAR are UNDEFINED.

## Attributes

VBAR is a 32-bit register.

## Field descriptions

The VBAR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Vector Base Address																											RES0				

### Bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

### Bits [4:0]

Reserved, RES0.

## Accessing the VBAR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

# VDFSR, Virtual SError Exception Syndrome Register

The VDFSR characteristics are:

## Purpose

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When a virtual SError interrupt is taken, the syndrome value is reported in [DFSR](#).{AET, ExT} and the remainder of the [DFSR](#) is set as defined by VMSAv8-32. For more information, see 'The AArch32 Virtual Memory System Architecture'.

If the virtual SError interrupt is deferred by an ESB instruction, then the syndrome value is written to [VDISR](#).

## Configuration

AArch32 System register VDFSR bits [31:0] are architecturally mapped to AArch64 System register [VSESR\\_EL2\[31:0\]](#) when the highest implemented Exception level is using AArch64.

This register is present only when FEAT\_RAS is implemented. Otherwise, direct accesses to VDFSR are UNDEFINED.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when [SCR](#).NS == 1.

## Attributes

VDFSR is a 32-bit register.

## Field descriptions

The VDFSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																AET		RES0ExT		RES0											

### Bits [31:16]

Reserved, RES0.

### AET, bits [15:14]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[15:4] is set to VDFSR.AET.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR](#)[15:4] is set to VDFSR.AET.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [13]

Reserved, RES0.

### ExT, bit [12]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[12] is set to VDFSR.ExT.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR](#)[12] is set to VDFSR.ExT.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bits [11:0]

Reserved, RES0.

## Accessing the VDFSR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when `SCR.NS == 1`.

Accesses to this register use the following encodings:

`MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}`

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0101	0b0010	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T5 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T5 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;

# VDISR, Virtual Deferred Interrupt Status Register

The VDISR characteristics are:

## Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

## Configuration

AArch32 System register VDISR bits [31:0] are architecturally mapped to AArch64 System register [VDISR\\_EL2\[31:0\]](#).

This register is present only when FEAT\_RAS is implemented. Otherwise, direct accesses to VDISR are UNDEFINED.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

## Attributes

VDISR is a 32-bit register.

## Field descriptions

The VDISR bit assignments are:

### When TTBCR.EAE == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
A	RES0										AET	RES0	EXT	RES0	FS[4]	LPAE	RES0					FS[3:0]									

### A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [30:16]

Reserved, RES0.

### AET, bits [15:14]

The value copied from [VDFS.R.AET](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [13]

Reserved, RES0.

### ExT, bit [12]

The value copied from [VDFS.R.ExT](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bit [11]

Reserved, RES0.

This field is bit[4] of FS[4:0].

### FS, [4], bits [10, 3:0]

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError interrupt.

FS	Meaning
0b10110	Asynchronous SError interrupt.

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR[10].
- FS[3:0] is VDISR[3:0].

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

### LPAE, bit [9]

Format.

Set to TTBCR.EAE when an ESB instruction defers a virtual SError interrupt.

LPAE	Meaning
0b0	Using the Short-descriptor translation table format.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

### Bits [8:4]

Reserved, RES0.

### FS[3:0], bits [3:0]

This field is bits[3:0] of FS[4:0].

See FS[4] for the field description.

### When TTBCR.EAE == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
A	RES0										AET	RES0	Ext	RES0	LPAE	RES0	STATUS														

### A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

On a Warm reset, this This field resets to an architecturally UNKNOWN value.

### Bits [30:16]

Reserved, RES0.

### AET, bits [15:14]

The value copied from VDESR.AET.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Bit [13]

Reserved, RES0.

#### ExT, bit [12]

The value copied from [VDFSR](#).ExT.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Bits [11:10]

Reserved, RES0.

#### LPAE, bit [9]

Format.

Set to [TTBCR](#).EAE when an ESB instruction defers a virtual SError interrupt.

LPAE	Meaning
0b1	Using the Long-descriptor translation table format.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Bits [8:6]

Reserved, RES0.

#### STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.

STATUS	Meaning
0b010001	Asynchronous SError interrupt.

All other values are reserved.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Accessing the VDISR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

An indirect write to VDISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of [DISR](#) occurring in program order after the ESB instruction.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when [SCR](#).NS == 1.

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b0001	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then

# VMPIDR, Virtualization Multiprocessor ID Register

The VMPIDR characteristics are:

## Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of [MPIDR](#).

## Configuration

AArch32 System register VMPIDR bits [31:0] are architecturally mapped to AArch64 System register [VMPIDR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VMPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the [MPIDR](#).

## Attributes

VMPIDR is a 32-bit register.

## Field descriptions

The VMPIDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
M	U	RES0					MT	Aff2					Aff1					Aff0													

### M, bit [31]

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

M	Meaning
0b0	This implementation does not include the ARMv7 Multiprocessing Extensions functionality.
0b1	This implementation includes the ARMv7 Multiprocessing Extensions functionality.

From Armv8 this bit is RES1.

### U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.U](#).

### Bits [29:25]

Reserved, RES0.

**MT, bit [24]**

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

MT	Meaning
0b0	Performance of PEs at the lowest affinity level is largely independent.
0b1	Performance of PEs at the lowest affinity level is very interdependent.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.MT](#).

**Aff2, bits [23:16]**

Affinity level 2. See the description of Aff0 for more information.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff2](#).

**Aff1, bits [15:8]**

Affinity level 1. See the description of Aff0 for more information.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff1](#).

**Aff0, bits [7:0]**

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or [MPIDR\\_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff0](#).

**Accessing the VMPIDR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

# VPIDR, Virtualization Processor ID Register

The VPIDR characteristics are:

## Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of [MIDR](#).

## Configuration

AArch32 System register VPIDR bits [31:0] are architecturally mapped to AArch64 System register [VPIDR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the [MIDR](#).

## Attributes

VPIDR is a 32-bit register.

## Field descriptions

The VPIDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Implementer								Variant				Architecture				PartNum								Revision							

### Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

Hex representation	ASCII representation	Implementer
0x41	A	Arm Limited
0x42	B	Broadcom Corporation
0x43	C	Cavium Inc.
0x44	D	Digital Equipment Corporation
0x49	I	Infineon Technologies AG
0x4D	M	Motorola or Freescale Semiconductor Inc.
0x4E	N	NVIDIA Corporation
0x50	P	Applied Micro Circuits Corporation
0x51	Q	Qualcomm Inc.
0x56	V	Marvell International Ltd.
0x69	i	Intel Corporation

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.Implementer](#).

**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Variant.

**Architecture, bits [19:16]**

Architecture version. Defined values are:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID * registers, see 'ID registers'.

All other values are reserved.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Architecture.

**PartNum, bits [15:4]**

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.PartNum.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the device.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Revision.

**Accessing the VPIDR**

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

# VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

## Purpose

The control register for stage 2 of the Non-secure PL1&0 translation regime.

### Note

This stage of translation always uses the Long-descriptor translation table format.

## Configuration

AArch32 System register VTCR bits [31:0] are architecturally mapped to AArch64 System register [VTCR\\_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

VTCR is a 32-bit register.

## Field descriptions

The VTCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES1	RES0	HWU62	HWU61	HWU60	HWU59	RES0					SH0	ORGN0	IRGN0	SLO	RES0	S	T0SZ														

### Bit [31]

Reserved, RES1.

### Bits [30:29]

Reserved, RES0.

### HWU62, bit [28]

When FEAT\_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU61, bit [27]**

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU60, bit [26]**

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU59, bit [25]**

**When FEAT\_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bits [24:14]

Reserved, RES0.

#### SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [VTTBR](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [VTTBR](#).

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [VTTBR](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### SL0, bits [7:6]

Starting level for translation table walks using [VTTBR](#).

SL0	Meaning
0b00	Start at level 2
0b01	Start at level 1

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of T0SZ, then a stage 2 level 1 Translation fault is generated.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bit [5]

Reserved, RES0.

## S, bit [4]

Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the behavior is CONSTRAINED UNPREDICTABLE and the stage 2 T0SZ value is treated as an UNKNOWN value, see 'Misprogramming VTCR.S'.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## T0SZ, bits [3:0]

The size offset of the memory region addressed by [VTTBR](#). The region size is  $2^{(32-T0SZ)}$  bytes.

This field holds a four-bit signed integer value, meaning it supports values from -8 to 7.

### Note

This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 1 Translation fault is generated.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Accessing the VTCR

Accesses to this register use the following encodings:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0010	0b0001	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then

# VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

## Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure PL1&0 translation regime, and other information for this translation regime.

## Configuration

AArch32 System register VTTBR bits [63:0] are architecturally mapped to AArch64 System register [VTTBR\\_EL2\[63:0\]](#).

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

## Attributes

VTTBR is a 64-bit register.

## Field descriptions

The VTTBR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								VMID								BADDR															
BADDR																CnP															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:56]

Reserved, RES0.

### VMID, bits [55:48]

The VMID for the translation table.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

### BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [VTCR.SL0](#) and [VTCR.T0SZ](#) as follows:

- If [VTCR.SL0](#) is 0b00, meaning that lookup starts at level 2, then x is 14 - [VTCR.T0SZ](#).

- If [VTCR.SL0](#) is 0b01, meaning that lookup starts at level 1, then x is 5 - [VTCR.T0SZ](#).
- If [VTCR.SL0](#) is either 0b10 or 0b11 then a stage 2 level 1 Translation fault is generated.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

## CnP, bit [0]

When **FEAT\_TTCNP** is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VTTBR are permitted to differ from the entries for VTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VTTBR are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1 and the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

### Note

If the value of the VTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBRs do not point to the same translation table entries when the VMID value is the same as the current VMID, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

## Accessing the VTTBR

Accesses to this register use the following encodings:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

# System Register index by functional group

Below are indexes for registers with the following main functional groups:

- [ID](#)
- [Memory](#)
- [Other](#)
- [Exception](#)
- [Special](#)
- [PSTATE](#)
- [Cache](#)
- [Address](#)
- [TLB](#)
- [PMU](#)
- [Reset](#)
- [Thread](#)
- [IMP DEF](#)
- [Timer](#)
- [Debug](#)
- [CTI](#)
- [Virt](#)
- [Secure](#)
- [Float](#)
- [Legacy](#)
- [GIC](#)
- [GICD](#)
- [GICR](#)
- [GICC](#)
- [GICV](#)
- [GICH](#)
- [GITS](#)
- [RAS](#)
- [MPAM](#)
- [Pointer authentication](#)
- [AMU](#)
- [GIC ITS registers](#)

## In the ID functional group:

Exec state	Name	Description
AArch32	CCSIDR	Current Cache Size ID Register

# AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

## Purpose

Disable control bits for the architected s event counters, [AMEVCNTR0<n>](#).

## Configuration

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR0\\_ELO\[31:0\]](#).

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENCLR0\[31:0\]](#).

The power domain of AMCNTENCLR0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT\_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are RES0.

## Attributes

AMCNTENCLR0 is a 32-bit register.

## Field descriptions

The AMCNTENCLR0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
P31P<n>, bit [n]	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1

P<n>, bit [n], for n = 0 to 31

P<n>, bit [n], for n = 31 to 0

Activity monitor event counter disable bit for [AMEVCNTR0<n>](#).

Bits [31:N] are RAZ/WI. N is the value in [AMCGCR.CG0NC](#).

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that <a href="#">AMEVCNTR0&lt;n&gt;</a> is disabled. When written, has no effect.
0b1	When read, means that <a href="#">AMEVCNTR0&lt;n&gt;</a> is enabled. When written, disables <a href="#">AMEVCNTR0&lt;n&gt;</a> .

On a Cold reset, this field resets to 0.

# AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

## Purpose

Disable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

## Configuration

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR1\\_ELO\[31:0\]](#).

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENCLR1\[31:0\]](#).

The power domain of AMCNTENCLR1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT\_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are RES0.

## Attributes

AMCNTENCLR1 is a 32-bit register.

## Field descriptions

The AMCNTENCLR1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
<a href="#">P&lt;n&gt;, bit [n]</a>	<a href="#">P30</a>	<a href="#">P29</a>	<a href="#">P28</a>	<a href="#">P27</a>	<a href="#">P26</a>	<a href="#">P25</a>	<a href="#">P24</a>	<a href="#">P23</a>	<a href="#">P22</a>	<a href="#">P21</a>	<a href="#">P20</a>	<a href="#">P19</a>	<a href="#">P18</a>	<a href="#">P17</a>	<a href="#">P16</a>	<a href="#">P15</a>	<a href="#">P14</a>	<a href="#">P13</a>	<a href="#">P12</a>	<a href="#">P11</a>	<a href="#">P10</a>	<a href="#">P9</a>	<a href="#">P8</a>	<a href="#">P7</a>	<a href="#">P6</a>	<a href="#">P5</a>	<a href="#">P4</a>	<a href="#">P3</a>	<a href="#">P2</a>	<a href="#">P1</a>

**[P<n>, bit \[n\], for n = 0 to 31](#)**

**[P<n>, bit \[n\], for n = 31 to 0](#)**

Activity monitor event counter disable bit for [AMEVCNTR1<n>](#).

Bits [31:N] are RAZ/WI. N is the value in [AMCGCR.CG1NC](#).

Possible values of each bit are:

<b>P&lt;n&gt;</b>	<b>Meaning</b>
0b0	When read, means that <a href="#">AMEVCNTR1&lt;n&gt;</a> is disabled. When written, has no effect.
0b1	When read, means that <a href="#">AMEVCNTR1&lt;n&gt;</a> is enabled. When written, disables <a href="#">AMEVCNTR1&lt;n&gt;</a> .

On a Cold reset, this field resets to 0.

## Accessing the AMCNTENCLR1

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENCLR1 are RAZ/WI. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

### Note

The number of auxiliary activity monitor event counters implemented is zero exactly when `AMCFGR.NCG == 0b0000`.

**AMCNTENCLR1 can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
AMU	0xC24	AMCNTENCLR1

Accesses on this interface are **RO**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

0b1	When read, means that <a href="#">AMEVCNTR1&lt;n&gt;</a> is enabled. When written, enables <a href="#">AMEVCNTR1&lt;n&gt;</a> .

On a Cold reset, this field resets to 0.

# CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

## Purpose

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- [CNTNSAR](#) controls whether CNTACR<n> is accessible by Non-secure accesses.
- If frame CNTELOBaseN is implemented, the [CNTELOACR](#) in frame CNTBaseN provides additional control of accesses to frame CNTELOBaseN.

## Configuration

The power domain of CNTACR<n> is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Implemented only if the value of [CNTTIDR](#).Frame<n> is 1.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

## Attributes

CNTACR<n> is a 32-bit register.

## Field descriptions

The CNTACR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
												RES0												RWPT		RWVT		RVOFF		RFRQ		RVCT		RPCT	

### Bits [31:6]

Reserved, RES0.

### RWPT, bit [5]

Read/write access to the EL1 Physical Timer registers [CNTP\\_CVAL](#), [CNTP\\_TVAL](#), and [CNTP\\_CTL](#), in frame <n>. The possible values of this bit are:

RWPT	Meaning
0b0	No access to the EL1 Physical Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the EL1 Physical Timer registers in frame <n>.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### RWVT, bit [4]

Read/write access to the Virtual Timer register [CNTV\\_CVAL](#), [CNTV\\_TVAL](#), and [CNTV\\_CTL](#), in frame <n>. The possible values of this bit are:

RWVT	Meaning
0b0	No access to the Virtual Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the Virtual Timer registers in frame <n>.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### RVOFF, bit [3]

Read-only access to [CNTVOFF](#), in frame <n>. The possible values of this bit are:

RVOFF	Meaning
0b0	No access to <a href="#">CNTVOFF</a> in frame <n>. The register is RES0.
0b1	Read-only access to <a href="#">CNTVOFF</a> in frame <n>.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### RFRQ, bit [2]

Read-only access to [CNTFRQ](#), in frame <n>. The possible values of this bit are:

RFRQ	Meaning
0b0	No access to <a href="#">CNTFRQ</a> in frame <n>. The register is RES0.
0b1	Read-only access to <a href="#">CNTFRQ</a> in frame <n>.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### RVCT, bit [1]

Read-only access to [CNTVCT](#), in frame <n>. The possible values of this bit are:

RVCT	Meaning
0b0	No access to <a href="#">CNTVCT</a> in frame <n>. The register is RES0.
0b1	Read-only access to <a href="#">CNTVCT</a> in frame <n>.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### RPCT, bit [0]

Read-only access to [CNTPCT](#), in frame <n>. The possible values of this bit are:

RPCT	Meaning
0b0	No access to <a href="#">CNTPCT</a> in frame <n>. The register is RES0.
0b1	Read-only access to <a href="#">CNTPCT</a> in frame <n>.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Accessing the CNTACR<n>

In a system that recognizes two Security states:

- CNTACR<n> is always accessible by Secure accesses.
- [CNTNSAR](#).NS<n> determines whether CNTACR<n> is accessible by Non-secure accesses.

(old)

# CNTCR, Counter Control Register

The CNTCR characteristics are:

## Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

## Configuration

The power domain of CNTCR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTCR is a 32-bit register.

## Field descriptions

The CNTCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0														FCREQ								RES0				SCEN		HDBG		EN	

### Bits [31:18]

Reserved, RES0.

### FCREQ, bits [17:8]

Frequency change request. Indicates the number of the entry in the Frequency modes table to select.

Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is IMPLEMENTATION DEFINED up to a maximum of 1004 entries, see 'The Frequency modes table'. An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

On a Warm reset, this field resets to 0.

### Bits [7:3]

Reserved, RES0.

### SCEN, bit [2]

When FEAT\_CNTSC is implemented:

Scale Enable.

SCEN	Meaning
0b0	Scaling is not enabled. The counter value is incremented by 0x1.0000000 for each counter tick.
0b1	Scaling is enabled. The counter is incremented by <a href="#">CNTSCR.ScaleVal</a> for each counter tick.

The SCEN bit can only be changed when the counter is disabled, when CNTCR.EN == 0.

If the value of CNTCR.SCEN changes when CNTCR.EN == 1 then:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

When the [CNTCV](#) register in the CNTControlBase frame of the memory mapped counter module is written to, the accumulated fraction information is reset to zero.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### HDBG, bit [1]

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

HDBG	Meaning
0b0	System counter ignores Halt-on-debug.
0b1	Asserted Halt-on-debug signal halts system counter update.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

#### EN, bit [0]

Enables the counter:

EN	Meaning
0b0	System counter disabled.
0b1	System counter enabled.

On a Warm reset, this [This](#) field resets to 0.

## Accessing the CNTCR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

#### CNTCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x000	CNTCR

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489ec15ad1565345720bed2a

# CNTCV, Counter Count Value register

The CNTCV characteristics are:

## Purpose

Indicates the current count value.

## Configuration

The power domain of CNTCV is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTCV is a 64-bit register.

## Field descriptions

The CNTCV bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CountValue																															
CountValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CountValue, bits [63:0]

Indicates the counter value.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the CNTCV

Frame	Accessibility
CNTControlBase	RW
CNTReadBase	RO

A write to CNTCV must be visible in the CNTPCT register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, and therefore this register instance, is implemented only in the Secure memory map.
- If the counter is enabled, the effect of writing to the register is UNKNOWN.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

### CNTCV can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTControlBase	0x008	CNTCV	63:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTReadBase	0x000	CNTCV	63:0

Accesses on this interface are **RO**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# CNTELOACR, Counter-timer EL0 Access Control Register

The CNTELOACR characteristics are:

## Purpose

An implementation of CNTELOACR in the frame at CNTBaseN controls whether the [CNTPCT](#), [CNTVCT](#), [CNTFRQ](#), EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTELOBaseN.

## Configuration

The power domain of CNTELOACR is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTELOACR is a 32-bit register.

## Field descriptions

The CNTELOACR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
										<a href="#">RES0</a>										<a href="#">ELOPTEN</a>		<a href="#">ELOVTEN</a>		<a href="#">RES0</a>				<a href="#">ELOVCTEN</a>		<a href="#">ELOPCTEN</a>	

### Bits [31:10]

Reserved, RES0.

### ELOPTEN, bit [9]

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the [CNTP\\_CVAL](#), [CNTP\\_TVAL](#), and [CNTP\\_CTL](#) registers in the current CNTBaseN frame are also accessible in the corresponding CNTELOBaseN frame. The possible values of this bit are:

ELOPTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### ELOVTEN, bit [8]

Second view read/write access control for the Virtual Timer registers. This bit controls whether the [CNTV\\_CVAL](#), [CNTV\\_TVAL](#), and [CNTV\\_CTL](#) registers in the current CNTBaseN frame are also accessible in the corresponding CNTELOBaseN frame. The possible values of this bit are:

ELOVTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bits [7:2]

Reserved, RES0.

## ELOVCTEN, bit [1]

Second view read access control for [CNTVCT](#) and [CNTERQ](#). The possible values of this bit are:

ELOVCTEN	Meaning
0b0	<a href="#">CNTVCT</a> is not visible in the second view. If ELOPCTEN is set to 0, <a href="#">CNTERQ</a> is not visible in the second view.
0b1	Access permitted. If <a href="#">CNTVCT</a> and <a href="#">CNTERQ</a> are visible in the current frame then they are visible in the second view.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## ELOPCTEN, bit [0]

Second view read access control for [CNTPCT](#) and [CNTERQ](#). The possible values of this bit are:

ELOPCTEN	Meaning
0b0	<a href="#">CNTPCT</a> is not visible in the second view. If ELOVCTEN is set to 0, <a href="#">CNTERQ</a> is not visible in the second view.
0b1	Access permitted. If <a href="#">CNTPCT</a> and <a href="#">CNTERQ</a> are visible in the current frame then they are visible in the second view.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

# Accessing the CNTEL0ACR

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

- The register location in that frame is RAZ/WI.
- If the corresponding CNTEL0BaseN frame is implemented, the registers [CNTERQ](#), [CNTP\\_CTL](#), [CNTP\\_CVAL](#), [CNTP\\_TVAL](#), [CNTPCT](#), [CNTV\\_CTL](#), [CNTV\\_CVAL](#), [CNTV\\_TVAL](#), and [CNTVCT](#) are not visible in that frame.

**CNTEL0ACR can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x014	CNTEL0ACR

Accesses on this interface are **RW**.

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

## Purpose

Indicates the base frequency of the system counter.

## Configuration

The power domain of CNTFID0 is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information, see 'The Frequency modes table'.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

## Attributes

CNTFID0 is a 32-bit register.

## Field descriptions

The CNTFID0 bit assignments are:

### Frequency, bits [31:0]

The base frequency of the system counter, in Hz.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the CNTFID0

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTFID0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020	CNTFID0

Accesses on this interface are **RO or RW**.

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# CNTFID<n>, Counter Frequency IDs, n > 0, n = 1 - 1003

The CNTFID<n> characteristics are:

## Purpose

Indicates alternative system counter update frequencies.

## Configuration

The power domain of CNTFID<n> is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, [CNTFID0](#), see 'The Frequency modes table'.

The number of CNTFID<n> registers is IMPLEMENTATION DEFINED, and the only required CNTFID<n> register is [CNTFID0](#).

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED up to this limit. For an implementation that includes registers in the IMPLEMENTATION DEFINED register space 0x0C0-0x0FC, the maximum number of entries in the Frequency modes table is 40, including the zero-word end marker.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

## Attributes

CNTFID<n> is a 32-bit register.

## Field descriptions

The CNTFID<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Frequency																															

### Frequency, bits [31:0]

A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. Arm strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

increment = (base frequency) / (selected frequency)

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTFID<n>

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes these registers, is implemented only in the Secure memory map.

**CNTFID<n> can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020 + (4 * n)	CNTFID<n>

Accesses on this interface are **RO or RW**.

3001/0907/2020 15:0657: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

## Purpose

This register is provided so that software can discover the frequency of the system counter. The instance of the register in the CNTCTLBase frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

## Configuration

The power domain of CNTFRQ is IMPLEMENTATION DEFINED.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTFRQ is a 32-bit register.

## Field descriptions

The CNTFRQ bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																Clock frequency															

### Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTFRQ

CNTFRQ must be implemented as an RW register in the CNTCTLBase frame.

In a system that recognizes two Security states, the instance of the register in the CNTCTLBase frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RFRQ](#) is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTFRQ is accessible as a RO register in that frame if both:
  - CNTFRQ is accessible in the corresponding CNTBaseN frame.
  - Either the value of [CNTEL0ACR.EL0VCTEN](#) is 1 or the value of [CNTEL0ACR.EL0PCTEN](#) is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

**CNTFRQ can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x010	CNTFRQ

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x010	CNTFRQ

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x000	CNTFRQ

Accesses on this interface are **RO**.

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

## Purpose

Provides the highest-level control of whether frames CNTBaseN and CNTELOBaseN are accessible by Non-secure accesses.

## Configuration

The power domain of CNTNSAR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTNSAR is a 32-bit register.

## Field descriptions

The CNTNSAR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								NS7	NS6	NS5	NS4	NS3	NS2	NS1	NS0

### Bits [31:8]

Reserved, RES0.

### NS<n>, bit [n], for n = 70 to 07

Non-secure access to frame n. The possible values of this bit are:

NS<n>	Meaning
0b0	Secure access only. Behaves as RES0 to Non-secure accesses.
0b1	Secure and Non-secure accesses permitted.

This bit also determines whether, in the CNTCTLBase frame, [CNTACR<n>](#) and [CNTVOFF<n>](#) are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTNSAR

In a system that recognizes two Security states, this register is only accessible by Secure accesses.

**CNTNSAR can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x004	CNTNSAR

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# CNTP\_CTL, Counter-timer Physical Timer Control

The CNTP\_CTL characteristics are:

## Purpose

Control register for the EL1 physical timer.

## Configuration

The power domain of CNTP\_CTL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTP\_CTL is a 32-bit register.

## Field descriptions

The CNTP\_CTL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																ISTATUS			IMASK		ENABLE										

### Bits [31:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP\\_TVAL](#) continues to count down.

**Note**

Disabling the output signal might be a power-saving option.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the CNTP\_CTL**

CNTP\_CTL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP\_CTL is accessible in that frame if the value of [CNTACR<n>.RWPT](#) is 1.
- Otherwise, the CNTP\_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP\_CTL is accessible in that frame if both:
  - CNTP\_CTL is accessible in the corresponding CNTBaseN frame:
  - The value of [CNTEL0ACR.EL0PTEN](#) is 1.
- Otherwise, the CNTP\_CTL address in that frame is RAZ/WI.

**CNTP\_CTL can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x02C	CNTP_CTL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x02C	CNTP_CTL

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# CNTP\_CVAL, Counter-timer Physical Timer CompareValue

The CNTP\_CVAL characteristics are:

## Purpose

Holds the 64-bit compare value for the EL1 physical timer.

## Configuration

The power domain of CNTP\_CVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTP\_CVAL is a 64-bit register.

## Field descriptions

The CNTP\_CVAL bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																CompareValue															
																CompareValue															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When [CNTP\\_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTP\\_CTL.ISTATUS](#) is set to 1.
- An interrupt is generated if [CNTP\\_CTL.IMASK](#) is 0.

When [CNTP\\_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTP\_CVAL

CNTP\_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP\_CVAL is accessible in that frame if the value of [CNTACR<n>.RWPT](#) is 1.
- Otherwise, the CNTP\_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP\_CVAL is accessible in that frame if both:
  - CNTP\_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of [CNTEL0ACR.ELOPTEN](#) is 1.
- Otherwise, the CNTP\_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP\_CVAL register must be accessible as an atomic 64-bit value.

#### CNTP\_CVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x020	CNTP_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x024	CNTP_CVAL	63:32

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x020	CNTP_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x024	CNTP_CVAL	63:32

Accesses on this interface are **RW**.

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# CNTP\_TVAL, Counter-timer Physical Timer TimerValue

The CNTP\_TVAL characteristics are:

## Purpose

Holds the timer value for the EL1 physical timer.

## Configuration

The power domain of CNTP\_TVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTP\_TVAL is a 32-bit register.

## Field descriptions

The CNTP\_TVAL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																TimerValue															

### TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If [CNTP\\_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTP\\_CTL.ENABLE](#) is 1, the value returned is (CompareValue - [CNTPCT](#)).

On a write of this register, CompareValue is set to ([CNTPCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP\\_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTP\\_CTL.ISTATUS](#) is set to 1.
- If [CNTP\\_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTP\\_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTP\_TVAL

CNTP\_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTELOBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTELOBaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.

- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP\_TVAL is accessible in that frame if the value of [CNTACR<n>.RWPT](#) is 1.
- Otherwise, the CNTP\_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP\_TVAL is accessible in that frame if both:
  - CNTP\_TVAL is accessible in the corresponding CNTBaseN frame:
  - The value of [CNTEL0ACR.EL0PTEN](#) is 1.
- Otherwise, the CNTP\_TVAL address in that frame is RAZ/WI.

#### CNTP\_TVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x028	CNTP_TVAL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x028	CNTP_TVAL

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# CNTSCR, Counter Scale Register

The CNTSCR characteristics are:

## Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

## Configuration

The power domain of CNTSCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT\_CNTSC is implemented. Otherwise, direct accesses to CNTSCR are RES0.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTSCR is a 32-bit register.

## Field descriptions

The CNTSCR bit assignments are:

### ScaleVal, bits [31:0]

Scale Value

When counter scaling is enabled, ScaleVal is the amount added to the counter value for every counter tick.

Counter tick is defined as one period of the current operating frequency of the Generic counter.

ScaleVal is expressed as an unsigned fixed point number with an 8-bit integer value and a 24-bit fractional value.

CNTSCR.ScaleVal can only be changed when CNTCR.EN == 0. If the value of this field is changed when CNTCR.EN == 1:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTSCR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x10	CNTSCR

Accesses on this interface are **RW**.

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489ec15ad1565345720bed2a

# CNTSR, Counter Status Register

The CNTSR characteristics are:

## Purpose

Provides counter frequency status information.

## Configuration

The power domain of CNTSR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTSR is a 32-bit register.

## Field descriptions

The CNTSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FCACK																RES0				DBGH		RES0									

### FCACK, bits [31:8]

Frequency change acknowledge. Indicates the currently selected entry in the Frequency modes table, see 'The Frequency modes table'.

On a Warm reset, thisThis field resets to 0.

### Bits [7:2]

Reserved, RES0.

### DBGH, bit [1]

Indicates whether the counter is halted because the Halt-on-debug signal is asserted:

DBGH	Meaning
0b0	Counter is not halted.
0b1	Counter is halted.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Bit [0]

Reserved, RES0.

## Accessing the CNTSR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

Accesses on this interface are **RO**.

# CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

## Purpose

Indicates the implemented timers in the memory map, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTEL0BaseN.
- Frame CNTBaseN has a virtual timer capability.

## Configuration

The power domain of CNTTIDR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTTIDR is a 32-bit register.

## Field descriptions

The CNTTIDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Frame7				Frame6				Frame5				Frame4				Frame3				Frame2				Frame1				Frame0			

**Frame<n>, bits [4n+3:4n], for n = 0 to 7**

**Frame<n>, bits [4n+3:4n], for n = 7 to 0**

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2], the FEL0 subfield, indicates whether frame CNTBase<n> has a second view, CNTEL0Base<n>. The possible values of this bit are:

Bit[2]	Meaning
0b0	Frame<n> does not have a second view. The <a href="#">CNTEL0ACR</a> register in the first view of the frame is RES0
0b1	Frame<n> has a second view, CNTEL0Base<n>.

If bit[0] is 0, bit[2] is RES0.

Bit[1], the FVI subfield, indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers [CNTV\\_CVAL](#), [CNTV\\_TVAL](#), and [CNTV\\_CTL](#).
- This CNTCTLBase frame implements the virtual timer offset register [CNTVOFF<n>](#).

The possible values of bit[1] are:

Bit[1]	Meaning
0b0	Frame<n> does not have virtual capability. The virtual time and offset registers are RES0.
0b1	Frame<n> has virtual capability. The virtual time and offset registers are implemented

If bit[0] is 0, bit[1] is RES0.

Bit[0], the FI subfield, indicates whether frame CNTBase<n> is implemented. The possible values of this bit are:

Bit[0]	Meaning
0b0	Frame<n> is not implemented. All registers associated with the frame are RES0.
0b1	Frame<n> is implemented

## Accessing the CNTTIDR

In a system that recognizes two Security states this register is accessible by both Secure and Non-secure accesses.

**CNTTIDR can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x008	CNTTIDR

Accesses on this interface are **RO**.

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# CNTV\_CTL, Counter-timer Virtual Timer Control

The CNTV\_CTL characteristics are:

## Purpose

Control register for the virtual timer.

## Configuration

The power domain of CNTV\_CTL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTV\_CTL is a 32-bit register.

## Field descriptions

The CNTV\_CTL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																ISTATUS			IMASK		ENABLE										

### Bits [31:3]

Reserved, RES0.

### ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

### IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

(old)

htmldiff from-

(new)

# CNTV\_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV\_CVAL characteristics are:

## Purpose

Holds the 64-bit compare value for the virtual timer.

## Configuration

The power domain of CNTV\_CVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTV\_CVAL is a 64-bit register.

## Field descriptions

The CNTV\_CVAL bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																CompareValue															
																CompareValue															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CompareValue, bits [63:0]

Holds the virtual timer CompareValue.

When [CNTV\\_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTV\\_CTL.ISTATUS](#) is set to 1.
- An interrupt is generated if [CNTV\\_CTL.IMASK](#) is 0.

When [CNTV\\_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTV\_CVAL

CNTV\_CVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV\_CVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV\_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV\_CVAL is accessible in that frame if both:
  - CNTV\_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV\_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV\_CVAL register must be accessible as an atomic 64-bit value.

#### CNTV\_CVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x030	CNTV_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x034	CNTV_CVAL	63:32

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x030	CNTV_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x034	CNTV_CVAL	63:32

Accesses on this interface are **RW**.

# CNTV\_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV\_TVAL characteristics are:

## Purpose

Holds the timer value for the virtual timer.

## Configuration

The power domain of CNTV\_TVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTV\_TVAL is a 32-bit register.

## Field descriptions

The CNTV\_TVAL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																TimerValue															

### TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If [CNTV\\_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTV\\_CTL.ENABLE](#) is 1, the value returned is (CompareValue - [CNTVCT](#)).

On a write of this register, CompareValue is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTV\\_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTV\\_CTL.ISTATUS](#) is set to 1.
- If [CNTV\\_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTV\\_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTV\_TVAL

CNTV\_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTELOBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTELOBaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.

- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV\_TVAL is accessible in that frame if the value of [CNTACR<n>.RWVT](#) is 1.
- Otherwise, the CNTV\_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV\_TVAL is accessible in that frame if both:
  - CNTV\_TVAL is accessible in the corresponding CNTBaseN frame:
  - The value of [CNTEL0ACR.EL0VTEN](#) is 1.
- Otherwise, the CNTV\_TVAL address in that frame is RAZ/WI.

**CNTV\_TVAL can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x038	CNTV_TVAL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x038	CNTV_TVAL

Accesses on this interface are **RW**.

# CNTVOFF, Counter-timer Virtual Offset

The CNTVOFF characteristics are:

## Purpose

Holds the 64-bit virtual offset for a CNTBaseN frame that has virtual timer capability. This is the offset between real time and virtual time.

## Configuration

The power domain of CNTVOFF is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTVOFF is a 64-bit register.

## Field descriptions

The CNTVOFF bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
														Virtual offset																	
														Virtual offset																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Virtual offset.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTVOFF

CNTVOFF is implemented, as a RO register, in any implemented CNTBaseN frame that has virtual timer capability.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTVOFF is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RVOFF](#) is 1.
- Otherwise, the CNTVOFF address in that frame is RAZ/WI.

### Note

CNTVOFF is never visible in any CNTEL0BaseN frame. This means that the CNTVOFF address in any implemented CNTEL0BaseN frame is RAZ/WI.

In an implementation that supports 64-bit atomic accesses, a CNTVOFF{<n>} register must be accessible as an atomic 64-bit value.

**CNTVOFF can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Range
Timer	CNTBaseN	0x018	31:0

Accesses on this interface are **RO**.

Component	Frame	Offset	Range
Timer	CNTBaseN	0x01C	63:32

Accesses on this interface are **RO**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# CNTVOFF<n>, Counter-timer Virtual Offsets, n = 0 - 7

The CNTVOFF<n> characteristics are:

## Purpose

Holds the 64-bit virtual offset for frame CNTBase<n>. This is the offset between real time and virtual time.

## Configuration

The power domain of CNTVOFF<n> is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

## Attributes

CNTVOFF<n> is a 64-bit register.

## Field descriptions

The CNTVOFF<n> bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																Virtual offset															
																Virtual offset															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:0]

Virtual offset.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the CNTVOFF<n>

In the CNTCTLBase frame a CNTVOFF<n> register must be implemented, as a RW register, for each CNTBaseN frame that has virtual timer capability. For more information, see 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames'.

### Note

The value of <n> in an instance of CNTVOFF<n> specifies the value of N for the associated CNTBaseN frame.

In a system that recognizes two Security states, for any CNTVOFF<n> register in the CNTCTLBase frame:

- CNTVOFF<n> is always accessible by Secure accesses.
- [CNTNSAR.NS<n>](#) determines whether CNTVOFF<n> is accessible by Non-secure accesses.

The register location of any unimplemented CNTVOFF<n> register in the CNTCTLBase frame is RAZ/WI.

The CNTVOFF<n> register is accessible in the CNTBaseN frame using [CNTVOFF](#).

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF<n> registers must be accessible as atomic 64-bit values.

**CNTVOFF<n> can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Range
Timer	CNTCTLBase	0x080 + (8 * n)	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Range
Timer	CNTCTLBase	0x084 + (8 * n)	63:32

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

## Purpose

Clears bits of the Application Trigger register.

## Configuration

CTIAPPCLEAR is in the Debug power domain.

## Attributes

CTIAPPCLEAR is a 32-bit register.

## Field descriptions

The CTIAPPCLEAR bit assignments are:

31	30	29	28	27	26	25	24
APPCLEAR31APPCLEAR<x>, bit [x]	APPCLEAR30	APPCLEAR29	APPCLEAR28	APPCLEAR27	APPCLEAR26	APPCLEAR25	APPCLEAR24

APPCLEAR<x>, bit [x], for x = 0 to 31

APPCLEAR<x>, bit [x], for x = 31 to 0

Application trigger <x> disable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

Writing to this bit has the following effect:

APPCLEAR<x>	Meaning
0b0	No effect.
0b1	Clear corresponding bit in CTIAPPTRIG to 0 and clear the corresponding channel event.

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use [CTIAPPULSE](#).

## Accessing the CTIAPPCLEAR

CTIAPPCLEAR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x018	CTIAPPCLEAR

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **WI**.
- When !SoftwareLockStatus() accesses to this register are **WO**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bbede489cc15ad1565345720bed2a

# CTIAPPPULSE, CTI Application Pulse register

The CTIAPPPULSE characteristics are:

## Purpose

Causes event pulses to be generated on ECT channels.

## Configuration

CTIAPPPULSE is in the Debug power domain.

## Attributes

CTIAPPPULSE is a 32-bit register.

## Field descriptions

The CTIAPPPULSE bit assignments are:

31	30	29	28	27	26	25	24
APPPULSE31APPPULSE<x>, bit [x]	APPPULSE30	APPPULSE29	APPPULSE28	APPPULSE27	APPPULSE26	APPPULSE25	APPPULSE24

APPPULSE<x>, bit [x], for x = 0 to 31

APPPULSE<x>, bit [x], for x = 31 to 0

Generate event pulse on ECT channel <x>.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Writing to this bit has the following effect:

APPPULSE<x>	Meaning
0b0	No effect.
0b1	Channel <x> event pulse generated.

**Note**

- The CTIAPPPULSE operation does not affect the state of the Application Trigger register, CTIAPPTRIG. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

## Accessing the CTIAPPPULSE

It is CONSTRAINED UNPREDICTABLE whether a write to CTIAPPPULSE generates an event on a channel if CTICONTROL.GLBEN is 0.

CTIAPPPULSE can be accessed through the external debug interface:

Component	Offset	Instance
-----------	--------	----------

CTI	0x01C	CTIAPPPULSE
-----	-------	-------------

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **WI**.
- When !SoftwareLockStatus() accesses to this register are **WO**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bcd2a

# CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

## Purpose

Sets bits of the Application Trigger register.

## Configuration

CTIAPPSET is in the Debug power domain.

## Attributes

CTIAPPSET is a 32-bit register.

## Field descriptions

The CTIAPPSET bit assignments are:

31	30	29	28	27	26	25	24	23	22
APPSET31APPSET<x>, bit [x]	APPSET30	APPSET29	APPSET28	APPSET27	APPSET26	APPSET25	APPSET24	APPSET23	APPSET22

APPSET<x>, bit [x], for x = 0 to 31

APPSET<x>, bit [x], for x = 31 to 0

Application trigger <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

APPSET<x>	Meaning
0b0	Reading this means the application trigger is inactive. Writing this has no effect.
0b1	Reading this means the application trigger is active. Writing this sets the corresponding bit in CTIAPPTRIG to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use CTIAPPULSE.

On a Cold reset, the value of this field is unchanged.

On an External debug reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## Accessing the CTIAPPSET

CTIAPPSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x014	CTIAPPSET

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489ec15ad1565345720bed2a

# CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

## Purpose

Provides the raw status of the ECT channel inputs to the CTI.

## Configuration

CTICHINSTATUS is in the Debug power domain.

## Attributes

CTICHINSTATUS is a 32-bit register.

## Field descriptions

The CTICHINSTATUS bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18
CHIN31 bit [n]	CHIN30	CHIN29	CHIN28	CHIN27	CHIN26	CHIN25	CHIN24	CHIN23	CHIN22	CHIN21	CHIN20	CHIN19	CHIN18

**CHIN<n>, bit [n], for n = 0 to 31**

**CHIN<n>, bit [n], for n = 31 to 0**

Input channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

CHIN<n>	Meaning
0b0	Input channel <n> is inactive.
0b1	Input channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

## Accessing the CTICHINSTATUS

CTICHINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x138	CTICHINSTATUS

Accesses on this interface are **RO**.

(old)	htmldiff from-	(new)

# CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

## Purpose

Provides the status of the ECT channel outputs from the CTI.

## Configuration

CTICHOUTSTATUS is in the Debug power domain.

## Attributes

CTICHOUTSTATUS is a 32-bit register.

## Field descriptions

The CTICHOUTSTATUS bit assignments are:

31	30	29	28	27	26	25	24	23	22	
CHOUT31CHOUT<n>, bit [n]	CHOUT30	CHOUT29	CHOUT28	CHOUT27	CHOUT26	CHOUT25	CHOUT24	CHOUT23	CHOUT22	CHOUT21

CHOUT<n>, bit [n], for n = 0 to 31

CHOUT<n>, bit [n], for n = 31 to 0

Output channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

CHOUT<n>	Meaning
0b0	Output channel <n> is inactive.
0b1	Output channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an output channel can be observed as active.

### Note

The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see CTIGATE.

## Accessing the CTICHOUTSTATUS

CTICHOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x13C	CTICHOUTSTATUS

Accesses on this interface are **RO**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

(old)

htmldiff from-

(new)

The CTICLAIMCLR characteristics are:

## Purpose

Used by software to read the values of the CLAIM bits, and to clear CLAIM tag bits to 0.

## Configuration

CTICLAIMCLR is in the Debug power domain.

Implementation of this register is OPTIONAL.

## Attributes

CTICLAIMCLR is a 32-bit register.

## Field descriptions

The CTICLAIMCLR bit assignments are:

[illegible]

**CLAIM<x>, bit [x], for x = 0 to 31**

**CLAIM<x>, bit [x], for x = 31 to 0**

CLAIM tag clear bit.

For values of x greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

For other values of  $x$ , reads return the value of  $\text{CLAIM}[x]$  and the behavior on writes is:

CLAIM<x>	Meaning
0b0	No action.
0b1	Indirectly clear CLAIM[x] to 0.

A single write to CTICLAIMCLR can clear multiple tags to 0.

An External Debug reset clears the CLAIM tag bits to 0.

## Accessing the CTICLAIMCLR

**CTICLAIMCLR can be accessed through the external debug interface:**

Component	Offset	Instance
CTI	0xFA4	CTICLAIMCLR

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# CTICLAIMSET, CTI CLAIM Tag Set register

The CTICLAIMSET characteristics are:

## Purpose

Used by software to set CLAIM bits to 1.

## Configuration

CTICLAIMSET is in the Debug power domain.

Implementation of this register is OPTIONAL.

## Attributes

CTICLAIMSET is a 32-bit register.

## Field descriptions

The CTICLAIMSET bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20
CLAIM31CLAIM<x>, bit [x]	CLAIM30	CLAIM29	CLAIM28	CLAIM27	CLAIM26	CLAIM25	CLAIM24	CLAIM23	CLAIM22	CLAIM21	CLAIM20

CLAIM<x>, bit [x], for x = 0 to 31

CLAIM<x>, bit [x], for x = 31 to 0

CLAIM tag set bit.

For values of x greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

For other values of x, the bit is RAO and the behavior on writes is:

CLAIM<x>	Meaning
0b0	No action.
0b1	Indirectly set CLAIM[x] tag to 1.

A single write to CTICLAIMSET can set multiple tags to 1.

An External Debug reset clears the CLAIM tag bits to 0.

## Accessing the CTICLAIMSET

CTICLAIMSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA0	CTICLAIMSET

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

## Purpose

Controls whether the CTI is enabled.

## Configuration

CTICONTROL is in the Debug power domain.

## Attributes

CTICONTROL is a 32-bit register.

## Field descriptions

The CTICONTROL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																GLBEN															

### Bits [31:1]

Reserved, RES0.

### GLBEN, bit [0]

Enables or disables the CTI mapping functions. Possible values of this field are:

GLBEN	Meaning
0b0	CTI mapping functions and application trigger disabled.
0b1	CTI mapping functions and application trigger enabled.

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it remains asserted after the mapping functions are disabled. All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

On a Cold reset, the value of this field is unchanged.

On an External debug reset, this field resets to 0.

On a Warm reset, the value of this field is unchanged.

## Accessing the CTICONTROL

CTICONTROL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x000	CTICONTROL

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

# CTIDEVCTL, CTI Device Control register

The CTIDEVCTL characteristics are:

## Purpose

Provides target-specific device controls

## Configuration

CTIDEVCTL is in the Debug power domain.

This register is present only when FEAT\_DoPD is implemented. Otherwise, direct accesses to CTIDEVCTL are RES0.

## Attributes

CTIDEVCTL is a 32-bit register.

## Field descriptions

The CTIDEVCTL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																RCE		OSUCE													

### Bits [31:2]

Reserved, RES0.

### RCE, bit [1]

Reset Catch Enable.

RCE	Meaning
0b0	Reset Catch debug event disabled.
0b1	Reset Catch debug event enabled.

On a Cold reset, the value of this field is unchanged.

On an External debug reset, this field resets to 0.

On a Warm reset, the value of this field is unchanged.

### OSUCE, bit [0]

OS Unlock Catch Enable

OSUCE	Meaning
0b0	OS Unlock Catch debug event disabled.
0b1	OS Unlock Catch debug event enabled.

On a Cold reset, the value of this field is unchanged.

On an External debug reset, this field resets to 0.

On a Warm reset, the value of this field is unchanged.

Component	Offset	Instance
CTI	0x150	CTIDEVCTL

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

## Purpose

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

## Configuration

CTIGATE is in the Debug power domain.

## Attributes

CTIGATE is a 32-bit register.

## Field descriptions

The CTIGATE bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	
GATE31	GATE<x>, bit [x]	GATE30	GATE29	GATE28	GATE27	GATE26	GATE25	GATE24	GATE23	GATE22	GATE21	GATE20	GATE19

**GATE<x>, bit [x], for x = 0 to 31**

**GATE<x>, bit [x], for x = 31 to 0**

Channel <x> gate enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

GATE<x>	Meaning
0b0	Disable output and, if <a href="#">CTIDEVID.INOUT</a> == 0b01, input channel <x> propagation.
0b1	Enable output and, if <a href="#">CTIDEVID.INOUT</a> == 0b01, input channel <x> propagation.

If GATE[x] is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

**On a Cold reset, the value of this field is unchanged.**

On an External debug reset, this field resets to an architecturally UNKNOWN value.

**On a Warm reset, the value of this field is unchanged.**

## Accessing the CTIGATE

CTIGATE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x140	CTIGATE

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489ec15ad1565345720bed2a

# CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

## Purpose

Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

## Configuration

CTIINEN<n> is in the Debug power domain.  
If input trigger n is not connected, the behavior of CTIINEN<n> is IMPLEMENTATION DEFINED.

## Attributes

CTIINEN<n> is a 32-bit register.

## Field descriptions

The CTIINEN<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18
INEN31INEN<x>, bit [x]	INEN30	INEN29	INEN28	INEN27	INEN26	INEN25	INEN24	INEN23	INEN22	INEN21	INEN20	INEN19	INEN18

INEN<x>, bit [x], for x = 0 to 31

INEN<x>, bit [x], for x = 31 to 0

Input trigger <n> to output channel <x> enable.  
Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

INEN<x>	Meaning
0b0	Input trigger <n> will not generate an event on output channel <x>.
0b1	Input trigger <n> will generate an event on output channel <x>.

On a Cold reset, the value of this field is unchanged.

On an External debug reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## Accessing the CTIINEN<n>

CTIINEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x020 + (4 * n)	CTIINEN<n>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bbede489ec15ad1565345720bed2a

# CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

## Purpose

Can be used to deactivate the output triggers.

## Configuration

CTIINTACK is in the Debug power domain.

## Attributes

CTIINTACK is a 32-bit register.

## Field descriptions

The CTIINTACK bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ACK31ACK<n>, bit [n]	ACK30	ACK29	ACK28	ACK27	ACK26	ACK25	ACK24	ACK23	ACK22	ACK21	ACK20	ACK19	ACK18	ACK17	ACK16

**ACK<n>, bit [n], for n = 0 to 31**

**ACK<n>, bit [n], for n = 31 to 0**

Acknowledge for output trigger <n>.

Bits [31:N] are RAZ/WI. N is the number of CTI triggers implemented as defined by the [CTIDEVID.NUMTRIG](#) field.

If any of the following is true, writes to ACK<n> are ignored:

- $n \geq \text{CTIDEVID.NUMTRIG}$ , the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by [CTIOUTEN<n>](#), is still active.

Otherwise, if any of the following are true, it is IMPLEMENTATION DEFINED whether writes to ACK<n> are ignored:

- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

ACK<n>	Meaning
0b0	No effect
0b1	Deactivate the trigger.

## Accessing the CTIINTACK

A debugger must read [CTITRIGOUTSTATUS](#) to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPPULSE to activate another trigger.

**CTIINTACK can be accessed through the external debug interface:**

Component	Offset	Instance
CTI	0x010	CTIINTACK

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **WI**.
- When !SoftwareLockStatus() accesses to this register are **WO**.

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

## Purpose

Indicates the current status of the Software Lock for CTI registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

## Configuration

CTILSR is in the Debug power domain.

If FEAT\_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses [CTILAR](#) to set or clear the lock, and CTILSR to check the current status of the lock.

## Attributes

CTILSR is a 32-bit register.

## Field descriptions

The CTILSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																													nTT	SLK	SLI

### Bits [31:3]

Reserved, RES0.

### nTT, bit [2]

Not thirty-two bit access required. RAZ.

### SLK, bit [1]

#### When the Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

On a Cold reset, the value of this field is unchanged.

On an External debug reset, this field resets to 1.

Reserved, RAZ.

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

**CTILSR can be accessed through a memory-mapped access to the external debug interface:**

Component	Offset	Instance
CTI	0xFB4	CTILSR

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bcd2a

# CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

## Purpose

Defines which input channels generate output trigger n.

## Configuration

CTIOUTEN<n> is in the Debug power domain.

If output trigger n is not connected, the behavior of CTIOUTEN<n> is IMPLEMENTATION DEFINED.

## Attributes

CTIOUTEN<n> is a 32-bit register.

## Field descriptions

The CTIOUTEN<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21
OUTEN31OUTEN<x>, bit [x]	OUTEN30	OUTEN29	OUTEN28	OUTEN27	OUTEN26	OUTEN25	OUTEN24	OUTEN23	OUTEN22	OUTEN21

OUTEN<x>, bit [x], for x = 0 to 31

OUTEN<x>, bit [x], for x = 31 to 0

Input channel <x> to output trigger <n> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

OUTEN<x>	Meaning
0b0	An event on input channel <x> will not cause output trigger <n> to be asserted.
0b1	An event on input channel <x> will cause output trigger <n> to be asserted.

On a Cold reset, the value of this field is unchanged.

On an External debug reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

## Accessing the CTIOUTEN<n>

CTIOUTEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
-----------	--------	----------

CTI	0x0A0 + (4 * n)	CTIOUTEN<n>
-----	-----------------	-------------

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

-------	----------------	-------

# CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

## Purpose

Provides the status of the trigger inputs.

## Configuration

CTITRIGINSTATUS is in the Debug power domain.

## Attributes

CTITRIGINSTATUS is a 32-bit register.

## Field descriptions

The CTITRIGINSTATUS bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	
TRIN31	TRIN<n>	TRIN30	TRIN29	TRIN28	TRIN27	TRIN26	TRIN25	TRIN24	TRIN23	TRIN22	TRIN21	TRIN20	TRIN19	TRIN18
bit [n]														

TRIN<n>, bit [n], for n = 0 to 31

TRIN<n>, bit [n], for n = 31 to 0

Trigger input <n> status.

Bits [31:N] are RAZ. N is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.

TRIN<n>	Meaning
0b0	Input trigger n is inactive.
0b1	Input trigger n is active.

Not implemented and not-connected input triggers are always inactive.

It is IMPLEMENTATION DEFINED whether an input trigger that does not support multicycle events can be observed as active.

## Accessing the CTITRIGINSTATUS

CTITRIGINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x130	CTITRIGINSTATUS

Accesses on this interface are RO.

# CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

## Purpose

Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicycle channel events.

## Configuration

CTITRIGOUTSTATUS is in the Debug power domain.

## Attributes

CTITRIGOUTSTATUS is a 32-bit register.

## Field descriptions

The CTITRIGOUTSTATUS bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	
TROUT31	TROUT<n>	TROUT30	TROUT29	TROUT28	TROUT27	TROUT26	TROUT25	TROUT24	TROUT23	TROUT22	TROUT21
bit[n]											

**TROUT<n>, bit [n], for n = 0 to 31**

**TROUT<n>, bit [n], for n = 31 to 0**

Trigger output <n> status.

Bits [31:N] are RAZ. N is the value in [CTIDEVID.NUMTRIG](#).

If  $n < N$ , and output trigger <n> is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicycle channel events, then permitted values for TROUT<n> are:

TROUT<n>	Meaning
0b0	Output trigger n is inactive.
0b1	Output trigger n is active.

Otherwise when  $n < N$  it is IMPLEMENTATION DEFINED whether TROUT<n> behaves as described here or is RAZ.

## Accessing the CTITRIGOUTSTATUS

CTITRIGOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x134	CTITRIGOUTSTATUS

Accesses on this interface are **RO**.

# CTITRIGOUTSTATUS, CTI Trigger Out Status register

# DBGBCR<n>\_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>\_EL1 characteristics are:

## Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>\\_EL1](#).

## Configuration

External register DBGBCR<n>\_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGBCR<n>\\_EL1\[31:0\]](#).

External register DBGBCR<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBCR<n>\[31:0\]](#).

DBGBCR<n>\_EL1 is in the Core power domain.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

## Attributes

DBGBCR<n>\_EL1 is a 32-bit register.

## Field descriptions

The DBGBCR<n>\_EL1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								BT				LBN				SSC		HMC	RES0				BAS			RES0	PMC	E			

When the E field is zero, all the other fields in the register are ignored.

### Bits [31:24]

Reserved, RES0.

### BT, bits [23:20]

Breakpoint Type. Possible values are:

BT	Meaning
0b0000	Unlinked instruction address match. <a href="#">DBGBVR&lt;n&gt;_EL1</a> is the address of an instruction.
0b0001	As 0b0000 but linked to a Context matching breakpoint.
0b0010	Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of <a href="#">HCR_EL2.E2H</a> is 1, if either the PE is executing at EL0 with <a href="#">HCR_EL2.TGE</a> set to 1 or the PE is executing at EL2, then <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> must match the <a href="#">CONTEXTIDR_EL2</a> value. Otherwise, <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> must match the <a href="#">CONTEXTIDR_EL1</a> value.
0b0011	As 0b0010, with linking enabled.
0b0100	Unlinked instruction address mismatch. <a href="#">DBGBVR&lt;n&gt;_EL1</a> is the address of an instruction to be stepped.
0b0101	As 0b0100, with linking enabled.
0b0110	Unlinked <a href="#">CONTEXTIDR_EL1</a> match. <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> is a Context ID compared against <a href="#">CONTEXTIDR_EL1</a> .
0b0111	As 0b0110, with linking enabled.
0b1000	Unlinked VMID match. <a href="#">DBGBVR&lt;n&gt;_EL1.VMID</a> is a VMID compared against <a href="#">VTTBR_EL2.VMID</a> .
0b1001	As 0b1000, with linking enabled.
0b1010	Unlinked VMID and Context ID match. <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> is a Context ID compared against <a href="#">CONTEXTIDR_EL1</a> , and <a href="#">DBGBVR&lt;n&gt;_EL1.VMID</a> is a VMID compared against <a href="#">VTTBR_EL2.VMID</a> .
0b1011	As 0b1010, with linking enabled.
0b1100	Unlinked <a href="#">CONTEXTIDR_EL2</a> match. <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID2</a> is a Context ID compared against <a href="#">CONTEXTIDR_EL2</a> .
0b1101	As 0b1100, with linking enabled.
0b1110	Unlinked Full Context ID match. <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID</a> is compared against <a href="#">CONTEXTIDR_EL1</a> , and <a href="#">DBGBVR&lt;n&gt;_EL1.ContextID2</a> is compared against <a href="#">CONTEXTIDR_EL2</a> .
0b1111	As 0b1110, with linking enabled.

Constraints on breakpoint programming mean some values are reserved under certain conditions.

For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved DBGBCR<n>\_EL1.BT values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

## LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>\_EL1.E is 0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

## SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the

permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>\_EL1.{SSC, HMC, PMC} values'.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see [DBGBCR<n>\\_EL1.SSC](#) description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## Bits [12:9]

Reserved, RES0.

## BAS, bits [8:5]

When AArch32 is supported at any Exception level:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	<a href="#">DBGBVR&lt;n&gt;_EL1</a>	Use for T32 instructions
0b1100	<a href="#">DBGBVR&lt;n&gt;_EL1</a> + 2	Use for T32 instructions
0b1111	<a href="#">DBGBVR&lt;n&gt;_EL1</a>	Use for A64 and A32 instructions

All other values are reserved.

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint
0b0011	<a href="#">DBGBVR&lt;n&gt;_EL1</a>	Use for stepping T32 instructions
0b1100	<a href="#">DBGBVR&lt;n&gt;_EL1</a> + 2	Use for stepping T32 instructions
0b1111	<a href="#">DBGBVR&lt;n&gt;_EL1</a>	Use for stepping A64 and A32 instructions

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

#### Otherwise:

Reserved, RES1.

#### Bits [4:3]

Reserved, RES0.

#### PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the [DBGBCR<n>\\_EL1](#).SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

#### E, bit [0]

Enable breakpoint [DBGBVR<n>\\_EL1](#). Possible values are:

E	Meaning
0b0	Breakpoint disabled.
0b1	Breakpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## Accessing the DBGBCR<n>\_EL1

#### Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

#### DBGBCR<n>\_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x408 + (16 * n)	DBGBCR<n>_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489ec15ad1565345720bed2a

# DBGBVR<n>\_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>\_EL1 characteristics are:

## Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register [DBGBCR<n>\\_EL1](#).

## Configuration

External register DBGBVR<n>\_EL1 bits [63:0] are architecturally mapped to AArch64 System register [DBGBVR<n>\\_EL1\[63:0\]](#).

External register DBGBVR<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBVR<n>\[31:0\]](#).

External register DBGBVR<n>\_EL1 bits [63:32] are architecturally mapped to AArch32 System register [DBGXVR<n>\[31:0\]](#).

DBGBVR<n>\_EL1 is in the Core power domain.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

## Attributes

How this register is interpreted depends on the value of [DBGBCR<n>\\_EL1](#).BT.

- When [DBGBCR<n>\\_EL1](#).BT is 0b0x0x, this register holds a virtual address.
- When [DBGBCR<n>\\_EL1](#).BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When [DBGBCR<n>\\_EL1](#).BT is 0b100x, this register holds a VMID.
- When [DBGBCR<n>\\_EL1](#).BT is 0b101x, this register holds a VMID and a Context ID.
- When [DBGBCR<n>\\_EL1](#).BT is 0b111x, this register holds two Context ID values.

For other values of [DBGBCR<n>\\_EL1](#).BT, this register is RES0.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

## Attributes

DBGBVR<n>\_EL1 is a 64-bit register.

## Field descriptions

The DBGBVR<n>\_EL1 bit assignments are:

## When DBGBCR<n>\_EL1.BT == 0b0x0x:

### RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

### VA[52:49], bits [52:49]

#### When FEAT\_LVA is implemented:

Extension to VA[48:2]. See VA[48:2] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

#### Otherwise:

Extension to RESS[14:4]. See RESS[14:4] for more details.

### VA[48:2], bits [48:2]

If the address is being matched in an AArch64 stage 1 translation regime:

- This field contains bits[48:2] of the address for comparison.
- When FEAT\_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

### Bits [1:0]

Reserved, RES0.

## When DBGBCR<n>\_EL1.BT == 0b001x:

## Bits [63:32]

Reserved, RES0.

## ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR\\_EL2](#) when (FEAT\_VHE is implemented, or EL2 is using AArch64, FEAT\_Debugv8p2 is implemented), EL2 is using AArch64, [HCR\\_EL2](#).E2H is 1, and either:

- The PE is executing at EL2.
- [HCR\\_EL2](#).TGE is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against the following:

- [CONTEXTIDR](#) when the PE is executing at AArch32.
- [CONTEXTIDR\\_EL1](#) when the PE is executing at AArch64.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## When DBGBCR<n>\_EL1.BT == 0b011x, EL2 is implemented and (FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented):

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																																
ContextID																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

## Bits [63:32]

Reserved, RES0.

## ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR\\_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## When DBGBCR<n>\_EL1.BT == 0b100x and EL2 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																VMID[15:8]								VMID[7:0]							
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## Bits [63:48]

Reserved, RES0.

## VMID[15:8], bits [47:40]

When FEAT\_VHE is implemented and VTCR\_EL2.VS == 1:

Extension to VMID[7:0]. See DBGBVR<n>\_EL1.VMID[7:0] for more details.

If EL2 is using AArch32, this field is RES0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.

## VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR\_EL2.VS is 0.
- FEAT\_VMID16 is not implemented.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## Bits [31:0]

Reserved, RES0.

## When DBGBCR<n>\_EL1.BT == 0b101x and EL2 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																VMID[15:8]								VMID[7:0]							
ContextID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## Bits [63:48]

Reserved, RES0.

## VMID[15:8], bits [47:40]

When FEAT\_VMID16 is implemented and VTCR\_EL2.VS == 1:

Extension to VMID[7:0]. See DBGBVR<n>\_EL1.VMID[7:0] for more details.

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**Otherwise:**

Reserved, RES0.

**VMID[7:0], bits [39:32]**

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCR\\_EL2](#).VS is 0.
- FEAT\_VMID16 is not implemented.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

**ContextID, bits [31:0]**

Context ID value for comparison against [CONTEXTIDR\\_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

**When DBGBCR<n>\_EL1.BT == 0b110x, EL2 is implemented and (FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented):**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																ContextID2																
																RES0																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

**ContextID2, bits [63:32]**

Context ID value for comparison against [CONTEXTIDR\\_EL2](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

**Bits [31:0]**

Reserved, RES0.

**When DBGBCR<n>\_EL1.BT == 0b111x, EL2 is implemented and (FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented):**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																ContextID2																
																ContextID																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

ContextID2, bits [63:32]

Context ID value for comparison against [CONTEXTIDR\\_EL2](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR\\_EL1](#).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Accessing the DBGBVR<n>\_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGBVR<n>\_EL1 can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x400 + (16 * n)	DBGBVR<n>_EL1	63:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# DBGWCR<n>\_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>\_EL1 characteristics are:

## Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>\\_EL1](#).

## Configuration

External register DBGWCR<n>\_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGWCR<n>\\_EL1\[31:0\]](#).

External register DBGWCR<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWCR<n>\[31:0\]](#).

DBGWCR<n>\_EL1 is in the Core power domain.

If watchpoint n is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

## Attributes

DBGWCR<n>\_EL1 is a 32-bit register.

## Field descriptions

The DBGWCR<n>\_EL1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															

When the E field is zero, all the other fields in the register are ignored.

### Bits [31:29]

Reserved, RES0.

### MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00001	Reserved.
0b00010	Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn\_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## Bits [23:21]

Reserved, RES0.

## WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>\\_EL1](#) is being watched.

BAS	Description
xxxxxxx1	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1</a>
xxxxxx1x	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1</a> + 1
xxxxx1xx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1</a> + 2
xxxx1xxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1</a> + 3

In cases where [DBGWVR<n>\\_EL1](#) addresses a double-word:

BAS	Description, if <a href="#">DBGWVR&lt;n&gt;_EL1[2] == 0</a>
xxx1xxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1</a> + 4
xx1xxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1</a> + 5
x1xxxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1</a> + 6
1xxxxxxx	Match byte at <a href="#">DBGWVR&lt;n&gt;_EL1</a> + 7

If [DBGWVR<n>\\_EL1\[2\] == 1](#), only BAS[3:0] is used. Arm deprecates setting [DBGWVR<n>\\_EL1\[2\] == 1](#).

The valid values for BAS are non-zero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>.BAS values'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**E, bit [0]**

Enable watchpoint n. Possible values are:

E	Meaning
0b0	Watchpoint disabled.
0b1	Watchpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## Accessing the DBGWCR<n>\_EL1

### Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**DBGWCR<n>\_EL1 can be accessed through the external debug interface:**

Component	Offset	Instance
Debug	0x808 + (16 * n)	DBGWCR<n>_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# DBGWVR<n>\_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>\_EL1 characteristics are:

## Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>\\_EL1](#).

## Configuration

External register DBGWVR<n>\_EL1 bits [63:0] are architecturally mapped to AArch64 System register [DBGWVR<n>\\_EL1\[63:0\]](#).

External register DBGWVR<n>\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWVR<n>\[31:0\]](#).

DBGWVR<n>\_EL1 is in the Core power domain.

If watchpoint n is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

## Attributes

DBGWVR<n>\_EL1 is a 64-bit register.

## Field descriptions

The DBGWVR<n>\_EL1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RESS[14:4]											Bits[52:49]				VA[48:2]																
																		VA[48:2]												RES0	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### RESS[14:4], bits [63:53]

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

### VA[52:49], bits [52:49]

When FEAT\_LVA is implemented:

Extension to VA[48:2]. See VA[48:2] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

# EDDFR, External Debug Feature Register

The EDDFR characteristics are:

## Purpose

Provides top level information about the debug system.

### Note

Debuggers must use [EDDEVARCH](#) to determine the Debug architecture version.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

It is IMPLEMENTATION DEFINED whether EDDFR is implemented in the Core power domain or in the Debug power domain.

## Attributes

EDDFR is a 64-bit register.

## Field descriptions

The EDDFR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TraceFilt				UNKNOWN											
CTX_CMPs				RES0				WRPs				RES0				BRPs				PMUVer				TraceVer				UNKNOWN			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:44]

Reserved, RES0.

### TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension is not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension is implemented.

All other values are reserved.

FEAT\_TRF implements the functionality added by 0b0001.

From Armv8.4, the permitted values are 0b0000 and 0b0001.

### Bits [39:32]

Reserved, UNKNOWN.

**CTX\_CMPs, bits [31:28]**

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64DFR0\\_EL1.CTX\\_CMPs](#).

**Bits [27:24]**

Reserved, RES0.

**WRPs, bits [23:20]**

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64DFR0\\_EL1.WRPs](#).

**Bits [19:16]**

Reserved, RES0.

**BRPs, bits [15:12]**

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64DFR0\\_EL1.BRPs](#).

**PMUVer, bits [11:8]**

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and also includes support for: <ul style="list-style-type: none"> <li>Extended 16-bit <a href="#">PMEVTYPER&lt;n&gt;_EL0</a>.evtCount field.</li> <li>If EL2 is implemented, the <a href="#">MDCR_EL2</a>.HPMD control bit.</li> </ul>
0b0101	PMUv3 for Armv8.4. As 0b0100, and also includes support for the <a href="#">PMMIR_EL1</a> register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and also includes support for: <ul style="list-style-type: none"> <li>64-bit event counters.</li> <li>If EL2 is implemented, the <a href="#">MDCR_EL2</a>.HCCD control bit.</li> <li>If EL3 is implemented, the <a href="#">MDCR_EL3</a>.SCCD control bit.</li> </ul>
0b0111	PMUv3 for Armv8.7. As 0b0110, and also includes support for: <ul style="list-style-type: none"> <li>The <a href="#">PMCR_EL0</a>.FZO and, if EL2 is implemented, <a href="#">MDCR_EL2</a>.HPMFZO control bits.</li> <li>If EL3 is implemented, the <a href="#">MDCR_EL3</a>.{MPMX,MCCD} control bits.</li> </ul>
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT\_PMUv3 implements the functionality identified by the value 0b0001.

FEAT\_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT\_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT\_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT\_PMUv3p7 implements the functionality identified by the value 0b0111.

From Armv8.1, if FEAT\_PMUv3 is implemented, the value 0b0001 is not permitted.

From Armv8.4, if FEAT\_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT\_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT\_PMUv3 is implemented, the value 0b0110 is not permitted.

## TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

TraceVer	Meaning
0b0000	PE trace unit System registers not implemented.
0b0001	PE trace unit System registers implemented.

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64DFR0\\_EL1](#).TraceVer.

## Bits [3:0]

Reserved, UNKNOWN.

# Accessing the EDDFR

EDDFR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD28	EDDFR	31:0

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

Component	Offset	Instance	Range
Debug	0xD2C	EDDFR	63:32

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bcd2a

# EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

## Purpose

Controls Exception Catch debug events.

## Configuration

External register EDECCR bits [31:0] are architecturally mapped to AArch64 System register [OSECCR\\_EL1\[31:0\]](#).

External register EDECCR bits [31:0] are architecturally mapped to AArch32 System register [DBGOSECCRI31:0\]](#).

EDECCR is in the Core power domain.

## Attributes

EDECCR is a 32-bit register.

## Field descriptions

The EDECCR bit assignments are:

### When FEAT\_Debugv8p2 is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																NSR3	NSR2	NSR1	NSR0	SR3	SR2	SR1	SR0	NSE3	NSE2	NSE1	NSE0	SE3	SE2	SE1	SE0

### Bits [31:16]

Reserved, RES0.

### NSR<n>, bit [n+12], for n = 30 to 03

Controls Non-secure exception catch on exception return to EL<n> in conjunction with NSE<n>. For information, see 'Summary of Exception Catch debug event control'.

NSR<n>	Meaning
0b0	If the corresponding NSE<n> bit is 0, then Exception Catch debug events are disabled for Non-secure Exception level <n>.
0b1	If the corresponding NSE<n> bit is 1, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Non-secure Exception level <n>.
	If the corresponding NSE<n> bit is 0, then Exception Catch debug events are enabled for exception returns to Non-secure Exception level <n>.
	If the corresponding NSE<n> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure Exception level <n>.

If EL3 is not implemented and the PE behaves as if [SCR\\_EL3.NS](#) is set to 0, this field is reserved, RES0.

**Note**

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level is permitted to generate an Exception Catch debug event.

A value of the NSR field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSR field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSR by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**SR<n>, bit [n+8], for n = 0 to 3**

**SR<n>, bit [n+8], for n = 3 to 0**

Controls Secure exception catch on exception return to EL<n> in conjunction with SE<n>. For information, see 'Summary of Exception Catch debug event control'.

SR<n>	Meaning
0b0	If the corresponding SE<n> bit is 0, then Exception Catch debug events are disabled for Secure Exception level <n>. If the corresponding SE<n> bit is 1, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Secure Exception level <n>.
0b1	If the corresponding SE<n> bit is 0, then Exception Catch debug events are enabled for exception returns to Secure Exception level <n>. If the corresponding SE<n> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure Exception level <n>.

If EL3 is not implemented and the PE behaves as if [SCR\\_EL3.NS](#) is set to 1, this field is reserved, RES0.

**Note**

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level is permitted to generate an Exception Catch debug event.

A value of the SR field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SR field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SR by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**NSE<n>, bit [n+4], for n = 0 to 3**

**NSE<n>, bit [n+4], for n = 3 to 0**

Coarse-grained Non-secure exception catch for EL<n>. This controls whether Exception Catch debug events are enabled for Non-secure EL<n>. This also controls:

- The behavior of exception catch on exception entry to EL<n>.
- The behavior of exception catch on exception return to EL<n> in conjunction with NSR<n>.

NSE<n>	Meaning
0b0	If the corresponding NSR<n> bit is 0, then Exception Catch debug events are disabled for Non-secure Exception level <n>. If the corresponding NSR<n> bit is 1, then Exception Catch debug events are enabled for exception returns to Non-secure Exception level <n>.
0b1	If the corresponding NSR<n> bit is 0, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Non-secure Exception level <n>. If the corresponding NSR<n> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure Exception level <n>.

If EL3 is not implemented and the PE behaves as if [SCR\\_EL3.NS](#) is set to 0, this field is reserved, RES0.

A value of the NSE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSE by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

#### SE<n>, bit [n], for n = 0 to 3

#### SE<n>, bit [n], for n = 3 to 0

Coarse-grained Secure exception catch for EL<n>. This field controls whether Exception Catch debug events are enabled for Secure EL<n>.

- The behavior of exception catch on exception entry to EL<n>.
- The behavior of exception catch on exception return to EL<n> in conjunction with SR<n>.

SE<n>	Meaning
0b0	If the corresponding SR<n> bit is 0, then Exception Catch debug events are disabled for Secure Exception level <n>. If the corresponding SR<n> bit is 1, then Exception Catch debug events are enabled for exception returns to Secure Exception level <n>.
0b1	If the corresponding SR<n> bit is 0, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Secure Exception level <n>. If the corresponding SR<n> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure Exception level <n>.

If EL3 is not implemented and the PE behaves as if [SCR\\_EL3.NS](#) is set to 1, this field is reserved, RES0.

A value of the SE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SE by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

#### Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												NSE3		NSE2		NSE1		NSE0		SE3		SE2		SE1		SE0					

**Bits [31:8]**

Reserved, RES0.

**NSE<n>, bit [n+4], for n = 30 to 03**

Coarse-grained Non-secure exception catch. If EL3 and EL2 are not implemented and the PE behaves as if [SCR\\_EL3.NS](#) is set to 0, this field is reserved, RES0. Otherwise, possible values for this field are:

NSE<n>	Meaning
0b0	Exception Catch debug events are disabled for Non-secure Exception level <n>.
0b1	Exception Catch debug events are enabled for Non-secure Exception level <n>.

A value of the NSE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSE by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

**SE<n>, bit [n], for n = 0 to 3****SE<n>, bit [n], for n = 3 to 0**

Coarse-grained Secure exception catch.

SE<n>	Meaning
0b0	Exception Catch debug events are disabled for Secure Exception level <n>.
0b1	Exception Catch debug events are enabled for Secure Exception level <n>.

If EL3 is not implemented and the PE behaves as if [SCR\\_EL3.NS](#) is set to 1, this field is reserved, RES0.

A value of the SE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SE by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

## Accessing the EDECCR

EDECCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x098	EDECCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489ec15ad1565345720bed2a

# EDECR, External Debug Execution Control Register

The EDECR characteristics are:

## Purpose

Controls Halting debug events.

## Configuration

If FEAT\_DoPD is implemented, this register is in the Core power domain.

If FEAT\_DoPD is not implemented, this register is in the Debug power domain.

## Attributes

EDECR is a 32-bit register.

## Field descriptions

The EDECR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																SS			RCE	OS		SU		CE							

### Bits [31:3]

Reserved, RES0.

### SS, bit [2]

Halting step enable. Possible values of this field are:

SS	Meaning
0b0	Halting step debug event disabled.
0b1	Halting step debug event enabled.

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is CONSTRAINED UNPREDICTABLE as described in 'Changing the value of EDECR.SS when not in Debug state'.

On a Cold reset, when FEAT\_DoPD is implemented, this field resets to 0.

On a Cold reset, when FEAT\_DoPD is not implemented, the value of this field is unchanged.

On an External debug reset, when FEAT\_DoPD is implemented, the value of this field is unchanged.

On an External debug reset, when FEAT\_DoPD is not implemented, this field resets to 0.

On a Warm reset, the value of this field is unchanged.

**RCE, bit [1]****When FEAT\_DoPD is not implemented:****RCE, bit [1]****When FEAT\_DoPD is not implemented:**

Reset Catch Enable.

RCE	Meaning
0b0	Reset Catch debug event disabled.
0b1	Reset Catch debug event enabled.

On a Cold reset, when FEAT\_DoPD is not implemented, the value of this field is unchanged.

On an External debug reset, when FEAT\_DoPD is implemented, the value of this field is unchanged.

On an External debug reset, when FEAT\_DoPD is not implemented, this field resets to 0.

On a Warm reset, the value of this field is unchanged.

On an External Cold debug reset, when FEAT\_DoPD is implemented, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**OSUCE, bit [0]****When FEAT\_DoPD is not implemented:**

OS Unlock Catch Enable.

OSUCE	Meaning
0b0	OS Unlock Catch debug event disabled.
0b1	OS Unlock Catch debug event enabled.

On a Cold reset, when FEAT\_DoPD is not implemented, the value of this field is unchanged.

On an External debug reset, when FEAT\_DoPD is implemented, the value of this field is unchanged.

On an External debug reset, when FEAT\_DoPD is not implemented, this field resets to 0.

On a Warm reset, the value of this field is unchanged.

On an External Cold debug reset, when FEAT\_DoPD is implemented, this field resets to 0.

**Otherwise:**

Reserved, RES0.

## Accessing the EDECR

**EDECR can be accessed through the external debug interface:**

Component	Offset	Instance
Debug	0x024	EDECR

This interface is accessible as follows:

- When (FEAT\_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are **RO**.

- When (FEAT\_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489ec15ad1565345720bed2a

# EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

## Purpose

Indicates the current status of the software lock for external debug registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

## Configuration

If FEAT\_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT\_DoPD is not implemented, this register is in the Debug power domain.

Software uses [EDLAR](#) to set or clear the lock, and EDLSR to check the current status of the lock.

## Attributes

EDLSR is a 32-bit register.

## Field descriptions

The EDLSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																nTT			SLK	SLI											

### Bits [31:3]

Reserved, RES0.

### nTT, bit [2]

Not thirty-two bit access required. RAZ.

### SLK, bit [1]

#### When Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

On a Cold reset, when FEAT\_DoPD is implemented, this field resets to 1.

On a Cold reset, when FEAT\_DoPD is not implemented, the value of this field is unchanged.

On an External debug reset, when FEAT DoPD is implemented, the value of this field is unchanged.

On an External debug reset, when FEAT DoPD is not implemented, this field resets to 1.

~~On a Warm reset, the value of this field is unchanged.~~

**Otherwise:**

Reserved, RAZ.

### SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

## Accessing the EDLSR

**EDLSR can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
Debug	0xFB4	EDLSR

This interface is accessible as follows:

- When FEAT\_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bcd2a

# EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

## Purpose

Holds a sampled instruction address value.

## Configuration

EDPCSR is in the Core power domain.

This register is present only when FEAT\_PCSRv8 is implemented and FEAT\_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDPCSR are RES0.

EDPCSR is a pair of 32-bit registers.

If FEAT\_VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Note

FEAT\_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

## Attributes

If FEAT\_VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.

EDPCSR is a 64-bit pair register of 32-bit registers.

## Field descriptions

The EDPCSR bit assignments are:

### When FEAT\_VHE is not implemented or EDSCR.SC2 == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
PC Sample high word, EDPCSRhi																															
PC Sample low word																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

PC Sample high word, EDPCSRhi. If EDVIDSR.HV == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, [EDCIDS](#)R, and [EDVIDS](#)R to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, [EDCIDS](#)R, and [EDVIDS](#)R. The translation regime that EDPCSR samples can be determined from [EDVIDS](#)R.{NS,E2,E3}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, [EDCIDS](#)R, and [EDVIDS](#)R are unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## When FEAT\_VHE is implemented and EDSCR.SC2 == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
NS		EL		RES0				PC Sample high word, EDPCSRhi																								
PC Sample low word																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

## NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**EL, bits [62:61]**

Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

EL	Meaning
0b00	Sample is from EL0.
0b01	Sample is from EL1.
0b10	Sample is from EL2.
0b11	Sample is from EL3.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

**Bits [60:56]**

Reserved, RES0.

**Bits [55:32]**

PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

**Bits [31:0]**

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#) to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#). The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#) are unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

## Accessing the EDPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'

**EDPCSR can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance	Range
Debug	0x0A0	EDPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
Debug	0x0AC	EDPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

## Purpose

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

## Configuration

It is IMPLEMENTATION DEFINED whether EDPFR is implemented in the Core power domain or in the Debug power domain.

## Attributes

EDPFR is a 64-bit register.

## Field descriptions

The EDPFR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN				UNKNOWN				RES0				UNKNOWN				AMU				UNKNOWN				SEL2				SVE			
UNKNOWN				GIC				AdvSIMD				FP				EL3				EL2				EL1				EL0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:60]

From Armv8.5:

Bits [63:60]

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

Bits [59:56]

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

**Bits [55:52]**

Reserved, RES0.

**Bits [51:48]****From Armv8.4:**

Reserved, UNKNOWN.

**Otherwise:**

Reserved, RES0.

**AMU, bits [47:44]**

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT\_AMUv1 implements the functionality identified by the value 0b0001.

FEAT\_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

**Bits [43:40]****From Armv8.2:**

Reserved, UNKNOWN.

**Otherwise:**

Reserved, RES0.

**SEL2, bits [39:36]**

Secure EL2. Defined values are:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

All other values are reserved.

**SVE, bits [35:32]**

Scalable Vector Extension. Defined values are:

SVE	Meaning
0b0000	SVE is not implemented.
0b0001	SVE is implemented.

All other values are reserved.

### Bits [31:28]

#### From Armv8.2:

Reserved, UNKNOWN.

#### Otherwise:

Reserved, RES0.

### GIC, bits [27:24]

System register GIC interface support. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64PFR0\\_EL1](#).GIC.

### AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following Sisd and SIMD operations: <ul style="list-style-type: none"> <li>Integer byte, halfword, word and doubleword element operations.</li> <li>Single-precision and double-precision floating-point arithmetic.</li> <li>Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.</li> </ul>
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support, that does not include the FEAT\_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support, that includes the FEAT\_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64PFR0\\_EL1](#).AdvSIMD.

**FP, bits [19:16]**

Floating-point. Defined values are:

FP	Meaning
0b0000	Floating-point is implemented, and includes support for: <ul style="list-style-type: none"> <li>Single-precision and double-precision floating-point types.</li> <li>Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.</li> </ul>
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support, that does not include the FEAT\_FP16 extension.
- 0b0001 in an implementation with floating-point support, that includes the FEAT\_FP16 extension.
- 0b1111 in an implementation without floating-point support.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64PFR0\\_EL1](#).FP.

**EL3, bits [15:12]**

AArch64 EL3 Exception level handling. Defined values are:

EL3	Meaning
0b0000	EL3 is not implemented or cannot be executed in AArch64 state.
0b0001	EL3 can be executed in AArch64 state only.
0b0010	EL3 can be executed in both Execution states.

When the value of [EDAA32PFR](#).EL3 is non-zero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64PFR0\\_EL1](#).EL3.

**EL2, bits [11:8]**

AArch64 EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented or cannot be executed in AArch64 state.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in both Execution states.

When the value of [EDAA32PFR](#).EL2 is non-zero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64PFR0\\_EL1](#).EL2.

**EL1, bits [7:4]**

AArch64 EL1 Exception level handling. Defined values are:

EL1	Meaning
0b0000	EL1 cannot be executed in AArch64 state. EL1 can be executed in AArch32 state only.
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64PFR0\\_EL1](#).EL1.

### EL0, bits [3:0]

AArch64 EL0 Exception level handling. Defined values are:

EL0	Meaning
0b0000	EL0 cannot be executed in AArch64 state. EL0 can be executed in AArch32 state only.
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID\\_AA64PFR0\\_EL1](#).EL0.

## Accessing the EDPFR

EDPFR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD20	EDPFR	31:0

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

Component	Offset	Instance	Range
Debug	0xD24	EDPFR	63:32

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

3001/0907/2020 15:0757; ccead0cb9f089f9cceec50268e82aec9e7104721180324f0b9997b0de489ec15ad1565345720bed2a

(old)

htmldiff from-

(new)

- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When OSLockStatus() or SoftwareLockStatus(), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **WO/RAZ**.

## CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the [DBGPRCR.CORENPDRQ](#) and [DBGPRCR\\_EL1.CORENPDRQ](#) fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see 'Core power domain power states'.

### Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

**On a Warm reset, the value of this field is unchanged.**

Accessing this field has the following behavior:

- When OSLockStatus(), access to this field is **UNKNOWN/WI**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

## Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																COREPUR0		RES0	CWRR	CORENPDR0											

## Bits [31:4]

Reserved, RES0.

**COREPURQ, bit [3]**

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain, and that the power controller emulates powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

COREPURQ	Meaning
0b0	Do not request power up of the Core power domain.
0b1	Request power up of the Core power domain, and emulation of powerdown.

In an implementation that includes the recommended external debug interface, this bit drives the DBGPWRUPREQ signal.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off.

**Note**

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On an External debug reset, this field resets to 0.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

**Bit [2]**

Reserved, RES0.

**CWRR, bit [1]**

Warm reset request. ~~Write-only bit that reads as zero.~~

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

CWRR	Meaning
0b0	No action.
0b1	Request Warm reset.

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or SoftwareLockStatus(), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **WO/RAZ**.

## CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the [DBGPRCR.CORENPDRQ](#) and [DBGPRCR\\_EL1.CORENPDRQ](#) fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR.COREPURQ](#) on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see 'Core power domain power states'.

### Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, this field resets to the value in [EDPRCR.COREPURQ](#).

**On a Warm reset, the value of this field is unchanged.**

Accessing this field has the following behavior:

- When !IsCorePowered(), or DoubleLockStatus() or OSLockStatus(), access to this field is **UNKNOWN/WI**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

## Accessing the EDPRCR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

### EDPRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x310	EDPRCR

This interface is accessible as follows:

- When (FEAT\_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are **RO**.
- When (FEAT\_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489ec15ad1565345720bed2a

# EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

## Purpose

Holds information about the reset and powerdown state of the PE.

## Configuration

EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT\_DoPD is implemented then all fields in this register are in the Core power domain.

## Attributes

EDPRSR is a 32-bit register.

## Field descriptions

The EDPRSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
RES0											SDR	SP	MA	DE	PM	AD	SD	AD	ED	AD	DL	K	OS	LK	HAL	T	E	D	SR	R	SP	D	P	U

### Bits [31:12]

Reserved, RES0.

### SDR, bit [11]

Sticky Debug Restart. Set to 1 when the PE exits Debug state.

Permitted values are:

SDR	Meaning
0b0	The PE has not restarted since EDPRSR was last read.
0b1	The PE has restarted since EDPRSR was last read.

### Note

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is UNKNOWN on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If The Core power domain is powered up, then following a read of EDPRSR:

- If FEAT\_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT\_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain and the Warm reset domain.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When (FEAT\_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

**SPMAD, bit [10]**

**When FEAT\_Debugv8p4 is implemented:**

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because AllowExternalPMUAccess() == FALSE.

Permitted values are:

SPMAD	Meaning
0b0	No Non-secure external debug interface accesses to the external Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read.
0b1	At least one Non-secure external debug interface access to the external Performance Monitors register has failed and returned an error because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT\_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT\_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When (FEAT\_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

**Otherwise:**

Sticky EPMAD error.

SPMAD	Meaning
0b0	No external debug interface accesses to the Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.
0b1	At least one external debug interface access to the Performance Monitors registers has failed and returned an error because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT\_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT\_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When (FEAT\_DoPD is not implemented and !IsCorePowered()), or OSLockStatus(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

**EPMAD, bit [9]**

When FEAT\_Debugv8p4 is implemented:

External Performance Monitors Access Disable status.

EPMAD	Meaning
0b0	External Non-secure Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE for a Non-secure access.
0b1	External Non-secure Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT\_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

Otherwise:

External Performance Monitors access disable status.

EPMAD	Meaning
0b0	External Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE.
0b1	External Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT\_DoPD is not implemented and !IsCorePowered()), or OSLockStatus(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

**SDAD, bit [8]**

When FEAT\_Debugv8p4 is implemented:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

SDAD	Meaning
0b0	No Non-secure external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.
0b1	At least one Non-secure external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT\_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT\_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When (FEAT\_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

#### Otherwise:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

SDAD	Meaning
0b0	No external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.
0b1	At least one external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT\_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT\_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This bit is UNKNOWN on reads if OSLockStatus() == TRUE and external debug writes to [OSLAR\\_EL1](#) do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When (FEAT\_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

#### EDAD, bit [7]

##### When FEAT\_Debugv8p4 is implemented:

External Debug Access Disable status.

EDAD	Meaning
0b0	External Non-secure access to breakpoint registers, watchpoint registers, and <a href="#">OSLAR_EL1</a> enabled. AllowExternalDebugAccess() == TRUE for a Non-secure access.
0b1	External Non-secure access to breakpoint registers, watchpoint registers, and <a href="#">OSLAR_EL1</a> disabled. AllowExternalDebugAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT\_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

**When FEAT\_Debugv8p2 is implemented:**

External Debug Access Disable status.

EDAD	Meaning
0b0	External access to breakpoint registers, watchpoint registers, and <a href="#">OSLAR_EL1</a> enabled. AllowExternalDebugAccess() == TRUE.
0b1	External access to breakpoint registers, watchpoint registers, and <a href="#">OSLAR_EL1</a> disabled. AllowExternalDebugAccess() == FALSE.

This bit is not valid and reads UNKNOWN if OSLockStatus() == TRUE and external debug writes to [OSLAR\\_EL1](#) do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT\_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

**Otherwise:**

External Debug Access Disable status.

EDAD	Meaning
0b0	External access to breakpoint registers, watchpoint registers, and <a href="#">OSLAR_EL1</a> enabled. AllowExternalDebugAccess() == TRUE.
0b1	External access to breakpoint registers, watchpoint registers disabled. It is IMPLEMENTATION DEFINED whether accesses to <a href="#">OSLAR_EL1</a> are enabled or disabled. AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT\_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

**DLK, bit [6]****When FEAT\_Debugv8p4 is implemented:**

This field is RES0.

**When FEAT\_Debugv8p2 is implemented and FEAT\_DoubleLock is implemented:**

Double Lock.

From Armv8.2, this field is deprecated.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When IsCorePowered() and !DoubleLockStatus(), access to this field is **RAZ/WI**.
- Otherwise, access to this field is **UNKNOWN/WI**.

**When FEAT\_DoubleLock is implemented:**

Double Lock.

This field returns the result of the pseudocode function DoubleLockStatus().

If the Core power domain is powered up and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether:

- EDPRSR.PU reads as 1, EDPRSR.DLK reads as 1, and EDPRSR.SPD is UNKNOWN.
- EDPRSR.PU reads as 0, EDPRSR.DLK is UNKNOWN, and EDPRSR.SPD reads as 0.

This field is in the Core power domain.

DLK	Meaning
0b0	DoubleLockStatus() returns FALSE.
0b1	DoubleLockStatus() returns TRUE and the Core power domain is powered up.

Accessing this field has the following behavior:

- When FEAT\_DoPD is not implemented and !IsCorePowered(), access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

**OSLK, bit [5]**

OS Lock status bit.

A read of this bit returns the value of [OSLSR\\_EL1](#).OSLK.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT\_DoPD is not implemented and !IsCorePowered()), DoubleLockStatus() and EDPRSR.R == 1, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

**HALTED, bit [4]**

Halted status bit.

HALTED	Meaning
0b0	PE is in Non-debug state.
0b1	PE is in Debug state.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When FEAT\_DoPD is not implemented and !IsCorePowered(), access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

**SR, bit [3]**

Sticky core Reset status bit.

Permitted values are:

SR	Meaning
0b0	The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read.
0b1	The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read.

If EDPRSR.PU reads as 1 and EDPRSR.R reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of EDPRSR:

- If FEAT\_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT\_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power ~~domain and the Warm reset~~ domain.

On a Warm reset, this ~~This~~ field resets to 1.

Accessing this field has the following behavior:

- When (FEAT\_DoPD is not implemented and !IsCorePowered()) or DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

## R, bit [2]

PE Reset status bit.

Permitted values are:

R	Meaning
0b0	The non-debug logic of the PE is not in reset state.
0b1	The non-debug logic of the PE is in reset state.

If FEAT\_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT\_DoPD is not implemented and !IsCorePowered()) or DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

## SPD, bit [1]

Sticky core Powerdown status bit.

If FEAT\_DoubleLock is implemented and DoubleLockStatus() == TRUE, then:

- If FEAT\_Debugv8p2 is implemented, this bit reads as 0.
- If FEAT\_Debugv8p2 is not implemented, this bit might read as 0 or 1.

For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

SPD	Meaning
0b0	If EDPRSR.PU is 0, it is not known whether the state of the debug registers in the Core power domain is lost. If EDPRSR.PU is 1, the state of the debug registers in the Core power domain has not been lost.
0b1	The state of the debug registers in the Core power domain has been lost.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT\_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT\_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

When FEAT\_DoPD is not implemented and the Core power domain is in either retention or powerdown state, the value of EDPRSR.SPD is IMPLEMENTATION DEFINED. For more information, see 'EDPRSR.SPD when the Core domain is in either retention or powerdown state'.

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

This field is in the Core power ~~domain and the Cold reset~~ domain.

On a Cold reset, this field resets to 1.

Accessing this field has the following behavior:

- When FEAT\_DoPD is not implemented and !IsCorePowered(), access to this field is **RAZ/WI**.
- When IsCorePowered() and DoubleLockStatus(), access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

## PU, bit [0]

### When FEAT\_DoPD is implemented:

Core powerup status bit.

Access to this field is **RAO/WI**.

### When FEAT\_Debugv8p2 is implemented:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

PU	Meaning
0b0	Either the Core power domain is in a low-power or powerdown state, or FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, meaning the debug registers in the Core power domain cannot be accessed.
0b1	The Core power domain is in a powerup state, and either FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, meaning the debug registers in the Core power domain can be accessed.

If FEAT\_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'.

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

Access to this field is **RO**.

### Otherwise:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

When the Core power domain is powered-up and DoubleLockStatus() == TRUE, then the value of EDPRSR.PU is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.

Otherwise, permitted values are:

PU	Meaning
0b0	Core power domain is in a low-power or powerdown state where the debug registers in the Core power domain cannot be accessed.
0b1	Core power domain is in a powerup state where the debug registers in the Core power domain can be accessed.

If FEAT\_DoubleLock is implemented, the Core power domain is powered up, and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

If FEAT\_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

Access to this field is **RO**.

## Accessing the EDPRSR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If FEAT\_DoubleLock is not implemented or DoubleLockStatus() == FALSE, then:
  - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
  - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).
- Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If FEAT\_DoPD is not implemented and the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

### EDPRSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x314	EDPRSR

This interface is accessible as follows:

- When FEAT\_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bbede489ec15ad1565345720bed2a

# EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

## Purpose

Main control register for the debug implementation.

## Configuration

External register EDSCR bits [30:29] are architecturally mapped to AArch64 System register [MDCCSR\\_EL0\[30:29\]](#).

EDSCR is in the Core power domain.

## Attributes

EDSCR is a 32-bit register.

## Field descriptions

The EDSCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TFO	RXfull	TXfull	TO	RXO	TXU	PipeAdv	ITE	INTdis	TDAMA	SC2	NSRES0	SDDRES0	HDE	RW	ELA	ERR	STATUS														

### TFO, bit [31]

When FEAT\_TRF is implemented:

### TFO, bit [31]

When FEAT\_TRF is implemented:

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

TFO	Meaning
0b0	Trace Filter controls are not affected.
0b1	Trace Filter controls in <a href="#">TRFCR_EL1</a> , <a href="#">TRFCR_EL2</a> are ignored. Trace Filter controls <a href="#">TRFCR</a> and <a href="#">HTRFCR</a> are ignored.

When [OSLSR\\_EL1](#).OSLK == 1, this bit can be indirectly read and written through the [MDSCR\\_EL1](#) and [DBGDSCRext](#) System registers.

This bit is ignored by the PE when ExternalSecureNoninvasiveDebugEnabled() == FALSE and the Effective value of [MDCR\\_EL3](#).STE == 1.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

### Otherwise:

Reserved, RES0.

**RXfull, bit [30]**

DTRRX full.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Access to this field is **RO**.

**TXfull, bit [29]**

DTRTX full.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Access to this field is **RO**.

**ITO, bit [28]**

ITR overrun.

If the PE is in Non-debug state, this bit is UNKNOWN. ITO is set to 0 on entry to Debug state.

Access to this field is **RO**.

**RXO, bit [27]**

DTRRX overrun.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Access to this field is **RO**.

**TXU, bit [26]**

DTRTX underrun.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Access to this field is **RO**.

**PipeAdv, bit [25]**

Pipeline advance. Set to 1 every time the PE pipeline retires one or more instructions. Cleared to 0 by a write to [EDRCR](#).CSPA.

The architecture does not define precisely when this bit is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing.

Access to this field is **RO**.

**ITE, bit [24]**

ITR empty.

If the PE is in Non-debug state, this bit is UNKNOWN. It is always valid in Debug state.

Access to this field is **RO**.

**INTdis, bits [23:22]**

**When FEAT\_Debugv8p4 is implemented:**

Interrupt disable. Disables taking interrupts in Non-Debug state.

INTdis	Meaning
0b000b0	Masking of interrupts is controlled by PSTATE and interrupt routing controls.
0b010b1	If ExternalSecureDebugEnabled() == TRUE, then all interrupts, including virtual and SError interrupts, are masked. If ExternalSecureDebugEnabled() == FALSE, then all interrupts targetting Non-secure state are masked.

When [OSLSR\\_EL1.OSLK](#) == 1, this field can be indirectly read and written through the [MDSCR\\_EL1](#) and [DBGDSCRext](#) System registers.

This field is ignored by the PE and treated as zero when ExternalDebugEnabled() == FALSE.

When FEAT\_Debugv8p4 is implemented, bit[23] of the register is RES0.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**Otherwise:**

Interrupt disable.

When [OSLSR\\_EL1.OSLK](#) == 1, this field can be indirectly read and written through the [MDSCR\\_EL1](#) and [DBGDSCRext](#) System registers.

INTdis	Meaning
0b00	Do not disable interrupts.
0b01	Disable interrupts taken to Non-secure EL1.
0b10	Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If ExternalSecureInvasiveDebugEnabled() == TRUE, also disable interrupts taken to Secure EL1.
0b11	Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If ExternalSecureInvasiveDebugEnabled() == TRUE, also disable all other interrupts.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**TDA, bit [21]**

Traps accesses to the following debug System registers:

- AArch64: [DBGBCR<n>\\_EL1](#), [DBGBVR<n>\\_EL1](#), [DBGWCR<n>\\_EL1](#), [DBGWVR<n>\\_EL1](#).
- AArch32: [DBGBCR<n>](#), [DBGBVR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#).

The possible values of this field are:

TDA	Meaning
0b0	Accesses to debug System registers do not generate a Software Access Debug event.
0b1	Accesses to debug System registers generate a Software Access Debug event, if <a href="#">OSLSR_EL1</a> .OSLK is 0 and if halting is allowed.

On a Cold reset, this field resets to 0.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

### MA, bit [20]

Memory access mode. Controls the use of memory-access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

MA	Meaning
0b0	Normal access mode.
0b1	Memory access mode.

On a Cold reset, this field resets to 0.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

### SC2, bit [19]

~~When FEAT\_PCSRv8 is implemented, (FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented) and FEAT\_PCSRv8p2 is not implemented:~~

### SC2, bit [19]

**When FEAT\_PCSRv8 is implemented, (FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented) and FEAT\_PCSRv8p2 is not implemented:**

Sample [CONTEXTIDR\\_EL2](#). Controls whether the PC Sample-based Profiling Extension samples [CONTEXTIDR\\_EL2](#) or [VTTBR\\_EL2](#).VMID.

SC2	Meaning
0b0	Sample <a href="#">VTTBR_EL2</a> .VMID.
0b1	Sample <a href="#">CONTEXTIDR_EL2</a> .

On a Cold reset, this field resets to 0.

~~On an External debug reset, the value of this field is unchanged.~~

~~On a Warm reset, the value of this field is unchanged.~~

### Otherwise:

Reserved, RES0.

### NS, bit [18]

Non-secure status. When in Debug state, gives the current Security state:

NS	Meaning
0b0	Secure state, IsSecure() == TRUE.
0b1	Non-secure state, IsSecure() == FALSE.

In Non-debug state, this bit is UNKNOWN.

Access to this field is **RO**.

### Bit [17]

Reserved, RES0.

### SDD, bit [16]

Secure debug disabled.

On entry to Debug state:

- If entering in Secure state, SDD is set to 0.
- If entering in Non-secure state, SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled().

In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

In Non-debug state:

- SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a context synchronization event is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

Access to this field is **RO**.

### Bit [15]

Reserved, RES0.

### HDE, bit [14]

Halting debug enable. The possible values of this field are:

HDE	Meaning
0b0	Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.
0b1	Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

### RW, bits [13:10]

Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level.

RW	Meaning	Applies when
0b1111	All Exception levels are using AArch64 or the PE is in Non-debug state.	
0b1110	The PE is in Debug state. EL0 is using AArch32. All other Exception levels are using AArch64. Only permitted if the PE is executing at EL0.	When AArch32 is supported at any Exception level
0b110x	The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 and EL3 are using AArch64. Only permitted if EL2 is implemented and enabled in the current Security state.	When AArch32 is supported at any Exception level
0b10xx	The PE is in Debug state. EL0, EL1, and, if implemented in the current Security state, EL2 are using AArch32. EL3 is using AArch64.	When AArch32 is supported at any Exception level, EL3 is implemented, EL3 is using AArch64 and EL2 is implemented
0b0xxx	The PE is in Debug state. All Exception levels are using AArch32.	When AArch32 is supported at any Exception level

In Non-debug state, this field is RAO.

Access to this field is **RO**.

#### EL, bits [9:8]

Exception level. In Debug state, this gives the current Exception level of the PE.

In Non-debug state, this field is RAZ.

Access to this field is **RO**.

#### A, bit [7]

SError interrupt pending. In Debug state, indicates whether an SError interrupt is pending:

- If [HCR\\_EL2](#).{AMO, TGE} = {1, 0}, EL2 is enabled in the current Security state, and the PE is executing at EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

A	Meaning
0b0	No SError interrupt pending.
0b1	SError interrupt pending.

A debugger can read EDSCR to check whether an SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

UNKNOWN in Non-debug state.

Access to this field is **RO**.

#### ERR, bit [6]

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

On a Cold reset, this field resets to 0.

**On an External debug reset, the value of this field is unchanged.**

**On a Warm reset, the value of this field is unchanged.**

Access to this field is **RO**.

**STATUS, bits [5:0]**

Debug status flags.

<b>STATUS</b>	<b>Meaning</b>
0b000001	PE is restarting, exiting Debug state.
0b000010	PE is in Non-debug state.
0b000111	Breakpoint.
0b010011	External debug request.
0b011011	Halting step, normal.
0b011111	Halting step, exclusive.
0b100011	OS Unlock Catch.
0b100111	Reset Catch.
0b101011	Watchpoint.
0b101111	HLT instruction.
0b110011	Software access to debug register.
0b110111	Exception Catch.
0b111011	Halting step, no syndrome.

All other values of STATUS are reserved.

Access to this field is **RO**.

## Accessing the EDSCR

**EDSCR can be accessed through the external debug interface:**

<b>Component</b>	<b>Offset</b>	<b>Instance</b>
Debug	0x088	EDSCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

## Purpose

Contains sampled values captured on reading [EDPCSR](#)[31:0].

## Configuration

EDVIDSR is in the Core power domain.

This register is present only when FEAT\_PCSRv8 is implemented and FEAT\_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDVIDSR are RES0.

If FEAT\_VHE is implemented, the format of this register differs depending on the value of [EDSCR.SC2](#).

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

When the PC Sample-based Profiling Extension is implemented in the external debug registers space, if EL2 is not implemented and EL3 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

### Note

FEAT\_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

## Attributes

EDVIDSR is a 32-bit register.

If FEAT\_VHE is implemented, the format of this register differs depending on the value of [EDSCR.SC2](#).

## Field descriptions

The EDVIDSR bit assignments are:

### When FEAT\_VHE is not implemented or EDSCR.SC2 == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NS	E2	E3	HV	RES0												VMID[15:8]								VMID							

This format applies in all Armv8.0 implementations.

### NS, bit [31]

Non-secure state sample. Indicates the Security state associated with the most recent [EDPCSR](#) sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## E2, bit [30]

When EL2 is implemented:

## E2, bit [30]

When EL2 is implemented:

Exception level 2 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL2.

E2	Meaning
0b0	Sample is not from EL2.
0b1	Sample is from EL2.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.

## E3, bit [29]

When EL3 is implemented and the highest implemented Exception level is using AArch64 state:

Exception level 3 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL3 using AArch64.

E3	Meaning
0b0	Sample is not from EL3 using AArch64.
0b1	Sample is from EL3 using AArch64.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.

## HV, bit [28]

EDPCSRhi ([EDPCSR](#)[63:32]) valid. Indicates whether bits [63:32] of the most recent [EDPCSR](#) sample might be nonzero:

HV	Meaning
0b0	Bits[63:32] of the most recent EDPCSR sample are zero.
0b1	Bits[63:32] of the most recent EDPCSR sample might be nonzero.

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi ([EDPCSR](#)[63:32]) does not need to be read.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## Bits [27:16]

Reserved, RES0.

## VMID[15:8], bits [15:8]

When FEAT\_VMID16 is implemented and EL2 is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.

## VMID, bits [7:0]

When EL2 is implemented:

VMID sample. The VMID associated with the most recent EDPCSRlo ([EDPCSR](#)[31:0]) sample. When the most recent [EDPCSR](#) sample was generated:

- This field is RES0 if any of the following apply:
  - The PE is executing in Secure state.
  - The PE is executing at EL2.
- Otherwise:
  - If EL2 is using AArch64 and either FEAT\_VMID16 is not implemented or [VTCR\\_EL2](#).VS is 1, this field is set to [VTTBR\\_EL2](#).VMID.
  - If EL2 is using AArch64, FEAT\_VMID16 is implemented, and [VTCR\\_EL2](#).VS is 0, PMVIDSR.VMID[7:0] is set to [VTTBR\\_EL2](#).VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
  - If EL2 is using AArch32, this field is set to [VTTBR](#).VMID.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.

## When (FEAT\_VHE is implemented or FEAT\_Debugv8p2 is implemented) and EDSCR.SC2 == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">CONTEXTIDR_EL2</a>																															

## CONTEXTIDR\_EL2, bits [31:0]

Context ID. The value of [CONTEXTIDR\\_EL2](#) that is associated with the most recent [EDPCSR](#) sample. When the most recent [EDPCSR](#) sample was generated:

- If EL2 was using AArch64 and the PE was executing in Non-secure state, then this field is set to the Context ID sampled from [CONTEXTIDR\\_EL2](#).
- If EL2 was using AArch32 or the PE was executing in Secure state, then this field is set to an UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## Accessing the EDVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

**EDVIDSR can be accessed through the external debug interface:**

Component	Offset	Instance
Debug	0x0A8	EDVIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# ERRCRICR0, Critical Error Interrupt Configuration Register 0

The ERRCRICR0 characteristics are:

## Purpose

Critical Error Interrupt configuration register.

## Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR0 are RES0.

ERRCRICR0 is implemented only as part of a memory-mapped group of error records.

## Attributes

ERRCRICR0 is a 64-bit register.

## Field descriptions

The ERRCRICR0 bit assignments are:

**When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0								ADDR																								
ADDR																																RES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### Bits [63:56]

Reserved, RES0.

### ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRCRICR0.ADDR << 2) is the address that the component writes to when signaling the Critical Error Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

### Bits [1:0]

Reserved, RES0.

# ERRCRICR1, Critical Error Interrupt Configuration Register 1

The ERRCRICR1 characteristics are:

## Purpose

Critical Error Interrupt configuration register.

## Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR1 are RES0.

ERRCRICR1 is implemented only as part of a memory-mapped group of error records.

## Attributes

ERRCRICR1 is a 32-bit register.

## Field descriptions

The ERRCRICR1 bit assignments are:

**When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

# ERRCRICR2, Critical Error Interrupt Configuration Register 2

The ERRCRICR2 characteristics are:

## Purpose

Critical Error Interrupt control and configuration register.

## Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR2 are RES0.

ERRCRICR2 is implemented only as part of a memory-mapped group of error records.

## Attributes

ERRCRICR2 is a 32-bit register.

## Field descriptions

The ERRCRICR2 bit assignments are:

**When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8		7		6		5	4	3	2	1	0																					
RES0																								IRQENRES0		NSMSIRES0		SHRES0		MemAttrRES0																									

### Bits [31:8]

Reserved, RES0.

### IRQEN, bitBit [7]

When the component ~~supports~~~~does not support~~ disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

On an Error recovery reset, this field resets to 0.

### Otherwise:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

**Otherwise:****NSMSI, bit [6]**

**When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRCRICR2:**

Security Message attribute signaled Defines interrupt the enable. physical Enables address generation space for of message signaled interrupts.

NSMSI	Meaning
0b0	Secure.Disabled.
0b1	Non-secure.Enabled.

On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED 0 value.:

On a Cold reset, this field resets to 0.

**Bit [6]**

**When the component allows Non-secure writes to ERRCRICR2:**

**When the component allows Non-secure writes to ERRCRICR2:**

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

**Otherwise**When the component does not support configuring the Security attribute for message signaled interrupts:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

Security attribute. Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Secure.
0b1	Non-secure.

On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

**Bits [5:4]**

**When the component does not support configuring the Shareability domain:**

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

**Otherwise:**

**Otherwise:**

**SH, bits [5:4]**

**When the component supports configuring the Shareability domain:**

Shareability. Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Not shared.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when ERRCRICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

**Bits [3:0]**

**When the component does not support configuring the memory type:**

~~Reserved, RES0.~~

~~Memory type.~~

~~The component does not support configuring the memory type, meaning the memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.~~

**Otherwise:**

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

**MemAttr, bits [3:0]**

**When the component supports configuring the memory type for message signaled interrupts:**

Memory type. Defines the memory type and attributes for message signaled interrupts.

MemAttr	Meaning
0b0000	Device-nGnRnE memory.
0b0001	Device-nGnRE memory.
0b0010	Device-nGRE memory.
0b0011	Device-GRE memory.
0b0101	Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111	Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001	Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010	Normal memory, Inner Write-Through, Outer Write-Through.
0b1011	Normal memory, Inner Write-Back, Outer Write-Through.
0b1101	Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110	Normal memory, Inner Write-Through, Outer Write-Back.
0b1111	Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

#### Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

### When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

# ERRERICR2, Error Recovery Interrupt Configuration Register 2

The ERRERICR2 characteristics are:

## Purpose

Error Recovery Interrupt control and configuration register.

## Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR2 are RES0.

ERRERICR2 is implemented only as part of a memory-mapped group of error records.

## Attributes

ERRERICR2 is a 32-bit register.

## Field descriptions

The ERRERICR2 bit assignments are:

**When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:**

### Bits [31:8]

Reserved, RES0.

### IRQEN, bitBit [7]

When the component ~~supports~~~~does not support~~ disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

On an Error recovery reset, this field resets to 0.

### Otherwise:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

Otherwise:  
NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRERICR2:

Security Message attribute signaled Defines interrupt the enable. physical Enables address generation space for of message signaled interrupts.

NSMSI	Meaning
0b0	Secure.Disabled.
0b1	Non-secure.Enabled.

On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED 0 value.:

On a Cold reset, this field resets to 0.

Bit [6]

When the component allows Non-secure writes to ERRERICR2:

When the component allows Non-secure writes to ERRERICR2:

Reserved, RES0.  
Security attribute. Defines the physical address space for message signaled interrupts.  
The Security attribute used for message signaled interrupts is Non-secure.

OtherwiseWhen the component does not support configuring the Security attribute for message signaled interrupts:

Reserved, RES0.  
Security attribute. Defines the physical address space for message signaled interrupts.  
The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

Security attribute. Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Secure.
0b1	Non-secure.

On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [5:4]

When the component does not support configuring the Shareability domain:

Reserved, RES0.  
Shareability.  
The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

Otherwise:

Otherwise:  
SH, bits [5:4]

When the component supports configuring the Shareability domain:

Shareability. Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Not shared.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when ERRERICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [3:0]

When the component does not support configuring the memory type:

Reserved, RES0.

Memory type.

The component does not support configuring the memory type, meaning the memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

<b>MemAttr</b>	<b>Meaning</b>
0b0000	Device-nGnRnE memory.
0b0001	Device-nGnRE memory.
0b0010	Device-nGRE memory.
0b0011	Device-GRE memory.
0b0101	Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111	Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001	Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010	Normal memory, Inner Write-Through, Outer Write-Through.
0b1011	Normal memory, Inner Write-Back, Outer Write-Through.
0b1101	Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110	Normal memory, Inner Write-Through, Outer Write-Back.
0b1111	Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

### Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The ERRGSR characteristics are:

## Purpose

Shows the status for the records in the group.

## Configuration

ERRGSR is implemented only as part of a memory-mapped group of error records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

## Attributes

ERRGSR is a 64-bit register.

## Field descriptions

The ERRGSR bit assignments are:

**Bits [63:56]**

Reserved, RES0.

**S<m>, bit [m], for m = 550 to 055**

**When error record <m> is implemented and error record <m> supports this type of reporting:**

The status for error record <m>. A read-only copy of [ERR<m>STATUS.V](#).

<b>S&lt;m&gt;</b>	<b>Meaning</b>
0b0	No error.
0b1	One or more errors.

If the Common Fault Injection Model is implemented, up-to 24 records can be implemented meaning bits [55:24] are RES0.

**Otherwise:**

Reserved, RES0.

## Accessing the ERRGSR

**ERRGSR can be accessed through the memory-mapped interfaces:**

Component	Offset
RAS	0xE00

Accesses on this interface are **RO**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489ce15ad1565345720bed2a

# ERRIRQSR, Error Interrupt Status Register

The ERRIRQSR characteristics are:

## Purpose

Interrupt status register.

## Configuration

This register is present only when interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQSR are RES0.

ERRIRQSR is implemented only as part of a memory-mapped group of error records.

## Attributes

ERRIRQSR is a 64-bit register.

## Field descriptions

The ERRIRQSR bit assignments are:

When the implementation uses the recommended layout for the ERRIRQCR<n> registers:

### Bits [63:6]

Reserved, RES0.

### CRIERR, bit [5]

When the Critical Error Interrupt is implemented:

Critical Error Interrupt error.

CRIERR	Meaning
0b0	Critical Error Interrupt write has not returned an error since this bit was last cleared to zero.
0b1	Critical Error Interrupt write has returned an error since this bit was last cleared to zero.

This bit is read/write-one-to-clear.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**CRI, bit [4]****When the Critical Error Interrupt is implemented:**

Critical Error Interrupt write in progress.

CRI	Meaning
0b0	Critical Error Interrupt write not in progress.
0b1	Critical Error Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

**Note**

This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual [ERR<n>STATUS](#) registers.

Access to this field is **RO**.

**Otherwise:**

Reserved, RES0.

**ERIERR, bit [3]****When the Error Recovery Interrupt is implemented:**

Error Recovery Interrupt error.

ERIERR	Meaning
0b0	Error Recovery Interrupt write has not returned an error since this bit was last cleared to zero.
0b1	Error Recovery Interrupt write has returned an error since this bit was last cleared to zero.

This bit is read/write-one-to-clear.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

**On a Cold reset, this field resets to an architecturally UNKNOWN value.**

**Otherwise:**

Reserved, RES0.

**ERI, bit [2]****When the Error Recovery Interrupt is implemented:**

Error Recovery Interrupt write in progress.

ERI	Meaning
0b0	Error Recovery Interrupt write not in progress.
0b1	Error Recovery Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

---

#### Note

This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual [ERR<n>STATUS](#) registers.

---

Access to this field is **RO**.

#### Otherwise:

Reserved, RES0.

#### FHIERR, bit [1]

##### When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt error.

FHIERR	Meaning
0b0	Fault Handling Interrupt write has not returned an error since this bit was last cleared to zero.
0b1	Fault Handling Interrupt write has returned an error since this bit was last cleared to zero.

This bit is read/write-one-to-clear.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

~~On a Cold reset, this field resets to an architecturally UNKNOWN value.~~

#### Otherwise:

Reserved, RES0.

#### FHI, bit [0]

##### When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt write in progress.

FHI	Meaning
0b0	Fault Handling Interrupt write not in progress.
0b1	Fault Handling Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

---

#### Note

This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual [ERR<n>STATUS](#) registers.

---

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing the ERRIRQSR

ERRIRQSR can be accessed through the memory-mapped interfaces:

Component	Offset
RAS	0xEF8

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

(old)htmldiff from-(new)

# ERR<n>ADDR, Error Record Address Register, n = 0 - 65534

The ERR<n>ADDR characteristics are:

## Purpose

If an address is associated with a detected error, then it is written to ERR<n>ADDR when the error is recorded. It is IMPLEMENTATION DEFINED how the recorded address maps to the software-visible physical address. Software might have to reconstruct the actual physical addresses using the identity of the node and knowledge of the system.

## Configuration

This register is present only when error record <n> is implemented and error record <n> includes an address associated with an error. Otherwise, direct accesses to ERR<n>ADDR are RES0.

[ERR<q>ER](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

## Attributes

ERR<n>ADDR is a 64-bit register.

## Field descriptions

The ERR<n>ADDR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
NS	SI	AI	VA	RES0				PADDR																								
PADDR																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### NS, bit [63]

Non-secure attribute.

NS	Meaning
0b0	ERR<n>ADDR.PADDRThe address is a Secure address.Secure.
0b1	ERR<n>ADDR.PADDRThe address is a Non-secure address.Non-secure.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### SI, bit [62]

Secure Incorrect. Indicates whether ERR<n>ADDR.NSthe NS bit is valid.

SI	Meaning
0b0	ERR<n>ADDR.NSThe NS bit is correct. That is, it matches the programmers' view of the Non-secure attribute for this recorded location.
0b1	ERR<n>ADDR.NSThe NS bit might not be correct, and might not match the programmers' view of the Non-secure attribute for the recorded location.

It is IMPLEMENTATION DEFINED whether this bit is read-only or read/write.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### AI, bit [61]

Address Incorrect. Indicates whether ERR<n>ADDR.PADDR the PADDR field is a valid physical address that is known to match the programmers' view of the physical address for the recorded location.

AI	Meaning
0b0	ERR<n>ADDR.PADDR The PADDR field is a valid physical address. That is, it matches the programmers' view of the physical address for the recorded location.
0b1	ERR<n>ADDR.PADDR The PADDR field might not be a valid physical address, and might not match the programmers' view of the physical address for the recorded location.

It is IMPLEMENTATION DEFINED whether this bit is read-only or read/write.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### VA, bit [60]

Virtual Address. Indicates whether ERR<n>ADDR.PADDR the PADDR field is a virtual address.

VA	Meaning
0b0	ERR<n>ADDR.PADDR The PADDR field is not a virtual address.
0b1	ERR<n>ADDR.PADDR The PADDR field is a virtual address.

No context information is provided for the virtual address. When ERR<n>ADDR.VA == 0b1, ERR<n>ADDR.{NS,SI,AI} read as {0,1,1}.

Support for this bit is optional. If this bit is not implemented and ERR<n>ADDR.PADDR field is a virtual address, then ERR<n>ADDR.{NS,SI,AI} read as {0,1,1}.

It is IMPLEMENTATION DEFINED whether this bit is read-only or read/write.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### Bits [59:56]

Reserved, RES0.

### PADDR, bits [55:0]

Physical Address. Address of the recorded location. If the physical address size implemented by this component is smaller than the size of this field, then high-order bits are unimplemented and either RES0 or have a fixed read-only IMPLEMENTATION DEFINED value. Low-order address bits might also be unimplemented and RES0, for example, if the physical address is always aligned to the size of a protection granule.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ERR<n>ADDR

ERR<n>ADDR ignores writes if all of the following are true:

- Any of the following are true:

ERR<n>ADDR, Error Record Address Register, n = 0 - 65534

- The RAS Common Fault Injection Model Extension is implemented by the node that owns this error record and `ERR<q>PFGF.AV == 0b0`.
- The RAS Common Fault Injection Model Extension is not implemented by the node that owns this error record.
- `ERR<n>STATUS.AV == 0b1`.

**ERR<n>ADDR can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
RAS	0x018 + (64 * n)	ERR<n>ADDR

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# ERR<n>CTLR, Error Record Control Register, n = 0 - 65534

The ERR<n>CTLR characteristics are:

## Purpose

The error control register contains enable bits for the node that writes to this record:

- Enabling error detection and correction.
- Enabling the critical error, error recovery, and fault handling interrupts.
- Enabling in-band error response for Uncorrected errors.

For each bit, if the selected node does not support the feature, then the bit is RES0. The definition of each record is IMPLEMENTATION DEFINED.

## Configuration

This register is present only when error record <n> is implemented and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>CTLR are RES0.

ERR<n>FR describes the features implemented by the node.

## Attributes

ERR<n>CTLR is a 64-bit register.

## Field descriptions

The ERR<n>CTLR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34					
IMPLEMENTATION DEFINED																																		
RES0																CI	RES0	WDUI	Bit[10]	DUI	WC	FI	Bit[8]	CFI	WUE	WFI	WUI	Bit[4]	UE	Bit[3]	F	Bit[2]	UI	IM
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2					

### IMPLEMENTATION DEFINED, bits [63:32]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

### Bits [31:14]

Reserved, RES0.

### CI, bit [13]

When ERR<n>FR.CI == 0b10:

Critical error interrupt enable. When enabled, the critical error interrupt is generated for a critical error condition.

CI	Meaning
0b0	Critical error interrupt not generated for critical errors. Critical errors are treated as Uncontained errors.
0b1	Critical error interrupt generated for critical errors.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**Bit [12]**

Reserved, RES0.

**WDUI, bit [11]**

**When ERR<n>FR.DUI == 0b11:**

Error recovery interrupt for deferred errors on writes enable.

When enabled, the error recovery interrupt is generated for detected Deferred errors on writes.

WDUI	Meaning
0b0	Error recovery interrupt not generated for deferred errors on writes.
0b1	Error recovery interrupt generated for deferred errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**DUI, bit [10]**

**When ERR<n>FR.DUI == 0b10:**

Error recovery interrupt for deferred errors enable.

When [ERR<n>FR.DUI == 0b10](#), this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all detected Deferred errors.

DUI	Meaning
0b0	Error recovery interrupt not generated for deferred errors.
0b1	Error recovery interrupt generated for deferred errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**When ERR<n>FR.DUI == 0b11:**

Error recovery interrupt for deferred errors on reads enable.

When [ERR<n>FR.DUI == 0b11](#), this bit is named RDUI.

When enabled, the error recovery interrupt is generated for detected Deferred errors on reads.

<b>RDUI</b>	<b>Meaning</b>
0b0	Error recovery interrupt not generated for deferred errors on reads.
0b1	Error recovery interrupt generated for deferred errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

**On an Error recovery reset, the value of this field is unchanged.**

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### WCFI, bit [9]

**When ERR<n>FR.CFI == 0b11:**

Fault handling interrupt for Corrected errors on writes enable.

When enabled:

- If the node implements Corrected error counters for writes, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 0b1. For more information, see [ERR<n>MISC0](#).
- Otherwise, the fault handling interrupt is also generated for detected Corrected errors onwrites.

<b>WCFI</b>	<b>Meaning</b>
0b0	Fault handling interrupt not generated for Corrected errors on writes.
0b1	Fault handling interrupt generated for Corrected errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

**On an Error recovery reset, the value of this field is unchanged.**

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### CFI, bit [8]

**When ERR<n>FR.CFI == 0b10:**

Fault handling interrupt for Corrected errors enable.

When [ERR<n>FR.CFI](#) == 0b10, this control applies to errors arising from both reads and writes.

When enabled:

- If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 0b1. For more information, see [ERR<n>MISC0](#).
- Otherwise, the fault handling interrupt is also generated for all detected Corrected errors.

<b>CFI</b>	<b>Meaning</b>
0b0	Fault handling interrupt not generated for Corrected errors.
0b1	Fault handling interrupt generated for Corrected errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### When ERR<n>FR.CFI == 0b11:

Fault handling interrupt for Corrected errors on reads enable.

When ERR<n>FR.CFI == 0b11, this bit is named RCFI.

When enabled:

- If the node implements Corrected error counters for reads, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 0b1. For more information, see ERR<n>MISC0.
- Otherwise, the fault handling interrupt is also generated for detected Corrected errors on reads.

RCFI	Meaning
0b0	Fault handling interrupt not generated for Corrected errors on reads.
0b1	Fault handling interrupt generated for Corrected errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### WUE, bit [7]

##### When ERR<n>FR.UE == 0b11:

In-band Uncorrected error reporting on writes enable.

When enabled, responses to writes that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External Abort).

WUE	Meaning
0b0	External Abort response for Uncorrected errors on writes disabled.
0b1	External Abort response for Uncorrected errors on writes enabled.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### WFI, bit [6]

##### When ERR<n>FR.FI == 0b11:

Fault handling interrupt on writes enable.

When enabled:

- The fault handling interrupt is generated for detected Deferred errors and Uncorrected errors.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters for writes, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 0b1.
  - Otherwise, the fault handling interrupt is also generated for detected Corrected errors on writes.

WFI	Meaning
0b0	Fault handling interrupt on writes disabled.
0b1	Fault handling interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### WUI, bit [5]

When **ERR<n>FR.UI == 0b11**:

Uncorrected error recovery interrupt on writes enable.

When enabled, the error recovery interrupt is generated for detected Uncorrected errors on writes that are not deferred.

WUI	Meaning
0b0	Error recovery interrupt on writes disabled.
0b1	Error recovery interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

### UE, bit [4]

When **ERR<n>FR.UE == 0b10**:

In-band Uncorrected error reporting enable.

When **ERR<n>FR.UE == 0b10**, this control applies to errors arising from both reads and writes.

When enabled, responses to transactions that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External Abort).

UE	Meaning
0b0	External Abort response for Uncorrected errors disabled.
0b1	External Abort response for Uncorrected errors enabled.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**When ERR<n>FR.UE == 0b11:**

In-band Uncorrected error reporting on reads enable.

When [ERR<n>FR.UE](#) == 0b11, this bit is named RUE.

When enabled, responses to reads that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External Abort).

RUE	Meaning
0b0	External Abort response for Uncorrected errors on reads disabled.
0b1	External Abort response for Uncorrected errors on reads enabled.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**FI, bit [3]****When ERR<n>FR.FI == 0b10:**

Fault handling interrupt enable.

When [ERR<n>FR.FI](#) == 0b10, this control applies to errors arising from both reads and writes.

When enabled:

- The fault handling interrupt is generated for all detected Deferred errors and Uncorrected errors.
- If the fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 0b1.
  - Otherwise, the fault handling interrupt is also generated for all detected Corrected errors.

FI	Meaning
0b0	Fault handling interrupt disabled.
0b1	Fault handling interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**When ERR<n>FR.FI == 0b11:**

Fault handling interrupt on reads enable.

When [ERR<n>FR.FI](#) == 0b11, this bit is named RFI.

When enabled:

- The fault handling interrupt is generated for detected Deferred errors and Uncorrected errors.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters for reads, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 0b1.
  - Otherwise, the fault handling interrupt is also generated for detected Corrected errors on reads.

RFI	Meaning
0b0	Fault handling interrupt on reads disabled.
0b1	Fault handling interrupt on reads enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### UI, bit [2]

##### When ERR<n>FR.UI == 0b10:

Uncorrected error recovery interrupt enable.

When ERR<n>FR.UI == 0b10, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all detected Uncorrected errors that are not deferred.

UI	Meaning
0b0	Error recovery interrupt disabled.
0b1	Error recovery interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

##### When ERR<n>FR.UI == 0b11:

Uncorrected error recovery interrupt on reads enable.

When ERR<n>FR.UI == 0b11, this bit is named RUI.

When enabled, the error recovery interrupt is generated for detected Uncorrected errors on reads that are not deferred.

RUI	Meaning
0b0	Error recovery interrupt on reads disabled.
0b1	Error recovery interrupt on reads enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### IMPLEMENTATION DEFINED, bit [1]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

# ERR<n>FR, Error Record Feature Register, n = 0 - 65534

The ERR<n>FR characteristics are:

## Purpose

Defines whether <n> is the first record owned by a node:

- If <n> is the first error record owned by a node, then ERR<n>FR.ED != 0b00.
- If <n> is not the first error record owned by a node, then ERR<n>FR.ED == 0b00.

If <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

## Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.

## Attributes

ERR<n>FR is a 64-bit register.

## Field descriptions

The ERR<n>FR bit assignments are:

### When ERR<n>FR.ED != 0b00:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

### IMPLEMENTATION DEFINED, bits [63:55]

When ERR<n>FR.FR\_X != 1:

### IMPLEMENTATION DEFINED, bits [63:55]

When ERR<n>FR.FR\_X != 1:

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

**CE, bits [54:53]****When ERR<n>FR.FRX == 1:**

Corrected Error recording. Describes the types of Corrected Error the node can record.

CE	Meaning
0b00	The node does not record any type of Corrected Error.
0b01	The node can record transient or persistent Corrected Errors (Corrected Errors that are recorded as <a href="#">ERR&lt;n&gt;STATUS.CE == 0b01</a> and <a href="#">0b11</a> ).
0b10	The node can record of a non-specific Corrected Error (a Corrected Error that is recorded as <a href="#">ERR&lt;n&gt;STATUS.CE == 0b10</a> ).
0b11	The node can record any type of Corrected Error.

**Otherwise:**

Reserved for identifying IMPLEMENTATION DEFINED controls.

**DE, bit [52]****When ERR<n>FR.FRX == 1:**

Deferred Error recording. Describes whether the node can record this type of error.

DE	Meaning
0b0	The node does not record this type of error.
0b1	The node can record this type of error.

**Otherwise:**

Reserved for identifying IMPLEMENTATION DEFINED controls.

**UEO, bit [51]****When ERR<n>FR.FRX == 1:**

Latent or Restartable Error recording. Describes whether the node can record this type of error.

UEO	Meaning
0b0	The node does not record this type of error.
0b1	The node can record this type of error.

**Otherwise:**

Reserved for identifying IMPLEMENTATION DEFINED controls.

**UER, bit [50]****When ERR<n>FR.FRX == 1:**

Signaled or Recoverable Error recording. Describes whether the node can record this type of error.

UER	Meaning
0b0	The node does not record this type of error.
0b1	The node can record this type of error.

**Otherwise:**

Reserved for identifying IMPLEMENTATION DEFINED controls.

**UEU, bit [49]****When ERR<n>FR.FRX == 1:**

Unrecoverable Error recording. Describes whether the node can record this type of error.

UEU	Meaning
0b0	The node does not record this type of error.
0b1	The node can record this type of error.

**Otherwise:**

Reserved for identifying IMPLEMENTATION DEFINED controls.

**UC, bit [48]****When ERR<n>FR.FRX == 1:**

Uncontainable Error recording. Describes whether the node can record this type of error.

UC	Meaning
0b0	The node does not record this type of error.
0b1	The node can record this type of error.

**Otherwise:**

Reserved for identifying IMPLEMENTATION DEFINED controls.

**IMPLEMENTATION DEFINED, bits [47:32]**

Reserved for identifying IMPLEMENTATION DEFINED controls.

**FRX, bit [31]****When RAS System Architecture v1.1 is implemented:**

Feature Register extension. Defines whether ERR&lt;n&gt;FR[63:48] are architecturally defined.

FRX	Meaning
0b0	ERR<n>FR[63:48] are IMPLEMENTATION DEFINED.
0b1	ERR<n>FR[63:48] are defined by the architecture.

**Otherwise:**

Reserved, RES0.

**Bits [30:26]**

Reserved, RES0.

**TS, bits [25:24]**Timestamp Extension. Indicates whether, for each error record <m> owned by this node, [ERR<m>MISC3](#) is used as the timestamp register, and, if it is, the timebase used by the timestamp.

TS	Meaning
0b00	The node does not support a timestamp register.
0b01	The node implements a timestamp register. The timestamp uses the same timebase as the system Generic Timer.
<b>Note</b> For an error record which has an affinity to a PE, this is the same timer that is visible through <a href="#">CNTPCT_ELO</a> at the highest Exception level on that PE.	
0b10	The node implements a timestamp register. The timebase for the timestamp is IMPLEMENTATION DEFINED.

All other values are reserved.

#### CI, bits [23:22]

Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented.

CI	Meaning
0b00	Does not support the critical error interrupt. <a href="#">ERR&lt;n&gt;CTLR.CI</a> is RES0.
0b01	Critical error interrupt is supported and always enabled. <a href="#">ERR&lt;n&gt;CTLR.CI</a> is RES0.
0b10	Critical error interrupt is supported and controllable using <a href="#">ERR&lt;n&gt;CTLR.CI</a> .

All other values are reserved.

#### INJ, bits [21:20]

Fault Injection Extension. Indicates whether the RAS Common Fault Injection Model Extension is implemented.

INJ	Meaning
0b00	The node does not support the RAS Common Fault Injection Model Extension.
0b01	The node implements the RAS Common Fault Injection Model Extension. See <a href="#">ERR&lt;n&gt;PFGE</a> for more information.

All other values are reserved.

#### CEO, bits [19:18]

When **ERR<n>FR.CEC != 0b000**:

Corrected Error overwrite. Indicates the behavior when a second Corrected error is detected after a first Corrected error has been recorded by an error record <m> owned by the node.

CEO	Meaning
0b00	Counts Corrected errors if a counter is implemented. Keeps the previous error syndrome. If the counter overflows, or no counter is implemented, then <a href="#">ERR&lt;m&gt;STATUS.OF</a> is set to 0b1.
0b01	Counts Corrected errors. If <a href="#">ERR&lt;m&gt;STATUS.OF</a> == 0b1 before the Corrected error is counted, then keeps the previous syndrome. Otherwise the previous syndrome is overwritten. If the counter overflows, then <a href="#">ERR&lt;m&gt;STATUS.OF</a> is set to 0b1.

All other values are reserved.

Otherwise:

Reserved, RES0.

#### DUI, bits [17:16]

**When ERR<n>FR.UI != 0b00:**

Error recovery interrupt for deferred errors control. Indicates whether the control for enabling error recovery interrupts on deferred errors are implemented.

DUI	Meaning
0b00	Does not support the control for enabling error recovery interrupts on deferred errors. <a href="#">ERR&lt;n&gt;CTLR.DUI</a> is RES0.
0b10	Control for enabling error recovery interrupts on deferred errors is supported and controllable using <a href="#">ERR&lt;n&gt;CTLR.DUI</a> .
0b11	Control for enabling error recovery interrupts on deferred errors is supported and controllable using <a href="#">ERR&lt;n&gt;CTLR.WDUI</a> for writes and <a href="#">ERR&lt;n&gt;CTLR.RDUI</a> for reads.

All other values are reserved.

**Otherwise:**

Reserved, RES0.

**RP, bit [15]****When ERR<n>FR.CEC != 0b000:**

Repeat counter. Indicates whether the node implements the repeat Corrected error counter in [ERR<m>MISC0](#) for each error record <m> owned by the node that implements the standard Corrected error counter.

RP	Meaning
0b0	A single CE counter is implemented.
0b1	A first (repeat) counter and a second (other) counter are implemented. The repeat counter is the same size as the primary error counter.

**Otherwise:**

Reserved, RES0.

**CEC, bits [14:12]**

Corrected Error Counter. Indicates whether the node implements the standard Corrected error counter (CE counter) mechanisms in [ERR<m>MISC0](#) for each error record <m> owned by the node that can record countable errors.

CEC	Meaning
0b000	Does not implement the standard Corrected error counter model.
0b010	Implements an 8-bit Corrected error counter in <a href="#">ERR&lt;m&gt;MISC0[39:32]</a> .
0b100	Implements a 16-bit Corrected error counter in <a href="#">ERR&lt;m&gt;MISC0[47:32]</a> .

All other values are reserved.

**Note**

Implementations might include other error counter models, or might include the standard model and not indicate this in ERR<n>FR.

**CFI, bits [11:10]****When ERR<n>FR.FI != 0b00:**

Fault handling interrupt for corrected errors. Indicates whether the control for enabling fault handling interrupts on corrected errors are implemented.

CFI	Meaning
0b00	Does not support the control for enabling fault handling interrupts on corrected errors. <a href="#">ERR&lt;n&gt;CTLR.CFI</a> is RES0.
0b10	Control for enabling fault handling interrupts on corrected errors is supported and controllable using <a href="#">ERR&lt;n&gt;CTLR.CFI</a> .
0b11	Control for enabling fault handling interrupts on corrected errors is supported and controllable using <a href="#">ERR&lt;n&gt;CTLR.WCFI</a> for writes and <a href="#">ERR&lt;n&gt;CTLR.RCFI</a> for reads.

All other values are reserved.

**Otherwise:**

Reserved, RES0.

**UE, bits [9:8]**

In-band uncorrected error reporting. Indicates whether the in-band uncorrected error reporting (External Aborts) and associated controls are implemented.

UE	Meaning
0b00	Does not support the in-band uncorrected error reporting (External Aborts). <a href="#">ERR&lt;n&gt;CTLR.UE</a> is RES0.
0b01	In-band uncorrected error reporting (External Aborts) is supported and always enabled. <a href="#">ERR&lt;n&gt;CTLR.UE</a> is RES0.
0b10	In-band uncorrected error reporting (External Aborts) is supported and controllable using <a href="#">ERR&lt;n&gt;CTLR.UE</a> .
0b11	In-band uncorrected error reporting (External Aborts) is supported and controllable using <a href="#">ERR&lt;n&gt;CTLR.WUE</a> for writes and <a href="#">ERR&lt;n&gt;CTLR.RUE</a> for reads.

**FI, bits [7:6]**

Fault handling interrupt. Indicates whether the fault handling interrupt and associated controls are implemented.

FI	Meaning
0b00	Does not support the fault handling interrupt. <a href="#">ERR&lt;n&gt;CTLR.FI</a> is RES0.
0b01	Fault handling interrupt is supported and always enabled. <a href="#">ERR&lt;n&gt;CTLR.FI</a> is RES0.
0b10	Fault handling interrupt is supported and controllable using <a href="#">ERR&lt;n&gt;CTLR.FI</a> .
0b11	Fault handling interrupt is supported and controllable using <a href="#">ERR&lt;n&gt;CTLR.WFI</a> for writes and <a href="#">ERR&lt;n&gt;CTLR.RFI</a> for reads.

**UI, bits [5:4]**

Error recovery interrupt for uncorrected errors. Indicates whether the error handling interrupt and associated controls are implemented.

UI	Meaning
0b00	Does not support the error handling interrupt. <a href="#">ERR&lt;n&gt;CTLR.UI</a> is RES0.
0b01	Error handling interrupt is supported and always enabled. <a href="#">ERR&lt;n&gt;CTLR.UI</a> is RES0.
0b10	Error handling interrupt is supported and controllable using <a href="#">ERR&lt;n&gt;CTLR.UI</a> .
0b11	Error handling interrupt is supported and controllable using <a href="#">ERR&lt;n&gt;CTLR.WUI</a> for writes and <a href="#">ERR&lt;n&gt;CTLR.RUI</a> for reads.

**IMPLEMENTATION DEFINED, bits [3:2]**

IMPLEMENTATION DEFINED.

**ED, bits [1:0]**

Error reporting and logging. Indicates whether error record <n> is the first record owned the node, and, if so, whether it implements the controls for enabling and disabling error reporting and logging.

ED	Meaning
0b01	Error reporting and logging always enabled. <a href="#">ERR&lt;n&gt;CTLR.ED</a> is RES0.
0b10	Error reporting and logging is controllable using <a href="#">ERR&lt;n&gt;CTLR.ED</a> .

All other values are reserved.

**When ERR<n>FR.ED == 0b00:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																														ED

# ERR<n>MISC0, Error Record Miscellaneous Register 0, n = 0 - 65534

The ERR<n>MISC0 characteristics are:

## Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to ~~locate~~ identify where the FRU in which the error was detected, detected, and might contain enough information to locate the error within that FRU.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record <n> implements architecturally-defined error counters ([ERR<q>FR.CEC](#) != 0b000), and error record <n> can record countable errors, then ERR<n>MISC0 implements the architecturally-defined error counter or counters.

## Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC0 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC0, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

---

### Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

---

## Attributes

ERR<n>MISC0 is a 64-bit register.

## Field descriptions

The ERR<n>MISC0 bit assignments are:

**When ERR<q>FR.CEC == 0b000:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**OFO, bit [63]**

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

OFO	Meaning
0b0	Other counter has not overflowed.
0b1	Other counter has overflowed.

A direct write that modifies this bit might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this bit to an UNKNOWN value.

**On an Error recovery reset, the value of this field is unchanged.**

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**CECO, bits [62:48]**

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

**On an Error recovery reset, the value of this field is unchanged.**

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**OFR, bit [47]**

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

OFR	Meaning
0b0	Repeat counter has not overflowed.
0b1	Repeat counter has overflowed.

A direct write that modifies this bit might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this bit to an UNKNOWN value.

**On an Error recovery reset, the value of this field is unchanged.**

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## CECR, bits [46:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

### Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

**On an Error recovery reset, the value of this field is unchanged.**

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## IMPLEMENTATION DEFINED, bits [31:0]

## IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

## OFO, bit [47]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

OFO	Meaning
0b0	Other counter has not overflowed.
0b1	Other counter has overflowed.

A direct write that modifies this bit might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this bit to an UNKNOWN value.

**On an Error recovery reset, the value of this field is unchanged.**

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**CECO, bits [46:40]**

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**OFR, bit [39]**

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

OFR	Meaning
0b0	Repeat counter has not overflowed.
0b1	Repeat counter has overflowed.

A direct write that modifies this bit might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this bit to an UNKNOWN value.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**CECR, bits [38:32]**

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

**Note**

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED syndrome.

**Accessing the ERR<n>MISC0**

Reads from ERR<n>MISC0 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<q>PFGF.MV is 0b1, then some parts of this register are read/write when ERR<n>STATUS.MV == 0b1. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV == 0b1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

**Note**

Component	Offset	Instance

# ERR<n>MISC1, Error Record Miscellaneous Register 1, n = 0 - 65534

The ERR<n>MISC1 characteristics are:

## Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to **locate** **identify** **where** **the** **FRU** **in which** **the** **error** **was** **detected**, **detected**, and might contain enough information to locate the error within that FRU.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

## Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC1 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC1, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

### Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

## Attributes

ERR<n>MISC1 is a 64-bit register.

## Field descriptions

The ERR<n>MISC1 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

### IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

(old)

htmldiff from-

(new)

# ERR<n>MISC2, Error Record Miscellaneous Register 2, n = 0 - 65534

The ERR<n>MISC2 characteristics are:

## Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to ~~locate~~ identify where the FRU in which the error was detected, detected, and might contain enough information to locate the error within that FRU.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

## Configuration

This register is present only when (an implementation implements ERR<n>MISC2 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC2 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC2, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<n>MISC2 does not require zeroing to return the record to a quiescent state.

### Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

## Attributes

ERR<n>MISC2 is a 64-bit register.

## Field descriptions

The ERR<n>MISC2 bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																															
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## Accessing the ERR<n>MISC2

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and [ERR<q>PFGF.MV](#) is 0b1, then some parts of this register are read/write when [ERR<n>STATUS.MV](#) == 0b1. See [ERR<n>PFGF.MV](#) for more information.

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When `ERR<n>STATUS.MV == 0b1`, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

Component	Offset	Instance
RAS	0x030 + (64 * n)	ERR<n>MISC2

3001/0907/2020 15:07:57; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bcd2a

# ERR<n>MISC3, Error Record Miscellaneous Register 3, n = 0 - 65534

The ERR<n>MISC3 characteristics are:

## Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to ~~locate~~ identify where the FRU in which the error was detected, detected, and might contain enough information to locate the error within that FRU.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record n supports the RAS Timestamp Extension ([ERR<q>FR.TS](#) != 0b00), then ERR<n>MISC3 contains the timestamp value for error record n when the error was detected. Otherwise the contents of ERR<n>MISC3 are IMPLEMENTATION DEFINED.

## Configuration

This register is present only when (an implementation implements ERR<n>MISC3 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC3 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC3, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<n>MISC3 does not require zeroing to return the record to a quiescent state.

---

### Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

---

## Attributes

ERR<n>MISC3 is a 64-bit register.

## Field descriptions

The ERR<n>MISC3 bit assignments are:

**When ERR<q>FR.TS != 0b00:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																TS															
																TS															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**TS, bits [63:0]**

Timestamp. Timestamp value recorded when the error was detected. Valid only if [ERR<n>STATUS.V](#) == 0b1.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO** or **RW**.

**When ERR<q>FR.TS == 0b00:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																IMPLEMENTATION DEFINED															
																IMPLEMENTATION DEFINED															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**IMPLEMENTATION DEFINED, bits [63:0]**

IMPLEMENTATION DEFINED syndrome.

**Accessing the ERR<n>MISC3**

Reads from ERR<n>MISC3 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and [ERR<q>PFGF.MV](#) is 0b1, then some parts of this register are read/write when [ERR<n>STATUS.MV](#) == 0b1. See [ERR<n>PFGF](#) for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When [ERR<n>STATUS.MV](#) == 0b1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

**Note**

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

**ERR<n>MISC3 can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
RAS	0x038 + (64 * n)	ERR<n>MISC3

Accesses on this interface are **RW**.

(old)

htmldiff from-

(new)

# ERR<n>PFGCDN, Pseudo-fault Generation Countdown Register, n = 0 - 65534

The ERR<n>PFGCDN characteristics are:

## Purpose

Generates one of the errors enabled in the corresponding [ERR<n>PFGCTL](#) register.

## Configuration

This register is present only when error record <n> is implemented, the node implements the RAS Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCDN are RES0.

[ERR<n>FR](#) describes the features implemented by the node.

## Attributes

ERR<n>PFGCDN is a 64-bit register.

## Field descriptions

The ERR<n>PFGCDN bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																CDN															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### CDN, bits [31:0]

Countdown value.

This field is copied to Error Generation Counter when either:

- Software writes [ERR<n>PFGCTL](#).CDNEN with 1.
- The Error Generation Counter decrements to zero and [ERR<n>PFGCTL](#).R == 0b1.

While [ERR<n>PFGCTL](#).CDNEN == 0b1 and the Error Generation Counter is nonzero, the counter decrements by 1 for each cycle at an IMPLEMENTATION DEFINED clock rate. When the counter reaches 0, one of the errors enabled in the [ERR<n>PFGCTL](#) register is generated.

---

### Note

The current Error Generation Counter value is not visible to software.

---

~~On an Error recovery reset, the value of this field is unchanged.~~

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Page 3005

R	Meaning
0b0	On reaching 0, the Error Generation Counter will stop.
0b1	On reaching 0, the Error Generation Counter is set to <a href="#">ERR&lt;n&gt;PFGCDN</a> .CDN.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## Bits [29:13]

Reserved, RES0.

## MV, bit [12]

Miscellaneous syndrome. The value that is written to [ERR<n>STATUS](#).MV when an injected error is recorded.

MV	Meaning
0b0	<a href="#">ERR&lt;n&gt;STATUS</a> .MV is set to 0b0 when an injected error is recorded.
0b1	<a href="#">ERR&lt;n&gt;STATUS</a> .MV is set to 0b1 when an injected error is recorded.

This bit reads-as-one if the node always records some syndrome in ERR<n>MISC<m>, setting [ERR<n>STATUS](#).MV to 1, when an injected error is recorded. This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## AV, bit [11]

Address syndrome. The value that is written to [ERR<n>STATUS](#).AV when an injected error is recorded.

AV	Meaning
0b0	<a href="#">ERR&lt;n&gt;STATUS</a> .AV is set to 0b0 when an injected error is recorded.
0b1	<a href="#">ERR&lt;n&gt;STATUS</a> .AV is set to 0b1 when an injected error is recorded.

This bit reads-as-one if the node always sets [ERR<n>STATUS](#).AV to 0b1 when an injected error is recorded. This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## PN, bit [10]

Poison flag. The value that is written to [ERR<n>STATUS](#).PN when an injected error is recorded.

PN	Meaning
0b0	<a href="#">ERR&lt;n&gt;STATUS</a> .PN is set to 0b0 when an injected error is recorded.
0b1	<a href="#">ERR&lt;n&gt;STATUS</a> .PN is set to 0b1 when an injected error is recorded.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**ER, bit [9]**

Error Reported flag. The value that is written to [ERR<n>STATUS.ER](#) when an injected error is recorded.

ER	Meaning
0b0	<a href="#">ERR&lt;n&gt;STATUS.ER</a> is set to 0b0 when an injected error is recorded.
0b1	<a href="#">ERR&lt;n&gt;STATUS.ER</a> is set to 0b1 when an injected error is recorded.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**CI, bit [8]**

Critical Error flag. The value that is written to [ERR<n>STATUS.CI](#) when an injected error is recorded.

CI	Meaning
0b0	<a href="#">ERR&lt;n&gt;STATUS.CI</a> is set to 0b0 when an injected error is recorded.
0b1	<a href="#">ERR&lt;n&gt;STATUS.CI</a> is set to 0b1 when an injected error is recorded.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**CE, bits [7:6]**

Corrected Error generation enable. Controls the type of Corrected Error condition that might be generated.

CE	Meaning
0b00	No error of this type will be generated.
0b01	A non-specific Corrected Error, that is, a Corrected Error that is recorded as <a href="#">ERR&lt;n&gt;STATUS.CE == 0b10</a> , might be generated when the Error Generation Counter decrements to zero.
0b10	A transient Corrected Error, that is, a Corrected Error that is recorded as <a href="#">ERR&lt;n&gt;STATUS.CE == 0b01</a> , might be generated when the Error Generation Counter decrements to zero.
0b11	A persistent Corrected Error, that is, a Corrected Error that is recorded as <a href="#">ERR&lt;n&gt;STATUS.CE == 0b11</a> , might be generated when the Error Generation Counter decrements to zero.

The set of permitted values for this field is defined by [ERR<n>PFGF.CE](#).

This field is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**DE, bit [5]**

Deferred Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

DE	Meaning
0b0	No error of this type will be generated.
0b1	An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### UEO, bit [4]

Latent or Restartable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

UEO	Meaning
0b0	No error of this type will be generated.
0b1	An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### UER, bit [3]

Signaled or Recoverable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

UER	Meaning
0b0	No error of this type will be generated.
0b1	An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### UEU, bit [2]

Unrecoverable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

UEU	Meaning
0b0	No error of this type will be generated.
0b1	An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### UC, bit [1]

Uncontainable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

UC	Meaning
0b0	No error of this type will be generated.
0b1	An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

Overflow flag. The value that is written to [ERR<n>STATUS.OF](#) when an injected error is recorded.

OF	Meaning
0b0	<a href="#">ERR&lt;n&gt;STATUS</a> .OF is set to 0b0 when an injected error is recorded.
0b1	<a href="#">ERR&lt;n&gt;STATUS</a> .OF is set to 0b1 when an injected error is recorded.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ERR<n>PFGCTL

**ERR<n>PFGCTL can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
RAS	0x808 + (64 * n)	ERR<n>PFGCTL

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bcd2a

## htmldiff from-

**(new)**

**Note**

If ERR<n>PFGF.SYN == 0b1, software can write specific values into the [ERR<n>STATUS](#).{IERR, SERR} fields when setting up a fault injection event. The sets of values that can be written to these fields is IMPLEMENTATION DEFINED.

**Bits [28:13]**

Reserved, RES0.

**MV, bit [12]**

Miscellaneous syndrome.

Additional syndrome injection. Defines whether software can control all or part of the syndrome recorded in the ERR<n>MISC<m> registers when an injected error is recorded.

It is IMPLEMENTATION DEFINED which syndrome fields in ERR<n>MISC<m> this refers to, as some fields might always be recorded by an error. For example, a Corrected Error counter.

MV	Meaning
0b0	When an injected error is recorded, the node might record IMPLEMENTATION DEFINED additional syndrome in ERR<n>MISC<m>. If any syndrome is recorded in ERR<n>MISC<m>, then <a href="#">ERR&lt;n&gt;STATUS</a> .MV is set to 0b1.
0b1	When an injected error is recorded, the node does not update all the syndrome fields in the ERR<n>MISC<m> and does one of: <ul style="list-style-type: none"> <li>The node does not update any fields in ERR&lt;n&gt;MISC&lt;m&gt; and sets <a href="#">ERR&lt;n&gt;STATUS</a>.MV to <a href="#">ERR&lt;n&gt;PFGCTL</a>.MV.</li> <li>The node records some syndrome in ERR&lt;n&gt;MISC&lt;m&gt; and sets <a href="#">ERR&lt;n&gt;STATUS</a>.MV to 0b1. <a href="#">ERR&lt;n&gt;PFGCTL</a>.MV is RAO. <a href="#">ERR&lt;n&gt;PFGCTL</a>.MV is RAO.</li> </ul> <p>The syndrome fields that the node does not update are unchanged and are writable when <a href="#">ERR&lt;n&gt;STATUS</a>.MV == 0b0.</p>

**Note**

If ERR<n>PFGF.MV == 0b1, software can write specific values into the ERR<n>MISC<m> registers when setting up a fault injection event. The values that can be written to these registers are IMPLEMENTATION DEFINED.

**AV, bit [11]**

Address syndrome. Address syndrome injection.

AV	Meaning
0b0	When an injected error is recorded, the node either sets <a href="#">ERR&lt;n&gt;ADDR</a> and <a href="#">ERR&lt;n&gt;STATUS</a> .AV for the access, or leaves these unchanged.
0b1	When an injected error is recorded, the node does not update <a href="#">ERR&lt;n&gt;ADDR</a> and does one of: <ul style="list-style-type: none"> <li>Sets <a href="#">ERR&lt;n&gt;STATUS</a>.AV to <a href="#">ERR&lt;n&gt;PFGCTL</a>.AV.</li> <li>Sets <a href="#">ERR&lt;n&gt;STATUS</a>.AV to 0b1. <a href="#">ERR&lt;n&gt;PFGCTL</a>.AV is RAO. <a href="#">ERR&lt;n&gt;ADDR</a> is writable when <a href="#">ERR&lt;n&gt;STATUS</a>.AV == 0b0.</li> </ul>

**Note**

If ERR<n>PFGF.AV == 0b1, software can write a specific value into [ERR<n>ADDR](#) when setting up a fault injection event.

**PN, bit [10]**

Poison flag. Describes how the fault generation feature of the node sets the [ERR<n>STATUS.PN](#) status flag.

PN	Meaning
0b0	When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets <a href="#">ERR&lt;n&gt;STATUS.PN</a> to 0b1.
0b1	When an injected error is recorded, <a href="#">ERR&lt;n&gt;STATUS.PN</a> is set to <a href="#">ERR&lt;n&gt;PFGCTL.PN</a> .

This behavior replaces the architecture-defined rules for setting the PN bit.

This bit reads-as-zero if the node does not support this flag.

**ER, bit [9]**

Error Reported flag. Describes how the fault generation feature of the node sets the [ERR<n>STATUS.ER](#) status flag.

ER	Meaning
0b0	When an injected error is recorded, the node sets <a href="#">ERR&lt;n&gt;STATUS.ER</a> according to the architecture-defined rules for setting the ER bit.
0b1	When an injected error is recorded, <a href="#">ERR&lt;n&gt;STATUS.ER</a> is set to <a href="#">ERR&lt;n&gt;PFGCTL.ER</a> . This behavior replaces the architecture-defined rules for setting the ER bit.

This bit reads-as-zero if the node does not support this flag.

**CI, bit [8]**

Critical Error flag. Describes how the fault generation feature of the node sets the [ERR<n>STATUS.CI](#) status flag.

CI	Meaning
0b0	When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets <a href="#">ERR&lt;n&gt;STATUS.CI</a> to 0b1.
0b1	When an injected error is recorded, <a href="#">ERR&lt;n&gt;STATUS.CI</a> is set to <a href="#">ERR&lt;n&gt;PFGCTL.CI</a> .

This behavior replaces the architecture-defined rules for setting the CI bit.

This bit reads-as-zero if the node does not support this flag.

**CE, bits [7:6]**

Corrected Error generation. Describes the types of Corrected Error that the fault generation feature of the node can generate.

CE	Meaning
0b00	The fault generation feature of the node cannot generate this type of error.
0b01	The fault generation feature of the node allows generation of a non-specific Corrected Error, that is, a Corrected Error that is recorded as <a href="#">ERR&lt;n&gt;STATUS.CE</a> == 0b10.
0b11	The fault generation feature of the node allows generation of transient or persistent Corrected Errors, that is, Corrected Errors that are recorded as <a href="#">ERR&lt;n&gt;STATUS.CE</a> == 0b01 and 0b11.

All other values are reserved.

If [ERR<n>FR.FRX](#) is 0b1 then [ERR<n>FR.CE](#) indicates whether the node supports this type of error.

This field reads-as-zeros if the node does not support this type of error.

**DE, bit [5]**

Deferred Error generation. Describes whether the fault generation feature of the node can generate this type of error.

DE	Meaning
0b0	The fault generation feature of the node cannot generate this type of error.
0b1	The fault generation feature of the node allows generation of this type of error.

If [ERR<n>FR.FRX](#) is 0b1 then [ERR<n>FR.DE](#) indicates whether the node supports this type of error.

This bit reads-as-zero if the node does not support this type of error.

#### UEO, bit [4]

Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

UEO	Meaning
0b0	The fault generation feature of the node cannot generate this type of error.
0b1	The fault generation feature of the node allows generation of this type of error.

If [ERR<n>FR.FRX](#) is 0b1 then [ERR<n>FR.UEO](#) indicates whether the node supports this type of error.

This bit reads-as-zero if the node does not support this type of error.

#### UER, bit [3]

Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

UER	Meaning
0b0	The fault generation feature of the node cannot generate this type of error.
0b1	The fault generation feature of the node allows generation of this type of error.

If [ERR<n>FR.FRX](#) is 0b1 then [ERR<n>FR.UER](#) indicates whether the node supports this type of error.

This bit reads-as-zero if the node does not support this type of error.

#### UEU, bit [2]

Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

UEU	Meaning
0b0	The fault generation feature of the node cannot generate this type of error.
0b1	The fault generation feature of the node allows generation of this type of error.

If [ERR<n>FR.FRX](#) is 0b1 then [ERR<n>FR.UEU](#) indicates whether the node supports this type of error.

This bit reads-as-zero if the node does not support this type of error.

#### UC, bit [1]

Uncontainable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

UC	Meaning
0b0	The fault generation feature of the node cannot generate this type of error.
0b1	The fault generation feature of the node allows generation of this type of error.

htmldiff from-

(new)

# ERR<n>STATUS, Error Record Primary Status Register, n = 0 - 65534

The ERR<n>STATUS characteristics are:

## Purpose

Contains status information for error record <n>, including:

- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a Requester.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An IMPLEMENTATION DEFINED extended error code.

Within this register:

- The {AV, V, MV} bits are valid bits that define whether error record <n> registers are valid.
- The {UE, OF, CE, DE, UET} bits encode the types of error or errors recorded.
- The {CI, ER, PN, IERR, SERR} fields are syndrome fields.

## Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>STATUS are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>STATUS, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

---

### Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

---

## Attributes

ERR<n>STATUS is a 64-bit register.

## Field descriptions

The ERR<n>STATUS bit assignments are:

### When RAS System Architecture v1.1 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
AV	V	UE	ER	OF	MV	CE	DE	PN	UET	CI	RES0					IERR								SERR							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### Bits [63:32]

Reserved, RES0.

#### AV, bit [31]

When error record <n> includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to 0.

#### Otherwise:

Reserved, RES0.

#### V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to 0.

#### UE, bit [29]

Uncorrected Error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V == 0b0.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## ER, bit [28]

Error Reported.

ER	Meaning
0b0	No in-band error (External Abort) reported.
0b1	An External Abort was signaled by the <b>componentnode</b> to the Requester making the access or other transaction. This can be because any of the following are true: <ul style="list-style-type: none"> <li>The applicable one of the <a href="#">ERR&lt;q&gt;CTLR</a>.{WUE,RUE,UE} bits is implemented and was set to 0b1 when an Uncorrected error was detected.</li> <li>The applicable one of the <a href="#">ERR&lt;q&gt;CTLR</a>.{WUE,RUE,UE} bits is not implemented and the <b>componentnode</b> always reports errors.</li> </ul>

It is IMPLEMENTATION DEFINED whether this bit can be set to 0b1 by a Deferred error.

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V == 0b0.
- ERR<n>STATUS.UE == 0b0 and this bit is never set to 0b1 by a Deferred error.
- ERR<n>STATUS.{UE,DE} == {0,0} and this bit can be set to 0b1 by a Deferred error.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

### Note

An External Abort signaled by the **componentnode** might be masked and not generate any exception.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This bit is set to 0b1 when one of the following occurs:

- A Corrected error counter is implemented, an error is counted, and the counter overflows.
- ERR<n>STATUS.V was previously set to 0b1, a Corrected error counter is not implemented, and a Corrected error is recorded.
- ERR<n>STATUS.V was previously set to 0b1, and a type of error other than a Corrected error is recorded.

Otherwise, this bit is unchanged when an error is recorded.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this bit to an UNKNOWN value.
- A direct write to this bit that clears this bit to zero might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
0b0	Since this bit was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed.
0b1	Since this bit was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V == 0b0.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## MV, bit [26]

When error record <n> includes an additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC<m> not valid.
0b1	The IMPLEMENTATION DEFINED contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record.

This bit is read/write-one-to-clear.

### Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to 0.

## Otherwise:

Reserved, RES0.

## CE, bits [25:24]

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a component or node detects whether a correctable error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when an corrected error is recorded.

When clearing ERR<n>STATUS.V to 0b0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

This field is not valid and reads UNKNOWN if ERR<n>STATUS.V == 0b0.

This field is read/write-ones-to-clear. Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## DE, bit [23]

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V == 0b0.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected.

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V == 0b0.
- ERR<n>STATUS.{DE,UE} == {0,0}.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

When clearing ERR<n>STATUS.V to 0b0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

This field is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V == 0b0.
- ERR<n>STATUS.UE == 0b0.

This field is read/write-ones-to-clear. Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

---

#### Note

Software might use the information in the error record registers to determine what recovery is necessary.

---

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### CI, bit [19]

Critical Error. Indicates whether a critical error condition has been recorded.

CI	Meaning
0b0	No critical error condition.
0b1	Critical error condition.

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V == 0b0.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### Bits [18:16]

Reserved, RES0.

### IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

---

#### Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

---

This field is not valid and reads UNKNOWN if all of the following are true:

- Any of the following are true:
  - The RAS Common Fault Injection Model Extension is implemented by the node that owns this error record and ERR<q>PFGF.SYN == 0b0.
  - The RAS Common Fault Injection Model Extension is not implemented by the node that owns this error record.
- ERR<n>STATUS.V == 0b0.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**SERR, bits [7:0]**

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

<b>SERR</b>	<b>Meaning</b>
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, <b>nSEI</b> pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.
0x11	Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another <b>component.node</b> .
0x14	Internal timeout. For example, timeout on interface within the <b>component.node</b> .
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the <b>component.node</b> has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

**Note**

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

This field is not valid and reads UNKNOWN if all of the following are true:

- Any of the following are true:
  - The RAS Common Fault Injection Model Extension is implemented by the node that owns this error record and [ERR<q>PFGF.SYN](#) == 0b0.
  - The RAS Common Fault Injection Model Extension is not implemented by the node that owns this error record.
- ERR<n>STATUS.V == 0b0.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## When RAS System Architecture v1.0 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
AV	V	UE	ER	OF	MV	CE	DE	PN	UET	RES0						IERR						SERR									
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:32]

Reserved, RES0.

### AV, bit [31]

When error record <n> includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	<a href="#">ERR&lt;n&gt;ADDR</a> not valid.
0b1	<a href="#">ERR&lt;n&gt;ADDR</a> contains an address associated with the highest priority error recorded by this record.

This bit ignores writes if ERR<n>STATUS.{CE,DE,UE} != {0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to 0.

### Otherwise:

Reserved, RES0.

### V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

This bit ignores writes if ERR<n>STATUS.{CE,DE,UE} != {0b00,0,0}, and is not being cleared to 0b0 in the same write.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to 0.

## UE, bit [29]

Uncorrected Error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V == 0b0. This bit ignores writes if ERR<n>STATUS.OF == 0b1 and is not being cleared to 0b0 in the same write.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## ER, bit [28]

Error Reported.

ER	Meaning
0b0	No in-band error (External Abort) reported.
0b1	An External Abort was signaled by the <b>componentnode</b> to the Requester making the access or other transaction. This can be because any of the following are true: <ul style="list-style-type: none"> <li>The applicable one of the <a href="#">ERR&lt;q&gt;CTLR</a>.{WUE,RUE,UE} bits is implemented and was set to 0b1 when an Uncorrected error was detected.</li> <li>The applicable one of the <a href="#">ERR&lt;q&gt;CTLR</a>.{WUE,RUE,UE} bits is not implemented and the <b>componentnode</b> always reports errors.</li> </ul>

It is IMPLEMENTATION DEFINED whether this bit can be set to 0b1 by a Deferred error.

If this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero, when any of:

- Clearing ERR<n>STATUS.V to 0b0.
- Clearing ERR<n>STATUS.UE to 0b0, if this bit is never set to 0b1 by a Deferred error.
- Clearing ERR<n>STATUS.{UE,DE} to {0,0}, if this bit can be set to 0b1 by a Deferred error.

This bit is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V == 0b0.
- ERR<n>STATUS.UE == 0b0 and this bit is never set to 0b1 by a Deferred error.
- ERR<n>STATUS.{UE,DE} == {0,0} and this bit can be set to 0b1 by a Deferred error.

This bit ignores writes if ERR<n>STATUS.{CE,DE,UE} != {0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

### Note

An External Abort signaled by the **componentnode** might be masked and not generate any exception.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This bit is set to 0b1 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 0b1.
- A Deferred error is detected, ERR<n>STATUS.UE == 0b0 and ERR<n>STATUS.DE == 0b1.
- A Corrected error is detected, no Corrected error counter is implemented, ERR<n>STATUS.UE == 0b0, ERR<n>STATUS.DE == 0b0, and ERR<n>STATUS.CE != 0b00. ERR<n>STATUS.CE might be updated for the new Corrected error.
- A Corrected error counter is implemented, ERR<n>STATUS.UE == 0b0, ERR<n>STATUS.DE == 0b0, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this bit is set to 0b1 when one of the following occurs:

- A Deferred error is detected and ERR<n>STATUS.UE == 0b1.
- A Corrected error is detected, no Corrected error counter is implemented, and either or both the ERR<n>STATUS.UE or ERR<n>STATUS.DE bits are set to 0b1.
- A Corrected error counter is implemented, either or both the ERR<n>STATUS.UE or ERR<n>STATUS.DE bits are set to 0b1, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this bit is cleared to 0b0 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 0b0.
- A Deferred error is detected, ERR<n>STATUS.UE == 0b0 and ERR<n>STATUS.DE == 0b0.
- A Corrected error is detected, ERR<n>STATUS.UE == 0b0, ERR<n>STATUS.DE == 0b0 and ERR<n>STATUS.CE == 0b00.

The IMPLEMENTATION DEFINED clearing of this bit might also depend on the value of the other error status bits.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this bit to an UNKNOWN value.
- A direct write to this bit that clears this bit to 0b0 might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
0b0	<p>If ERR&lt;n&gt;STATUS.UE == 0b1, then no error syndrome for an Uncorrected error has been discarded.</p> <p>If ERR&lt;n&gt;STATUS.UE == 0b0 and ERR&lt;n&gt;STATUS.DE == 0b1, then no error syndrome for a Deferred error has been discarded.</p> <p>If ERR&lt;n&gt;STATUS.UE == 0b0, ERR&lt;n&gt;STATUS.DE == 0b0, and a Corrected error counter is implemented, then the counter has not overflowed.</p> <p>If ERR&lt;n&gt;STATUS.UE == 0b0, ERR&lt;n&gt;STATUS.DE == 0b0, ERR&lt;n&gt;STATUS.CE != 0b00, and no Corrected error counter is implemented, then no error syndrome for a Corrected error has been discarded.</p> <p><b>Note</b> This bit might have been set to 0b1 when an error syndrome was discarded and later cleared to 0b0 when a higher priority syndrome was recorded.</p>
0b1	At least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V == 0b0.

This bit is read/write-one-to-clear.

**On an Error recovery reset, the value of this field is unchanged.**

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**MV, bit [26]**

When error record <n> includes an additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC<m> not valid.
0b1	The IMPLEMENTATION DEFINED contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record.

This bit ignores writes if ERR<n>STATUS.{CE,DE,UE} != {0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

This bit is read/write-one-to-clear.

**Note**

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**CE, bits [25:24]**

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a component or node detects whether a correctable error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0b0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

This field is not valid and reads UNKNOWN if ERR<n>STATUS.V == 0b0. This field ignores writes if ERR<n>STATUS.OF == 0b1 and is not being cleared to 0b0 in the same write.

This field is read/write-ones-to-clear. Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**DE, bit [23]**

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V == 0b0. This bit ignores writes if ERR<n>STATUS.OF == 0b1 and is not being cleared to 0b0 in the same write.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected.

If this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero, when any of:

- Clearing ERR<n>STATUS.V to 0b0.
- Clearing both ERR<n>STATUS.{DE, UE} to 0b0.

This bit is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V == 0b0.
- ERR<n>STATUS.{DE,UE} == {0,0}.

This bit ignores writes if ERR<n>STATUS.{CE,DE,UE} != {0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

If this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0b0.
- Clearing ERR<n>STATUS.UE to 0b0.

This field is not valid and reads UNKNOWN if any of the following are true:

- ERR<n>STATUS.V == 0b0.
- ERR<n>STATUS.UE == 0b0.

This field ignores writes if ERR<n>STATUS.{CE,DE,UE} != {0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

This field is read/write-ones-to-clear. Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

---

#### Note

Software might use the information in the error record registers to determine what recovery is necessary.

---

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### Bits [19:16]

Reserved, RES0.

#### IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

---

#### Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

---

This field is not valid and reads UNKNOWN if all of the following are true:

- Any of the following are true:
  - The RAS Common Fault Injection Model Extension is implemented by the node that owns this error record and `ERR<q>PFGE.SYN == 0b0`.
  - The RAS Common Fault Injection Model Extension is not implemented by the node that owns this error record.
- `ERR<n>STATUS.V == 0b0`.

This field ignores writes if ERR<n>STATUS.{CE,DE,UE} != {0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

#### SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, <b>nSEI</b> pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.
0x11	Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another <b>component.node</b> .
0x14	Internal timeout. For example, timeout on interface within the <b>component.node</b> .
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the <b>component.node</b> has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

#### Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

This field is not valid and reads UNKNOWN if all of the following are true:

- Any of the following are true:
  - The RAS Common Fault Injection Model Extension is implemented by the node that owns this error record and [ERR<q>PFGF.SYN](#) == 0b0.
  - The RAS Common Fault Injection Model Extension is not implemented by the node that owns this error record.
- ERR<n>STATUS.V == 0b0.

This field ignores writes if ERR<n>STATUS.{CE,DE,UE} != {0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

**On an Error recovery reset, the value of this field is unchanged.**

On a Cold reset, this field resets to an architecturally UNKNOWN value.

## Accessing the ERR<n>STATUS

The {AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI} fields are write-one-to-clear, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero. The {IERR, SERR} fields are read/write fields, although the set of implemented valid values is IMPLEMENTATION DEFINED. See also [ERR<n>PFGF.SYN](#).

After reading ERR<n>STATUS, software must clear the valid bits in the register to allow new errors to be recorded. However, between reading the register and clearing the valid bits, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

- Writes to the {UE, DE, CE} fields are ignored if the OF bit is set and is not being cleared.
- Writes to the V bit are ignored if any of the {UE, DE, CE} fields are nonzero and are not being cleared.
- Writes to the {AV, MV} bits and {ER, PN, UET, IERR, SERR} syndrome fields are ignored if the highest priority error status field is nonzero and not being cleared. The error status fields in priority order from highest to lowest, are UE, DE, and CE.

When RAS System Architecture v1.1 is implemented, a write to the register is ignored if all of:

- Any of {V, UE, OF, CE, DE} fields are nonzero before the write.
- The write does not clear the nonzero {V, UE, OF, CE, DE} fields to zero by writing ones to the applicable field or fields.

Some of the fields in ERR<n>STATUS are also defined as UNKNOWN where certain combinations of the {V, DE, UE} status fields are zero. The rules for writes to ERR<n>STATUS allow a node to implement such a field as a fixed read-only value.

For example, when RAS System Architecture v1.1 is implemented, a write to ERR<n>STATUS when ERR<n>STATUS.V is 1 results in either ERR<n>STATUS.V field being cleared to zero, or ERR<n>STATUS.V not changing. Since all fields in ERR<n>STATUS, other than {AV, V, MV}, usually read as UNKNOWN values when ERR<n>STATUS.V is zero, this means those fields can be implemented as read-only if applicable.

To ensure correct and portable operation, when software is clearing the valid bits in the register to allow new errors to be recorded, Arm recommends that software:

- Determine which fields to clear to zero by reading ERR<n>STATUS.
- Write ones to all the write-one-to-clear fields that are nonzero.
- Write zero to all the read/write fields.
- Write zero to all the write-one-to-clear fields that are zero.

Otherwise, these fields might not have the correct value when a new fault is recorded.

An exception is when the node supports writing to these fields as part of fault injection. See also [ERR<n>PFGF.SYN](#).

### ERR<n>STATUS can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x010 + (64 * n)	ERR<n>STATUS

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489ec15ad1565345720bed2a

# GICC\_ABPR, CPU Interface Aliased Binary Point Register

The GICC\_ABPR characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

## Configuration

The reset value of this register is defined as (minimum [GICC\\_BPR.Binary\\_Point](#) + 1), resulting in a permitted range of 0x1-0x4.

In systems that support two Security states:

- This register is an alias of the Non-secure copy of [GICC\\_BPR](#).
- Non-secure accesses to this register return a shifted value of the binary point.
- If [ICC\\_CTLR\\_EL3.CBPR\\_EL1NS](#) == 1, Secure accesses to this register access [ICC\\_BPR0\\_EL1](#).

## Attributes

GICC\_ABPR is a 32-bit register.

The reset value of this register is defined as (minimum [GICC\\_BPR.Binary\\_Point](#) + 1), resulting in a permitted range of 0x1-0x4.

## Field descriptions

The GICC\_ABPR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																Binary Point															

### Bits [31:3]

Reserved, RES0.

### Binary\_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- 'Secure ICC\_BPR1\_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when [GICC\\_CTLR.CBPR](#) == 0.
- 'Non-secure ICC\_BPR1\_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for all other cases.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the GICC\_ABPR

This register is used only when System register access is not enabled. When System register access is enabled, the System registers [ICC\\_BPR0\\_EL1](#) and [ICC\\_BPR1\\_EL1](#) provide equivalent functionality.

**GICC\_ABPR can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC CPU interface	0x001C	GICC_ABPR

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# GICC\_APR<n>, CPU Interface Active Priorities Registers, n = 0 - 3

The GICC\_APR<n> characteristics are:

## Purpose

Provides information about interrupt active priorities.

## Configuration

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

When [GICD\\_CTLR.DS](#) == 0, these registers are Banked, and Non-secure accesses do not affect Secure operation. The Secure copies of these registers hold active priorities for Group 0 interrupts, and the Non-secure copies provide a Non-secure view of the active priorities for Group 1 interrupts.

GICC\_APR1 is only implemented in implementations that support 6 or more bits of priority. GICC\_APR2 and GICC\_APR3 are only implemented in implementations that support 7 bits of priority.

When [GICD\\_CTLR.DS](#)==1, these registers hold the active priorities for Group 0 interrupts, and the active priorities for Group 1 interrupts are held by the [GICC\\_NSAPR<n>](#) registers.

## Attributes

GICC\_APR<n> is a 32-bit register.

## Field descriptions

The GICC\_APR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to 0.

## Accessing the GICC\_APR<n>

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- In AArch64:
  - For Group 0, [ICC\\_AP0R<n>\\_EL1](#).
  - For Group 1, [ICC\\_AP1R<n>\\_EL1](#).
- In AArch32:
  - For Group 0, [ICC\\_AP0R<n>](#).
  - For Group 1, [ICC\\_AP1R<n>](#).

# GICC\_BPR, CPU Interface Binary Point Register

The GICC\_BPR characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field.

## Configuration

In systems that support two Security states:

- This register is Banked.
- The Secure instance of this register determines Group 0 interrupt preemption.
- The Non-secure instance of this register determines Group 1 interrupt preemption.

In systems that support only one Security state, when [GICC\\_CTLR](#).CBPR == 0, this register determines only Group 0 interrupt preemption.

When [GICC\\_CTLR](#).CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

## Attributes

GICC\_BPR is a 32-bit register.

## Field descriptions

The GICC\_BPR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																		Binary Point													

### Bits [31:3]

Reserved, RES0.

### Binary\_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- 'Secure ICC\_BPR1\_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when [GICC\\_CTLR](#).CBPR == 0.
- 'Non-secure ICC\_BPR1\_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for all other cases.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Note

Aliasing the Non-secure GICC\_BPR as [GICC\\_ABPR](#) in a multiprocessor system permits a PE that can make only Secure accesses to configure the preemption setting for Group 1 interrupts by accessing [GICC\\_ABPR](#).

(old)

htmldiff from-

(new)

# GICC\_CTLR, CPU Interface Control Register

The GICC\_CTLR characteristics are:

## Purpose

Controls the CPU interface, including enabling of interrupt groups, interrupt signal bypass, binary point registers used, and separation of priority drop and interrupt deactivation.

### Note

If the GIC implementation supports two Security states, independent EOI controls are provided for accesses from each Security state. Secure accesses handle both Group 0 and Group 1 interrupts, and Non-secure accesses handle Group 1 interrupts only.

## Configuration

In a GIC implementation that supports two Security states:

- This register is Banked.
- The register bit assignments are different in the Secure and Non-secure copies.

## Attributes

GICC\_CTLR is a 32-bit register.

## Field descriptions

The GICC\_CTLR bit assignments are:

### When GICD\_CTLR.DS==0, Non-secure access:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										EOImodeNS		RES0	IRQBypDisGrp1		FIQBypDisGrp1		RES0	EnableGrp1													

### Bits [31:10]

Reserved, RES0.

### EOImodeNS, bit [9]

Controls the behavior of Non-secure accesses to [GICC\\_EOIR](#), [GICC\\_AEOIR](#), and [GICC\\_DIR](#).

EOImodeNS	Meaning
0b0	<a href="#">GICC_EOIR</a> and <a href="#">GICC_AEOIR</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">GICC_DIR</a> are UNPREDICTABLE.
0b1	<a href="#">GICC_EOIR</a> and <a href="#">GICC_AEOIR</a> provide priority drop functionality only. <a href="#">GICC_DIR</a> provides interrupt deactivation functionality.

### Note

---

An implementation is permitted to make this bit RAO/WI.

---

On a Warm reset, this **This** field resets to 0.

#### Bits [8:7]

Reserved, RES0.

#### IRQBypDisGrp1, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC\\_SRE\\_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this **This** field resets to 0.

#### FIQBypDisGrp1, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQBypDisGrp1	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC\\_SRE\\_EL3.DFB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this **This** field resets to 0.

#### Bits [4:1]

Reserved, RES0.

#### EnableGrp1, bit [0]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
0b0	Group 1 interrupt signaling is disabled.
0b1	Group 1 interrupt signaling is enabled.

On a Warm reset, this **This** field resets to 0.

**When GICD\_CTLR.DS==0, Secure access:**

313029282726252423222120191817161514131211	10	9	8	7	6
RES0	EOImodeNS	EOImodeS	IRQBypDisGrp1	FIQBypDisGrp1	IRQBypDisGrp0

**Bits [31:11]**

Reserved, RES0.

**EOImodeNS, bit [10]**

Controls the behavior of Non-secure accesses to [GICC\\_EOIR](#), [GICC\\_AEOIR](#), and [GICC\\_DIR](#).

EOImodeNS	Meaning
0b0	<a href="#">GICC_EOIR</a> and <a href="#">GICC_AEOIR</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">GICC_DIR</a> are UNPREDICTABLE.
0b1	<a href="#">GICC_EOIR</a> and <a href="#">GICC_AEOIR</a> provide priority drop functionality only. <a href="#">GICC_DIR</a> provides interrupt deactivation functionality.

**Note**

An implementation is permitted to make this bit RAO/WI.

On a Warm reset, this field resets to 0.

**EOImodeS, bit [9]**

Controls the behavior of Secure accesses to [GICC\\_EOIR](#), [GICC\\_AEOIR](#), and [GICC\\_DIR](#).

EOImodeS	Meaning
0b0	<a href="#">GICC_EOIR</a> and <a href="#">GICC_AEOIR</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">GICC_DIR</a> are UNPREDICTABLE.
0b1	<a href="#">GICC_EOIR</a> and <a href="#">GICC_AEOIR</a> provide priority drop functionality only. <a href="#">GICC_DIR</a> provides interrupt deactivation functionality.

**Note**

An implementation is permitted to make this bit RAO/WI.

This field shares state with [GICC\\_CTLR.EOImode](#).

On a Warm reset, this field resets to 0.

**IRQBypDisGrp1, bit [8]**

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC\\_SRE\\_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this **This** field resets to 0.

### FIQByDisGrp1, bit [7]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQByDisGrp1	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC\\_SRE\\_EL3](#).DFB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this **This** field resets to 0.

### IRQByDisGrp0, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:

IRQByDisGrp0	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC\\_SRE\\_EL3](#).DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this **This** field resets to 0.

### FIQByDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

FIQByDisGrp0	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC\\_SRE\\_EL3](#).DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this **This** field resets to 0.

### CBPR, bit [4]

Controls whether [GICC\\_BPR](#) provides common control of preemption to Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	<a href="#">GICC_BPR</a> determines preemption for Group 0 interrupts only. <a href="#">GICC_ABPR</a> determines preemption for Group 1 interrupts.
0b1	<a href="#">GICC_BPR</a> determines preemption for both Group 0 and Group 1 interrupts.

This field is an alias of [ICC\\_CTLR\\_EL3.CBPR\\_EL1NS](#).

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of [GICC\\_BPR](#) returns the value of Secure [GICC\\_BPR](#).Binary\_Point, incremented by 1, and saturated to 0b111.
- Non-secure writes of [GICC\\_BPR](#) are ignored.

On a Warm reset, this **This** field resets to 0.

### FIQEn, bit [3]

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

FIQEn	Meaning
0b0	Group 0 interrupts are signaled using the IRQ signal.
0b1	Group 0 interrupts are signaled using the FIQ signal.

Group 1 interrupts are signaled using the IRQ signal only.

If an implementation supports two Security states, this bit is permitted to be RAO/WI.

On a Warm reset, this **This** field resets to 0.

### Bit [2]

Reserved, RES0.

### EnableGrp1, bit [1]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
0b0	Group 1 interrupt signaling is disabled.
0b1	Group 1 interrupt signaling is enabled.

On a Warm reset, this **This** field resets to 0.

### EnableGrp0, bit [0]

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

EnableGrp0	Meaning
0b0	Group 0 interrupt signaling is disabled.
0b1	Group 0 interrupt signaling is enabled.

On a Warm reset, this **This** field resets to 0.

## When GICD\_CTLR.DS == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5																																											
										RES0										EOImode										IRQBypDisGrp1										FIQBypDisGrp1										IRQBypDisGrp0										FIQBypDisGrp0									

### Bits [31:10]

Reserved, RES0.

**EOImode, bit [9]**

Controls the behavior of accesses to [GICC\\_EOIR](#), [GICC\\_AEOIR](#), and [GICC\\_DIR](#).

EOImode	Meaning
0b0	<a href="#">GICC_EOIR</a> and <a href="#">GICC_AEOIR</a> provide both priority drop and interrupt deactivation functionality. Accesses to <a href="#">GICC_DIR</a> are UNPREDICTABLE.
0b1	<a href="#">GICC_EOIR</a> and <a href="#">GICC_AEOIR</a> provide priority drop functionality only. <a href="#">GICC_DIR</a> provides interrupt deactivation functionality.

**Note**

An implementation is permitted to make this bit RAO/WI.

This field shares state with [GICC\\_CTLR.EOImodeS](#).

On a Warm reset, this field resets to 0.

**IRQBypDisGrp1, bit [8]**

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC\\_SRE\\_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to 0.

**FIQBypDisGrp1, bit [7]**

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQBypDisGrp1	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC\\_SRE\\_EL3.DFB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to 0.

**IRQBypDisGrp0, bit [6]**

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:

IRQBypDisGrp0	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC\\_SRE\\_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this ~~This~~ field resets to 0.

### FIQBypDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

FIQBypDisGrp0	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC\\_SRE\\_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this ~~This~~ field resets to 0.

### CBPR, bit [4]

Controls whether [GICC\\_BPR](#) provides common control of preemption to Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	<a href="#">GICC_BPR</a> determines preemption for Group 0 interrupts only. <a href="#">GICC_ABPR</a> determines preemption for Group 1 interrupts.
0b1	<a href="#">GICC_BPR</a> determines preemption for both Group 0 and Group 1 interrupts.

This field is an alias of [ICC\\_CTLR\\_EL3.CBPR\\_EL1NS](#).

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of [GICC\\_BPR](#) returns the value of Secure [GICC\\_BPR](#).Binary\_Point, incremented by 1, and saturated to 0b111.
- Non-secure writes of [GICC\\_BPR](#) are ignored.

On a Warm reset, this ~~This~~ field resets to 0.

### FIQEn, bit [3]

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

FIQEn	Meaning
0b0	Group 0 interrupts are signaled using the IRQ signal.
0b1	Group 0 interrupts are signaled using the FIQ signal.

Group 1 interrupts are signaled using the IRQ signal only.

If an implementation supports two Security states, this bit is permitted to be RAO/WI.

On a Warm reset, this ~~This~~ field resets to 0.

Reserved, RES0.

### EnableGrp1, bit [1]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
0b0	Group 1 interrupt signaling is disabled.
0b1	Group 1 interrupt signaling is enabled.

### EnableGrp0, bit [0]

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

EnableGrp0	Meaning
0b0	Group 0 interrupt signaling is disabled.
0b1	Group 0 interrupt signaling is enabled.

## Accessing the GICC\_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC\\_CTLR](#) and [ICC\\_MCTLR](#) provide equivalent functionality.
- For AArch64 implementations, [ICC\\_CTLR\\_EL1](#) and [ICC\\_CTLR\\_EL3](#) provide equivalent functionality.

Component	Offset	Instance
GIC CPU interface	0x0000	GICC_CTLR

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

# GICC\_NSAPR<n>, CPU Interface Non-secure Active Priorities Registers, n = 0 - 3

The GICC\_NSAPR<n> characteristics are:

## Purpose

Provides information about Group 1 interrupt active priorities.

## Configuration

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

When [GICD\\_CTLR.DS](#)==0, these registers are RAZ/WI to Non-secure accesses.

GICC\_NSAPR1 is only implemented in implementations that support 6 or more bits of priority. GICC\_NSAPR2 and GICC\_NSAPR3 are only implemented in implementations that support 7 bits of priority.

## Attributes

GICC\_NSAPR<n> is a 32-bit register.

## Field descriptions

The GICC\_NSAPR<n> bit assignments are:

### IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to 0.

## Accessing the GICC\_NSAPR<n>

GICC\_NSAPR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x00E0 + (4 * n)	GICC_NSAPR<n>

This interface is accessible as follows:

- When [GICD\\_CTLR.DS](#) == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

htmldiff from-

(new)

# GICC\_PMR, CPU Interface Priority Mask Register

The GICC\_PMR characteristics are:

## Purpose

This register provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

### Note

Higher interrupt priority corresponds to a lower value of the Priority field.

## Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

## Attributes

GICC\_PMR is a 32-bit register.

## Field descriptions

The GICC\_PMR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																Priority															

### Bits [31:8]

Reserved, RES0.

### Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = 0b0.
- For 64 supported levels, bits [1:0] = 0b00.
- For 32 supported levels, bits [2:0] = 0b000.
- For 16 supported levels, bits [3:0] = 0b0000.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the GICC\_PMR

If the GIC implementation supports two Security states:

- Non-secure accesses to this register can only read or write values corresponding to the lower half of the priority range.
- If a Secure write has programmed the register with a value that corresponds to a value in the upper half of the priority range then:
  - Any Non-secure read of the register returns 0x00, regardless of the value held in the register.
  - Non-secure writes are ignored.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

#### GICC\_PMR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0004	GICC_PMR

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICD\_CPENDSGIR<n>, SGI Clear-Pending Registers, n = 0 - 3

The GICD\_CPENDSGIR<n> characteristics are:

## Purpose

Removes the pending state from an SGI.

A write to this register changes the state of a pending SGI to inactive, and the state of an active and pending SGI to active.

## Configuration

Four SGI clear-pending registers are implemented. Each register contains eight clear-pending bits for each of four SGIs, for a total of 16 possible SGIs.

In multiprocessor implementations, each PE has a copy of these registers.

## Attributes

GICD\_CPENDSGIR<n> is a 32-bit register.

## Field descriptions

The GICD\_CPENDSGIR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4
SGI_clear_pending_bits3SGI_clear_pending_bits<x>, bits [8x+7:8x], for x = 0 to 3								SGI_clear_pending_bits2SGI_clear_pending_bits1SGI_clear_pe																			

**SGI\_clear\_pending\_bits<x>, bits [8x+7:8x], for x = 0 to 3**

**SGI\_clear\_pending\_bits<x>, bits [8x+7:8x], for x = 3 to 0**

Removes the pending state from SGI number  $4n + x$  for the PE corresponding to the bit number written to.

Reads and writes have the following behavior:

SGI_clear_pending_bits<x>	Meaning
0x00	If read, indicates that the SGI from the corresponding PE is not pending and is not active and pending. If written, has no effect.
0x01	If read, indicates that the SGI from the corresponding PE is pending or is active and pending. If written, removes the pending state from the SGI for the corresponding PE.

On a Warm reset, this field resets to 0.

For SGI ID m, generated by processing element C writing to the corresponding [GICD\\_SGIR](#) field, where DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_CPENDSGIR<n> number is given by  $n = m \text{ DIV } 4$ .
- The offset of the required register is  $(0xF10 + (4n))$ .

- The offset of the required field within the register GICD\_CPENDSGIR<n> is given by m MOD 4.
- The required bit in the 8-bit SGI clear-pending field m is bit C.

## Accessing the GICD\_CPENDSGIR<n>

These registers are used only when affinity routing is not enabled. When affinity routing is enabled, this register is RES0. An implementation is permitted to make the register RAZ/WI in this case.

A register bit that corresponds to an unimplemented SGI is RAZ/WI.

These registers are byte-accessible.

If the GIC implementation supports two Security states:

- A register bit that corresponds to a Group 0 interrupt is RAZ/WI to Non-secure accesses.
- Register bits corresponding to unimplemented PEs are RAZ/WI.

**GICD\_CPENDSGIR<n> can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Distributor	0x0F10 + (4 * n)	GICD_CPENDSGIR<n>

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

(old)

htmldiff from-

(new)

The GICD\_CTLR characteristics are:

## Purpose

Enables interrupts and affinity routing.

## Configuration

The format of this register depends on the Security state of the access and the number of Security states supported, which is specified by GICD\_CTLR.DS.

## Attributes

GICD\_CTLR is a 32-bit register.

## Field descriptions

The GICD\_CTLR bit assignments are:

**When access is Secure, in a system that supports two Security states:**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RWP																								E1NWF	DS	ARE	NS	ARE	S	RES0	EnableGrp1S	EnableGrp1NS	EnableGrp1S

**RWP, bit [31]**

Register Write Pending. Read only. Indicates whether a register write is in progress or not:

<b>RWP</b>	<b>Meaning</b>
0b0	No register write in progress. The effects of previous register writes to the affected register fields are visible to all logical components of the GIC architecture, including the CPU interfaces.
0b1	Register write in progress. The effects of previous register writes to the affected register fields are not guaranteed to be visible to all logical components of the GIC architecture, including the CPU interfaces, as the effects of the changes are still being propagated.

This field tracks writes to:

- GICD\_CTLR[2:0], the Group Enables, for transitions from 1 to 0 only.
- GICD\_CTLR[7:4], the ARE bits, E1NWF bit and DS bit.
- GICD\_ICENABLER<n>.

Updates to other register fields are not tracked by this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [30:8]**

Reserved, RES0.

**E1NWF, bit [7]**

Enable 1 of N Wakeup Functionality.

It is IMPLEMENTATION DEFINED whether this bit is programmable, or RAZ/WI.

If it is implemented, then it has the following behavior:

<b>E1NWF</b>	<b>Meaning</b>
0b0	A PE that is asleep cannot be picked for 1 of N interrupts.
0b1	A PE that is asleep can be picked for 1 of N interrupts as determined by IMPLEMENTATION DEFINED controls.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**DS, bit [6]**

Disable Security.

<b>DS</b>	<b>Meaning</b>
0b0	Non-secure accesses are not permitted to access and modify registers that control Group 0 interrupts.
0b1	Non-secure accesses are permitted to access and modify registers that control Group 0 interrupts.

If DS is written from 0 to 1 when GICD\_CTLR.ARE\_S == 1, then GICD\_CTLR.ARE for the single Security state is RAO/WI.

If the Distributor only supports a single Security state, this bit is RAO/WI.

If the Distributor supports two Security states, it IMPLEMENTATION DEFINED whether this bit is programmable or implemented as RAZ/WI.

When this field is set to 1, all accesses to GICD\_CTLR access the single Security state view, and all bits are accessible.

When set to 1, this field can only be cleared by a hardware reset.

Writing this bit from 0 to 1 is UNPREDICTABLE if any of the following is true:

- [GICD\\_CTLR.EnableGrp0](#) == 1.
- [GICD\\_CTLR.EnableGrp1S](#) == 1.
- [GICD\\_CTLR.EnableGrp1NS](#) == 1.
- One or more INTID is in the Active or Active and Pending state.

On a Warm reset, this **This** field resets to 0.

**ARE\_NS, bit [5]**

Affinity Routing Enable, Non-secure state.

<b>ARE_NS</b>	<b>Meaning</b>
0b0	Affinity routing disabled for Non-secure state.
0b1	Affinity routing enabled for Non-secure state.

When affinity routing is enabled for the Secure state, this field is RAO/WI.

Changing the ARE\_NS settings from 0 to 1 is UNPREDICTABLE except when GICD\_CTLR.EnableGrp1 Non-secure == 0.

Changing the ARE\_NS settings from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility for Non-secure state is not implemented, this field is RAO/WI.

On a Warm reset, this **This** field resets to 0.

**ARE\_S, bit [4]**

Affinity Routing Enable, Secure state.

ARE_S	Meaning
0b0	Affinity routing disabled for Secure state.
0b1	Affinity routing enabled for Secure state.

Changing the ARE\_S setting from 0 to 1 is UNPREDICTABLE except when all of the following apply:

- GICD\_CTLR.EnableGrp0==0.
- GICD\_CTLR.EnableGrp1S==0.
- GICD\_CTLR.EnableGrp1NS==0.

Changing the ARE\_S settings from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility for Secure state is not implemented, this field is RAO/WI.

On a Warm reset, this field resets to 0.

### Bit [3]

Reserved, RES0.

### EnableGrp1S, bit [2]

Enable Secure Group 1 interrupts.

EnableGrp1S	Meaning
0b0	Secure Group 1 interrupts are disabled.
0b1	Secure Group 1 interrupts are enabled.

If GICD\_CTLR.ARE\_S == 0, this field is RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EnableGrp1NS, bit [1]

Enable Non-secure Group 1 interrupts.

EnableGrp1NS	Meaning
0b0	Non-secure Group 1 interrupts are disabled.
0b1	Non-secure Group 1 interrupts are enabled.

#### Note

This field also controls whether LPis are forwarded to the PE.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EnableGrp0, bit [0]

Enable Group 0 interrupts.

EnableGrp0	Meaning
0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## When access is Non-secure, in a system that supports two Security states:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RWP													RES0														ARE NS	RES0	EnableGrp1A	EnableGrp1	

**RWP, bit [31]**

This bit is a read-only alias of the Secure GICD\_CTLR.RWP bit.

**Bits [30:5]**

Reserved, RES0.

**ARE\_NS, bit [4]**

This bit is a read-write alias of the Secure GICD\_CTLR.ARE\_NS bit.

If GICv2 backwards compatibility for Non-secure state is not implemented, this field is RAO/WI.

**Bits [3:2]**

Reserved, RES0.

**EnableGrp1A, bit [1]**

If ARE\_NS == 1, then this bit is a read-write alias of the Secure GICD\_CTLR.EnableGrp1NS bit.

If ARE\_NS == 0, then this bit is RES0.

**EnableGrp1, bit [0]**

If ARE\_NS == 0, then this bit is a read-write alias of the Secure GICD\_CTLR.EnableGrp1NS bit.

If ARE\_NS == 1, then this bit is RES0.

**When in a system that supports only a single Security state:**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RWP	RES0										nASSGReq		E1NWF	DS	RES0	ARE	RES0	EnableGrp1	EnableGrp0												

**RWP, bit [31]**

Register Write Pending. Read only. Indicates whether a register write is in progress or not:

RWP	Meaning
0b0	No register write in progress. The effects of previous register writes to the affected register fields are visible to all logical components of the GIC architecture, including the CPU interfaces.
0b1	Register write in progress. The effects of previous register writes to the affected register fields are not guaranteed to be visible to all logical components of the GIC architecture, including the CPU interfaces, as the effects of the changes are still being propagated.

This field tracks updates to:

- GICD\_CTLR[2:0], the Group Enables, for transitions from 1 to 0 only.
- GICD\_CTLR[7:4], the ARE bits, E1NWF bit and DS bit.
- GICD\_ICENABLER<n>, the bits that allow disabling of SPIs.

Updates to other register fields are not tracked by this field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [30:9]**

Reserved, RES0.

**nASSGReq, bit [8]**

When FEAT\_GICv4p1 is implemented:

Controls whether SGIs have an active state.

This bit is RES0 if [GICD\\_TYPER2](#).GICD\_TYPER2.nASSGReq is 0.

This bit is WI when any of GICD\_CTLR.{EnableGrp0,EnableGrp1} is 1.

nASSGReq	Meaning
0b0	SGIs have an active state and must be deactivated.
0b1	SGIs do not have an active state and do not require deactivation.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

**E1NWF, bit [7]**

Enable 1 of N Wakeup Functionality.

It is IMPLEMENTATION DEFINED whether this bit is programmable, or RAZ/WI.

If it is implemented, then it has the following behavior:

E1NWF	Meaning
0b0	A PE that is asleep cannot be picked for 1 of N interrupts.
0b1	A PE that is asleep can be picked for 1 of N interrupts as determined by IMPLEMENTATION DEFINED controls.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**DS, bit [6]**

Disable Security. This field is RAO/WI.

**Bit [5]**

Reserved, RES0.

**ARE, bit [4]**

Affinity Routing Enable.

ARE	Meaning
0b0	Affinity routing disabled.
0b1	Affinity routing enabled.

Changing the ARE settings from 0 to 1 is UNPREDICTABLE except when all of the following apply:

- GICD\_CTLR.EnableGrp1==0.
- GICD\_CTLR.EnableGrp0==0.

Changing ARE from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility is not implemented, this field is RAO/WI.

On a Warm reset, this field resets to 0.

**Bits [3:2]**

Reserved, RES0.

### EnableGrp1, bit [1]

Enable Group 1 interrupts.

EnableGrp1	Meaning
0b0	Group 1 interrupts disabled.
0b1	Group 1 interrupts enabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### EnableGrp0, bit [0]

Enable Group 0 interrupts.

EnableGrp0	Meaning
0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the GLCD\_CTLR

If an interrupt is pending within a CPU interface when the corresponding GICD\_CTLR.EnableGrpX bit is written from 1 to 0 the interrupt must be retrieved from the CPU interface.

### Note

This might have no effect on the forwarded interrupt if it has already been activated. When a write changes the value of ARE for a Security state or the value of the DS bit, the format used for interpreting the remaining bits provided in the write data is the format that applied before the write takes effect.

**GICD\_CTLR can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Distributor	0x0000	GICD_CTLR

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bcd2a

# GICD\_ICTIVER<n>, Interrupt Clear-Active Registers, n = 0 - 31

The GICD\_ICTIVER<n> characteristics are:

## Purpose

Deactivates the corresponding interrupt. These registers are used when saving and restoring GIC state.

## Configuration

These registers are available in all GIC configurations. If GICD\_CTLR.DS==0, these registers are Common.

The number of implemented GICD\_ICTIVER<n> registers is (GICD\_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD\_ICTIVER0 is Banked for each connected PE with GICR\_TYPER.Processor\_Number < 8.

Accessing GICD\_ICTIVER0 from a PE with GICR\_TYPER.Processor\_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

## Attributes

GICD\_ICTIVER<n> is a 32-bit register.

## Field descriptions

The GICD\_ICTIVER<n> bit assignments are:

31	30	29	28	27
Clear_active_bit31Clear_active_bit<x>, bit [x], for x = 0 to 31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27

Clear\_active\_bit<x>, bit [x], for x = 0 to 31

Clear\_active\_bit<x>, bit [x], for x = 31 to 0

Removes the active state from interrupt number 32n + x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

On a Warm reset, thisThis field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_ICACTIVER<n> number, n, is given by  $n = m \text{ DIV } 32$ .
- The offset of the required GICD\_ICACTIVER is  $(0 \times 380 + (4 \times n))$ .
- The bit number of the required group modifier bit in this register is  $m \text{ MOD } 32$ .

## Accessing the GICD\_ICACTIVER<n>

When affinity routing is enabled for the Security state of an interrupt, the bits corresponding to SGIs and PPIs in that Security state are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by [GICR\\_ICACTIVER0](#).

Bits corresponding to unimplemented interrupts are RAZ/WI.

If `GICD_CTLR.DS=0`, unless the `GICD_NSACR<n>` registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

**GICD\_ICACTIVER<n> can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Distributor	0x0380 + (4 * n)	GICD_ICACTIVER<n>

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

(old)

## htmldiff from-

**(new)**

The GICD\_ICACTIVER<n>E characteristics are:

## Purpose

Removes the active state from the corresponding SPI in the extended SPI range.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICD\_ICACTIVER<n>E are RES0.

When GICD\_TYPER.ESPI==0, these registers are RES0.

When GICD\_TYPER.ESPI==1, the number of implemented GICD\_ICACTIVER<n>E registers is (GICD\_TYPER.ESPI\_range+1). Registers are numbered from 0.

## Attributes

GICD\_ICACTIVER<n>E is a 32-bit register.

## Field descriptions

The GICD\_ICACTIVER<n>E bit assignments are:

31	30	29	28	27
Clear_active_bit31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27

bit [x], for x = 0 to 31

**Clear\_active\_bit<x>, bit [x], for x = 0 to 31**

**Clear active bit<x>, bit [x], for x = 31 to 0**

For the extended SPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

On a Warm reset, this ~~This~~ field resets to 0.

For INTID  $m$ , when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_ICACTIVER<n>E number, n, is given by  $n = (m-4096) \text{ DIV } 32$ .
- The offset of the required GICD\_ICACTIVER<n>E is  $(0x1C00 + (4*n))$ .
- The bit number of the required group modifier bit in this register is  $(m-4096) \text{ MOD } 32$ .

# GICD\_ICENABLER<n>, Interrupt Clear-Enable Registers, n = 0 - 31

The GICD\_ICENABLER<n> characteristics are:

## Purpose

Disables forwarding of the corresponding interrupt to the CPU interfaces.

## Configuration

These registers are available in all GIC configurations. If [GICD\\_CTLR.DS](#)==0, these registers are Common.

The number of implemented [GICD\\_ICENABLER<n>](#) registers is ([GICD\\_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD\_ICENABLER0 is Banked for each connected PE with [GICR\\_TYPER.Processor\\_Number](#) < 8.

Accessing GICD\_ICENABLER0 from a PE with [GICR\\_TYPER.Processor\\_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

## Attributes

GICD\_ICENABLER<n> is a 32-bit register.

## Field descriptions

The GICD\_ICENABLER<n> bit assignments are:

31	30	29	28	27
Clear_enable_bit31Clear_enable_bit<x>, bit [x], for x = 0 to 31	Clear_enable_bit30	Clear_enable_bit29	Clear_enable_bit28	Clear_enable_bit27

**Clear\_enable\_bit<x>, bit [x], for x = 0 to 31**

**Clear\_enable\_bit<x>, bit [x], for x = 31 to 0**

For SPIs and PPIs, controls the forwarding of interrupt number 32n + x to the CPU interfaces. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# GICD\_ICENABLER<n>E, Interrupt Clear-Enable Registers, n = 0 - 31

The GICD\_ICENABLER<n>E characteristics are:

## Purpose

Disables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICD\_ICENABLER<n>E are RES0.

When [GICD\\_TYPER.ESPI](#)==0, these registers are RES0.

When [GICD\\_TYPER.ESPI](#)==1, the number of implemented [GICD\\_ICENABLER<n>E](#) registers is ([GICD\\_TYPER.ESPI\\_range](#)+1). Registers are numbered from 0.

## Attributes

GICD\_ICENABLER<n>E is a 32-bit register.

## Field descriptions

The GICD\_ICENABLER<n>E bit assignments are:

31	30	29	28	27
Clear_enable_bit31Clear_enable_bit<x>, bit [x], for x = 0 to 31	Clear_enable_bit30	Clear_enable_bit29	Clear_enable_bit28	Clear_enable_bit27

**Clear\_enable\_bit<x>, bit [x], for x = 0 to 31**

**Clear\_enable\_bit<x>, bit [x], for x = 31 to 0**

For the extended SPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

On a Warm reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_ICENABLER<n>E number, n, is given by  $n = (m-4096) \text{ DIV } 32$ .
- The offset of the required GICD\_ICENABLER<n>E is  $(0x1400 + (4*n))$ .

When affinity routing is not enabled for the Security state of an interrupt in GICD\_ICENABLER<n>E, the corresponding bit is RES0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Component	Offset	Instance
GIC Distributor	0x1400 + (4 * n)	GICD_ICENABLER<n>E

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.

# GICD\_ICFGR<n>, Interrupt Configuration Registers, n = 0 - 63

The GICD\_ICFGR<n> characteristics are:

## Purpose

Determines whether the corresponding interrupt is edge-triggered or level-sensitive.

## Configuration

These registers are available in all GIC configurations. If the GIC implementation supports two Security states, these registers are Common.

GICD\_ICFGR1 is Banked for each connected PE with [GICR\\_TYPER](#).Processor\_Number < 8.

Accessing GICD\_ICFGR1 from a PE with [GICR\\_TYPER](#).Processor\_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR\_ICFGR<n>

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int\_config field.

For SGIs, Int\_config fields are RO, meaning that GICD\_ICFGR0 is RO.

Changing Int\_config when the interrupt is individually enabled is UNPREDICTABLE.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

Fields corresponding to unimplemented interrupts are RAZ/WI.

## Attributes

GICD\_ICFGR<n> is a 32-bit register.

## Field descriptions

The GICD\_ICFGR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0															
Int_config15Int_config<x>, bits [2x+1:2x], for x = 0 to 15																	Int_config14		Int_config13		Int_config12		Int_config11		Int_config10		Int_config9		Int_config8		Int_config7		Int_config6		Int_config5		Int_config4		Int_config3		Int_config2		Int_config1		Int_config0	

**Int\_config<x>, bits [2x+1:2x], for x = 0 to 15**

**Int\_config<x>, bits [2x+1:2x], for x = 15 to 0**

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int\_config[0] (bit [2x]) is RES0.

Possible values of Int\_config[1] (bit [2x+1]) are:

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b01	Corresponding interrupt is edge-triggered.

For SGIs, Int\_config[1] is RAO/WI.

For SPIs and PPIs, Int\_config[1] is programmable unless the implementation supports two Security states and the bit corresponds to a Group 0 or Secure Group 1 interrupt, in which case the bit is RAZ/WI to Non-secure accesses.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the GICD\_ICFGR<n>

GICD\_ICFGR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	0x0C00 + (4 * n)	GICD_ICFGR<n>

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

# GICD\_ICFGR<n>E, Interrupt Configuration Registers (Extended SPI Range), n = 0 - 63

The GICD\_ICFGR<n>E characteristics are:

## Purpose

Determines whether the corresponding SPI in the extended SPI range is edge-triggered or level-sensitive.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICD\_ICFGR<n>E are RES0.

When GICD\_TYPER.ESPI==0, these registers are RES0.

When GICD\_TYPER.ESPI==1, the number of implemented GICD\_ICFGR<n>E registers is ((GICD\_TYPER.ESPI\_range+1)\*2). Registers are numbered from 0.

## Attributes

GICD\_ICFGR<n>E is a 32-bit register.

## Field descriptions

The GICD\_ICFGR<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15
Int_config15	Int_config<x>, bits [2x+1:2x], for x = 0 to 15															
		Int_config14	Int_config13	Int_config12	Int_config11	Int_config10	Int_config9	Int_config8	Int_config7	Int_config6	Int_config5	Int_config4	Int_config3	Int_config2	Int_config1	Int_config0

Int\_config<x>, bits [2x+1:2x], for x = 0 to 15

Int\_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int\_config[0] (bit[2x]) is RES0.

Possible values of Int\_config[1] (bit[2x+1]) are:

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b01	Corresponding interrupt is edge-triggered.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the GICD\_ICFGR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD\_ICFGR<n>E, the corresponding bit is RES0.

When GICD\_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

(old)htmldiff from-(new)

# GICD\_ICPENDR<n>, Interrupt Clear-Pending Registers, n = 0 - 31

The GICD\_ICPENDR<n> characteristics are:

## Purpose

Removes the pending state from the corresponding interrupt.

## Configuration

These registers are available in all GIC configurations. If [GICD\\_CTLR.DS](#)==0, these registers are Common.

The number of implemented [GICD\\_ICPENDR<n>](#) registers is ([GICD\\_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD\_ICPENDR0 is Banked for each connected PE with [GICR\\_TYPER.Processor\\_Number](#) < 8.

Accessing GICD\_ICPENDR0 from a PE with [GICR\\_TYPER.Processor\\_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

## Attributes

GICD\_ICPENDR<n> is a 32-bit register.

## Field descriptions

The GICD\_ICPENDR<n> bit assignments are:

31	30	29	28	
Clear_pending_bit31Clear_pending_bit<x>, bit [x], for x = 0 to 31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_per

Clear\_pending\_bit<x>, bit [x], for x = 0 to 31

Clear\_pending\_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, removes the pending state from interrupt number 32n + x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on any PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending: <ul style="list-style-type: none"> <li>On this PE if the interrupt is an SGI or PPI.</li> <li>On at least one PE if the interrupt is an SPI.</li> </ul> If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: <ul style="list-style-type: none"> <li>If the interrupt is an SGI. In this case, the write is ignored. The pending state of an SGI can be cleared using <a href="#">GICD_CPENDSGIR&lt;n&gt;</a>.</li> <li>If the interrupt is not pending and is not active and pending.</li> <li>If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to <a href="#">GICD_ISPENDR&lt;n&gt;</a>. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.</li> </ul>

On a Warm reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_ICPENDR<n> number, n, is given by  $n = m \text{ DIV } 32$ .
- The offset of the required GICD\_ICPENDR is  $(0x200 + (4*n))$ .
- The bit number of the required group modifier bit in this register is  $m \text{ MOD } 32$ .

## Accessing the GICD\_ICPENDR<n>

Clear-pending bits for SGIs are RO/WI.

When affinity routing is enabled for the Security state of an interrupt:

- Bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by [GICR\\_ICPENDRO](#).
- Bits corresponding to Group 0 and Group 1 Secure interrupts can only be cleared by Secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If [GICD\\_CTLR.DS](#) == 0, unless the [GICD\\_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

**GICD\_ICPENDR<n> can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Distributor	$0x0280 + (4 * n)$	GICD_ICPENDR<n>

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

# GICD\_ICPENDR<n>E, Interrupt Clear-Pending Registers (extended SPI range), n = 0 - 31

The GICD\_ICPENDR<n>E characteristics are:

## Purpose

Removes the pending state to the corresponding SPI in the extended SPI range.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICD\_ICPENDR<n>E are RES0.

When [GICD\\_TYPER](#).ESPI==0, these registers are RES0.

When [GICD\\_TYPER](#).ESPI==1, the number of implemented GICD\_ICPENDR<n>E registers is ([GICD\\_TYPER](#).ESPI\_range+1). Registers are numbered from 0.

## Attributes

GICD\_ICPENDR<n>E is a 32-bit register.

## Field descriptions

The GICD\_ICPENDR<n>E bit assignments are:

31	30	29	28	
Clear_pending_bit31Clear_pending_bit<x>, bit [x], for x = 0 to 31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_per

Clear\_pending\_bit<x>, bit [x], for x = 0 to 31

Clear\_pending\_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the pending state to interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: <ul style="list-style-type: none"><li>If the interrupt is not pending and is not active and pending.</li><li>If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ICPENDR&lt;n&gt;E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.</li></ul>

- The corresponding GICD\_ICPENDR<n>E number, n, is given by  $n = (m-4096) \text{ DIV } 32$ .
- The offset of the required GICD\_ICPENDR<n>E is  $(0 \times 1800 + (4 * n))$ .
- The bit number of the required group modifier bit in this register is  $(m-4096) \text{ MOD } 32$ .

When affinity routing is not enabled for the Security state of an interrupt in GICD\_ICPENDR<n>E, the corresponding bit is RES0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Component	Offset	Instance

# GICD\_IGROUPR<n>, Interrupt Group Registers, n = 0 - 31

The GICD\_IGROUPR<n> characteristics are:

## Purpose

Controls whether the corresponding interrupt is in Group 0 or Group 1.

## Configuration

These registers are available in all GIC configurations. If [GICD\\_CTLR.DS](#)==0, these registers are Secure.

The number of implemented GICD\_IGROUPR<n> registers is ([GICD\\_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD\_IGROUPR0 is Banked for each connected PE with [GICR\\_TYPER.Processor\\_Number](#) < 8.

Accessing GICD\_IGROUPR0 from a PE with [GICR\\_TYPER.Processor\\_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

## Attributes

GICD\_IGROUPR<n> is a 32-bit register.

## Field descriptions

The GICD\_IGROUPR<n> bit assignments are:

31	30	29	28	27
Group_status_bit31Group_status_bit<x>, bit [x], for x = 0 to 31	Group_status_bit30	Group_status_bit29	Group_status_bit28	Group_status_bit27

Group\_status\_bit<x>, bit [x], for x = 0 to 31

Group\_status\_bit<x>, bit [x], for x = 31 to 0

Group status bit.

Group_status_bit<x>	Meaning
0b0	When <a href="#">GICD_CTLR.DS</a> ==1, the corresponding interrupt is Group 0. When <a href="#">GICD_CTLR.DS</a> ==0, the corresponding interrupt is Secure.
0b1	When <a href="#">GICD_CTLR.DS</a> ==1, the corresponding interrupt is Group 1. When <a href="#">GICD_CTLR.DS</a> ==0, the corresponding interrupt is Non-secure Group 1.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICD\\_IGRPMODR<n>](#) to form a 2-bit field that defines an interrupt group. The encoding of this field is described in [GICD\\_IGRPMODR<n>](#).

If affinity routing is disabled for the Security state of an interrupt, then:

- The corresponding [GICD\\_IGRPMODR<n>](#) bit is RES0.
- For Secure interrupts, the interrupt is Secure Group 0.
- For Non-secure interrupts, the interrupt is Non-secure Group 1.

On a Warm reset, when ~~When~~ `n == 0`, this field resets to an UNKNOWN value.

On a Warm reset, when  $n > 0$ , this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_IGROUP<n> number, n, is given by  $n = m \text{ DIV } 32$ .
- The offset of the required GICD\_IGROUP is  $(0 \times 080 + (4 * n))$ .
- The bit number of the required group modifier bit in this register is  $m \text{ MOD } 32$ .

## Accessing the GICD\_IGROUPR<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR\_IGROUPR0.

When [GICD\\_CTLR.DS==0](#), the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

### Note

Accesses to GICD\_IGROUPR0 when affinity routing is not enabled for a Security state access the same state as [GICR\\_IGROUPR0](#), and must update Redistributor state associated with the PE performing the accesses. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

**GICD\_IGROUPR<n> can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Distributor	$0x0080 + (4 * n)$	GICD_IGROUPR<n>

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICD\_IGRPMODR<n>, Interrupt Group Modifier Registers, n = 0 - 31

The GICD\_IGRPMODR<n> characteristics are:

## Purpose

When [GICD\\_CTLR.DS](#)==0, this register together with the [GICD\\_IGROUPR<n>](#) registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- Secure Group 1.

## Configuration

When [GICD\\_CTLR.DS](#)==0, these registers are Secure.

The number of implemented [GICD\\_IGROUPR<n>](#) registers is ([GICD\\_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

When [GICD\\_CTLR.ARE\\_S](#)==0 or [GICD\\_CTLR.DS](#)==1, the GICD\_IGRPMODR<n> registers are RES0. An implementation can make these registers RAZ/WI in this case.

## Attributes

GICD\_IGRPMODR<n> is a 32-bit register.

## Field descriptions

The GICD\_IGRPMODR<n> bit assignments are:

31	30	29	28
Group_modifier_bit31Group_modifier_bit<x>, bit [x], for x = 0 to 31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28

**Group\_modifier\_bit<x>, bit [x], for x = 0 to 31**

**Group\_modifier\_bit<x>, bit [x], for x = 31 to 0**

Group modifier bit. When affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICD\\_IGROUPR<n>](#) to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

On a Warm reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_IGRPMODR<n> number, n, is given by  $n = m \text{ DIV } 32$ .

- The offset of the required GICD\_IGRPMDR is  $(0 \times 080 + (4 \times n))$ .
- The bit number of the required group modifier bit in this register is  $m \text{ MOD } 32$ .

See [GICD\\_IGROUPR<n>](#) for information about the GICD\_IGRPMODR0 reset value.

## Accessing the GICD\_IGRPMODR<n>

When affinity routing is enabled for Secure state, GICD\_IGRPMODR0 is RES0 and equivalent functionality is proved by [GICR\\_IGRPMODR0](#).

When `GICD_CTLR.DS==0`, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

### Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

**GICD\_IGRPMODR<n> can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Distributor	0x0D00 + (4 * n)	GICD_IGRPMODR<n>

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICD\_IGRPMODR<n>E, Interrupt Group Modifier Registers (extended SPI range), n = 0 - 31

The GICD\_IGRPMODR<n>E characteristics are:

## Purpose

When [GICD\\_CTLR.DS](#)==0, this register together with the [GICD\\_IGROUPR<n>E](#) registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICD\_IGRPMODR<n>E are RES0.

GICD\_IGRPMODR<n>E resets to 0x00000000.

When [GICD\\_TYPER.ESPI](#)==0, these registers are RES0.

When [GICD\\_TYPER.ESPI](#)==1:

- The number of implemented GICD\_IGRPMODR<n>E registers is ([GICD\\_TYPER.ESPI\\_range](#)+1). Registers are numbered from 0.
- When [GICD\\_CTLR.DS](#)==0, this register is Secure.

## Attributes

GICD\_IGRPMODR<n>E is a 32-bit register.

## Field descriptions

The GICD\_IGRPMODR<n>E bit assignments are:

31	30	29	28	
Group_modifier_bit31	Group_modifier_bit<x>, bit [x], for x = 0 to 31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28

**Group\_modifier\_bit<x>, bit [x], for x = 0 to 31**

**Group\_modifier\_bit<x>, bit [x], for x = 31 to 0**

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICD\\_IGROUPR<n>E](#) to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

- The corresponding GICD\_IGRPMDR<n>E number, n, is given by  $n = (m-4096) \text{ DIV } 32$ .
- The offset of the required GICD\_IGRPMDR<n>E is  $(0x3400 + (4*n))$ .
- The bit number of the required group modifier bit in this register is  $(m-4096) \text{ MOD } 32$ .

When affinity routing is not enabled for the Security state of an interrupt in GICD\_IGRPMODR<n>E, the corresponding bit is RES0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Component	Offset	Instance
GIC Distributor	0x3400 + (4 * n)	GICD_IGRPMODR<n>E

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

# GICD\_IPRIORITYR<n>, Interrupt Priority Registers, n = 0 - 254

The GICD\_IPRIORITYR<n> characteristics are:

## Purpose

Holds the priority of the corresponding interrupt.

## Configuration

These registers are available in all configurations of the GIC. When [GICD\\_CTLR.DS](#)==0, these registers are Common.

The number of implemented GICD\_IPRIORITYR<n> registers is 8\*([GICD\\_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD\_IPRIORITYR0 to GICD\_IPRIORITYR7 are Banked for each connected PE with [GICR\\_TYPER.Processor\\_Number](#) < 8.

Accessing GICD\_IPRIORITYR0 to GICD\_IPRIORITYR7 from a PE with [GICR\\_TYPER.Processor\\_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

## Attributes

GICD\_IPRIORITYR<n> is a 32-bit register.

## Field descriptions

The GICD\_IPRIORITYR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Priority_offset_3B								Priority_offset_2B								Priority_offset_1B								Priority_offset_0B							

### Priority\_offset\_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, thisThis field resets to 0.

### Priority\_offset\_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, thisThis field resets to 0.

### Priority\_offset\_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, thisThis field resets to 0.

Priority\_offset\_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_IPRIORITYR<n> number, n, is given by  $n = m \text{ DIV } 4$ .
- The offset of the required GICD\_IPRIORITYR<n> register is  $(0x400 + (4*n))$ .
- The byte offset of the required Priority field in this register is  $m \text{ MOD } 4$ , where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Accessing the GICD\_IPRIORITYR<n>

These registers are always used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt:

- GICR\_IPRIORITYR<n> is used instead of GICD\_IPRIORITYR<n> where n = 0 to 7 (that is, for SGIs and PPIs).
- GICD\_IPRIORITYR<n> is RAZ/WI where n = 0 to 7.

These registers are byte-accessible.

A register field corresponding to an unimplemented interrupt is RAZ/WI.

A GIC might implement fewer than eight priority bits, but must implement at least bits [7:4] of each field. In each field, unimplemented bits are RAZ/WI, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When GICD\_CTLR.DS==0:

- A register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in 'Software accesses of interrupt priority' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

It is IMPLEMENTATION DEFINED whether changing the value of a priority field changes the priority of an active interrupt.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD\_IPRIORITYR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Distributor	$0x0400 + (4 * n)$	GICD_IPRIORITYR<n>

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

(old)	htmldiff from-	(new)
-------	----------------	-------

**GICD\_IPRIORITYR<n>E, Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC., n = 0 - 255**

The GICD\_IPRIORITYR<n>E characteristics are:

## Purpose

Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICD\_IPRIORITYR<n>E are RES0.

When `GICD_TYPER.ESPI=0`, these registers are RES0.

When [GICD\\_TYPER](#).ESPI==1, the number of implemented GICD\_IPRIORITYR<n>E registers is (([GICD\\_TYPER](#).ESPI range+1)\*8). Registers are numbered from 0.

## Attributes

GICD\_IPRIORITYR<n>E is a 32-bit register.

## Field descriptions

The GICD\_IPRIORITYR<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Priority offset 3B								Priority offset 2B								Priority offset 1B								Priority offset 0B							

### Priority offset 3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Priority offset 2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Priority offset 1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Priority\_offset\_0B, bits [7:0]

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For interrupt ID  $m$ , when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_IPRIORITYR<n> number, n, is given by  $n = (m-4096) \text{ DIV } 4$ .
- The offset of the required GICD\_IPRIORITYR<n>E register is  $(0x2000 + (4*n))$ .
- The byte offset of the required Priority field in this register is  $m \text{ MOD } 4$ , where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

## Accessing the GICD\_IPRIORITYR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD\_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD\_CTLR.DS==0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

## Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

**GICD\_IPRIORITYR<n>E can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Distributor	$0x2000 + (4 * n)$	GICD_IPRIORITYR<n>E

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICD\_IROUTER<n>, Interrupt Routing Registers, n = 32 - 1019

The GICD\_IROUTER<n> characteristics are:

## Purpose

When affinity routing is enabled, provides routing information for the SPI with INTID n.

## Configuration

These registers are available in all configurations of the GIC. If the GIC implementation supports two Security states, these registers are Common.

The maximum value of n is given by (32\*(GICD\_TYPER.ITLinesNumber+1) - 1). [GICD\\_IROUTER<n>](#) registers where n=0 to 31 are reserved.

## Attributes

GICD\_IROUTER<n> is a 64-bit register.

## Field descriptions

The GICD\_IROUTER<n> bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																								Aff3							
Interrupt_Routing_Mode		RES0						Aff2								Aff1								Aff0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:40]

Reserved, RES0.

### Aff3, bits [39:32]

Affinity level 3, the least significant affinity level field.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Interrupt\_Routing\_Mode, bit [31]

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

Interrupt_Routing_Mode	Meaning
0b0	Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.
0b1	Interrupts routed to any PE defined as a participating node.

If GICD\_IROUTER<n>.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending ~~behavior it is will not be forwarded to any PE and will remain pending.~~   
CONSTRAINED UNPREDICTABLE:

- The interrupt is not forwarded to any PE, direct reads return the written value
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the UNKNOWN implemented PE
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the written value

In implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI.

When this bit is set to 1, GICD\_IROUTER<n>.{Aff3, Aff2, Aff1, Aff0} are UNKNOWN.

---

#### Note

An implementation might choose to make the Aff<n> fields RO when this field is 1.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [30:24]

Reserved, RES0.

### Aff2, bits [23:16]

Affinity level 2, an intermediate affinity level field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Aff1, bits [15:8]

Affinity level 1, an intermediate affinity level field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Aff0, bits [7:0]

Affinity level 0, the most significant affinity level field.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

For an SPI with INTID m:

- The corresponding GICD\_IROUTER<n> register number, n, is given by  $n = m$ .
- The offset of the GICD\_IROUTER<n> register is  $0x6000 + 8n$ .

## Accessing the GICD\_IROUTER<n>

These registers are used only when affinity routing is enabled. When affinity routing is not enabled:

- These registers are RES0. An implementation is permitted to make the register RAZ/WI in this case.
- The [GICD\\_ITARGETSR<n>](#) registers provide interrupt routing information.

---

#### Note

When affinity routing becomes enabled for a Security state (for example, following a reset or following a write to [GICD\\_CTLR](#)) the value of all writeable fields in this register is UNKNOWN for that Security state. When the group of an interrupt changes so the ARE setting for the interrupt changes to 1, the value of this register is UNKNOWN for that interrupt.

---

If [GICD\\_CTLR.DS](#)=0, unless the [GICD\\_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any GICD\_IROUTER<n> registers that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

### Bits [63:40]

Reserved, RES0.

### Aff3, bits [39:32]

Affinity level 3, the least significant affinity level field.

### Interrupt\_Routing\_Mode, bit [31]

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

Interrupt_Routing_Mode	Meaning
0b0	Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.
0b1	Interrupts routed to any PE defined as a participating node.

If GICD\_IROUTER<n>E.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending **behavior it is will not be forwarded to any PE and will remain pending. CONSTRAINED UNPREDICTABLE:**

- The interrupt is not forwarded to any PE, direct reads return the written value
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the UNKNOWN implemented PE
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the written value

In implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI.

When this bit is set to 1, GICD\_IROUTER<n>E.{Aff3, Aff2, Aff1, Aff0} are UNKNOWN.

**Note**

An implementation might choose to make the Aff<n> fields RO when this field is 1.

**Bits [30:24]**

Reserved, RES0.

**Aff2, bits [23:16]**

Affinity level 2, an intermediate affinity level field.

**Aff1, bits [15:8]**

Affinity level 1, an intermediate affinity level field.

**Aff0, bits [7:0]**

Affinity level 0, the most significant affinity level field.

For an SPI with INTID m:

- The corresponding GICD\_IROUTER<n>E register number, n, is given by  $n = m$ .
- The offset of the GICD\_IROUTER<n>E register is  $0x6000 + 8n$ .

**Accessing the GICD\_IROUTER<n>E**

When affinity routing is not enabled for the Security state of an interrupt in GICD\_IROUTER<n>E, the register is RES0.

When GICD\_CTLR.DS==0, a register that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICD\_IROUTER<n>E can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Distributor	$0x8000 + (8 * n)$	GICD_IROUTER<n>E

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489ec15ad1565345720bed2a

(old)	htmldiff from-	(new)
-------	----------------	-------

(old)htmldiff from-(new)

# GICD\_ISACTIVER<n>, Interrupt Set-Active Registers, n = 0 - 31

The GICD\_ISACTIVER<n> characteristics are:

## Purpose

Activates the corresponding interrupt. These registers are used when saving and restoring GIC state.

## Configuration

These registers are available in all GIC configurations. If GICD\_CTLR.DS==0, these registers are Common.

The number of implemented GICD\_ISACTIVER<n> registers is (GICD\_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD\_ISACTIVER0 is Banked for each connected PE with GICR\_TYPER.Processor\_Number < 8.

Accessing GICD\_ISACTIVER0 from a PE with GICR\_TYPER.Processor\_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

## Attributes

GICD\_ISACTIVER<n> is a 32-bit register.

## Field descriptions

The GICD\_ISACTIVER<n> bit assignments are:

31	30	29	28	27	26
Set_active_bit31Set_active_bit<x>, bit [x], for x = 0 to 31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_b

Set\_active\_bit<x>, bit [x], for x = 0 to 31

Set\_active\_bit<x>, bit [x], for x = 31 to 0

Adds the active state to interrupt number 32n + x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

On a Warm reset, thisThis field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_ISACTIVER<n> number, n, is given by  $n = m \text{ DIV } 32$ .
- The offset of the required GICD\_ISACTIVER is  $(0 \times 300 + (4 \times n))$ .
- The bit number of the required group modifier bit in this register is  $m \text{ MOD } 32$ .

## Accessing the GICD\_ISACTIVER<n>

When affinity routing is enabled for the Security state of an interrupt, bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by [GICR\\_ISACTIVER0](#).

Bits corresponding to unimplemented interrupts are RAZ/WI.

If `GICD_CTLR.DS=0`, unless the `GICD_NSACR<n>` registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

The bit reads as one if the status of the interrupt is active or active and pending. [GICD\\_ISPENDR<n>](#) and [GICD\\_ICPENDR<n>](#) provide the pending status of the interrupt.

**GICD\_ISACTIVER<n> can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Distributor	0x0300 + (4 * n)	GICD_ISACTIVER<n>

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICD\_ISACTIVER<n>E, Interrupt Set-Active Registers (extended SPI range), n = 0 - 31

The GICD\_ISACTIVER<n>E characteristics are:

## Purpose

Adds the active state to the corresponding SPI in the extended SPI range.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICD\_ISACTIVER<n>E are RES0.

When GICD\_TYPER.ESPI==0, these registers are RES0.

When GICD\_TYPER.ESPI==1, the number of implemented GICD\_ISACTIVER<n>E registers is (GICD\_TYPER.ESPI\_range+1). Registers are numbered from 0.

## Attributes

GICD\_ISACTIVER<n>E is a 32-bit register.

## Field descriptions

The GICD\_ISACTIVER<n>E bit assignments are:

31	30	29	28	27	26
Set_active_bit31Set_active_bit<x>, bit [x], for x = 0 to 31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_b

Set\_active\_bit<x>, bit [x], for x = 0 to 31

Set\_active\_bit<x>, bit [x], for x = 31 to 0

For the extended SPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

On a Warm reset, thisThis field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_ISACTIVER<n>E number, n, is given by  $n = (m-4096) \text{ DIV } 32$ .
- The offset of the required GICD\_ISACTIVER<n>E is  $(0x1A00 + (4*n))$ .
- The bit number of the required group modifier bit in this register is  $(m-4096) \text{ MOD } 32$ .

(old)htmldiff from-(new)

# GICD\_ISENABLER<n>, Interrupt Set-Enable Registers, n = 0 - 31

The GICD\_ISENABLER<n> characteristics are:

## Purpose

Enables forwarding of the corresponding interrupt to the CPU interfaces.

## Configuration

These registers are available in all GIC configurations. If [GICD\\_CTLR.DS](#)==0, these registers are Common.

The number of implemented GICD\_ISENABLER<n> registers is ([GICD\\_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD\_ISENABLER0 is Banked for each connected PE with [GICR\\_TYPER.Processor\\_Number](#) < 8.

Accessing GICD\_ISENABLER0 from a PE with [GICR\\_TYPER.Processor\\_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

## Attributes

GICD\_ISENABLER<n> is a 32-bit register.

## Field descriptions

The GICD\_ISENABLER<n> bit assignments are:

31	30	29	28	27	26
Set_enable_bit31Set_enable_bit<x>, bit [x], for x = 0 to 31	Set_enable_bit30	Set_enable_bit29	Set_enable_bit28	Set_enable_bit27	Set_enable_bit26

Set\_enable\_bit<x>, bit [x], for x = 0 to 31

Set\_enable\_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, controls the forwarding of interrupt number 32n + x to the CPU interfaces. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

It is IMPLEMENTATION DEFINED whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to [GICD\\_ISENABLER<n>](#) and [GICD\\_ICENABLER<n>](#) where n=0.

# GICD\_ISPENDR<n>, Interrupt Set-Pending Registers, n = 0 - 31

The GICD\_ISPENDR<n> characteristics are:

## Purpose

Adds the pending state to the corresponding interrupt.

## Configuration

These registers are available in all GIC configurations. If [GICD\\_CTLR.DS](#)==0, these registers are Common.

The number of implemented [GICD\\_ISPENDR<n>](#) registers is ([GICD\\_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD\_ISPENDR0 is Banked for each connected PE with [GICR\\_TYPER.Processor\\_Number](#) < 8.

Accessing GICD\_ISPENDR0 from a PE with [GICR\\_TYPER.Processor\\_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

## Attributes

GICD\_ISPENDR<n> is a 32-bit register.

## Field descriptions

The GICD\_ISPENDR<n> bit assignments are:

31	30	29	28	27
Set_pending_bit31Set_pending_bit<x>, bit [x], for x = 0 to 31	Set_pending_bit30	Set_pending_bit29	Set_pending_bit28	Set_pending_bit27

Set\_pending\_bit<x>, bit [x], for x = 0 to 31

Set\_pending\_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, adds the pending state to interrupt number 32n + x. Reads and writes have the following behavior:

Set pending bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on any PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending: <ul style="list-style-type: none"> <li>On this PE if the interrupt is an SGI or PPI.</li> <li>On at least one PE if the interrupt is an SPI.</li> </ul> If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: <ul style="list-style-type: none"> <li>If the interrupt is an SGI. The pending state of an SGI can be set using <a href="#">GICD_SPENDSGIR&lt;n&gt;</a>.</li> <li>If the interrupt is not inactive and is not active.</li> <li>If the interrupt is already pending because of a write to <a href="#">GICD_ISPENDR&lt;n&gt;</a>.</li> <li>If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.</li> </ul>

On a Warm reset, this field resets to 0.

## Accessing the GICD\_ISPENDR<n>

Set-pending bits for SGIs are read-only and ignore writes. The Set-pending bits for SGIs are provided as [GICD\\_SPENDSGIR<n>](#).

When affinity routing is enabled for the Security state of an interrupt:

- Bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR\_ISPENDR0.
- Bits corresponding to Group 0 and Group 1 Secure interrupts can only be set by Secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If [GICD\\_CTLR.DS](#)==0, unless the [GICD\\_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

**GICD\_ISPENDR<n> can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Distributor	0x0200 + (4 * n)	GICD_ISPENDR<n>

This interface is accessible as follows:

- When [GICD\\_CTLR.DS](#) == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

(new)

The GICD\_ISPENDR<n>E characteristics are:

## Purpose

Adds the pending state to the corresponding SPI in the extended SPI range.

# Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICD\_ISPENDR<n>E are RES0.

When `GICD_TYPER.ESPI=0`, these registers are RES0.

When [GICD\\_TYPER](#).ESPI==1, the number of implemented GICD\_ISPENDR<n>E registers is ([GICD\\_TYPER](#).ESPI range+1). Registers are numbered from 0.

## Attributes

GICD\_ISPENDR<n>E is a 32-bit register.

## Field descriptions

The GICD\_ISPENDR<n>E bit assignments are:

31		30		29		28		27	
Set_pending_bit31		Set_pending_bit<x>		Set_pending_bit30		Set_pending_bit29		Set_pending_bit28	
bit [x], for x = 0 to 31									

**Set\_pending\_bit<x>, bit [x], for x = 0 to 31**

**Set\_pending\_bit<x>, bit [x], for x = 31 to 0**

For the extended SPIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: <ul style="list-style-type: none"> <li>• If the interrupt is already pending because of a write to GICD_ISPENDR&lt;n&gt;E.</li> <li>• If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.</li> </ul>

On a Warm reset, this ~~This~~ field resets to 0.

(old)

htmldiff from-

(new)

# GICD\_ITARGETSR<n>, Interrupt Processor Targets Registers, n = 0 - 254

The GICD\_ITARGETSR<n> characteristics are:

## Purpose

When affinity routing is not enabled, holds the list of target PEs for the interrupt. That is, it holds the list of CPU interfaces to which the Distributor forwards the interrupt if it is asserted and has sufficient priority.

## Configuration

These registers are available in all configurations of the GIC. When [GICD\\_CTLR.DS](#)==0, these registers are Common.

The number of implemented GICD\_ITARGETSR<n> registers is 8\*([GICD\\_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD\_ITARGETSR0 to GICD\_ITARGETSR7 are Banked for each connected PE with [GICR\\_TYPER.Processor\\_Number](#) < 8.

Accessing GICD\_ITARGETSR0 to GICD\_ITARGETSR7 from a PE with [GICR\\_TYPER.Processor\\_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

## Attributes

GICD\_ITARGETSR<n> is a 32-bit register.

## Field descriptions

The GICD\_ITARGETSR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">CPU_targets_offset_3B</a>								<a href="#">CPU_targets_offset_2B</a>								<a href="#">CPU_targets_offset_1B</a>								<a href="#">CPU_targets_offset_0B</a>							

PEs in the system number from 0, and each bit in a PE targets field refers to the corresponding PE. For example, a value of 0x3 means that the Pending interrupt is sent to PEs 0 and 1. For GICD\_ITARGETSR0-GICD\_ITARGETSR7, a read of any targets field returns the number of the PE performing the read.

### CPU\_targets\_offset\_3B, bits [31:24]

PE targets for an interrupt, at byte offset 3.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### CPU\_targets\_offset\_2B, bits [23:16]

PE targets for an interrupt, at byte offset 2.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### CPU\_targets\_offset\_1B, bits [15:8]

PE targets for an interrupt, at byte offset 1.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### CPU\_targets\_offset\_0B, bits [7:0]

PE targets for an interrupt, at byte offset 0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

The bits that are set to 1 in the PE targets field determine which PEs are targeted:

Value of PE targets field	Interrupt targets
0bxxxxxxx1	CPU interface 0
0bxxxxxx1x	CPU interface 1
0bxxxxx1xx	CPU interface 2
0bxxxx1xxx	CPU interface 3
0bxxx1xxxx	CPU interface 4
0bxx1xxxxx	CPU interface 5
0bx1xxxxxx	CPU interface 6
0b1xxxxxxx	CPU interface 7

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_ITARGETSR<n> number, n, is given by  $n = m \text{ DIV } 4$ .
- The offset of the required GICD\_ITARGETSR<n> register is  $(0x800 + (4*n))$ .
- The byte offset of the required Priority field in this register is  $m \text{ MOD } 4$ , where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Software can write to these registers at any time. Any change to a targets field value:

- Has no effect on any active interrupt. This means that removing a CPU interface from a targets list does not cancel an active state for interrupts on that CPU interface. There is no effect on interrupts that are active and pending until the active status is cleared, at which time it is treated as a pending interrupt.
- Has an effect on any pending interrupts. This means:
  - Enables the CPU interface to be chosen as a target for the pending interrupt using an IMPLEMENTATION DEFINED mechanism.
  - Removing a CPU interface from the target list of a pending interrupt removes the pending state of the interrupt on that CPU interface.

## Accessing the GICD\_ITARGETSR<n>

These registers are used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt, the target PEs for an interrupt are defined by [GICD\\_IROUTER<n>](#) and the associated byte in GICD\_ITARGETSR<n> is RES0. An implementation is permitted to make the byte RAZ/WI in this case.

- These registers are byte-accessible.
- A register field corresponding to an unimplemented interrupt is RAZ/WI.
- A field bit corresponding to an unimplemented CPU interface is RAZ/WI.
- GICD\_ITARGETSR0-GICD\_ITARGETSR7 are read-only. Each field returns a value that corresponds only to the PE reading the register.
- It is IMPLEMENTATION DEFINED which, if any, SPIs are statically configured in hardware. The field for such an SPI is read-only, and returns a value that indicates the PE targets for the interrupt.
- If [GICD\\_CTLR.DS](#)==0, unless the [GICD\\_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

In a single connected PE implementation, all interrupts target one PE, and these registers are RAZ/WI.

---

### Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

---

This interface is accessible as follows:

- 3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489ee15ad1565345720bed2a

# GICD\_NSACR<n>, Non-secure Access Control Registers, n = 0 - 63

The GICD\_NSACR<n> characteristics are:

## Purpose

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

## Configuration

The concept of selective enabling of Non-secure access to Group 0 and Secure Group 1 interrupts applies to SGIs and SPIs.

GICD\_NSACR0 is a Banked register used for SGIs. A copy is provided for every PE that has a CPU interface and that supports this feature.

## Attributes

GICD\_NSACR<n> is a 32-bit register.

## Field descriptions

The GICD\_NSACR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	:
NS_access15	NS_access<x>														
bits [2x+1:2x], for x = 0 to 15	NS_access14	NS_access13	NS_access12	NS_access11	NS_access10	NS_access9	NS_acc								

NS\_access<x>, bits [2x+1:2x], for x = 0 to 15

NS\_access<x>, bits [2x+1:2x], for x = 15 to 0

Controls Non-secure access of the interrupt with ID 16n + x.

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:

NS_access<x>	Meaning
0b00	No Non-secure access is permitted to fields associated with the corresponding interrupt.
0b01	Non-secure read and write access is permitted to set-pending bits in <a href="#">GICD_ISPENDR&lt;n&gt;</a> associated with the corresponding interrupt. A Non-secure write access to <a href="#">GICD_SETSPI_NSR</a> is permitted to set the pending state of the corresponding interrupt. A Non-secure write access to <a href="#">GICD_SGIR</a> is permitted to generate a Secure SGI for the corresponding interrupt. An implementation might also provide read access to clear-pending bits in <a href="#">GICD_ICPENDR&lt;n&gt;</a> associated with the corresponding interrupt.
0b10	As 0b01, but adds Non-secure read and write access permission to fields associated with the corresponding interrupt in the <a href="#">GICD_ICPENDR&lt;n&gt;</a> registers. A Non-secure write access to <a href="#">GICD_CLRSPI_NSR</a> is permitted to clear the pending state of the corresponding interrupt. Also adds Non-secure read access permission to fields associated with the corresponding interrupt in the <a href="#">GICD_ISACTIVER&lt;n&gt;</a> and <a href="#">GICD_ICACTIVER&lt;n&gt;</a> registers.
0b11	For GICD_NSACR0 this encoding is reserved and treated as 10. For all other GICD_NSACR<n> registers this encoding is treated as 0b10, but adds Non-secure read and write access permission to <a href="#">GICD_ITARGETSR&lt;n&gt;</a> and <a href="#">GICD_IROUTER&lt;n&gt;</a> fields associated with the corresponding interrupt.

On a Warm reset, this ~~This~~ field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD\_NSACR<n> number, n, is given by  $n = m \text{ DIV } 16$ .
- The offset of the required GICD\_NSACR<n> register is  $(0xE00 + (4*n))$ .

#### Note

Because each field in this register comprises two bits, GICD\_NSACR0 controls access rights to SGI registers, GICD\_NSACR1 controls access to PPI registers (and is always RAZ/WI), and all other GICD\_NSACR<n> registers control access to SPI registers.

For compatibility with GICv2, writes to GICD\_NSACR0 for a particular PE must be coordinated within the Distributor and must update [GICR\\_NSACR](#) for the Redistributor associated with that PE.

## Accessing the GICD\_NSACR<n>

When [GICD\\_CTLR.DS](#)==1, this register is RAZ/WI.

~~These registers are Secure, and are RAZ/WI to Non-secure accesses.~~

These registers are always used when affinity routing is not enabled. When affinity routing is enabled for the Secure state, GICD\_NSACR0 is RES0 and [GICR\\_NSACR](#) provides equivalent functionality for SGIs.

These registers do not support PPIs, therefore GICD\_NSACR1 is RAZ/WI.

**GICD\_NSACR<n> can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Distributor	$0xE00 + (4 * n)$	GICD_NSACR<n>

This interface is accessible as follows:

~~When an access is Secure access on this interface are RW.~~

- When GICD\_CTLR.DS == 1 accesses to this register are **RAZ/WI**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RAZ/WI**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# GICD\_NSACR<n>E, Non-secure Access Control Registers, n = 0 - 63

The GICD\_NSACR<n>E characteristics are:

## Purpose

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICD\_NSACR<n>E are RES0.

When [GICD\\_TYPER](#).ESPI==0, these registers are RES0.

When [GICD\\_TYPER](#).ESPI==1, the number of implemented GICD\_ICFGR<n>E registers is (([GICD\\_TYPER](#).ESPI\_range+1)\*2). Registers are numbered from 0.

## Attributes

GICD\_NSACR<n>E is a 32-bit register.

## Field descriptions

The GICD\_NSACR<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
NS_access15NS_access<x>, bits [2x+1:2x], for x = 0 to 15		NS_access14NS_access13NS_access12NS_access11NS_access10NS_access9NS_access8NS_access7NS_access6NS_access5NS_access4NS_access3NS_access2NS_access1NS_access0													

NS\_access<x>, bits [2x+1:2x], for x = 0 to 15

NS\_access<x>, bits [2x+1:2x], for x = 15 to 0

Controls Non-secure access of the interrupt with ID 16n + x.

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:

97 #include &lt;sys/uio.h&gt; 98 #include &lt;sys/errno.h&gt; 99 #include &lt;sys/signal.h&gt; 100 #include &lt;sys/unistd.h&gt; 101 #include &lt;sys/types.h&gt; 102 #include &lt;sys/stat.h&gt; 103 #include &lt;fcntl.h&gt; 104 #include &lt;sys/time.h&gt; 105 #include &lt;sys/resource.h&gt; 106 #include &lt;sys/wait.h&gt; 107 #include &lt;sys/mman.h&gt; 108 #include &lt;sys/param.h&gt; 109 #include &lt;sys/uio.h&gt; 110 #include &lt;sys/errno.h&gt; 111 #include &lt;sys/signal.h&gt; 112 #include &lt;sys/unistd.h&gt; 113 #include &lt;sys/types.h&gt; 114 #include &lt;sys/stat.h&gt; 115 #include &lt;fcntl.h&gt; 116 #include &lt;sys/time.h&gt; 117 #include &lt;sys/resource.h&gt; 118 #include &lt;sys/wait.h&gt; 119 #include &lt;sys/mman.h&gt; 120 #include &lt;sys/param.h&gt; 121 #include &lt;sys/uio.h&gt; 122 #include &lt;sys/errno.h&gt; 123 #include &lt;sys/signal.h&gt; 124 #include &lt;sys/unistd.h&gt; 125 #include &lt;sys/types.h&gt; 126 #include &lt;sys/stat.h&gt; 127 #include &lt;fcntl.h&gt; 128 #include &lt;sys/time.h&gt; 129 #include &lt;sys/resource.h&gt; 130 #include &lt;sys/wait.h&gt; 131 #include &lt;sys/mman.h&gt; 132 #include &lt;sys/param.h&gt; 133 #include &lt;sys/uio.h&gt; 134 #include &lt;sys/errno.h&gt; 135 #include &lt;sys/signal.h&gt; 136 #include &lt;sys/unistd.h&gt; 137 #include &lt;sys/types.h&gt; 138 #include &lt;sys/stat.h&gt; 139 #include &lt;fcntl.h&gt; 140 #include &lt;sys/time.h&gt; 141 #include &lt;sys/resource.h&gt; 142 #include &lt;sys/wait.h&gt; 143 #include &lt;sys/mman.h&gt; 144 #include &lt;sys/param.h&gt; 145 #include &lt;sys/uio.h&gt; 146 #include &lt;sys/errno.h&gt; 147 #include &lt;sys/signal.h&gt; 148 #include &lt;sys/unistd.h&gt; 149 #include &lt;sys/types.h&gt; 150 #include &lt;sys/stat.h&gt; 151 #include &lt;fcntl.h&gt; 152 #include &lt;sys/time.h&gt; 153 #include &lt;sys/resource.h&gt; 154 #include &lt;sys/wait.h&gt; 155 #include &lt;sys/mman.h&gt; 156 #include &lt;sys/param.h&gt; 157 #include &lt;sys/uio.h&gt; 158 #include &lt;sys/errno.h&gt; 159 #include &lt;sys/signal.h&gt; 160 #include &lt;sys/unistd.h&gt; 161 #include &lt;sys/types.h&gt; 162 #include &lt;sys/stat.h&gt; 163 #include &lt;fcntl.h&gt; 164 #include &lt;sys/time.h&gt; 165 #include &lt;sys/resource.h&gt; 166 #include &lt;sys/wait.h&gt; 167 #include &lt;sys/mman.h&gt; 168 #include &lt;sys/param.h&gt; 169 #include &lt;sys/uio.h&gt; 170 #include &lt;sys/errno.h&gt; 171 #include &lt;sys/signal.h&gt; 172 #include &lt;sys/unistd.h&gt; 173 #include &lt;sys/types.h&gt; 174 #include &lt;sys/stat.h&gt; 175 #include &lt;fcntl.h&gt; 176 #include &lt;sys/time.h&gt; 177 #include &lt;sys/resource.h&gt; 178 #include &lt;sys/wait.h&gt; 179 #include &lt;sys/mman.h&gt; 180 #include &lt;sys/param.h&gt; 181 #include &lt;sys/uio.h&gt; 182 #include &lt;sys/errno.h&gt; 183 #include &lt;sys/signal.h&gt; 184 #include &lt;sys/unistd.h&gt; 185 #include &lt;sys/types.h&gt; 186 #include &lt;sys/stat.h&gt; 187 #include &lt;fcntl.h&gt; 188 #include &lt;sys/time.h&gt; 189 #include &lt;sys/resource.h&gt; 190 #include &lt;sys/wait.h&gt; 191 #include &lt;sys/mman.h&gt; 192 #include &lt;sys/param.h&gt; 193 #include &lt;sys/uio.h&gt; 194 #include &lt;sys/errno.h&gt; 195 #include &lt;sys/signal.h&gt; 196 #include &lt;sys/unistd.h&gt; 197 #include &lt;sys/types.h&gt; 198 #include &lt;sys/stat.h&gt; 199 #include &lt;fcntl.h&gt; 200 #include &lt;sys/time.h&gt; 201 #include &lt;sys/resource.h&gt; 202 #include &lt;sys/wait.h&gt; 203 #include &lt;sys/mman.h&gt; 204 #include &lt;sys/param.h&gt; 205 #include &lt;sys/uio.h&gt; 206 #include &lt;sys/errno.h&gt; 207 #include &lt;sys/signal.h&gt; 208 #include &lt;sys/unistd.h&gt; 209 #include &lt;sys/types.h&gt; 210 #include &lt;sys/stat.h&gt; 211 #include &lt;fcntl.h&gt; 212 #include &lt;sys/time.h&gt; 213 #include &lt;sys/resource.h&gt; 214 #include &lt;sys/wait.h&gt; 215 #include &lt;sys/mman.h&gt; 216 #include &lt;sys/param.h&gt; 217 #include &lt;sys/uio.h&gt; 218 #include &lt;sys/errno.h&gt; 219 #include &lt;sys/signal.h&gt; 220 #include &lt;sys/unistd.h&gt; 221 #include &lt;sys/types.h&gt; 222 #include &lt;sys/stat.h&gt; 223 #include &lt;fcntl.h&gt; 224 #include &lt;sys/time.h&gt; 225 #include &lt;sys/resource.h&gt; 226 #include &lt;sys/wait.h&gt; 227 #include &lt;sys/mman.h&gt; 228 #include &lt;sys/param.h&gt; 229 #include &lt;sys/uio.h&gt; 230 #include &lt;sys/errno.h&gt; 231 #include &lt;sys/signal.h&gt; 232 #include &lt;sys/unistd.h&gt; 233 #include &lt;sys/types.h&gt; 234 #include &lt;sys/stat.h&gt; 235 #include &lt;fcntl.h&gt; 236 #include &lt;sys/time.h&gt; 237 #include &lt;sys/resource.h&gt; 238 #include &lt;sys/wait.h&gt; 239 #include &lt;sys/mman.h&gt; 240 #include &lt;sys/param.h&gt; 241 #include &lt;sys/uio.h&gt; 242 #include &lt;sys/errno.h&gt; 243 #include &lt;sys/signal.h&gt; 244 #include &lt;sys/unistd.h&gt; 245 #include &lt;sys/types.h&gt; 246 #include &lt;sys/stat.h&gt; 247 #include &lt;fcntl.h&gt; 248 #include &lt;sys/time.h&gt; 249 #include &lt;sys/resource.h&gt; 250 #include &lt;sys/wait.h&gt; 251 #include &lt;sys/mman.h&gt; 252 #include &lt;sys/param.h&gt; 253 #include &lt;sys/uio.h&gt; 254 #include &lt;sys/errno.h&gt; 255 #include &lt;sys/signal.h&gt; 256 #include &lt;sys/unistd.h&gt; 257 #include &lt;sys/types.h&gt; 258 #include &lt;sys/stat.h&gt; 259 #include &lt;fcntl.h&gt; 260 #include &lt;sys/time.h&gt; 261 #include &lt;sys/resource.h&gt; 262 #include &lt;sys/wait.h&gt; 263 #include &lt;sys/mman.h&gt; 264 #include &lt;sys/param.h&gt; 265 #include &lt;sys/uio.h&gt; 266 #include &lt;sys/errno.h&gt; 267 #include &lt;sys/signal.h&gt; 268 #include &lt;sys/unistd.h&gt; 269 #include &lt;sys/types.h&gt; 270 #include &lt;sys/stat.h&gt; 271 #include &lt;fcntl.h&gt; 272 #include &lt;sys/time.h&gt; 273 #include &lt;sys/resource.h&gt; 274 #include &lt;sys/wait.h&gt; 275 #include &lt;sys/mman.h&gt; 276 #include &lt;sys/param.h&gt; 277 #include &lt;sys/uio.h&gt; 278 #include &lt;sys/errno.h&gt; 279 #include &lt;sys/signal.h&gt; 280 #include &lt;sys/unistd.h&gt; 281 #include &lt;sys/types.h&gt; 282 #include &lt;sys/stat.h&gt; 283 #include &lt;fcntl.h&gt; 284 #include &lt;sys/time.h&gt; 285 #include &lt;sys/resource.h&gt; 286 #include &lt;sys/wait.h&gt; 287 #include &lt;sys/mman.h&gt; 288 #include &lt;sys/param.h&gt; 289 #include &lt;sys/uio.h&gt; 290 #include &lt;sys/errno.h&gt; 291 #include &lt;sys/signal.h&gt; 292 #</pre>		

For interrupt ID  $m$ , when DIV and MOD are the integer division and modulo operations:

- When GICD\_CTLR.DS == **10** accesses to this register are **RAZ/WI**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RAZ/WI**.

- (old)

## htmldiff from-

- The offset of the required field within the register GICD\_SPENDSGIR<n> is given by  $m \text{ MOD } 4$ .
- The required bit in the 8-bit SGI set-pending field  $m$  is bit  $C$ .

## Accessing the GICD\_SPENDSGIR<n>

These registers are used only when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt then the bit associated with SGI in that Security state is RES0. An implementation is permitted to make the register RAZ/WI in this case.

A register bit that corresponds to an unimplemented SGI is RAZ/WI.

These registers are byte-accessible.

If the GIC implementation supports two Security states:

- A register bit that corresponds to a Group 0 interrupt is RAZ/WI to Non-secure accesses.
- Register bits corresponding to unimplemented PEs are RAZ/WI.

**GICD\_SPENDSGIR<n> can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Distributor	0x0F20 + (4 * n)	GICD_SPENDSGIR<n>

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICD\_TYPER, Interrupt Controller Type Register

The GICD\_TYPER characteristics are:

## Purpose

Provides information about what features the GIC implementation supports. It indicates:

- Whether the GIC implementation supports two Security states.
- The maximum number of INTIDs that the GIC implementation supports.
- The number of PEs that can be used as interrupt targets.

## Configuration

This register is available in all configurations of the GIC. When [GICD\\_CTLR.DS](#)==0, this register is Common.

## Attributes

GICD\_TYPER is a 32-bit register.

## Field descriptions

The GICD\_TYPER bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ESPI_range	RSS	No1N	A3V	IDbits	DVIS	LPIS	MBIS	num_LPIs	SecurityExtn	RES0	ESPI	CPUNumber	ITLinesNumber																		

ESPI\_range, bits [31:27]

When GICD\_TYPER.ESPI == 1:

ESPI\_range, bits [31:27]

When GICD\_TYPER.ESPI == 1:

Indicates the maximum INTID in the Extended SPI range.

- Maximum Extended SPI INTID is  $(32 * (\text{ESPI\_range} + 1) + 4095)$

Maximum Extended SPI INTID is  $(32 * (\text{ESPI\_range} + 1) + 4095)$

Otherwise:

Reserved, RES0.

### RSS, bit [26]

Range Selector Support.

RSS	Meaning
0b0	The IRI supports targeted SGIs with affinity level 0 values of 0 - 15.
0b1	The IRI supports targeted SGIs with affinity level 0 values of 0 - 255.

**No1N, bit [25]**

Indicates whether 1 of N SPI interrupts are supported.

No1N	Meaning
0b0	1 of N SPI interrupts are supported.
0b1	1 of N SPI interrupts are not supported.

**A3V, bit [24]**

Affinity 3 valid. Indicates whether the Distributor supports nonzero values of Affinity level 3.

A3V	Meaning
0b0	The Distributor only supports zero values of Affinity level 3.
0b1	The Distributor supports nonzero values of Affinity level 3.

**IDbits, bits [23:19]**

The number of interrupt identifier bits supported, minus one.

**DVIS, bit [18]**

When **FEAT\_GICv4** **FEAT\_GICv3** is **not** implemented:

Indicates whether the implementation supports Direct Virtual LPI injection.

DVIS	Meaning
0b0	The implementation does not support Direct Virtual LPI injection.
0b1	The implementation supports Direct Virtual LPI injection.

Otherwise:

Reserved, RES0.

**LPIS, bit [17]**

Indicates whether the implementation supports LPIS.

LPIS	Meaning
0b0	The implementation does not support LPIS.
0b1	The implementation supports LPIS.

**MBIS, bit [16]**

Indicates whether the implementation supports message-based interrupts by writing to Distributor registers.

MBIS	Meaning
0b0	The implementation does not support message-based interrupts by writing to Distributor registers. The <a href="#">GICD_CLRSPI_NSR</a> , <a href="#">GICD_SETSPI_NSR</a> , <a href="#">GICD_CLRSPI_SR</a> , and <a href="#">GICD_SETSPI_SR</a> registers are reserved.
0b1	The implementation supports message-based interrupts by writing to the <a href="#">GICD_CLRSPI_NSR</a> , <a href="#">GICD_SETSPI_NSR</a> , <a href="#">GICD_CLRSPI_SR</a> , or <a href="#">GICD_SETSPI_SR</a> registers.

**num\_LPIs, bits [15:11]**

Number of supported LPIS.

- 0b00000 Number of LPIS as indicated by GICD\_TYPER.IDbits.

- All other values Number of LPis supported is  $2^{(\text{num\_LPis}+1)}$ .
  - Available LPI INTIDs are  $8192..(8192 + 2^{(\text{num\_LPis}+1)} - 1)$ .
  - This field cannot indicate a maximum LPI INTID greater than that indicated by GICD\_TYPER.IDbits.

When the supported INTID width is less than 14 bits, this field is RES0 and no LPis are supported.

### SecurityExtn, bit [10]

Indicates whether the GIC implementation supports two Security states:

When GICD\_CTLR.DS == 1, this field is RAZ.

SecurityExtn	Meaning
0b0	The GIC implementation supports only a single Security state.
0b1	The GIC implementation supports two Security states.

### Bit [9]

Reserved, RES0.

### ESPI, bit [8]

Extended SPI

ESPI	Meaning
0b0	Extended SPI range not implemented.
0b1	Extended SPI range implemented.

### CPUNumber, bits [7:5]

Reports the number of PEs that can be used when affinity routing is not enabled, minus 1.

These PEs must be numbered contiguously from zero, but the relationship between this number and the affinity hierarchy from MPIDR is IMPLEMENTATION DEFINED. If the implementation does not support ARE being zero, this field is 000.

### ITLinesNumber, bits [4:0]

Indicates the maximum SPI INTID range that the GIC implementation supports. If the value of this field is N, the maximum SPI INTID is  $32(N+1)-1$ . For example, indicates 00011 specifies that the maximum SPI supported INTID is 127.

If the maximum value SPI of INTID thisan fieldimplementation might support is N,1019 the (field maximumvalue SPI11111). INTIDRegardless is of  $32(N+1)$  the minusrange 1. of ForINTIDs example, defined 00011by specifies this thatfield, theinterrupt maximumIDs SPI1020-1023 INTIDare inreserved isfor 127.special purposes.

Regardless of the range of INTIDs defined by this field, interrupt IDs 1020-1023 are reserved for special purposes.

A value of 0 indicates no SPIs are support.

#### Note

The value derived from this field specifies the maximum number of SPIs that the GIC implementation might support. An implementation might not implement all SPIs up to this maximum.

The ITLinesNumber field only indicates the maximum number of SPIs that the GIC implementation might support. This value determines the number of instances of the following interrupt registers:

- [GICD\\_IGROUPR<n>](#).

- [GICD\\_ISENBALER<n>.](#)
- [GICD\\_ICENABLER<n>.](#)
- [GICD\\_ISPENDR<n>.](#)
- [GICD\\_ICPENDR<n>.](#)
- [GICD\\_ISACTIVER<n>.](#)
- [GICD\\_ICTACTIVER<n>.](#)
- [GICD\\_IPRIORITYR<n>.](#)
- [GICD\\_ITARGETSR<n>.](#)
- [GICD\\_ICFGR<n>.](#)

The GIC architecture does not require a GIC implementation to support a continuous range of SPI interrupt IDs. Software must check which SPI INTIDs are supported, up to the maximum value indicated by GICD\_TYPER.ITLinesNumber.

## Accessing the GICD\_TYPER

**GICD\_TYPER can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Distributor	0x0004	GICD_TYPER

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICH\_APR<n>, Active Priorities Registers, n = 0 - 3

The GICH\_APR<n> characteristics are:

## Purpose

These registers track which preemption levels are active in the virtual CPU interface, and indicate the current active priority. Corresponding bits are set to 1 in this register when an interrupt is acknowledged, based on [GICH\\_LR<n>](#). Priority, and the least significant bit set is cleared on EOI.

## Configuration

This register is available when the GIC implementation supports interrupt virtualization.

The number of registers required depends on how many bits are implemented in [GICH\\_LR<n>](#). Priority:

- When 5 priority bits are implemented, 1 register is required (GICH\_APR0).
- When 6 priority bits are implemented, 2 registers are required (GICH\_APR0, GICH\_APR1).
- When 7 priority bits are implemented, 4 registers are required (GICH\_APR0, GICH\_APR1, GICH\_APR2, GICH\_APR3).

Unimplemented registers are RAZ/WI.

## Attributes

GICH\_APR<n> is a 32-bit register.

## Field descriptions

The GICH\_APR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

**P<x>, bit [x], for x = 0 to 31**

**P<x>, bit [x], for x = 31 to 0**

Active priorities. Possible values of each bit are:

P<x>	Meaning
0b0	There is no interrupt active at the priority corresponding to that bit.
0b1	There is an interrupt active at the priority corresponding to that bit.

The correspondence between priorities and bits depends on the number of bits of priority that are implemented.

If 5 bits of priority are implemented (bits [7:3] of priority), then there are 32 priority groups, and the active state of these priorities are held in GICH\_APR0 in the bits corresponding to Priority[7:3].

If 6 bits of priority are implemented (bits [7:2] of priority), then there are 64 priority groups, and:

- The active state of priorities 0 - 124 are held in GICH\_APR0 in the bits corresponding to 0:Priority[6:2].
- The active state of priorities 128 - 252 are held in GICH\_APR1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of priority are implemented (bits [7:1] of priority), then there are 128 priority groups, and:

- The active state of priorities 0 - 62 are held in GICH\_APR0 in the bits corresponding to 00:Priority[5:1].
- The active state of priorities 64 - 126 are held in GICH\_APR1 in the bits corresponding to 01:Priority[5:1].
- The active state of priorities 128 - 190 are held in GICH\_APR2 in the bits corresponding to 10:Priority[5:1].
- The active state of priorities 192 - 254 are held in GICH\_APR3 in the bits corresponding to 11:Priority[5:1].

On a Warm reset, this field resets to 0.

## Accessing the GICH\_APR<n>

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- In AArch64:
  - For Group 0, [ICH\\_AP0R<n>\\_EL2](#).
  - For Group 1, [ICH\\_AP1R<n>\\_EL2](#).
- In AArch32:
  - For Group 0, [ICH\\_AP0R<n>](#).
  - For Group 1, [ICH\\_AP1R<n>](#).

**GICH\_APR<n> can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Virtual interface control	$0 \times 00F0 + (4 * n)$	GICH_APR<n>

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bbede489cc15ad1565345720bed2a

# GICH\_EISR, End Interrupt Status Register

The GICH\_EISR characteristics are:

## Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

## Configuration

This register is available when the GIC implementation supports interrupt virtualization.

## Attributes

GICH\_EISR is a 32-bit register.

## Field descriptions

The GICH\_EISR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8
RES0																Status15 bit [n], for n = 0 to 15	Status14	Status13	Status12	Status11	Status10	Status9	Status8

### Bits [31:16]

Reserved, RES0.

### Status<n>, bit [n], for n = 15 to 0

EOI maintenance interrupt status for List register <n>:

Status<n>	Meaning
0b0	GICH_LR<n> does not have an EOI maintenance interrupt.
0b1	GICH_LR<n> has an EOI maintenance interrupt that has not been handled.

For any GICH\_LR<n> register, the corresponding status bit is set to 1 if all of the following are true:

- GICH\_LR<n>.State is 0b00.
- GICH\_LR<n>.HW == 0.
- GICH\_LR<n>.EOI == 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the GICH\_EISR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH\_EISR provides equivalent functionality.
- For AArch64 implementations, ICH\_EISR\_EL2 provides equivalent functionality.

Bits corresponding to unimplemented List registers are RAZ.

Component	Offset	Instance
GIC Virtual interface control	0x0020	GICH_EISR

- When GICD\_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

# GICH\_ELRSR, Empty List Register Status Register

The GICH\_ELRSR characteristics are:

## Purpose

Indicates which List registers contain valid interrupts.

## Configuration

This register is available when the GIC implementation supports interrupt virtualization.

## Attributes

GICH\_ELRSR is a 32-bit register.

## Field descriptions

The GICH\_ELRSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8
RES0																Status15	Status14	Status13	Status12	Status11	Status10	Status9	Status8

### Bits [31:16]

Reserved, RES0.

### Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>:

Status<n>	Meaning
0b0	GICH_LR<n>, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.
0b1	GICH_LR<n> does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.

For any GICH\_LR<n> register, the corresponding status bit is set to 1 if GICH\_LR<n>.State is 0b00 and either:

- GICH\_LR<n>.HW == 1.
- GICH\_LR<n>.EOI == 0.

On a Warm reset, this field resets to 1.

## Accessing the GICH\_ELRSR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH\_ELRSR provides equivalent functionality.
- For AArch64 implementations, ICH\_ELRSR\_EL2 provides equivalent functionality.

Bits corresponding to unimplemented List registers are RES0.

This interface is accessible as follows:

- 3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

(old)	htmldiff from-	(new)
-------	----------------	-------

The GICH\_HCR characteristics are:

## Purpose

Controls the virtual CPU interface.

## Configuration

This register is available when the GIC implementation supports interrupt virtualization.

## Attributes

GICH\_HCR is a 32-bit register.

## Field descriptions

The GICH\_HCR bit assignments are:

3130292827262524232221201918171615141312111098										7	6	5	4	3	2	1	0
EOICount	RES0							VGrp1DIE	VGrp1EIE	VGrp0DIE	VGrp0EIE	NPIEL	RENPIEL	UIEEn			

**EOICount, bits [31:27]**

Counts the number of EOIs received that do not have a corresponding entry in the List registers. The virtual CPU interface increments this field automatically when a matching EOI is received. EOIs that do not clear a bit in [GICH\\_APR<n>](#) do not cause an increment. If an EOI occurs when the value of this field is 31, then the field wraps to 0.

The maintenance interrupt is asserted whenever this field is nonzero and GICH\_HCR.LRENPIE == 1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [26:8]**

Reserved, RES0.

### VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is disabled:

VGrp1DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">GICV_CTLR.EnableGrp1</a> == 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is enabled:

VGrp1EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">GICV_CTLR.EnableGrp1 == 1</a> .

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is disabled:

VGrp0DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">GICV_CTLR.EnableGrp0 == 0</a> .

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is enabled:

VGrp0EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when <a href="#">GICV_CTLR.EnableGrp0 == 1</a> .

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### NPIE, bit [3]

No Pending Interrupt Enable.

Enables the signaling of a maintenance interrupt while no pending interrupts are present in the List registers:

NPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable.

Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register for an EOI request:

LRENPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while <a href="#">GICH_HCR.EOICount</a> is not 0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

# GICH\_LR<n>, List Registers, n = 0 - 15

The GICH\_LR<n> characteristics are:

## Purpose

These registers provide context information for the virtual CPU interface.

## Configuration

This register is available when the GIC implementation supports interrupt virtualization.

A maximum of 16 List registers can be provided. [GICH\\_VTR](#).ListRegs defines the number implemented. Unimplemented List registers are RAZ/WI.

## Attributes

GICH\_LR<n> is a 32-bit register.

## Field descriptions

The GICH\_LR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HWGroup		State	Priority					RES0			pINTID												vINTID								

### HW, bit [31]

Indicates whether this virtual interrupt is a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt corresponding to the INTID:

HW	Meaning
0b0	This interrupt is triggered entirely in software. No notification is sent to the Distributor when the virtual interrupt is deactivated.
0b1	A hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using GICH_LR<n>.pINTID to indicate the physical interrupt identifier. If <a href="#">GICV_CTLR</a> .EOImode == 0, this request corresponds to a write to <a href="#">GICV_EOIR</a> or <a href="#">GICV_AEOIR</a> , otherwise it corresponds to a write to <a href="#">GICV_DIR</a> .

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Group, bit [30]

Indicates whether the interrupt is Group 0 or Group 1:

Group	Meaning
0b0	Group 0 virtual interrupt. <a href="#">GICV_CTLR</a> .FIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and <a href="#">GICV_CTLR</a> .EnableGrp0 enables signaling of this interrupt to the virtual machine.
0b1	Group 1 virtual interrupt, signaled as a virtual IRQ. <a href="#">GICV_CTLR</a> .EnableGrp1 enables signaling of this interrupt to the virtual machine.

### Note

---

[GICV\\_CTLR](#).CBPR controls whether [GICV\\_BPR](#) or [GICV\\_ABPR](#) determines if a pending Group 1 interrupt has sufficient priority to preempt current execution.

---

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### State, bits [29:28]

The state of the interrupt. This field has one of the following values:

State	Meaning
0b00	Inactive
0b01	Pending
0b10	Active
0b11	Active and pending

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the inactive state are ignored, except for the purpose of generating virtual maintenance interrupts.

---

#### Note

For hardware interrupts, the active and pending state is held in the Distributor rather than the virtual CPU interface. A hypervisor must only use the active and pending state for software originated interrupts, which are typically associated with virtual devices, or for SGIs.

---

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### Priority, bits [27:23]

The priority of this interrupt.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

### Bits [22:20]

Reserved, RES0.

### pINTID, bits [19:10]

The function of this field depends on the value of GICH\_LR<n>.HW.

When GICH\_LR<n>.HW == 0:

- Bit [19] indicates whether the interrupt triggers an EOI maintenance interrupt. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits [18:13] are reserved, SBZ.
- If the vINTID field value corresponds to an SGI (that is, 0-15), bits [12:10] contain the number of the requesting PE. This appears in the corresponding field of [GICV\\_IAR](#) or [GICV\\_AIAR](#). If the vINTID field value is not 0-15, this field must be cleared to 0.

When GICH\_LR<n>.HW == 1:

- This field indicates the pINTID that the hypervisor forwards to the Distributor. This field is only required to implement enough bits to hold a valid value for the ID configuration. Any unused higher order bits are RAZ/WI.
- If the value of pINTID is 0-15 or 1020-1023, behavior is UNPREDICTABLE. If the value of pINTID is 16-31, this field applies to the PPI associated with this same PE as the virtual CPU interface requesting the deactivation.

On a Warm reset, this [This](#) field resets to an architecturally UNKNOWN value.

# GICH\_MISR, Maintenance Interrupt Status Register

The GICH\_MISR characteristics are:

## Purpose

Indicates which maintenance interrupts are asserted.

## Configuration

This register is available when the GIC implementation supports interrupt virtualization.

## Attributes

GICH\_MISR is a 32-bit register.

## Field descriptions

The GICH\_MISR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								VGrp1D		VGrp1E		VGrp0D		VGrp0E		NPL		REN		U		EOI									

### Bits [31:8]

Reserved, RES0.

### VGrp1D, bit [7]

vPE Group 1 Disabled.

VGrp1D	Meaning
0b0	vPE Group 1 Disabled maintenance interrupt not asserted.
0b1	vPE Group 1 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [GICH\\_HCR.VGrp1DIE](#) == 1 and [GICH\\_VMCR.VENG1](#) == 0.

On a Warm reset, this field resets to 0.

### VGrp1E, bit [6]

vPE Group 1 Enabled.

VGrp1E	Meaning
0b0	vPE Group 1 Enabled maintenance interrupt not asserted.
0b1	vPE Group 1 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [GICH\\_HCR.VGrp1EIE](#) == 1 and [GICH\\_VMCR.VENG1](#) == 1.

On a Warm reset, this field resets to 0.

### VGrp0D, bit [5]

vPE Group 0 Disabled.

VGrp0D	Meaning
0b0	vPE Group 0 Disabled maintenance interrupt not asserted.
0b1	vPE Group 0 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [GICH\\_HCR.VGrp0DIE](#) == 1 and [GICH\\_VMCR.VENG0](#) == 0.

On a Warm reset, this ~~This~~ field resets to 0.

#### VGrp0E, bit [4]

vPE Group 0 Enabled.

VGrp0E	Meaning
0b0	vPE Group 0 Enabled maintenance interrupt not asserted.
0b1	vPE Group 0 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [GICH\\_HCR.VGrp0EIE](#) == 1 and [GICH\\_VMCR.VENG0](#) == 1.

On a Warm reset, this ~~This~~ field resets to 0.

#### NP, bit [3]

No Pending.

NP	Meaning
0b0	No Pending maintenance interrupt not asserted.
0b1	No Pending maintenance interrupt asserted.

This maintenance interrupt is asserted when [GICH\\_HCR.NPIE](#) == 1 and no List register is in the pending state.

On a Warm reset, this ~~This~~ field resets to 0.

#### LREN, bit [2]

List Register Entry Not Present.

LREN	Meaning
0b0	List Register Entry Not Present maintenance interrupt not asserted.
0b1	List Register Entry Not Present maintenance interrupt asserted.

This maintenance interrupt is asserted when [GICH\\_HCR.LRENPIE](#) == 1 and [GICH\\_HCR.EOICount](#) is nonzero.

On a Warm reset, this ~~This~~ field resets to 0.

#### U, bit [1]

Underflow.

U	Meaning
0b0	Underflow maintenance interrupt not asserted.
0b1	Underflow maintenance interrupt asserted.

This maintenance interrupt is asserted when [GICH\\_HCR.UIE](#) == 1 and zero or one of the List register entries are marked as a valid interrupt.

On a Warm reset, this ~~This~~ field resets to 0.

#### EOI, bit [0]

End Of Interrupt.

(old)

# GICH\_VMCR, Virtual Machine Control Register

The GICH\_VMCR characteristics are:

## Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state. This register is updated when a virtual machine updates the virtual CPU interface registers.

## Configuration

This register is available when the GIC implementation supports interrupt virtualization.

## Attributes

GICH\_VMCR is a 32-bit register.

## Field descriptions

The GICH\_VMCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VPMR								VBPR0		VBPR1		RES0						VEOIM		RES0		VCBPR		VFIQEn		VAcKtI		VENG1		VENG0	

### VPMR, bits [31:24]

Virtual priority mask. The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

This alias field is updated when a VM updates [GICV\\_PMR](#).Priority.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if `GICH_VMCR.VCBPR == 1`.

This alias field is updated when a VM updates [GICV\\_BPR](#).Binary\_Point.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 1 interrupt preemption if `GICH_VMCR.VCBPR == 0`.

This alias field is updated when a VM updates [GICV\\_ABPR](#).Binary\_Point.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [17:10]

Reserved, RES0.

**VEOIM, bit [9]**

Virtual EOImode. Possible values of this bit are:

VEOIM	Meaning
0b0	A write of an INTID to <a href="#">GICV_EOIR</a> or <a href="#">GICV_AEOIR</a> drops the priority of the interrupt with that INTID, and also deactivates that interrupt.
0b1	A write of an INTID to <a href="#">GICV_EOIR</a> or <a href="#">GICV_AEOIR</a> only drops the priority of the interrupt with that INTID. Software must write to <a href="#">GICV_DIR</a> to deactivate the interrupt.

This alias field is updated when a VM updates [GICV\\_CTLR](#).EOImode.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**Bits [8:5]**

Reserved, RES0.

**VCBPR, bit [4]**

Virtual Common Binary Point Register. Possible values of this bit are:

VCBPR	Meaning
0b0	<a href="#">GICV_ABPR</a> determines the preemption group for Group 1 interrupts.
0b1	<a href="#">GICV_BPR</a> determines the preemption group for Group 1 interrupts.

This alias field is updated when a VM updates [GICV\\_CTLR](#).CBPR.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**VFIQEn, bit [3]**

Virtual FIQ enable. Possible values of this bit are:

VFIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

This alias field is updated when a VM updates [GICV\\_CTLR](#).FIQEn.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**VAckCtl, bit [2]**

Virtual AckCtl. Possible values of this bit are:

VAckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of <a href="#">GICV_IAR</a> or <a href="#">GICV_HPPIR</a> returns an INTID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of <a href="#">GICV_IAR</a> or <a href="#">GICV_HPPIR</a> returns the INTID of the corresponding interrupt.

This alias field is updated when a VM updates [GICV\\_CTLR](#).AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

(old)

htmldiff from-

(new)

# GICR\_CTLR, Redistributor Control Register

The GICR\_CTLR characteristics are:

## Purpose

Controls the operation of a Redistributor, and enables the signaling of LPIs by the Redistributor to the connected PE.

## Configuration

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_CTLR is a 32-bit register.

## Field descriptions

The GICR\_CTLR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
UWP	RES0	DPG1S	DPG1NS	DPG0	RES0														RWP	IR	CES	EnableLPIs									

### UWP, bit [31]

Upstream Write Pending. Read-only. Indicates whether all upstream writes have been communicated to the Distributor.

UWP	Meaning
0b0	The effects of all upstream writes have been communicated to the Distributor, including any Generate SGI packets. For more information, see 'Generate SGI (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).
0b1	Not all the effects of upstream writes, including any Generate SGI packets, have been communicated to the Distributor. For more information, see 'Generate SGI (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

### Bits [30:27]

Reserved, RES0.

### DPG1S, bit [26]

Disable Processor selection for Group 1 Secure interrupts. When [GICR\\_TYPER.DPGS](#) == 1:

DPG1S	Meaning
0b0	A Group 1 Secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Secure Group 1 interrupts are enabled.
0b1	A Group 1 Secure SPI configured to use the 1 of N distribution model cannot select this PE.

When [GICR\\_TYPER.DPGS](#) == 0 this bit is RAZ/WI.

When [GICD\\_CTLR.DS](#)==1, this field is RAZ/WI. In GIC implementations that support two Security states, this field is only accessible by Secure accesses, and is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when [GICD\\_CTLR.ARE\\_S](#)==0.

On a Warm reset, this ~~This~~ field resets to 0.

#### DPG1NS, bit [25]

Disable Processor selection for Group 1 Non-secure interrupts. When [GICR\\_TYPER.DPGS](#) == 1:

DPG1NS	Meaning
0b0	A Group 1 Non-secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Non-secure Group 1 interrupts are enabled.
0b1	A Group 1 Non-secure SPI configured to use the 1 of N distribution model cannot select this PE.

When [GICR\\_TYPER.DPGS](#) == 0 this bit is RAZ/WI.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when [GICD\\_CTLR.ARE\\_NS](#)==0.

On a Warm reset, this ~~This~~ field resets to 0.

#### DPG0, bit [24]

Disable Processor selection for Group 0 interrupts. When [GICR\\_TYPER.DPGS](#) == 1:

DPG0	Meaning
0b0	A Group 0 SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Group 0 interrupts are enabled.
0b1	A Group 0 SPI configured to use the 1 of N distribution model cannot select this PE.

When [GICR\\_TYPER.DPGS](#) == 0 this bit is RAZ/WI.

When [GICD\\_CTLR.DS](#) == 1, this field is always accessible. In GIC implementations that support two Security states, this field is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when [GICD\\_CTLR.ARE\\_S](#) == 0.

On a Warm reset, this ~~This~~ field resets to 0.

#### Bits [23:4]

Reserved, RES0.

#### RWP, bit [3]

Register Write Pending. This bit indicates whether a register write for the current Security state is in progress or not.

RWP	Meaning
0b0	The effect of all previous writes to the following registers are visible to all agents in the system: <ul style="list-style-type: none"> <li><a href="#">GICR_ICENABLER0</a></li> <li><a href="#">GICR_CTLR.DPG1S</a></li> <li><a href="#">GICR_CTLR.DPG1NS</a></li> <li><a href="#">GICR_CTLR.DPG0</a></li> <li><a href="#">GICR_CTLR</a>, which clears EnableLPis from 1 to 0.</li> <li>In FEAT_GICv4p1, <a href="#">GICR_VPROPBASER</a>, which clears Valid from 1 to 0.</li> </ul>
0b1	The effect of all previous writes to the following registers are not guaranteed by the architecture to be visible to all agents in the system while the changes are still being propagated: <ul style="list-style-type: none"> <li><a href="#">GICR_ICENABLER0</a></li> <li><a href="#">GICR_CTLR.DPG1S</a></li> <li><a href="#">GICR_CTLR.DPG1NS</a></li> <li><a href="#">GICR_CTLR.DPG0</a></li> <li><a href="#">GICR_CTLR</a>, which clears EnableLPis from 1 to 0.</li> <li>In FEAT_GICv4p1, <a href="#">GICR_VPROPBASER</a>, which clears Valid from 1 to 0.</li> </ul>

**IR, bit [2]**

LPI invalidate registers supported.

This bit is read-only.

IR	Meaning
0b0	This bit does not indicate whether the GICR_INVLPIR, GICR_INVALLR and GICR_SYNCNR are implemented or not.
0b1	GICR_INVLPIR, GICR_INVALLR and GICR_SYNCNR are implemented.

If [GICR\\_TYPER](#).DirectLPI is 1 or [GICR\\_TYPER](#).RVPEI is 1, [GICR\\_INVLPIR](#), [GICR\\_INVALLR](#), and [GICR\\_SYNCNR](#) are always implemented.

Arm recommends that implementations report GICR\_CTLR.IR as 1 in these cases.

**CES, bit [1]**

Clear Enable Supported.

This bit is read-only.

CES	Meaning
0b0	The IRI does not indicate whether GICR_CTLR.EnableLPis is RES1 once set.
0b1	GICR_CTLR.EnableLPis is not RES1 once set.

Implementing GICR\_CTLR.EnableLPis as programmable and not reporting GICR\_CTLR.CES == 1 is deprecated.

Implementing GICR\_CTLR.EnableLPis as RES1 once set is deprecated.

When GICR\_CTLR.CES == 0, software cannot assume that GICR\_CTLR.EnableLPis is programmable without observing the bit being cleared.

**EnableLPis, bit [0]**

In implementations where affinity routing is enabled for the Security state:

EnableLPis	Meaning
0b0	LPI support is disabled. Any doorbell interrupt generated as a result of a write to a virtual LPI register must be discarded, and any ITS translation requests or commands involving LPis in this Redistributor are ignored.
0b1	LPI support is enabled.

**Note**

If [GICR\\_TYPER](#).PLPIS == 0, this field is RES0. If [GICD\\_CTLR](#).ARE\_NS is written from 1 to 0 when this bit is 1, behavior is an IMPLEMENTATION DEFINED choice between clearing GICR\_CTLR.EnableLPis to 0 or maintaining its current value.

When affinity routing is not enabled for the Non-secure state, this bit is RES0.

When written from 0 to 1, the Redistributor loads the LPI Pending table from memory to check for any pending interrupts.

After it has been written to 1, it is IMPLEMENTATION DEFINED whether the bit becomes RES1 or can be cleared by to 0.

Where the bit remains programmable:

- Software must observe GICR\_CTLR.RWP==0 after clearing GICR\_CTLR.EnableLPis from 1 to 0 before writing [GICR\\_PENDBASER](#) or [GICR\\_PROPBASER](#), otherwise behavior is UNPREDICTABLE.
- Software must observe GICR\_CTLR.RWP==0 after clearing GICR\_CTLR.EnableLPis from 1 to 0 before setting GICR\_CTLR.EnableLPis to 1, otherwise behavior is UNPREDICTABLE.

**Note**

If one or more ITS is implemented, Arm strongly recommends that all LPis are mapped to another Redistributor before GICR\_CTLR.EnableLPis is cleared to 0.

On a Warm reset, this field resets to 0.

The participation of a PE in the 1 of N distribution model for a given interrupt group is governed by the concatenation of [GICR\\_WAKER](#).ProcessorSleep, the appropriate [GICR\\_CTLR](#).DPG{1, 0} bit, and the PE interrupt group enable. The behavior options are:

PS	DPG{1S, 1NS, 0}	Enable	PE Behavior
0b0	0b0	0b0	The PE cannot be selected.
0b0	0b0	0b1	The PE can be selected.
0b0	0b1	*	The PE cannot be selected.
0b1	*	*	The PE cannot be selected when <a href="#">GICD_CTLR</a> .E1NWF == 0. When <a href="#">GICD_CTLR</a> .E1NWF == 1, the mechanism by which PEs are selected is IMPLEMENTATION DEFINED.

If an SPI using the 1 of N distribution model has been forwarded to the PE, and a write to GICR\_CTLR occurs that changes the DPG bit for the interrupt group of the SPI, the IRI must attempt to select a different target PE for the SPI. This might have no effect on the forwarded SPI if it has already been activated.

## Accessing the GICR\_CTLR

GICR\_CTLR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0000	GICR_CTLR

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

# GICR\_ICACTIVER0, Interrupt Clear-Active Register 0

The GICR\_ICACTIVER0 characteristics are:

## Purpose

Deactivates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

## Configuration

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_ICACTIVER0 is a 32-bit register.

## Field descriptions

The GICR\_ICACTIVER0 bit assignments are:

31	30	29	28	27
Clear_active_bit31Clear_active_bit<x>, bit [x], for x = 0 to 31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27

Clear\_active\_bit<x>, bit [x], for x = 0 to 31

Clear\_active\_bit<x>, bit [x], for x = 31 to 0

Removes the active state from interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the GICR\_ICACTIVER0

When affinity routing is not enabled for the Security state of an interrupt in GICR\_ICACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD\\_ICACTIVER<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD\\_ICACTIVER<n>](#).

When [GICD\\_CTLR](#).DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

This interface is accessible as follows:

- 3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICR\_ICACTIVER<n>E, Interrupt Clear-Active Registers, n = 1 - 2

The GICR\_ICACTIVER<n>E characteristics are:

## Purpose

Removes the active state from the corresponding PPI.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICR\_ICACTIVER<n>E are RES0.

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_ICACTIVER<n>E is a 32-bit register.

## Field descriptions

The GICR\_ICACTIVER<n>E bit assignments are:

31	30	29	28	27
Clear_active_bit31Clear_active_bit<x>, bit [x], for x = 0 to 31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27

Clear\_active\_bit<x>, bit [x], for x = 0 to 31

Clear\_active\_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR\_ICACTIVER<n>E number, n, is given by  $n = (m-1024) \text{ DIV } 32$ .
- The offset of the required GICR\_ICACTIVER<n>E is  $(0x200 + (4*n))$ .
- The bit number of the required group modifier bit in this register is  $(m-1024) \text{ MOD } 32$ .

# GICR\_ICENABLER0, Interrupt Clear-Enable Register 0

The GICR\_ICENABLER0 characteristics are:

## Purpose

Disables forwarding of the corresponding SGI or PPI to the CPU interfaces.

## Configuration

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_ICENABLER0 is a 32-bit register.

## Field descriptions

The GICR\_ICENABLER0 bit assignments are:

31	30	29	28	27
Clear_enable_bit31	Clear_enable_bit30	Clear_enable_bit29	Clear_enable_bit28	Clear_enable_bit27
bit [x], for x = 0 to 31				

**Clear\_enable\_bit<x>, bit [x], for x = 0 to 31**

**Clear\_enable\_bit<x>, bit [x], for x = 31 to 0**

For PPIs and SGIs, controls the forwarding of interrupt number x to the CPU interfaces. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the GICR\_ICENABLER0

When affinity routing is not enabled for the Security state of an interrupt in GICR\_ICENABLER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD\\_ICENABLER<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD\\_ICENABLER<n>](#).

When [GICD\\_CTLR.DS](#) == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

**GICR\_ICENABLER0 can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0180	GICR_ICENABLER0

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

# GICR\_ICENABLER<n>E, Interrupt Clear-Enable Registers, n = 1 - 2

The GICR\_ICENABLER<n>E characteristics are:

## Purpose

Disables forwarding of the corresponding PPI to the CPU interfaces.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICR\_ICENABLER<n>E are RES0.

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_ICENABLER<n>E is a 32-bit register.

## Field descriptions

The GICR\_ICENABLER<n>E bit assignments are:

31	30	29	28	27
Clear_enable_bit31Clear_enable_bit<x>, bit [x], for x = 0 to 31	Clear_enable_bit30	Clear_enable_bit29	Clear_enable_bit28	Clear_enable_bit27

Clear\_enable\_bit<x>, bit [x], for x = 0 to 31

Clear\_enable\_bit<x>, bit [x], for x = 31 to 0

For the extended PPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

On a Warm reset, thisThis field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR\_ICENABLER<n>E number, n, is given by  $n = (m-1024) \text{ DIV } 32$ .
- The offset of the required GICR\_ICENABLER<n>E is  $(0x180 + (4*n))$ .
- The bit number of the required group modifier bit in this register is  $(m-1024) \text{ MOD } 32$ .

# GICR\_ICFGR0, Interrupt Configuration Register 0

The GICR\_ICFGR0 characteristics are:

## Purpose

Determines whether the corresponding SGI is edge-triggered or level-sensitive.

## Configuration

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_ICFGR0 is a 32-bit register.

## Field descriptions

The GICR\_ICFGR0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15
Int_config15Int_config<x>, bits [2x+1:2x], for x = 0 to 15		Int_config14		Int_config13		Int_config12		Int_config11		Int_config10		Int_config9		Int_config8		Int_config7

Int\_config<x>, bits [2x+1:2x], for x = 0 to 15

Int\_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int\_config[0] (bit [2x]) is RES0.

Possible values of Int\_config[1] (bit [2x+1]) are:

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b01	Corresponding interrupt is edge-triggered.

For SGIs, Int\_config[1] is RAO/WI.

A read of this bit always returns the correct value to indicate the interrupt triggering method.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the GICR\_ICFGR0

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD\_ICFGR<n> with n=0.

When GICD\_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

This interface is accessible as follows:

- 3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICR\_ICFGR1, Interrupt Configuration Register 1

The GICR\_ICFGR1 characteristics are:

## Purpose

Determines whether the corresponding PPI is edge-triggered or level-sensitive.

## Configuration

A copy of this register is provided for each Redistributor.

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int\_config field.

Changing Int\_config when the interrupt is individually enabled is UNPREDICTABLE.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

## Attributes

GICR\_ICFGR1 is a 32-bit register.

## Field descriptions

The GICR\_ICFGR1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15
Int_config15	Int_config<x>, bits [2x+1:2x], for x = 0 to 15	Int_config14	Int_config13	Int_config12	Int_config11	Int_config10	Int_config9	Int_config8	Int_config7	Int_config6	Int_config5	Int_config4	Int_config3	Int_config2	Int_config1	Int_config0

Int\_config<x>, bits [2x+1:2x], for x = 0 to 15

Int\_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int\_config[0] (bit [2x]) is RES0.

Possible values of Int\_config[1] (bit [2x+1]) are:

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b01	Corresponding interrupt is edge-triggered.

A read of this bit always returns the correct value to indicate the interrupt triggering method.

For PPIs, Int\_config[1] is programmable unless the implementation supports two Security states and the bit corresponds to a Group 0 or Secure Group 1 interrupt, in which case the bit is RAZ/WI to Non-secure accesses.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the GICR\_ICFGR1

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD\_ICFGR<n> with n=1 .

**GICR\_ICFGR1 can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0C04	GICR_ICFGR1

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICR\_ICFGR<n>E, Interrupt configuration registers, n = 2 - 5

The GICR\_ICFGR<n>E characteristics are:

## Purpose

Determines whether the corresponding PPI in the extended PPI range is edge-triggered or level-sensitive.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICR\_ICFGR<n>E are RES0.

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_ICFGR<n>E is a 32-bit register.

## Field descriptions

The GICR\_ICFGR<n>E bit assignments are:

31	30	29	28	27	26	25	24
Int_config31Int_config<x>, bit [x], for x = 0 to 31	Int_config30	Int_config29	Int_config28	Int_config27	Int_config26	Int_config25	Int_config24

Int\_config<x>, bit [x], for x = 0 to 31

Int\_config<x>, bit [x], for x = 31 to 0

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int\_config[0] (bit [2x]) is RES0.

Possible values of Int\_config[1] (bit [2x+1]) are:

Int_config<x>	Meaning
0b0	The corresponding interrupt is level-sensitive.
0b1	The corresponding interrupt is edge-triggered.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

For each supported extended PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int\_config field.

## Accessing the GICR\_ICFGR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR\_ICFGR<n>E, the corresponding bit is RES0.

When GICD\_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICR\_ICFGR<n>E can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0C00 + (4 * n)	GICR_ICFGR<n>E

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489ec15ad1565345720bed2a

-------	----------------	-------

# GICR\_ICPENDR0, Interrupt Clear-Pending Register 0

The GICR\_ICPENDR0 characteristics are:

## Purpose

Removes the pending state from the corresponding SGI or PPI.

## Configuration

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_ICPENDR0 is a 32-bit register.

## Field descriptions

The GICR\_ICPENDR0 bit assignments are:

31	30	29	28	
Clear_pending_bit31	Clear_pending_bit<x>, bit [x], for x = 0 to 31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28

Clear\_pending\_bit<x>, bit [x], for x = 0 to 31

Clear\_pending\_bit<x>, bit [x], for x = 31 to 0

Removes the pending state from interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: <ul style="list-style-type: none"><li>If the interrupt is not pending and is not active and pending.</li><li>If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to <a href="#">GICD_ISPENDR&lt;n&gt;</a>. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.</li></ul>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the GICR\_ICPENDR0

When affinity routing is not enabled for the Security state of an interrupt in GICR\_ICPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD\\_ICPENDR<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD\\_ICENABLER<n>](#).

When `GICD_CTLR.DS == 0`, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

**GICR\_ICPENDR0 can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0280	GICR_ICPENDR0

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

# GICR\_ICPENDR<n>E, Interrupt Clear-Pending Registers, n = 1 - 2

The GICR\_ICPENDR<n>E characteristics are:

## Purpose

Removes the pending state from the corresponding PPI.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICR\_ICPENDR<n>E are RES0.

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_ICPENDR<n>E is a 32-bit register.

## Field descriptions

The GICR\_ICPENDR<n>E bit assignments are:

31	30	29	28	
Clear_pending_bit31Clear_pending_bit<x>, bit [x], for x = 0 to 31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_per

Clear\_pending\_bit<x>, bit [x], for x = 0 to 31

Clear\_pending\_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the pending state to interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: <ul style="list-style-type: none"><li>If the interrupt is not pending and is not active and pending.</li><li>If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICR_ICPENDR&lt;n&gt;E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.</li></ul>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# GICR\_IGROUPR0, Interrupt Group Register 0

The GICR\_IGROUPR0 characteristics are:

## Purpose

Controls whether the corresponding SGI or PPI is in Group 0 or Group 1.

## Configuration

This register is available in all GIC configurations. If the GIC implementation supports two Security states, this register is Secure.

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_IGROUPR0 is a 32-bit register.

## Field descriptions

The GICR\_IGROUPR0 bit assignments are:

31	30
Redistributor_group_status_bit31Redistributor_group_status_bit<x>, bit [x], for x = 0 to 31	Redistributor_group_status_bit30Redistributor_group_status_bit<x>, bit [x], for x = 0 to 31

Redistributor\_group\_status\_bit<x>, bit [x], for x = 0 to 31

Redistributor\_group\_status\_bit<x>, bit [x], for x = 31 to 0

Group status bit. In this register:

- Bits [31:16] are group status bits for PPIs.
- Bits [15:0] are group status bits for SGIs.

Redistributor_group_status_bit<x>	Meaning
0b0	When <a href="#">GICD_CTLR.DS</a> ==1, the corresponding interrupt is Group 0. When <a href="#">GICD_CTLR.DS</a> ==0, the corresponding interrupt is Secure.
0b1	When <a href="#">GICD_CTLR.DS</a> ==1, the corresponding interrupt is Group 1. When <a href="#">GICD_CTLR.DS</a> ==0, the corresponding interrupt is Non-secure Group 1.

When [GICD\\_CTLR.DS](#) == 0, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICR\\_IGRPMODR0](#) to form a 2-bit field that defines an interrupt group. The encoding of this field is at [GICR\\_IGRPMODR0](#).

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

The considerations for the reset value of this register are the same as those for [GICD\\_IGROUPR<n>](#) with n=0.

htmldiff from-

(new)

# GICR\_IGROUPR<n>E, Interrupt Group Registers, n = 1 - 2

The GICR\_IGROUPR<n>E characteristics are:

## Purpose

Controls whether the corresponding PPI is in Group 0 or Group 1.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICR\_IGROUPR<n>E are RES0.

When [GICD\\_CTLR.DS==0](#), this register is Secure.

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_IGROUPR<n>E is a 32-bit register.

## Field descriptions

The GICR\_IGROUPR<n>E bit assignments are:

31	30	29	28	27
Group_status_bit31Group_status_bit<x>, bit [x], for x = 0 to 31	Group_status_bit30	Group_status_bit29	Group_status_bit28	Group_status_bit27

**Group\_status\_bit<x>, bit [x], for x = 0 to 31**

**Group\_status\_bit<x>, bit [x], for x = 31 to 0**

Group status bit.

Group_status_bit<x>	Meaning
0b0	When <a href="#">GICD_CTLR.DS==1</a> , the corresponding interrupt is Group 0. When <a href="#">GICD_CTLR.DS==0</a> , the corresponding interrupt is Secure.
0b1	When <a href="#">GICD_CTLR.DS==1</a> , the corresponding interrupt is Group 1. When <a href="#">GICD_CTLR.DS==0</a> , the corresponding interrupt is Non-secure Group 1.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR\_IGRPMODR<n>E to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICR\_IGRPMODR<n>E.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR\_IGROUPR<n>E number, n, is given by  $n = (m-1024) \text{ DIV } 32$ .

- The offset of the required GICR\_IGROUPR<n>E is  $(0 \times 080 + (4 * n))$ .
- The bit number of the required group modifier bit in this register is  $(m - 1024) \text{ MOD } 32$ .

## Accessing the GICR\_IGROUPR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR\_IGROUPR<n>E, the corresponding bit is RES0.

When [GICD\\_CTLR.DS](#)=0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

**GICR\_IGROUPR<n>E can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0080 + (4 * n)	GICR_IGROUPR<n>E

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICR\_IGRPMODR0, Interrupt Group Modifier Register 0

The GICR\_IGRPMODR0 characteristics are:

## Purpose

When [GICD\\_CTLR.DS](#)==0, this register together with the [GICR\\_IGROUPR0](#) register, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

## Configuration

When [GICD\\_CTLR.DS](#)==0, this register is Secure.

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_IGRPMODR0 is a 32-bit register.

## Field descriptions

The GICR\_IGRPMODR0 bit assignments are:

31	30	29	28	
Group_modifier_bit31	Group_modifier_bit<x>, bit [x], for x = 0 to 31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28

Group\_modifier\_bit<x>, bit [x], for x = 0 to 31

Group\_modifier\_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICR\\_IGROUPR0](#) to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the GICR\_IGRPMODR0

When affinity routing is not enabled for the Security state of an interrupt in GICR\_IGRPMODR0, the corresponding bit is RES0 and equivalent functionality is provided by [GICD\\_IGRPMODR<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD\\_IGRPMODR<n>](#).

When [GICD\\_CTLR](#).ARE\_S == 0 or [GICD\\_CTLR](#).DS == 1, GICR\_IGRPMODR0 is RES0. An implementation can make this register RAZ/WI in this case.

When `GICD_CTLR.DS==0`, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

### Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

**GICR\_IGRPMODR0 can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0D00	GICR_IGRPMODR0

This interface is accessible as follows:

- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

# GICR\_INVALLR, Redistributor Invalidate All Register

The GICR\_INVALLR characteristics are:

## Purpose

Invalidates any cached configuration data of all physical LPIs, causing the GIC to reload the interrupt configuration from the physical LPI Configuration table at the address specified by [GICR\\_PROPBASER](#).

## Configuration

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_INVALLR is a 64-bit register.

## Field descriptions

The GICR\_INVALLR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
V	RES0															vPEIDV															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### V, bit [63]

When FEAT\_GICv4p1 is implemented:

### V, bit [63]

When FEAT\_GICv4p1 is implemented:

Indicates whether the INTID is virtual or physical.

V	Meaning
0b0	Invalidate is for a physical INTID.
0b1	Invalidate is for a virtual INTID.

Otherwise:

Reserved, RES0.

### Bits [62:48]

Reserved, RES0.

### vPEIDV, bits [47:32]

When FEAT\_GICv4p1 is implemented:

When GICR\_INVLPIR.V == 0, this field is RES0

When GICR\_INVLPIR.V == 1, this field is the target vPEID of the invalidate.

**Note**

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD\\_TYPER2.VIL](#) and [GICD\\_TYPER2.VID](#) fields. Unimplemented bits are RES0.

**Otherwise:**

Reserved, RES0.

**Bits [31:0]**

Reserved, RES0.

**Note**

If any LPI has been forwarded to the PE and a valid write to GICR\_INVALLR is received, the Redistributor must ensure it reloads its properties from memory. This has no effect on the forwarded LPI if it has already been activated.

## Accessing the GICR\_INVALLR

This register is mandatory when any of the following are true:

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

- [GICR\\_TYPER](#).Direct is 1.
- [GICR\\_CTLR](#).IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

Writes to this register have no effect if no physical LPIs are currently stored in the local Redistributor cache.

**GICR\_INVALLR can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x00B0	GICR_INVALLR

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

The GICR\_INVLPPIR characteristics are:

## Purpose

Invalidates the cached configuration data of a specified LPI, causing the GIC to reload the interrupt configuration from the physical LPI Configuration table at the address specified by [GICR\\_PROPBASER](#).

## Configuration

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_INVLPPIR is a 64-bit register.

## Field descriptions

The GICR\_INVLPID bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
V	RES0															vPEID																
INTID																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

## V, bit [63]

**When FEAT\_GICv4p1 is implemented:**

**V, bit [63]**

**When FEAT\_GlCv4p1 is implemented:**

Indicates whether the INTID is virtual or physical.

<b>V</b>	<b>Meaning</b>
<b>0b0</b>	Invalidate is for a physical INTID.
<b>0b1</b>	Invalidate is for a virtual INTID.

**Otherwise:**

Reserved, RES0.

### Bits [62:48]

Reserved, RES0.

**vPEID, bits [47:32]**

**When FEAT\_GICv4p1 is implemented:**

When GICR\_INVLPUR.V == 0, this field is RES0

When GICR INVLPIR.V == 1, this field is the target vPEID of the invalidate.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD\\_TYPER2.VIL](#) and [GICD\\_TYPER2.VID](#) fields. Unimplemented bits are RES0.

Otherwise:

Reserved, RES0.

INTID, bits [31:0]

The INTID of the physical LPI to be cleaned.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD\\_TYPER.IDbits](#) field. Unimplemented bits are RES0.

Note

If any LPI has been forwarded to the PE and a valid write to GICR\_INVLPIR is received, the Redistributor must ensure it reloads its properties from memory and apply any changes by retrieving and reforwarding the LPI as required. This has no effect on the forwarded LPI if it has already been activated.

Accessing the GICR\_INVLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory when any of the following are true:

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

- [GICR\\_TYPER.Direct](#) is 1.
- [GICR\\_CTLR.IR](#) is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

Writes to this register have no effect if either:

- The specified LPI is not currently stored in the local Redistributor.
- The pINTID field corresponds to an unimplemented LPI.

GICR\_INVLPIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x00A0	GICR_INVLPIR

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

# GICR\_IPRIORITYR<n>, Interrupt Priority Registers, n = 0 - 7

The GICR\_IPRIORITYR<n> characteristics are:

## Purpose

Holds the priority of the corresponding interrupt for each SGI and PPI supported by the GIC.

## Configuration

A copy of these registers is provided for each Redistributor.

These registers are configured as follows:

- GICR\_IPRIORITYR0-GICR\_IPRIORITYR3 store the priority of SGIs.
- GICR\_IPRIORITYR4-GICR\_IPRIORITYR7 store the priority of PPIs.

## Attributes

GICR\_IPRIORITYR<n> is a 32-bit register.

## Field descriptions

The GICR\_IPRIORITYR<n> bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Priority_offset_3B								Priority_offset_2B								Priority_offset_1B								Priority_offset_0B							

### Priority\_offset\_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Priority\_offset\_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Priority\_offset\_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Priority\_offset\_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

These registers are used when affinity routing is enabled for the Security state of the interrupt. When affinity routing is not enabled the bits corresponding to the interrupt are RAZ/WI and [GICD\\_IPRIORITYR<n>](#) provides equivalent functionality.

These registers are byte-accessible.

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in 'Software accesses of interrupt priority' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0400 + (4 * n)	GICR_IPRIORITYR<n>

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

# GICR\_IPRIORITYR<n>E, Interrupt Priority Registers (extended PPI range), n = 8 - 23

The GICR\_IPRIORITYR<n>E characteristics are:

## Purpose

Holds the priority of the corresponding interrupt for each extended PPI supported by the GIC.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICR\_IPRIORITYR<n>E are RES0.

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_IPRIORITYR<n>E is a 32-bit register.

## Field descriptions

The GICR\_IPRIORITYR<n>E bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Priority_offset_3B								Priority_offset_2B								Priority_offset_1B								Priority_offset_0B							

### Priority\_offset\_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Priority\_offset\_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Priority\_offset\_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Priority\_offset\_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

For interrupt ID  $m$ , when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR\_IPRIORITYR<n> number, n, is given by  $n = (m-1024) \text{ DIV } 4$ .
- The offset of the required GICR\_IPRIORITYR<n>E register is  $(0x400 + (4*n))$ .
- The byte offset of the required Priority field in this register is  $m \text{ MOD } 4$ , where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

## Accessing the GICR\_IPRIORITYR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR\_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD\_CTLR.DS==0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

## Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

**GICR\_IPRIORITYR<n>E can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0400 + (4 * n)	GICR_IPRIORITYR<n>E

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

# GICR\_ISACTIVER0, Interrupt Set-Active Register 0

The GICR\_ISACTIVER0 characteristics are:

## Purpose

Activates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

## Configuration

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_ISACTIVER0 is a 32-bit register.

## Field descriptions

The GICR\_ISACTIVER0 bit assignments are:

31	30	29	28	27	26
Set_active_bit31Set_active_bit<x>, bit [x], for x = 0 to 31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_b

Set\_active\_bit<x>, bit [x], for x = 0 to 31

Set\_active\_bit<x>, bit [x], for x = 31 to 0

Adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the GICR\_ISACTIVER0

When affinity routing is not enabled for the Security state of an interrupt in GICR\_ISACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD\\_ISACTIVER<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD\\_ISACTIVER<n>](#).

When [GICD\\_CTLR](#).DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

This interface is accessible as follows:

- 3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICR\_ISACTIVER<n>E, Interrupt Set-Active Registers, n = 1 - 2

The GICR\_ISACTIVER<n>E characteristics are:

## Purpose

Adds the active state to the corresponding PPI.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICR\_ISACTIVER<n>E are RES0.

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_ISACTIVER<n>E is a 32-bit register.

## Field descriptions

The GICR\_ISACTIVER<n>E bit assignments are:

31	30	29	28	27	26
Set_active_bit31Set_active_bit<x>, bit [x], for x = 0 to 31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_b

Set\_active\_bit<x>, bit [x], for x = 0 to 31

Set\_active\_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR\_ISACTIVER<n>E number, n, is given by  $n = (m-1024) \text{ DIV } 32$ .
- The offset of the required GICR\_ISACTIVER<n>E is  $(0x200 + (4*n))$ .
- The bit number of the required group modifier bit in this register is  $(m-1024) \text{ MOD } 32$ .

# GICR\_ISENABLER0, Interrupt Set-Enable Register 0

The GICR\_ISENABLER0 characteristics are:

## Purpose

Enables forwarding of the corresponding SGI or PPI to the CPU interfaces.

## Configuration

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_ISENABLER0 is a 32-bit register.

## Field descriptions

The GICR\_ISENABLER0 bit assignments are:

31	30	29	28	27	26
Set_enable_bit31	Set_enable_bit<x>, bit [x], for x = 0 to 31	Set_enable_bit30	Set_enable_bit29	Set_enable_bit28	Set_enable_bit27

**Set\_enable\_bit<x>, bit [x], for x = 0 to 31**

**Set\_enable\_bit<x>, bit [x], for x = 31 to 0**

For PPIs and SGIs, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

On a Warm reset, this field resets to 0.

## Accessing the GICR\_ISENABLER0

When affinity routing is not enabled for the Security state of an interrupt in GICR\_ISENABLER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD\\_ISENABLER<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD\\_ISENABLER<n>](#).

When [GICD\\_CTLR](#).DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

**GICR\_ISENABLER0 can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0100	GICR_ISENABLER0

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489ec15ad1565345720bed2a

# GICR\_ISENABLER<n>E, Interrupt Set-Enable Registers, n = 1 - 2

The GICR\_ISENABLER<n>E characteristics are:

## Purpose

Enables forwarding of the corresponding PPI to the CPU interfaces.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICR\_ISENABLER<n>E are RES0.

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_ISENABLER<n>E is a 32-bit register.

## Field descriptions

The GICR\_ISENABLER<n>E bit assignments are:

31	30	29	28	27	26
Set_enable_bit31Set_enable_bit<x>, bit [x], for x = 0 to 31	Set_enable_bit30	Set_enable_bit29	Set_enable_bit28	Set_enable_bit27	Set_enable_bit26

Set\_enable\_bit<x>, bit [x], for x = 0 to 31

Set\_enable\_bit<x>, bit [x], for x = 31 to 0

For the extended PPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

On a Warm reset, thisThis field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR\_ISENABLER<n>E number, n, is given by  $n = (m-1024) \text{ DIV } 32$ .
- The offset of the required GICR\_ISENABLER<n>E is  $(0 \times 100 + (4 \times n))$ .
- The bit number of the required group modifier bit in this register is  $(m-1024) \text{ MOD } 32$ .

# GICR\_ISPENDR0, Interrupt Set-Pending Register 0

The GICR\_ISPENDR0 characteristics are:

## Purpose

Adds the pending state to the corresponding SGI or PPI.

## Configuration

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_ISPENDR0 is a 32-bit register.

## Field descriptions

The GICR\_ISPENDR0 bit assignments are:

31	30	29	28	27
Set_pending_bit31Set_pending_bit<x>, bit [x], for x = 0 to 31	Set_pending_bit30	Set_pending_bit29	Set_pending_bit28	Set_pending_bit27

Set\_pending\_bit<x>, bit [x], for x = 0 to 31

Set\_pending\_bit<x>, bit [x], for x = 31 to 0

For PPIs and SGIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: <ul style="list-style-type: none"><li>If the interrupt is already pending because of a write to <a href="#">GICR_ISPENDR0</a>.</li><li>If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.</li></ul>

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

## Accessing the GICR\_ISPENDR0

When affinity routing is not enabled for the Security state of an interrupt in GICR\_ISPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD\\_ISPENDR<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD\\_ISPENDR<n>](#).

When `GICD_CTLR.DS == 0`, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

**GICR\_ISPENDRO can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0200	GICR_ISPENDR0

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

# GICR\_NSACR, Non-secure Access Control Register

The GICR\_NSACR characteristics are:

## Purpose

Enables Secure software to permit Non-secure software to create SGIs targeting the PE connected to this Redistributor by writing to [ICC\\_SGI1R\\_EL1](#), [ICC\\_ASGI1R\\_EL1](#) or [ICC\\_SGI0R\\_EL1](#).

For more information, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Configuration

For a description on when a write to [ICC\\_SGI0R\\_EL1](#), [ICC\\_SGI1R\\_EL1](#) or [ICC\\_ASGI1R\\_EL1](#) is permitted to generate an interrupt, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Attributes

GICR\_NSACR is a 32-bit register.

## Field descriptions

The GICR\_NSACR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	:
NS_access15NS_access<x>, bits [2x+1:2x], for x = 0 to 15		NS_access14NS_access13NS_access12NS_access11NS_access10NS_access9NS_acce													

NS\_access<x>, bits [2x+1:2x], for x = 0 to 15

NS\_access<x>, bits [2x+1:2x], for x = 15 to 0

Configures the level of Non-secure access permitted when the SGI is in Secure Group 0 or Secure Group 1, as defined from [GICR\\_IGROUPPR0](#) and [GICR\\_IGRPMODR0](#). A field is provided for each SGI. The possible values of each 2-bit field are:

NS_access<x>	Meaning
0b00	Non-secure writes are not permitted to generate Secure Group 0 SGIs or Secure Group 1 SGIs.
0b01	Non-secure writes are permitted to generate a Secure Group 0 SGI.
0b10	As 0b01, but additionally Non-secure writes to are permitted to generate a Secure Group 1 SGI.
0b11	Reserved. If the field is programmed to the reserved value, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the valid values. However, to maintain the principle that as the value increases additional accesses are permitted Arm strongly recommends that implementations treat this value as 0b10. It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the valid value chosen.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the GICR\_NSACR

When `GICD_CTLR.DS == 1`, this register is RAZ/WI.

When [GICD\\_CTLR](#).DS == 0, this register is Secure, and is RAZ/WI to Non-secure accesses.

This register is used when affinity routing is enabled. When affinity routing is not enabled for the Security state of the interrupt, [GICD\\_NSACR<n>](#) with n=0 provides equivalent functionality.

This register does not support PPIs.

**GICR\_NSACR can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0E00	GICR_NSACR

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bcd2a

**(new)**

The GICR\_PARTIDR characteristics are:

## Purpose

Sets the PARTID and PMG values used for memory accesses by the Redistributor.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GICR\_PARTIDR are RES0.

A copy of this register is provided for each Redistributor.

When [GICR\\_TYPER](#).MPAM==0, this register is RES0.

## Attributes

GICR\_PARTIDR is a 32-bit register.

## Field descriptions

The GICR\_PARTIDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMG								PARTID															

**Bits [31:24]**

Reserved, RES0.

**PMG, bits [23:16]**

PMG value used when Redistributor accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PMG values in the range 0 to PMG\_MAX are stateful or RES0.

On a Warm reset, this field resets to 0.

### PARTID, bits [15:0]

PARTID value used when Redistributor accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PARTID values in the range 0 to PARTID\_MAX are stateful or RES0.

On a Warm reset, this field resets to 0.

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x001C	GICR_PARTIDR

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

**(new)**

The GICR\_PENDBASER characteristics are:

## Purpose

Specifies the base address of the LPI Pending table, and the Shareability and Cacheability of accesses to the LPI Pending table.

## Configuration

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_PENDBASER is a 64-bit register.

## Field descriptions

The GICR\_PENDBASER bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0		PTZ		RES0		OuterCache		RES0		Physical_Address																						
Physical_Address																RES0		Shareability		InnerCache		RES0										
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

**Bit [63]**

Reserved, RES0.

**PTZ, bit [62]**

Pending Table Zero. Indicates to the Redistributor whether the LPI Pending table is zero when `GICR_CTLR.EnableLPIs == 1`.

This field is WO, and reads as 0.

PTZ	Meaning
0b0	The LPI Pending table is not zero, and contains live data.
0b1	The LPI Pending table is zero. Software must ensure the LPI Pending table is zero before this value is written.

**Bits [61:59]**

Reserved, RES0.

### OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Pending table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [55:52]

Reserved, RES0.

#### Physical\_Address, bits [51:16]

Bits [51:16] of the physical address containing the LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Bits [15:12]

Reserved, RES0.

#### Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Pending table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Pending table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [6:0]**

Reserved, RES0.

## Accessing the GICR\_PENDBASER

Having the GICR\_PENDBASER OuterCache, Shareability or InnerCache fields programmed to different values on different Redistributors with [GICR\\_CTLR.EnableLPis == 1](#) in the system is UNPREDICTABLE.

Changing GICR\_PENDBASER with [GICR\\_CTLR.EnableLPIs == 1](#) is UNPREDICTABLE.

**GICR\_PENDBASER can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0078	GICR_PENDBASER

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICR\_PROPBASER, Redistributor Properties Base Address Register

The GICR\_PROPBASER characteristics are:

## Purpose

Specifies the base address of the LPI Configuration table, and the Shareability and Cacheability of accesses to the LPI Configuration table.

## Configuration

A copy of this register is provided for each Redistributor.

An implementation might make this register RO, for example to correspond to an LPI Configuration table in read-only memory.

## Attributes

GICR\_PROPBASER is a 64-bit register.

## Field descriptions

The GICR\_PROPBASER bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0				OuterCache			RES0				Physical_Address																				
Physical_Address												Shareability				InnerCache				RES0				IDbits							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:59]

Reserved, RES0.

### OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Bits [55:52]

Reserved, RES0.

### Physical\_Address, bits [51:12]

Bits [51:12] of the physical address containing the LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Bits [6:5]

Reserved, RES0.

### IDbits, bits [4:0]

The number of bits of LPI INTID supported, minus one, by the LPI Configuration table starting at Physical\_Address.

If the value of this field is larger than the value of [GICD\\_TYPER.IDbits](#), the [GICD\\_TYPER.IDbits](#) value applies.

If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all physical LPIs are out of range.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

# GICR\_SYNCR, Redistributor Synchronize Register

The GICR\_SYNCR characteristics are:

## Purpose

Indicates completion of register based invalidate operations.

## Configuration

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_SYNCR is a 32-bit register.

## Field descriptions

The GICR\_SYNCR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															Busy

### Bits [31:1]

Reserved, RES0.

### Busy, bit [0]

Indicates completion of invalidation operations

Busy	Meaning
0b0	No operations are in progress.
0b1	A write is in progress to one or more of the following registers: <ul style="list-style-type: none"> <li><a href="#">GICR_INVLPIR</a>.</li> <li><a href="#">GICR_INVALLR</a>.</li> <li>GICv3, <a href="#">GICR_CLRLPIR</a>.</li> </ul>

This field tracks operations initiated on the same Redistributor.

## Accessing the GICR\_SYNCR

When this register is accessed, it is optional that an implementation might wait until all operations are complete before returning a value, in which case GICR\_SYNCR.Busy is always 0.

This register is mandatory when any of the following are true:

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

- [GICR\\_TYPER](#).Direct is 1.
- [GICR\\_CTLR](#).IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

This interface is accessible as follows:

- 3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICR\_TYPER, Redistributor Type Register

The GICR\_TYPER characteristics are:

## Purpose

Provides information about the configuration of this Redistributor.

## Configuration

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_TYPER is a 64-bit register.

## Field descriptions

The GICR\_TYPER bit assignments are:

6362616059	58	57	56	55545352515049484746454443424140	39	38	37	36	35	34	33	32							
Affinity_Value																			
PPInum	VSGI	CommonLP	Aff	Processor_Number								RVPEID	MPAM	DPGS	Last	DirectLP	Dirty	VLPI	SPLPI
3130292827	26	25	24	232221201918171615141312111098	7	6	5	4	3	2	1	0							

### Affinity\_Value, bits [63:32]

- The identity of the PE associated with this Redistributor.
- Bits [63:56] provide Aff3, the Affinity level 3 value for the Redistributor.
- Bits [55:48] provide Aff2, the Affinity level 2 value for the Redistributor.
- Bits [47:40] provide Aff1, the Affinity level 1 value for the Redistributor.
- Bits [39:32] provide Aff0, the Affinity level 0 value for the Redistributor.

### PPInum, bits [31:27]

When FEAT\_GICv3p1 is implemented:

The value derived from this field specifies the maximum PPI INTID that a GIC implementation can support. An implementation might not implement all PPIs up to this maximum.

PPInum	Meaning
0b00000	Maximum PPI INTID is 31.
0b00001	Maximum PPI INTID is 1087.
0b00010	Maximum PPI INTID is 1119.

All other values are reserved.

Otherwise:

Reserved, RES0.

**VSGI, bit [26]****When FEAT\_GICv4p1 is implemented:**

Indicates whether vSGIs are supported.

VSGI	Meaning
0b0	Direct injection of SGIs not supported.
0b1	Direct injection of SGIs supported.

**Otherwise:**

Reserved, RES0.

**CommonLPIAff, bits [25:24]**

The affinity level at which Redistributors share an LPI Configuration table.

CommonLPIAff	Meaning
0b00	All Redistributors must share an LPI Configuration table.
0b01	All Redistributors with the same Aff3 value must share an LPI Configuration table.
0b10	All Redistributors with the same Aff3.Aff2 value must share an LPI Configuration table.
0b11	All Redistributors with the same Aff3.Aff2.Aff1 value must share an LPI Configuration table.

**Processor\_Number, bits [23:8]**

A unique identifier for the PE. When [GITS\\_TYPER.PTA](#) == 0, an ITS uses this field to identify the interrupt target.

When affinity routing is disabled for a Security state, this field indicates which [GICD\\_ITARGETSR<n>](#) corresponds to this Redistributor.

**RVPEID, bit [7]****When FEAT\_GICv4p1 is implemented:**

Indicates how the resident vPE is specified.

RVPEID	Meaning
0b0	<a href="#">GICR_VPENDBASER</a> records the address of the vPE's Virtual Pending Table.
0b1	<a href="#">GICR_VPENDBASER</a> records vPEID.

**Otherwise:**

Reserved, RES0.

**MPAM, bit [6]****When FEAT\_GICv3p1 is implemented:**

MPAM

MPAM	Meaning
0b0	MPAM not supported.
0b1	MPAM supported.

**Otherwise:**

Reserved, RES0.

**DPGS, bit [5]**

Sets support for [GICR\\_CTLR.DPG\\*](#) bits.

DPGS	Meaning
0b0	<a href="#">GICR_CTLR.DPG*</a> bits are not supported.
0b1	<a href="#">GICR_CTLR.DPG*</a> bits are supported.

**Last, bit [4]**

Indicates whether this Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

Last	Meaning
0b0	This Redistributor is not the highest-numbered Redistributor in a series of contiguous Redistributor pages.
0b1	This Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

**DirectLPI, bit [3]**

Indicates whether this Redistributor supports direct injection of LPIs.

DirectLPI	Meaning
0b0	This Redistributor does not support direct injection of LPIs. The <a href="#">GICR_SETLPIR</a> , <a href="#">GICR_CLRLPIR</a> , <a href="#">GICR_INVLPPIR</a> , <a href="#">GICR_INVALLR</a> , and <a href="#">GICR_SYNCRR</a> registers are either not implemented, or have an IMPLEMENTATION DEFINED purpose.
0b1	This Redistributor supports direct injection of LPIs. The <a href="#">GICR_SETLPIR</a> , <a href="#">GICR_CLRLPIR</a> , <a href="#">GICR_INVLPPIR</a> , <a href="#">GICR_INVALLR</a> , and <a href="#">GICR_SYNCRR</a> registers are implemented.

**Dirty, bit [2]**

Controls the functionality of [GICR\\_VPENDBASER.Dirty](#).

Dirty	Meaning
0b0	<a href="#">GICR_VPENDBASER.Dirty</a> is UNKNOWN when <a href="#">GICR_VPENDBASER.Valid</a> == 1.
0b1	<a href="#">GICR_VPENDBASER.Dirty</a> indicates when the Virtual Pending Table has been parsed when <a href="#">GICR_VPENDBASER.Valid</a> is written from 0 to 1.

When [GICR\\_TYPER.VLPIS](#) == 0, this field is RES0.

**Note**

In [GICv4p1](#) [GICv4.1](#) implementations this field is RES1.

**VLPIS, bit [1]**

Indicates whether the GIC implementation supports virtual LPIs and the direct injection of virtual LPIs.

VLPIS	Meaning
0b0	The implementation does not support virtual LPIs or the direct injection of virtual LPIs.
0b1	The implementation supports virtual LPIs and the direct injection of virtual LPIs.

### Note

In GICv3 implementations this field is RES0.

### PLPIS, bit [0]

Indicates whether the GIC implementation supports physical LPIs.

PLPIS	Meaning
0b0	The implementation does not support physical LPIS.
0b1	The implementation supports physical LPIS.

## Accessing the GICR\_TYPER

**GICR\_TYPER can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0008	GICR_TYPER

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICR\_VPENDBASER, Virtual Redistributor LPI Pending Table Base Address Register

The GICR\_VPENDBASER characteristics are:

## Purpose

Specifies the base address of the memory that holds the virtual LPI Pending table for the currently scheduled virtual machine.

## Configuration

## Attributes

GICR\_VPENDBASER is a 64-bit register.

## Field descriptions

The GICR\_VPENDBASER bit assignments are:

### When FEAT\_GICv4 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
Valid	IDAI	Pending	Last	Dirty	RES0	Outer	Cache	RES0	Physical Address																							
Physical Address								RES0	Shareability		InnerCache		RES0																			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### Valid, bit [63]

This bit controls whether the virtual LPI Pending table is valid.

Valid	Meaning
0b0	The virtual LPI Pending table is not valid. No vPE is scheduled.
0b1	The virtual LPI Pending table is valid. A vPE is scheduled.

Setting GICR\_VPENDBASER.Valid == 1 when the associated CPU interface does not implement FEAT\_GICv4 is UNPREDICTABLE.

### Note

Software can determine whether a PE supports FEAT\_GICv3 or FEAT\_GICv4 by reading ID\_AA64PFR0\_EL1.

Writing a new value to any bit of GICR\_VPENDBASER, other than GICR\_VPENDBASER.Valid, when GICR\_VPENDBASER.Valid==1 is UNPREDICTABLE.

On a Warm reset, this field resets to 0.

### IDAI, bit [62]

Implementation Defined Area Invalid. Indicates whether the IMPLEMENTATION DEFINED area in the virtual LPI Pending table is valid.

IDAI	Meaning
0b0	The IMPLEMENTATION DEFINED area is valid.
0b1	The IMPLEMENTATION DEFINED area is invalid and all pending interrupt information is held in the architecturally defined part of the virtual LPI Pending table.

For more information, see 'LPI Pending tables' and 'Virtual LPI Configuration tables and virtual LPI Pending tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### PendingLast, bit [61]

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR\_VPENDBASER.Valid has been written from 1 to 0 and is otherwise UNKNOWN.

PendingLast	Meaning
0b0	There are no pending and enabled interrupts for the last scheduled vPE.
0b1	There is at least one pending interrupt for the last scheduled vPE. It is IMPLEMENTATION DEFINED whether this bit is set when the only pending interrupts for the last scheduled vPE are not enabled. Arm deprecates setting PendingLast to 1 when the only pending interrupts for the last scheduled virtual machine are not enabled.

When the GICR\_VPENDBASER.Valid bit is written from 0 to 1, this bit is RES1.

On a Warm reset, this field resets to 0.

### Dirty, bit [60]

When GICR\_VPENDBASER.Valid == 0:

Indicates whether a de-scheduling operation is in progress.

This field is read-only.

Dirty	Meaning
0b0	No de-scheduling operation in process.
0b1	De-scheduling operation in process.

Writing 1 to GICR\_VPENDBASER.Valid is UNPREDICTABLE while GICR\_VPENDBASER.Dirty==1.

On a Warm reset, this field resets to 0.

When GICR\_VPENDBASER.Valid == 1 and GICR\_TYPER.Dirty == 1:

This field is read-only. Reports whether the Virtual Pending table has been parsed.

Dirty	Meaning
0b0	Parsing of the Virtual Pending Table has completed.
0b1	Parsing of the Virtual Pending Table has not completed.

Writing 1 to GICR\_VPENDBASER.Valid is UNPREDICTABLE while GICR\_VPENDBASER.Dirty == 1.

On a Warm reset, this field resets to 0.

Otherwise:

This field is read-only. This fields is UNKNOWN.

On a Warm reset, this **This** field resets to 0.

#### Bit [59]

Reserved, RES0.

#### OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to virtual LPI Pending tables of vPEs targeting this Redistributor.

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the OuterCacheability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Bits [55:52]

Reserved, RES0.

#### Physical\_Address, bits [51:16]

Bits [51:16] of the physical address containing the virtual LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

#### Bits [15:12]

Reserved, RES0.

#### Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the virtual LPI Pending table.

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the Shareability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the virtual LPI Pending table.

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the InnerCacheability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

### Bits [6:0]

Reserved, RES0.

### When FEAT\_GICv4p1 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Valid	Doorbell	PendingLast	Dirty	VGrp0En	VGrp1En	RES0																									
RES0																								vPEID							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Valid, bit [63]

This bit controls whether a vPE is scheduled:

Valid	Meaning
0b0	The virtual LPI Pending table is not valid. No vPE is scheduled.
0b1	The virtual LPI Pending table is valid. A vPE is scheduled.

Setting GICR\_VPENDBASER.Valid == 1 when the associated CPU interface does not implement FEAT\_GICv4 is UNPREDICTABLE.

### Note

Software can determine whether a PE supports FEAT\_GICv3 or FEAT\_GICv4 by reading ID\_AA64PFR0\_EL1.

Writing a new value to any bit of GICR\_VPENDBASER, other than GICR\_VPENDBASER.Valid, when GICR\_VPENDBASER.Valid==1 is UNPREDICTABLE.

Setting GICR\_VPENDBASER.Valid to 1 is UNPREDICTABLE if [GICR\\_VPROPBASER](#).Valid == 0.

On a Warm reset, this **This** field resets to 0.

**Doorbell, bit [62]**

When GICR\_VPENDBASER.Valid is written from 1 to 0, this bit controls whether a default doorbell interrupt is requested for the descheduled vPE.

Doorbell	Meaning
0b0	No default doorbell requested.
0b1	Default doorbell requested.

When GICR\_VPENDBASER.Valid is written from 1 to 0, if there are outstanding enabled pending interrupts then this bit is treated as 0.

When GICR\_VPENDBASER.Valid is written from 1 to 0, if GICR\_VPENDBASER.PendingLast is written as 1 then this bit is treated as 0.

When GICR\_VPENDBASER.Valid == 1, reads return an UNKNOWN value.

On a Warm reset, this field resets to an UNKNOWN value.

**PendingLast, bit [61]**

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR\_VPENDBASER.Valid is written from 1 to 0 and is otherwise UNKNOWN.

PendingLast	Meaning
0b0	There are no pending and enabled interrupts for the last scheduled vPE.
0b1	There is at least one pending and enabled interrupt for the last scheduled vPE.

When the GICR\_VPENDBASER.Valid bit is written from 0 to 1, this bit is RES1.

When GICR\_VPENDBASER.Valid is written from 1 to 0, if GICR\_VPENDBASER.PendingLast is written as 1, then this bit is set to an UNKNOWN value.

On a Warm reset, this field resets to an UNKNOWN value.

**Dirty, bit [60]**

When GICR\_VPENDBASER.Valid == 0:

Read-only. Indicates whether a de-scheduling operation is in progress.

Dirty	Meaning
0b0	No de-scheduling operation in progress.
0b1	De-scheduling operation in progress.

Writing 1 to GICR\_VPENDBASER.Valid is UNPREDICTABLE while GICR\_VPENDBASER.Dirty == 1.

On a Warm reset, this field resets to 0.

Otherwise:

Read-only. Reports whether the Virtual Pending table has been parsed.

Dirty	Meaning
0b0	Parsing of the Virtual Pending Table is complete.
0b1	Parsing of the Virtual Pending Table has not completed.

Writing 1 to GICR\_VPENDBASER.Valid is UNPREDICTABLE while GICR\_VPENDBASER.Dirty == 1.

On a Warm reset, this field resets to 0.

**VGrp0En, bit [59]**

Enable virtual Group 0 interrupts.

VGrp0En	Meaning
0b0	Forwarding of virtual Group 0 interrupts disabled.
0b1	Forwarding of virtual Group 0 interrupts enabled.

Writing a new value to VGrp0En while [GICR\\_VPENDBASER.Valid==1](#) is CONSTRAINED UNPREDICTABLE:

- The update is ignored.
- The update is ignored for all purposes other than a direct read of the register.
- The virtual group enable is updated.

On a Warm reset, this **This** field resets to an UNKNOWN value.

**VGrp1En, bit [58]**

Enable virtual Group 1 interrupts.

VGrp1En	Meaning
0b0	Forwarding of virtual Group 1 interrupts disabled.
0b1	Forwarding of virtual Group 1 interrupts enabled.

Writing a new value to VGrp1En while [GICR\\_VPENDBASER.Valid==1](#) is CONSTRAINED UNPREDICTABLE:

- The update is ignored.
- The update is ignored for all purposes other than a direct read of the register.
- The virtual group enable is updated.

On a Warm reset, this **This** field resets to an UNKNOWN value.

**Bits [57:16]**

Reserved, RES0.

**vPEID, bits [15:0]**

When [GICR\\_VPENDBASER.Valid == 1](#), ID of scheduled vPE.

When [GICR\\_VPENDBASER.Valid == 1](#), if [GICR\\_VPENDBASER.vPEID](#) is set to a value greater than the configured vPEID width, the behavior of this field is CONSTRAINED UNPREDICTABLE:

- [GICR\\_VPENDBASER.vPEID](#) is treated as having an UNKNOWN valid value for all purposes other than a direct read of the register.
- [GICR\\_VPENDBASER.Valid](#) is treated as being set to 0 for all purposes other than a direct read of the register.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD\\_TYPER2.VIL](#) and [GICD\\_TYPER2.VID](#) fields, unimplemented bits are RES0.

**Accessing the GICR\_VPENDBASER**

The effect of a write to this register is not guaranteed to be visible throughout the affinity hierarchy, as indicated by [GICR\\_CTLR.RWP == 0](#).

**GICR\_VPENDBASER can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
-----------	-------	--------	----------

GIC Redistributor	VLPI_base	0x0078	GICR_VPENDBASER
-------------------	-----------	--------	-----------------

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICR\_VPROPBASER, Virtual Redistributor Properties Base Address Register

The GICR\_VPROPBASER characteristics are:

## Purpose

Specifies the base address of the memory that holds the virtual LPI Configuration table for the currently scheduled virtual machine.

## Configuration

This register is provided in FEAT\_GICv4 implementations only.

## Attributes

GICR\_VPROPBASER is a 64-bit register.

## Field descriptions

The GICR\_VPROPBASER bit assignments are:

### When FEAT\_GICv4 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0				OuterCache				RES0				Physical Address																			
Physical Address												Shareability				InnerCache				RES0				IDbits							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:59]

Reserved, RES0.

### OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bits [55:52]

Reserved, RES0.

## Physical\_Address, bits [51:12]

Bits [51:12] of the physical address containing the virtual LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

## Bits [6:5]

Reserved, RES0.

## IDbits, bits [4:0]

The number of bits of virtual LPI INTID supported, minus one.

If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all virtual LPIs are out of range.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**When FEAT\_GICv4p1 is implemented:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
Valid	RES0	Entry_Size	OuterCache	Indirect	Page_Size	Z	Physical Address																									
Physical Address																					Shareability		InnerCache		Size							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

**Valid, bit [63]**

This bit controls whether the vPE Configuration Table is valid:

Valid	Meaning
0b0	The vPE Configuration table is not valid.
0b1	The vPE Configuration table is valid.

TBC

On a Warm reset, this field resets to 0.

**Bit [62]**

Reserved, RES0.

**Entry\_Size, bits [61:59]**

Specifies the number of bytes per table entry, minus one.

This bit is read-only.

**OuterCache, bits [58:56]**

Indicates the Outer Cacheability attributes of accesses to the table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an UNKNOWN value.

**Indirect, bit [55]**

This field indicates whether GICR\_VPROPBASER specifies a single, flat table or a two-level table where the first level contains a list of descriptors.

Indirect	Meaning
0b0	Single Level. The Size field indicates the number of pages used to store data associated with each table entry.
0b1	Two Level. The Size field indicates the number of pages that contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used.

This field is RES0 for GIC implementations that only support flat tables.

On a Warm reset, this field resets to an UNKNOWN value.

### Page\_Size, bits [54:53]

The following values indicate the size of page that the translation table uses:

Page_Size	Meaning
0b00	4KB.
0b01	16KB.
0b10	64KB.
0b11	Reserved. Treated as 0b10.

#### Note

If the GIC implementation supports only a single, fixed page size, this field might be RO.

On a Warm reset, this field resets to an UNKNOWN value.

### Z, bit [52]

When GICR\_VPROPBASER.Valid is written from 0 to 1, GICR\_VPROPBASER.Z indicates whether the vPE Configuration table is known to contain all zeros.

Z	Meaning
0b0	The vPE Configuration table is not zero, and contains live data.
0b1	The vPE Configuration table is zero.

Setting GICR\_VPROPBASER.Z to 0 causes the IRI to reload configuration from memory

When GICR\_VPROPBASER.Valid is written from 0 to 1, if GICR\_VPROPBASER.Z==1 behavior is UNPREDICTABLE if the allocated memory does not contain all zeros.

This field is WO, and reads as 0.

### Physical\_Address, bits [51:12]

Bits [51:12] of the physical address containing the LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

On a Warm reset, this field resets to an UNKNOWN value.

### Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an UNKNOWN value.

### InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

On a Warm reset, this field resets to an UNKNOWN value.

### Size, bits [6:0]

The number of pages of physical memory allocated to the table, minus one.

[GICR VPROPBASE](#).Page Size specifies the size of each page.

On a Warm reset, this field resets to an UNKNOWN value.

## Accessing the GICR\_VPROPBASER

**GICR\_VPROPBASER can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
GIC Redistributor	VLPI_base	0x0070	GICR_VPROPBASER

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICR\_WAKER, Redistributor Wake Register

The GICR\_WAKER characteristics are:

## Purpose

Permits software to control the behavior of the WakeRequest power management signal corresponding to the Redistributor. Power management operations follow the rules in 'Power management' in in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

## Configuration

A copy of this register is provided for each Redistributor.

## Attributes

GICR\_WAKER is a 32-bit register.

## Field descriptions

The GICR\_WAKER bit assignments are:

31	3029282726252423222120191817161514131211109876543	2	1	0
IMPLEMENTATION DEFINED	RES0	ChildrenAsleep	ProcessorSleep	IMPLEMENTATION DEFINED

### IMPLEMENTATION DEFINED, bit [31]

IMPLEMENTATION DEFINED.

### Bits [30:3]

Reserved, RES0.

### ChildrenAsleep, bit [2]

Read-only. Indicates whether the connected PE is quiescent:

ChildrenAsleep	Meaning
0b0	An interface to the connected PE might be active.
0b1	All interfaces to the connected PE are quiescent.

On a Warm reset, thisThis field resets to 1.

### ProcessorSleep, bit [1]

Indicates whether the Redistributor can assert the **WakeRequest** signal:

ProcessorSleep	Meaning
0b0	This PE is not in, and is not entering, a low power state.
0b1	<p>The PE is either in, or is in the process of entering, a low power state.</p> <p>All interrupts that arrive at the Redistributor:</p> <ul style="list-style-type: none"> <li>• Assert a <b>WakeRequest</b> signal.</li> <li>• Are held in the pending state at the Redistributor, and are not communicated to the CPU interface.</li> </ul> <hr/> <p><b>Note</b></p> <p>When ProcessorSleep == 1, the Redistributor must ensure that any interrupts that are pending on the CPU interface are released.</p> <hr/> <p>For an implementation that is using the GIC Stream Protocol Interface:</p> <ul style="list-style-type: none"> <li>• A Quiesce command puts the interface between the Redistributor and the CPU interface in a quiescent state. For more information, see 'Quiesce (IRI)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).</li> <li>• A Release command releases any interrupts that are pending on the CPU interface. For more information, see 'Release (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).</li> </ul>

#### Note

Before powering down a PE, software must set this bit to 1 and wait until ChildrenAsleep == 1. After powering up a PE, or following a failed powerdown, software must set this bit to 0 and wait until ChildrenAsleep == 0.

Changing ProcessorSleep from 1 to 0 when ChildrenAsleep is not 1 results in UNPREDICTABLE behavior.

Changing ProcessorSleep from 0 to 1 when the Enable for each interrupt group in the associated CPU interface is not 0 results in UNPREDICTABLE behavior.

On a Warm reset, this field resets to 1.

#### IMPLEMENTATION DEFINED, bit [0]

IMPLEMENTATION DEFINED.

## Accessing the GICR\_WAKER

When GICD\_CTLR.DS==1, this register is always accessible.

When GICD\_CTLR.DS==0, this is a Secure register. This register is RAZ/WI to Non-secure accesses.

To ensure a Redistributor is quiescent, software must write to GICR\_WAKER with ProcessorSleep == 1, then poll the register until ChildrenAsleep == 1.

Resetting the connected PE when GICR\_WAKER.ProcessorSleep==0 or GICR\_WAKER.ChildrenAsleep==0, can lead to UNPREDICTABLE behaviour in the IRI.

Resetting the IRI when GICR\_WAKER.ProcessorSleep==0 or GICR\_WAKER.ChildrenAsleep==0 can lead to UNPREDICTABLE behaviour in the connected PE.

This interface is accessible as follows:

- 3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GICV\_ABPR, Virtual Machine Aliased Binary Point Register

The GICV\_ABPR characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

This register corresponds to [GICC\\_ABPR](#) in the physical CPU interface.

### Note

[GICH\\_LR<n>](#).Group determines whether a virtual interrupt is Group 0 or Group 1.

## Configuration

This register is available when the GIC implementation supports interrupt virtualization.

## Attributes

GICV\_ABPR is a 32-bit register.

## Field descriptions

The GICV\_ABPR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															
Binary Point																															

### Bits [31:3]

Reserved, RES0.

### Binary\_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to 0.

The Binary\_Point field of this register is aliased to [GICH\\_VMCR](#).VBPR1.

## Accessing the GICV\_ABPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC\\_BPR1](#) provides equivalent functionality.

- For AArch64 implementations, [ICC\\_BPR1\\_EL1](#) provides equivalent functionality.

The value contained in this register is one greater than the actual applied binary point value, as described in 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This register is used for Group 1 interrupts when `GICV_CTLR.CBPR == 0`. `GICV_BPR` provides equivalent functionality for Group 0 interrupts, and for Group 1 interrupts when `GICV_CTLR.CBPR == 1`.

**GICV\_ABPR can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Virtual CPU interface	0x001C	GICV_ABPR

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

# GICV\_BPR, Virtual Machine Binary Point Register

The GICV\_BPR characteristics are:

## Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

This register corresponds to [GICC\\_BPR](#) in the physical CPU interface.

### Note

[GICH\\_LR<n>](#).Group determines whether a virtual interrupt is Group 0 or Group 1.

## Configuration

This register is available when the GIC implementation supports interrupt virtualization.

When [GICV\\_CTLR](#).CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

## Attributes

GICV\_BPR is a 32-bit register.

## Field descriptions

The GICV\_BPR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																		Binary Point													

### Bits [31:3]

Reserved, RES0.

### Binary\_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see 'ICC\_BPR0\_EL1 Binary Point for Group 1 interrupts when CBPR == 1, or for Group 0 interrupts' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

The Binary\_Point field of this register is aliased to [GICH\\_VMCR](#).VBPR0.

## Accessing the GICV\_BPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC\\_BPR0](#) provides equivalent functionality.

- For AArch64 implementations, [ICC\\_BPR0\\_EL1](#) provides equivalent functionality.

**GICV\_BPR can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Virtual CPU interface	0x0008	GICV_BPR

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489ec15ad1565345720bed2a

# GICV\_CTLR, Virtual Machine Control Register

The GICV\_CTLR characteristics are:

## Purpose

Controls the behavior of virtual interrupts.

This register corresponds to the physical CPU interface register [GICC\\_CTLR](#).

## Configuration

This register is available when a GIC implementation supports interrupt virtualization.

## Attributes

GICV\_CTLR is a 32-bit register.

## Field descriptions

The GICV\_CTLR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										EOImode	RES0	CBPR	FIQEn	AckCtl	EnableGrp1	EnableGrp0															

### Bits [31:10]

Reserved, RES0.

### EOImode, bit [9]

Controls the behavior associated with the [GICV\\_EOIR](#), [GICV\\_AEOIR](#), and [GICV\\_DIR](#) registers:

EOImode	Meaning
0b0	Writes to <a href="#">GICV_EOIR</a> and <a href="#">GICV_AEOIR</a> perform priority drop and deactivate interrupt operations simultaneously. Behavior on a write to <a href="#">GICV_DIR</a> is unpredictable. When it has completed processing the interrupt, the virtual machine writes to <a href="#">GICV_EOIR</a> or <a href="#">GICV_AEOIR</a> to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the physical Distributor.
0b1	Writes to <a href="#">GICV_EOIR</a> and <a href="#">GICV_AEOIR</a> perform priority drop operation only. Writes to <a href="#">GICV_DIR</a> perform deactivate interrupt operation only. When it has completed processing the interrupt, the virtual machine writes to <a href="#">GICV_DIR</a> to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the Distributor.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

### Bits [8:5]

Reserved, RES0.

**CBPR, bit [4]**

Controls whether [GICV\\_BPR](#) affects both Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	<a href="#">GICV_BPR</a> affects Group 0 virtual interrupts only. <a href="#">GICV_ABPR</a> affects Group 1 virtual interrupts only.
0b1	<a href="#">GICV_BPR</a> affects both Group 0 and Group 1 virtual interrupts.

For more information, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**FIQEn, bit [3]**

FIQ Enable. Controls whether Group 0 virtual interrupts are presented as virtual FIQs:

FIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**AckCtl, bit [2]**

Arm deprecates use of this bit. Arm strongly recommends that software is written to operate with this bit always cleared to 0.

Acknowledge control. When the highest priority interrupt is Group 1, determines whether [GICV\\_IAR](#) causes the CPU interface to acknowledge the interrupt or returns the spurious identifier 1022, and whether [GICV\\_HPPIR](#) returns the interrupt ID or the special identifier 1022.

AckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of <a href="#">GICV_IAR</a> or <a href="#">GICV_HPPIR</a> returns an interrupt ID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of <a href="#">GICV_IAR</a> or <a href="#">GICV_HPPIR</a> returns the interrupt ID of the corresponding interrupt.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**EnableGrp1, bit [1]**

Enables the signaling of Group 1 virtual interrupts by the virtual CPU interface to the virtual machine:

EnableGrp1	Meaning
0b0	Signaling of Group 1 interrupts is disabled.
0b1	Signaling of Group 1 interrupts is enabled.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

**EnableGrp0, bit [0]**

Enables the signaling of Group 0 virtual interrupts by the virtual CPU interface to the virtual machine:

EnableGrp0	Meaning
0b0	Signaling of Group 0 interrupts is disabled.
0b1	Signaling of Group 0 interrupts is enabled.

On a Warm reset, this **This** field resets to an architecturally UNKNOWN value.

# Accessing the GICV\_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC\\_CTLR](#) provides equivalent functionality.
- For AArch64 implementations, [ICC\\_CTLR\\_EL1](#) provides equivalent functionality.

**GICV\_CTLR can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC Virtual CPU interface	0x0000	GICV_CTLR

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489ec15ad1565345720bed2a

# GICV\_PMR, Virtual Machine Priority Mask Register

The GICV\_PMR characteristics are:

## Purpose

This register provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

### Note

Higher interrupt priority corresponds to a lower value of the Priority field.

This register corresponds to the physical CPU interface register [GICC\\_PMR](#).

## Configuration

This register is available when the GIC implementation supports interrupt virtualization.

The Priority field of this register is aliased to [GICH\\_VMCR.VMPR](#), to enable state to be switched easily between virtual machines during context-switching.

## Attributes

GICV\_PMR is a 32-bit register.

## Field descriptions

The GICV\_PMR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								Priority							

### Bits [31:8]

Reserved, RES0.

### Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = 0b0.
- For 64 supported levels, bits [1:0] = 0b00.
- For 32 supported levels, bits [2:0] = 0b000.
- For 16 supported levels, bits [3:0] = 0b0000.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

# GITS\_BASER<n>, ITS Translation Table Descriptors, n = 0 - 7

The GITS\_BASER<n> characteristics are:

## Purpose

Specifies the base address and size of the ITS translation tables.

## Configuration

A copy of this register is provided for each ITS translation table.

Bits [63:32] and bits [31:0] are accessible independently.

A maximum of 8 GITS\_BASER<n> registers can be provided. Unimplemented registers are RES0.

When [GITS\\_CTLR.Enabled](#) == 1 or [GITS\\_CTLR.Quiescent](#) == 0, writing this register is UNPREDICTABLE.

## Attributes

GITS\_BASER<n> is a 64-bit register.

## Field descriptions

The GITS\_BASER<n> bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
Valid	Indirect	Inner	Cache	Type	Outer	Cache	Entry_Size	Physical_Address																								
Physical_Address																	Shareability		Page_Size		Size											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### Valid, bit [63]

Indicates whether software has allocated memory for the translation table:

Valid	Meaning
0b0	No memory is allocated for the translation table. The ITS discards any writes to the interrupt translation page when either: <ul style="list-style-type: none"> <li>GITS_BASER&lt;n&gt;.Type specifies any valid table entry type other than interrupt collections, that is, any value other than 0b100.</li> <li>GITS_BASER&lt;n&gt;.Type specifies an interrupt collection and <a href="#">GITS_TYPER.HCC</a> == 0.</li> </ul>
0b1	Memory is allocated to the translation table.

On a Warm reset, this field resets to 0.

### Indirect, bit [62]

This field indicates whether an implemented register specifies a single, flat table or a two-level table where the first level contains a list of descriptors.

Indirect	Meaning
0b0	Single Level. The Size field indicates the number of pages used by the ITS to store data associated with each table entry.
0b1	Two Level. The Size field indicates the number of pages which contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used.

For more information, see 'The ITS tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field is RAZ/WI for GIC implementations that only support flat tables. If the maximum width of the scaling factor that is identified by GITS\_BASER<n>.Type and the smallest page size that is supported result in a single level table that requires multiple pages, then implementing this bit as RAZ/WI is DEPRECATED.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### InnerCache, bits [61:59]

Indicates the Inner Cacheability attributes of accesses to the table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Type, bits [58:56]

Read only. Specifies the type of entity that requires entries in the corresponding translation table. The possible values of the field are:

Type	Meaning
0b000	Unimplemented. This register does not correspond to a translation table.
0b001	Devices. This register corresponds to a translation table that scales with the width of the DeviceID. Only a single GITS_BASER<n> register reports this type.
0b010	vPEs. FEAT_GICv4 only. This register corresponds to a translation table that scales with the number of vPEs in the system. The translation table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of vPEs in the system. Only a single GITS_BASER<n> register reports this type.
0b100	Interrupt collections. This register corresponds to a translation table that scales with the number of interrupt collections in the system. The translation table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of interrupt collections. Not more than one GITS_BASER<n> register will report this type.

Other values are reserved.

For FEAT\_GICv4p1, the registers are allocated as follows:

- GITS\_BASER0.Type is 0b001 (Device).
- GITS\_BASER1.Type is either 0b100 (Collection Table) or 0b000 (Unimplemented).
- GITS\_BASER2.Type is either 0b010 (vPE) or 0b000 (Unimplemented).
- GITS\_BASER<n>.Type, where 'n' is in the range 3 to 7, is 0b000 (Unimplemented).

For FEAT\_GICv3, FEAT\_GICv3p1, and FEAT\_GICv4, Arm recommends that the GITS\_BASER<n> use the same allocations.

Other allocations of Type values are deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### OuterCache, bits [55:53]

Indicates the Outer Cacheability attributes of accesses to the table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Entry\_Size, bits [52:48]

Read-only. Specifies the number of bytes per translation table entry, minus one.

### Physical\_Address, bits [47:12]

Physical Address. When Page\_Size is 4KB or 16KB:

- Bits [51:48] of the base physical address are zero.
- This field provides bits[47:12] of the base physical address of the table.
- Bits[11:0] of the base physical address are zero.
- The address must be aligned to the size specified in the Page Size field. Otherwise the effect is CONSTRAINED UNPREDICTABLE, and can be one of the following:
  - Bits[X:12], where X is derived from the page size, are treated as zero.
  - The value of bits[X:12] are used when calculating the address of a table access.

When Page\_Size is 64KB:

- Bits[47:16] of the register provide bits[47:16] of the base physical address of the table.
- Bits[15:12] of the register provide bits[51:48] of the base physical address of the table.
- Bits[15:0] of the base physical address are 0.

In implementations that support fewer than 52 bits of physical address, any unimplemented upper bits might be RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Page\_Size, bits [9:8]

The size of page that the translation table uses:

Page_Size	Meaning
0b00	4KB.
0b01	16KB.
0b10	64KB.
0b11	Reserved. Treated as 0b10.

#### Note

If the GIC implementation supports only a single, fixed page size, this field might be RO.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Size, bits [7:0]

The number of pages of physical memory allocated to the table, minus one. GITS\_BASER<n>.Page\_Size specifies the size of each page.

If GITS\_BASER<n>.Type == 0, this field is RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the GITS\_BASER<n>

GITS\_BASER<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0100 + (8 * n)	GITS_BASER<n>

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# GITS\_CBASER, ITS Command Queue Descriptor

The GITS\_CBASER characteristics are:

## Purpose

Specifies the base address and size of the ITS command queue.

## Configuration

Bits [63:32] and bits [31:0] are accessible separately.

## Attributes

GITS\_CBASER is a 64-bit register.

## Field descriptions

The GITS\_CBASER bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
Valid	RES0	InnerCache	RES0	OuterCache	RES0	Physical_Address																Physical_Address											
											Shareability											RES0	Size										
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

### Valid, bit [63]

Indicates whether software has allocated memory for the command queue:

Valid	Meaning
0b0	No memory is allocated for the command queue.
0b1	Memory is allocated to the command queue.

On a Warm reset, thisThis field resets to 0.

### Bit [62]

Reserved, RES0.

### InnerCache, bits [61:59]

Indicates the Inner Cacheability attributes of accesses to the command queue. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

On a Warm reset, thisThis field resets to an architecturally UNKNOWN value.

**Bits [58:56]**

Reserved, RES0.

**OuterCache, bits [55:53]**

Indicates the Outer Cacheability attributes of accesses to the command queue. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [52]**

Reserved, RES0.

**Physical\_Address, bits [51:12]**

Bits [51:12] of the base physical address of the command queue. Bits [11:0] of the base address are 0.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

If bits [15:12] are not all zeros, behavior is a CONSTRAINED UNPREDICTABLE choice:

- Bits [15:12] are treated as if all the bits are zero. The value read back from those bits is either the value written or zero.
- The result of the calculation of an address for a command queue read can be corrupted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Shareability, bits [11:10]**

Indicates the Shareability attributes of accesses to the command queue. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [9:8]**

Reserved, RES0.

# GITS\_CTLR, ITS Control Register

The GITS\_CTLR characteristics are:

## Purpose

Controls the operation of an ITS.

## Configuration

The ITS\_Number (bits [7:4]) and bit [1] fields apply only in FEAT\_GICv4 implementations, and are RES0 in FEAT\_GICv3 implementations.

## Attributes

GITS\_CTLR is a 32-bit register.

## Field descriptions

The GITS\_CTLR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
Quiescent	RES0										UMS	Irq	ITS_Number		ITS_Number		RES0	RES0	ImDe	ImDe	Enabl									

### Quiescent, bit [31]

Read-only. Indicates completion of all ITS operations when GITS\_CTLR.Enabled == 0.

Quiescent	Meaning
0b0	The ITS is not quiescent and cannot be powered down.
0b1	The ITS is quiescent and can be powered down.

For the ITS to be considered inactive, there must be no transactions in progress. In addition, all operations required to ensure that mapping data is consistent with external memory must be complete.

**Note**

In distributed GIC implementations, this bit is set to 1 only after the ITS forwards any operations that have not yet been completed to the Redistributors and receives confirmation that all such operations have reached the appropriate Redistributor.

In FEAT\_GICv3, FEAT\_GICv3p1, and FEAT\_GICv4, when GITS\_CTLR.Enabled == 1, the value of GITS\_CTLR.Quiescent is UNKNOWN.

In FEAT\_GICv4p1, when GITS\_CTLR.Enabled == 1, the value of GITS\_CTLR.Quiescent reads as 1 until the write to Enabled has taken effect and then reads as 0.

On a Warm reset, this field resets to 1.

### Bits [30:98]

Reserved, RES0.

**UMSlirq, bit [8]**

Unmapped MSI reporting interrupt enable.

UMSlirq	Meaning
0b0	The ITS does not assert an interrupt signal when <a href="#">GITS_STATUSR.UMSI</a> is 1.
0b1	The ITS asserts an interrupt signal when <a href="#">GITS_STATUSR.UMSI</a> is 1.

If [GITS\\_TYPER.UMSlirq](#) is 0, this field is RES0.

On a Warm reset, this field resets to 0.

**ITS\_Number, bits [7:4]**

In FEAT\_GICv3 implementations this field is RES0.

In FEAT\_GICv4 implementations with more than one ITS instance, this field indicates the ITS number for use with 'VMOVP GICv4.0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

It is IMPLEMENTATION DEFINED whether this field is programmable or RO.

If this field is programmable, changing this field when [GITS\\_CTLR.Quiescent](#) == 0 or [GITS\\_CTLR.Enabled](#) == 1 is UNPREDICTABLE.

On a Warm reset, this ~~This~~ field resets to an architecturally UNKNOWN value.

**Bits [3:2]**

Reserved, RES0.

**ImDe, bit [1]**

In GICv3 implementations, this bit is RES0.

In GICv4 implementations, this bit is IMPLEMENTATION DEFINED.

On a Warm reset, this ~~This~~ field resets to 0.

**Enabled, bit [0]**

Controls whether the ITS is enabled:

Enabled	Meaning
0b0	The ITS is not enabled. Writes to <a href="#">GITS_TRANSLATER</a> are ignored and no further command queue entries are processed.
0b1	The ITS is enabled. Writes to <a href="#">GITS_TRANSLATER</a> result in interrupt translations and the command queue is processed.

If a write to this register changes this field from 1 to 0, the ITS must ensure that both:

- Any caches containing mapping data are made consistent with external memory.
- [GITS\\_CTLR.Quiescent](#) == 0 until all caches are consistent with external memory.

Changing [GITS\\_CTLR.Enabled](#) from 0 to 1 when [GITS\\_CTLR.Quiescent](#) is 0 results in UNPREDICTABLE behavior.

On a Warm reset, this ~~This~~ field resets to 0.

## Accessing the GITS\_CTLR

**GITS\_CTLR can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC ITS control	0x0000	GITS_CTLR

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

**(new)**

# GITS\_CWRITER, ITS Write Register

The GITS\_CWRITER characteristics are:

## Purpose

Specifies the offset from [GITS\\_CBASER](#) where software writes the next ITS command.

## Configuration

Bits [63:32] and bits [31:0] are accessible separately.

## Attributes

GITS\_CWRITER is a 64-bit register.

## Field descriptions

The GITS\_CWRITER bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																Offset														RES0	Retry
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### Bits [63:20]

Reserved, RES0.

### Offset, bits [19:5]

Bits [19:5] of the offset from [GITS\\_CBASER](#). Bits [4:0] of the offset are zero.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Bits [4:1]

Reserved, RES0.

### Retry, bit [0]

Writing this bit has the following effects:

Retry	Meaning
0b0	No effect on the processing commands by the ITS.
0b1	Restarts the processing of commands by the ITS if it stalled because of a command error.
<b>Note</b> If the processing of commands is not stalled because of a command error, writing 1 to this bit has no effect.	

When read, this bit is RES0.

For more information, see 'The ITS command interface' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If `GITS_CWRITER` is written with a value outside of the valid range specified by [GITS\\_CBASER.Physical\\_Address](#) and [GITS\\_CBASER.Size](#), behavior is a CONSTRAINED UNPREDICTABLE choice, as follows:

- The command queue is considered invalid, and no further commands are processed until `GITS_CWRITER` is written with a value that is in the valid range.
- The value is treated as a valid `UNKNOWN` value.

An implementation might choose to report a system error in an IMPLEMENTATION DEFINED manner.

## Accessing the GITS\_CWRITER

**GITS CWRITER can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC ITS control	0x0088	GITS CWRITER

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GITS\_MPIDR, Report ITS's affinity.

The GITS\_MPIDR characteristics are:

## Purpose

Reports ITS's affinity when the vPE Table is shared with Redistributors.

## Configuration

This register is present only when FEAT\_GICv4p1 is implemented. Otherwise, direct accesses to GITS\_MPIDR are RES0.

A copy of this register is provided for each ITS.

When [GITS\\_TYPER](#).SVPET==0, this register is RES0.

## Attributes

GITS\_MPIDR is a 32-bit register.

## Field descriptions

The GITS\_MPIDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Aff3								Aff2								Aff1								RES0							

### Aff3, bits [31:24]

The Affinity level 3 value for the ITS.

### Aff2, bits [23:16]

The Affinity level 2 value for the ITS.

### Aff1, bits [15:8]

The Affinity level 1 value for the ITS.

### Bits [7:0]

Reserved, RES0.

## Accessing the GITS\_MPIDR

GITS\_MPIDR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x0018

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# GITS\_PARTIDR, Set PARTID and PMG Register

The GITS\_PARTIDR characteristics are:

## Purpose

Sets the PARTID and PMG values used for memory accesses by the ITS.

## Configuration

This register is present only when FEAT\_GICv3p1 is implemented. Otherwise, direct accesses to GITS\_PARTIDR are RES0.

A copy of this register is provided for each ITS.

When [GITS\\_TYPER](#).MPAM==0, this register is RES0.

## Attributes

GITS\_PARTIDR is a 32-bit register.

## Field descriptions

The GITS\_PARTIDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMG								PARTID															

### Bits [31:24]

Reserved, RES0.

### PMG, bits [23:16]

PMG value used when ITS accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PMG values in the range 0 to PMG\_MAX are stateful or RES0.

On a Warm reset, this ~~This~~ field resets to 0.

### PARTID, bits [15:0]

PARTID value used when ITS accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PARTID values in the range 0 to PARTID\_MAX are stateful or RES0.

On a Warm reset, this ~~This~~ field resets to 0.

## Accessing the GITS\_PARTIDR

**GITS\_PARTIDR can be accessed through the memory-mapped interfaces:**

Component	Offset
GIC ITS control	0x0014

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

3001/0907/2020 15:0657: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# GITS\_STATUSR, ITS Error Reporting Status Register

The GITS\_STATUSR characteristics are:

## Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.
- Unmapped MSIs.

## Configuration

## Attributes

GITS\_STATUSR is a 32-bit register.

## Field descriptions

The GITS\_STATUSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					
										RES0										Syndrome		Overflow		UMSI	WROD	RWOD	WRD	RRD								

### Bits [31:10]

Reserved, RES0.

### Syndrome, bits [9:6]

Syndrome for the MSI that set GITS\_STATUSR.UMSI to 1.

Syndrome	Meaning
0b0000	Unknown reason.
0b0010	DeviceID out of range.
0b0011	DeviceID unmapped.
0b0100	EventID out of range.
0b0101	EventID unmapped.
0b0111	Collection unmapped.
0b1001	vPEID unmapped.

An implementation might not support reporting all syndromes, and might report 0b0000 for any cause.

This field is UNKNOWN when GITS\_STATUSR.UMSI is 0.

### Overflow, bit [5]

Reports whether an unmapped MSI has been received while GITS\_STATUSR.UMSI is 1.

Overflow	Meaning
0b0	No unmapped MSIs have been received since GITS_STATUSR.UMSI set to 1.
0b1	At least one unmapped MSIs have been received since GITS_STATUSR.UMSI set to 1.

A software write of 1 to the bit clears it. A write of any other value is ignored.

If [GITS\\_TYPER](#).UMSI is 0, this field is RES0.

#### UMSI, bit [4]

Reports whether an unmapped MSI has been received

UMSI	Meaning
0b0	No unmapped MSIs have been received.
0b1	Unampped MSI received.

A software write of 1 to the bit clears it. A write of any other value is ignored.

If [GITS\\_TYPER](#).UMSI is 0, this field is RES0.

#### WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

#### RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

#### WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

#### RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

## Accessing the GITS\_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

**GITS\_STATUSR can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC ITS control	0x0020	GITS_STATUSR

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2020 15:07; ccead0cb9f089f9ceec50268e82aec9e71047211

# GITS\_TYPER, ITS Type Register

The GITS\_TYPER characteristics are:

## Purpose

Specifies the features that an ITS supports.

## Configuration

## Attributes

GITS\_TYPER is a 64-bit register.

## Field descriptions

The GITS\_TYPER bit assignments are:

### Bits [63:44]

### Bits [63:46]

Reserved, RES0.

### UMSIirqnID, bit [45:43]

When FEAT\_GICv4p1 is implemented:

Indicates support for generating an interrupt on receiving unmapped MSI.

UMSIirqnID	Meaning
0b0	Interrupt on unmapped MSI not supported.
0b1	Interrupt on unmapped MSI is supported.

If GITS\_TYPER.UMSI is 0, this field is RES0.

### UMSI, bit [44]

Indicates suport for reporting receipt of unmapped MSIs.

UMSI	Meaning
0b0	Reporting of unmapped MSIs is not supported.
0b1	Reporting of unmapped MSIs is supported.

### nID, bit [43]

When FEAT\_GICv4p1 is implemented:

nID

nID	Meaning
0b0	Individual doorbell interrupt supported.
0b1	Individual doorbell interrupt not supported.

Otherwise:

Reserved, RES0.

### SVPET, bits [42:41]

When FEAT\_GICv4p1 is implemented:

SVPET

SVPET	Meaning
0b00	vPE Table is not shared with Redistributors.
0b01	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR.Aff3.
0b10	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3 and Aff2.
0b11	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3, Aff2 and Aff1.

Otherwise:

Reserved, RES0.

### VMAPP, bit [40]

When FEAT\_GICv4p1 is implemented:

VMAPP

VMAPP	Meaning
0b0	FEAT_GICv4 VMAPP command layout.
0b1	FEAT_GICv4p1 VMAPP command layout.

Otherwise:

Reserved, RES0.

### VSGI, bit [39]

When FEAT\_GICv4p1 is implemented:

VSGI

VSGI	Meaning
0b0	Direct injection of SGIs is not supported.
0b1	Direct injection of SGIs is supported.

Otherwise:

Reserved, RES0.

### MPAM, bit [38]

When FEAT\_GICv3p1GIC, >=3.1 is implemented:

MPAM

MPAM	Meaning
0b0	MPAM is not supported.
0b1	MPAM is supported.

**Otherwise:**

Reserved, RES0.

**VMOVP, bit [37]**

Indicates the form of the VMOVP command.

VMOVP	Meaning
0b0	When moving a vPE, software must issue a VMOVP on all ITSs that have mappings for that vPE. The ITSList and Sequence Number fields in the VMOVP command must ensure synchronization, otherwise behavior is UNPREDICTABLE.
0b1	When moving a vPE, software must only issue a VMOVP on one of the ITSs that has a mapping for that vPE. The ITSList and Sequence Number fields in the VMOVP command are RES0.

**CIL, bit [36]**

Collection ID Limit.

CIL	Meaning
0b0	ITS supports 16-bit Collection ID, <a href="#">GITS_TYPER.CIDbits</a> is RES0.
0b1	<a href="#">GITS_TYPER.CIDbits</a> indicates supported Collection ID size

In implementations that do not support Collections in external memory, this bit is RES0 and the number of Collections supported is reported by [GITS\\_TYPER.HCC](#).

**CIDbits, bits [35:32]**

Number of Collection ID bits.

- The number of bits of Collection ID minus one.
- When [GITS\\_TYPER.CIL](#) == 0, this field is RES0.

**HCC, bits [31:24]**

Hardware Collection Count. The number of interrupt collections supported by the ITS without provisioning of external memory.

**Note**

Collections held in hardware are unmapped at reset.

**Bits [23:20]**

Reserved, RES0.

**PTA, bit [19]**

Physical Target Addresses. Indicates the format of the target address:

PTA	Meaning
0b0	The target address corresponds to the PE number specified by <a href="#">GICR_TYPER.Processor_Number</a> .
0b1	The target address corresponds to the base physical address of the required Redistributor.

For more information, see 'RDbase' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

### SEIS, bit [18]

SEI support. Indicates whether the virtual CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The ITS does not support local generation of SEIs.
0b1	The ITS supports local generation of SEIs.

### Devbits, bits [17:13]

The number of DeviceID bits implemented, minus one.

### ID\_bits, bits [12:8]

The number of EventID bits implemented, minus one.

### ITT\_entry\_size, bits [7:4]

Read-only. Indicates the number of bytes per translation table entry, minus one.

For more information about the ITS command 'MAPD', see MAPD.

### IMPLEMENTATION DEFINED, bit [3]

IMPLEMENTATION DEFINED.

### CCT, bit [2]

Cumulative Collection Tables.

CCT	Meaning
0b0	The total number of supported collections is determined by the number of collections held in memory only.
0b1	The total number of supported collections is determined by number of collections that are held in memory and the number indicated by GITS_TYPER.HCC.

If GITS\_TYPER.HCC == 0, or if memory backed collections are not supported (all [GITS\\_BASER<n>.Type](#) != 100), this bit is RES0.

### Virtual, bit [1]

When **FEAT\_GICv4** **FEAT\_GICv3** is **not** implemented:

Indicates whether the ITS supports virtual LPis and direct injection of virtual LPis:

Virtual	Meaning
0b0	The ITS does not support virtual LPis or direct injection of virtual LPis.
0b1	The ITS supports virtual LPis and direct injection of virtual LPis.

# GITS\_UMSIR, ITS Unmapped MSI register

The GITS\_UMSIR characteristics are:

## Purpose

Provides the DeviceID and EventID of the unmapped MSI that set [GITS\\_STATUSR](#).UMSI.

## Configuration

This register is present only when GITS\_TYPER.UMSI == 1. Otherwise, direct accesses to GITS\_UMSIR are RES0.

## Attributes

GITS\_UMSIR is a 64-bit register.

## Field descriptions

The GITS\_UMSIR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																DeviceID															
																EventID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### DeviceID, bits [63:32]

DeviceID of MSI that set [GITS\\_STATUSR](#).UMSI to 1.

If [GITS\\_STATUSR](#).UMSI is 0, this field is UNKNOWN.

### EventID, bits [31:0]

EventID of MSI that set [GITS\\_STATUSR](#).UMSI to 1.

If [GITS\\_STATUSR](#).UMSI is 0, this field is UNKNOWN.

## Accessing the GITS\_UMSIR

**GITS\_UMSIR can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC ITS control	0x0028	GITS_UMSIR

This interface is accessible as follows:

- When GICD\_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

# MPAMCFG\_CMAX, MPAM Cache Maximum Capacity Partition Configuration Register

The MPAMCFG\_CMAX characteristics are:

## Purpose

The MPAMCFG\_CMAX is a 32-bit read-write register that controls the maximum fraction of the cache capacity that the PARTID selected by [MPAMCFG\\_PART\\_SEL](#) is permitted to allocate. MPAMCFG\_CMAX\_s controls cache maximum capacity for the Secure PARTID selected by the Secure instance of [MPAMCFG\\_PART\\_SEL](#). MPAMCFG\_CMAX\_ns controls the cache maximum capacity for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG\\_PART\\_SEL](#).

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG\\_PART\\_SEL.RIS](#) and the PARTID selected by [MPAMCFG\\_PART\\_SEL.PARTID\\_SEL](#).

## Configuration

The power domain of MPAMCFG\_CMAX is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented and** [MPAMF\\_IDR.HAS\\_CCAP\\_PART](#) == 1. Otherwise, direct accesses to MPAMCFG\_CMAX are RES0.

## Attributes

MPAMCFG\_CMAX is a 32-bit register.

## Field descriptions

The MPAMCFG\_CMAX bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																CMAX															

### Bits [31:16]

Reserved, RES0.

### CMAX, bits [15:0]

Maximum cache capacity usage in fixed-point fraction format by the partition selected by [MPAMCFG\\_PART\\_SEL](#). The fraction represents the portion of the total cache capacity that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in [MPAMF\\_CCAP\\_IDR.CMAX\\_WD](#). Unimplemented bits within the field are RAZ/WI. The implemented bits of the CMAX field are always the most-significant bits of the field.

The fixed-point fraction CMAX is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the cache that can be represented in an implementation with w implemented bits is  $1 - 1/w$ .

## Accessing the MPAMCFG\_CMAX

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG\_CMAX\_s must be accessible from the Secure MPAM feature page. MPAMCFG\_CMAX\_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG\_CMAX\_s and MPAMCFG\_CMAX\_ns must be separate registers. The Secure instance (MPAMCFG\_CMAX\_s) accesses the cache capacity partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG\_CMAX\_ns) accesses the cache capacity partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG\_CMAX access the cache maximum capacity partitioning configuration settings for the cache resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS and the PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL.

When RIS is not implemented, loads and stores to MPAMCFG\_CMAX access the cache maximum capacity partitioning configuration settings for the PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG\_CMAX access the cache maximum capacity partitioning configuration settings for the internal PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL, and [MPAMCFG\\_PART\\_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG\_CMAX access the cache maximum capacity partitioning configuration settings for the request PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL, and [MPAMCFG\\_PART\\_SEL](#).INTERNAL must be 0.

#### MPAMCFG\_CMAX can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0108	MPAMCFG_CMAX_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0108	MPAMCFG_CMAX_s

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489ec15ad1565345720bed2a

# MPAMCFG\_CPBM<n>, MPAM Cache Portion Bitmap Partition Configuration Register, n = 0 - 1023

The MPAMCFG\_CPBM<n> characteristics are:

## Purpose

The MPAMCFG\_CPBM<n> register array gives access to the cache portion bitmap. Each register in the array is a read-write register that configures the cache portions numbered from  $\langle n \times 32 \rangle$  to  $\langle 31 \times 32 + (n \times 32) \rangle$  that a PARTID is allowed to allocate.

After setting [MPAMCFG\\_PART\\_SEL](#) with a PARTID, software writes to the MPAMCFG\_CPBM<n> register to configure which cache portions the PARTID is allowed to allocate.

The MPAMCFG\_CPBM<n> register that contains the bitmap bit corresponding to cache portion p has n equal to  $p[15:5]$ . The field, P<x>, of that MPAMCFG\_CPBM<n> register that contain the bitmap bit corresponding to cache portion p has x equal to  $p[4:0]$ .

The MPAMCFG\_CPBM<n> register that contains the bitmap bit corresponding to cache portion p has n equal to  $p \gg 5$ . The field, P<x>, of that MPAMCFG\_CPBM<n> register that contain the bitmap bit corresponding to cache portion p has x equal to  $p \& 0x1F$ .

MPAMCFG\_CPBM<n>\_s controls cache portions for the Secure PARTID selected by the Secure instance of [MPAMCFG\\_PART\\_SEL](#). MPAMCFG\_CPBM<n>\_ns controls the cache portions for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG\\_PART\\_SEL](#).

If [MPAMF\\_IDR](#).HAS\_RIS is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG\\_PART\\_SEL](#).RIS and the PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL.

## Configuration

The power domain of MPAMCFG\_CPBM<n> is IMPLEMENTATION DEFINED.

This register is present only when [FEAT\\_MPAM](#) is implemented and [MPAMF\\_IDR](#).HAS\_CPOR\_PART == 1. Otherwise, direct accesses to MPAMCFG\_CPBM<n> are RES0.

## Attributes

MPAMCFG\_CPBM<n> is a 32-bit register.

## Field descriptions

The MPAMCFG\_CPBM<n> bit assignments are:

31	30	29	28	27	26
$P \langle 32 * n + 31 \rangle$	$P \langle 32 * n + 30 \rangle$	$P \langle 32 * n + 29 \rangle$	$P \langle 32 * n + 28 \rangle$	$P \langle 32 * n + 27 \rangle$	$P \langle 32 * n + 26 \rangle$

**P<x>, bit [x], for x = 0 to 31**

Portion allocation control bit. Each cache portion allocation control bit, MPAMCFG\_CPBM<n>.P<x>, grants permission to the PARTID selected by [MPAMCFG\\_PART\\_SEL](#) to allocate cache lines within cache portion  $32n + x$ .

**P<x + (n \* 32)>, bit [x], for x = 31 to 0**

Portion allocation control bit. Each cache portion allocation control bit, MPAMCFG\_CPBM<n>.P<x>, grants permission to the PARTID selected by [MPAMCFG\\_PART\\_SEL](#) to allocate cache lines within cache portion  $\langle x + (n * 32) \rangle$ .

<b>P&lt;x + (n * 32)&gt;</b>	<b>Meaning</b>
0b0	The PARTID is not permitted to allocate into cache portion $\langle x32n + (n * 32) \rangle$ .
0b1	The PARTID is permitted to allocate within cache portion $\langle x32n + (n * 32) \rangle$ .

The number of bits in the cache portion partitioning bit map of this component is given in [MPAMF\\_CPOR\\_IDR.CPBM\\_WD](#). CPBM\_WD contains a value from 1 to  $2^{15}$ , inclusive. Values of CPBM\_WD greater than 32 require an array of 32-bit [MPAMCFG\\_CPBM<n>](#) registers to access the cache portion bitmap, up to 1024 registers.

Bits MPAMCFG\_CPBM<n>.P<<x>, + (n \* 32)>>, where  $\langle x32n + (n * 32) \rangle$  is greater than or CPBM\_WD, equal are not required to CPBM\_WD, be are implemented. RES0:

- If  $n > \text{MPAMF\_CPOR\_IDR.CPBM\_WD}[15:5]$ , the entire 32 P<x> are RES0.
- If  $n == \text{MPAMF\_CPOR\_IDR.CPBM\_WD}[15:5]$ , bits [31: CPBM\_WD[4:0]] are RES0 and the remaining bits are valid.
- If  $n < \text{MPAMF\_CPOR\_IDR.CPBM\_WD}[15:5]$ , the entire 32 P<x> are valid.

## Accessing the MPAMCFG\_CPBM<n>

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG\_CPBM<n>\_s must be accessible from the Secure MPAM feature page. MPAMCFG\_CPBM<n>\_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG\_CPBM<n>\_s and MPAMCFG\_CPBM<n>\_ns must be separate registers. The Secure instance (MPAMCFG\_CPBM<n>\_s) accesses the cache portion bitmap used for Secure PARTIDs, and the Non-secure instance (MPAMCFG\_CPBM<n>\_ns) accesses the cache portion bitmap used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG\_CPBM<n> access the cache portion bitmap configuration settings for the cache resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS and the PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL.

When RIS is not implemented, loads and stores to MPAMCFG\_CPBM<n> access the cache portion bitmap configuration settings for the PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG\_CPBM<n> access the cache portion bitmap configuration settings for the internal PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL, and [MPAMCFG\\_PART\\_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG\_CPBM<n> access the cache portion bitmap configuration settings for the request PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL, and [MPAMCFG\\_PART\\_SEL](#).INTERNAL must be 0.

**MPAMCFG\_CPBM<n> can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	$0x1000 + (4 * n)$	MPAMCFG_CPBM<n>_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	$0x1000 + (4 * n)$	MPAMCFG_CPBM<n>_ns

Accesses on this interface are **RW**.

# MPAMCFG\_INTPARTID, MPAM Internal PARTID Narrowing Configuration Register

The MPAMCFG\_INTPARTID characteristics are:

## Purpose

MPAMCFG\_INTPARTID is a 32-bit read-write register that controls the mapping of the PARTID selected by [MPAMCFG\\_PART\\_SEL](#) into a narrower internal PARTID (intPARTID).

MPAMCFG\_INTPARTID\_s controls the mapping for the Secure PARTID selected by the Secure instance of [MPAMCFG\\_PART\\_SEL](#). MPAMCFG\_INTPARTID\_ns controls the mapping for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG\\_PART\\_SEL](#).

The MPAMCFG\_INTPARTID register associates the request PARTID (reqPARTID) in the [MPAMCFG\\_PART\\_SEL](#) register with an internal PARTID (intPARTID) in this register. To set that association, store reqPARTID into the [MPAMCFG\\_PART\\_SEL](#) register and then store the intPARTID into the MPAMCFG\_INTPARTID register. To read the association, store reqPARTID into the MPAMCFG\_PART\_SEL register and then read MPAMCFG\_INTPARTID.

If the intPARTID stored into MPAMCFG\_INTPARTID is out-of-range or does not have the INTERNAL bit set, the association of reqPARTID to intPARTID is not written and [MPAMF\\_ESR](#) is set to indicate an intPARTID\_Range error.

If [MPAMCFG\\_PART\\_SEL](#).INTERNAL is 1 when MPAMCFG\_INTPARTID is read or written, [MPAMF\\_ESR](#) is set to indicate an Unexpected\_INTERNAL error.

## Configuration

The power domain of MPAMCFG\_INTPARTID is IMPLEMENTATION DEFINED.

This register is present only when [FEAT\\_MPAM](#) is implemented and [MPAMF\\_IDR.HAS\\_PARTID\\_NRW](#) == 1. Otherwise, direct accesses to MPAMCFG\_INTPARTID are RES0.

## Attributes

MPAMCFG\_INTPARTID is a 32-bit register.

## Field descriptions

The MPAMCFG\_INTPARTID bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
RES0																INTERNAL		INTPARTID														

### Bits [31:17]

Reserved, RES0.

### INTERNAL, bit [16]

Internal PARTID flag.

This bit must be 1 when written to the register. If written as 0, the write will not update the reqPARTID to intPARTID association.

On a read of this register, the bit will always read the value last written.

**INTPARTID, bits [15:0]**

This field contains the intPARTID mapped to the reqPARTID in [MPAMCFG\\_PART\\_SEL](#).

The maximum intPARTID supported is [MPAMF\\_PARTID\\_NRW\\_IDR](#).INTPARTID\_MAX.

**Accessing the MPAMCFG\_INTPARTID**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG\_INTPARTID\_s must be accessible from the Secure MPAM feature page. MPAMCFG\_INTPARTID\_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG\_INTPARTID\_s and MPAMCFG\_INTPARTID\_ns must be separate registers. The Secure instance (MPAMCFG\_INTPARTID\_s) accesses the PARTID narrowing used for Secure PARTIDs, and the Non-secure instance (MPAMCFG\_INTPARTID\_ns) accesses the PARTID narrowing used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG\_INTPARTID access the PARTID narrowing configuration settings without being affected by [MPAMCFG\\_PART\\_SEL](#).RIS.

Loads and stores to MPAMCFG\_INTPARTID access the PARTID narrowing configuration settings for the request PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL, and [MPAMCFG\\_PART\\_SEL](#).INTERNAL must be 0.

**MPAMCFG\_INTPARTID can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0600	MPAMCFG_INTPARTID_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0600	MPAMCFG_INTPARTID_ns

Accesses on this interface are **RW**.

# MPAMCFG\_MBW\_MAX, MPAM Memory Bandwidth Maximum Partition Configuration Register

The MPAMCFG\_MBW\_MAX characteristics are:

## Purpose

MPAMCFG\_MBW\_MAX is a 32-bit read-write register that controls the maximum fraction of memory bandwidth that the PARTID selected by [MPAMCFG\\_PART\\_SEL](#) is permitted to use. MPAMCFG\_MBW\_MAX\_s controls maximum bandwidth for the Secure PARTID selected by the Secure instance of [MPAMCFG\\_PART\\_SEL](#).

MPAMCFG\_MBW\_MAX\_ns controls the maximum bandwidth for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG\\_PART\\_SEL](#).

A PARTID that has used more than MAX is given no access to additional bandwidth if HARDLIM == 1 or is given additional bandwidth only if there are no requests from PARTIDs that have not exceeded their MAX if HARDLIM == 0.

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG\\_PART\\_SEL.RIS](#) and the PARTID selected by [MPAMCFG\\_PART\\_SEL.PARTID\\_SEL](#).

## Configuration

The power domain of MPAMCFG\_MBW\_MAX is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented**, MPAMF\_IDR.HAS\_MBW\_PART == 1 and MPAMF\_MBW\_IDR.HAS\_MAX == 1. Otherwise, direct accesses to MPAMCFG\_MBW\_MAX are RES0.

## Attributes

MPAMCFG\_MBW\_MAX is a 32-bit register.

## Field descriptions

The MPAMCFG\_MBW\_MAX bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">HARDLIM</a>	<a href="#">RES0</a>															<a href="#">MAX</a>															

### HARDLIM, bit [31]

Hard bandwidth limiting.

HARDLIM	Meaning
0b0	When MAX bandwidth is exceeded, the partition contends with a low preference for downstream bandwidth beyond MAX.
0b1	When MAX bandwidth is exceeded, the partition does not be use any more bandwidth until the memory bandwidth measurement for the partition falls below MAX.

### Bits [30:16]

Reserved, RES0.

**MAX, bits [15:0]**

Memory maximum bandwidth allocated to the partition selected by [MPAMCFG\\_PART\\_SEL](#). MAX is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in [MPAMF\\_MBW\\_IDR.BWA\\_WD](#). Unimplemented bits are RAZ/WI. The implemented bits of the MAX field are always to the left of the field. For example, if BWA\_WD = 3, the implemented bits are MPAMCFG\_MBW\_MAX[15:13] and MPAMCFG\_MBW\_MAX[12:0] are unimplemented.

The fixed-point fraction MAX is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the [bandwidthcache](#) that can be represented in an implementation with w implemented bits is  $1 - 1/w$ .

**Accessing the MPAMCFG\_MBW\_MAX**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG\_MBW\_MAX\_s must be accessible from the Secure MPAM feature page. MPAMCFG\_MBW\_MAX\_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG\_MBW\_MAX\_s and MPAMCFG\_MBW\_MAX\_ns must be separate registers. The Secure instance (MPAMCFG\_MBW\_MAX\_s) accesses the memory maximum bandwidth partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG\_MBW\_MAX\_ns) accesses the memory maximum bandwidth partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG\_MBW\_MAX access the memory maximum bandwidth partitioning configuration settings for the bandwidth resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS and the PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL.

When RIS is not implemented, loads and stores to MPAMCFG\_MBW\_MAX access the memory maximum bandwidth partitioning configuration settings for the PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG\_MBW\_MAX access the memory maximum bandwidth partitioning configuration settings for the internal PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL, and [MPAMCFG\\_PART\\_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG\_MBW\_MAX access the memory maximum bandwidth partitioning configuration settings for the request PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL, and [MPAMCFG\\_PART\\_SEL](#).INTERNAL must be 0.

**MPAMCFG\_MBW\_MAX can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0208	MPAMCFG_MBW_MAX_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0208	MPAMCFG_MBW_MAX_ns

Accesses on this interface are **RW**.

3001/0907/2020 15:0757: ccead0cb9f089f9cceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bcd2a

# MPAMCFG\_MBW\_MIN, MPAM Memory Bandwidth Minimum Partition Configuration Register

The MPAMCFG\_MBW\_MIN characteristics are:

## Purpose

MPAMCFG\_MBW\_MIN is a 32-bit read-write register that controls the minimum fraction of memory bandwidth that the PARTID selected by [MPAMCFG\\_PART\\_SEL](#) is permitted to use. MPAMCFG\_MBW\_MIN\_s controls the minimum bandwidth for the Secure PARTID selected by the Secure instance of [MPAMCFG\\_PART\\_SEL](#). MPAMCFG\_MBW\_MIN\_ns controls the minimum bandwidth for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG\\_PART\\_SEL](#).

A PARTID that has used less than MIN is given preferential access to bandwidth.

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG\\_PART\\_SEL.RIS](#) and the PARTID selected by [MPAMCFG\\_PART\\_SEL.PARTID\\_SEL](#).

## Configuration

The power domain of MPAMCFG\_MBW\_MIN is IMPLEMENTATION DEFINED.

This register is present only when [FEAT\\_MPAM](#) is implemented, [MPAMF\\_IDR.HAS\\_MBW\\_PART](#) == 1 and [MPAMF\\_MBW\\_IDR.HAS\\_MIN](#) == 1. Otherwise, direct accesses to MPAMCFG\_MBW\_MIN are RES0.

## Attributes

MPAMCFG\_MBW\_MIN is a 32-bit register.

## Field descriptions

The MPAMCFG\_MBW\_MIN bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																MIN															

### Bits [31:16]

Reserved, RES0.

### MIN, bits [15:0]

Memory minimum bandwidth allocated to the partition selected by [MPAMCFG\\_PART\\_SEL](#). MIN is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in [MPAMF\\_MBW\\_IDR.BWA\\_WD](#). Unimplemented bits are RAZ/WI. The implemented bits of the MIN field are always to the left of the field. For example, if BWA\_WD = 4, the implemented bits are MPAMCFG\_MBW\_MIN[15:12] and MPAMCFG\_MBW\_MIN[11:0] are unimplemented.

The fixed-point fraction MIN is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the [bandwidthcache](#) that can be represented in an implementation with w implemented bits is  $1 - 1/w$ .

When PARTID narrowing is not implemented, loads and stores to MPAMCFG\_MBW\_MIN access the memory minimum bandwidth partitioning configuration settings for the request PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL, and [MPAMCFG\\_PART\\_SEL](#).INTERNAL must be 0.

# MPAMCFG\_MBW\_PBM<n>, MPAM Bandwidth Portion Bitmap Partition Configuration Register, n = 0 - 127

The MPAMCFG\_MBW\_PBM<n> characteristics are:

## Purpose

The MPAMCFG\_MBW\_PBM<n> register array gives access to the memory bandwidth portion bitmap. Each register in the array is a read-write register that configures the **bandwidth** portions  $\langle 32 * n \rangle$  to  $\langle (32 * n) + 31 \rangle$  that a PARTID is allowed to allocate.

After setting [MPAMCFG\\_PART\\_SEL](#) with a PARTID, software writes to one or more of the MPAMCFG\_MBW\_PBM<n> registers to configure which **bandwidth** portions the PARTID is allowed to allocate.

The MPAMCFG\_MBW\_PBM<n> register that contains the bitmap bit corresponding to memory bandwidth portion p has n equal to  $p[11:5]$ . The field,  $P\langle x + (32 * n) \rangle$  of that MPAMCFG\_MBW\_PBM<n> register that contain the bitmap bit corresponding to memory bandwidth portion p has x equal to  $p[4:0]$ .

The MPAMCFG\_MBW\_PBM<n> register that contains the bitmap bit corresponding to memory bandwidth portion p has n equal to  $p \gg 5$ . The field,  $P\langle x \rangle$  of that MPAMCFG\_MBW\_PBM<n> register that contain the bitmap bit corresponding to memory bandwidth portion p has x equal to  $p \& 0x1F$ .

The MPAMCFG\_MBW\_PBM<n>\_s registers control the bandwidth portion bitmap for the Secure PARTID selected by the Secure instance of [MPAMCFG\\_PART\\_SEL](#). The MPAMCFG\_MBW\_PBM<n>\_ns registers control the bandwidth portion bitmap for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG\\_PART\\_SEL](#).

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG\\_PART\\_SEL.RIS](#) and the PARTID selected by [MPAMCFG\\_PART\\_SEL.PARTID\\_SEL](#).

## Configuration

The power domain of MPAMCFG\_MBW\_PBM<n> is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented**, [MPAMF\\_IDR.HAS\\_MBW\\_PART](#) == 1 and [MPAMF\\_MBW\\_IDR.HAS\\_PBM](#) == 1. Otherwise, direct accesses to MPAMCFG\_MBW\_PBM<n> are RES0.

## Attributes

MPAMCFG\_MBW\_PBM<n> is a 32-bit register.

## Field descriptions

The MPAMCFG\_MBW\_PBM<n> bit assignments are:

31	30	29	28	27	26
$P\langle 32 * n + 31 \rangle$	$P\langle 32 * n + 30 \rangle$	$P\langle 32 * n + 29 \rangle$	$P\langle 32 * n + 28 \rangle$	$P\langle 32 * n + 27 \rangle$	$P\langle 32 * n + 26 \rangle$

**$P\langle x \rangle$ , bit [x], for x = 0 to 31**

Portion allocation control bit. Each bandwidth portion allocation control bit MPAMCFG\_MBW\_PBM<n>. $P\langle x \rangle$  grants permission to the PARTID selected by [MPAMCFG\\_PART\\_SEL](#) to allocate bandwidth within bandwidth portion  $32n + x$ .

**$P\langle x + (32 * n) \rangle$ , bit [x], for x = 31 to 0**

Portion allocation control bit. Each bandwidth portion allocation control bit MPAMCFG\_MBW\_PBM<n>. $P\langle x + (32 * n) \rangle$  grants permission to the PARTID selected by [MPAMCFG\\_PART\\_SEL](#) to allocate bandwidth within bandwidth portion  $\langle x + (32 * n) \rangle$ .

<b>P&lt;x + (32 * n)&gt;</b>	<b>Meaning</b>
0b0	The PARTID is not permitted to allocate into bandwidth portion $\langle x32n + (32 * n) \rangle$ .
0b1	The PARTID is permitted to allocate within bandwidth portion $\langle x32n + (32 * n) \rangle$ .

The number of bits in the bandwidth portion partitioning bit map of this component is given in [MPAMF\\_MBW\\_IDR.BWPBM\\_WD](#). BWPBM\_WD contains a value from 1 to  $2^{12}$ , inclusive. Values of BWPBM\_WD greater than 32 require a group of 32-bit registers to access the bandwidth portion bitmap, up to 128 32-bit registers.

Bits MPAMCFG\_MBW\_PBM<n>.P<< <x>, + (32 \* n)>>, where  $\langle x32n + (32 * n) \rangle$  is greater than or BWPBM\_WD, equal are not required to BWPBM\_WD be implemented. RES0:

- If  $n > \text{MPAMF\_MBW\_IDR.BWPBM\_WD}[11:5]$ , the entire 32 P<x> are RES0.
- If  $n == \text{MPAMF\_MBW\_IDR.BWPBM\_WD}[11:5]$ , bits [31: BWPBM\_WD[4:0]] are RES0 and the remaining bits are valid.
- If  $n < \text{MPAMF\_MBW\_IDR.BWPBM\_WD}[11:5]$ , the entire 32 P<x> are valid.

## Accessing the MPAMCFG\_MBW\_PBM<n>

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG\_MBW\_PBM<n>\_s must be accessible from the Secure MPAM feature page. MPAMCFG\_MBW\_PBM<n>\_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG\_MBW\_PBM<n>\_s and MPAMCFG\_MBW\_PBM<n>\_ns must be separate registers. The Secure instance (MPAMCFG\_MBW\_PBM<n>\_s) accesses the memory bandwidth portion bitmap used for Secure PARTIDs, and the Non-secure instance (MPAMCFG\_MBW\_PBM<n>\_ns) accesses the memory bandwidth portion bitmap used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG\_MBW\_PBM<n> access the memory bandwidth portion bitmap configuration settings for the bandwidth resource instance selected by [MPAMCFG\\_PART\\_SEL.RIS](#) and the PARTID selected by [MPAMCFG\\_PART\\_SEL.PARTID\\_SEL](#).

When RIS is not implemented, loads and stores to MPAMCFG\_MBW\_PBM<n> access the memory bandwidth portion bitmap configuration settings for the PARTID selected by [MPAMCFG\\_PART\\_SEL.PARTID\\_SEL](#).

When PARTID narrowing is implemented, loads and stores to MPAMCFG\_MBW\_PBM<n> access the memory bandwidth portion bitmap configuration settings for the internal PARTID selected by [MPAMCFG\\_PART\\_SEL.PARTID\\_SEL](#), and [MPAMCFG\\_PART\\_SEL.INTERNAL](#) must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG\_MBW\_PBM<n> access the memory bandwidth portion bitmap configuration settings for the request PARTID selected by [MPAMCFG\\_PART\\_SEL.PARTID\\_SEL](#), and [MPAMCFG\\_PART\\_SEL.INTERNAL](#) must be 0.

**MPAMCFG\_MBW\_PBM<n> can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_ns

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489ec15ad1565345720bed2a

# MPAMCFG\_MBW\_PROP, MPAM Memory Bandwidth Proportional Stride Partition Configuration Register

The MPAMCFG\_MBW\_PROP characteristics are:

## Purpose

Controls the proportional stride of memory bandwidth that the PARTID selected by [MPAMCFG\\_PART\\_SEL](#) uses. MPAMCFG\_MBW\_PROP\_s controls the bandwidth proportional stride for the Secure PARTID selected by the Secure instance of [MPAMCFG\\_PART\\_SEL](#). MPAMCFG\_MBW\_PROP\_ns controls the bandwidth proportional stride for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG\\_PART\\_SEL](#).

Proportional stride is a relative cost of bandwidth requested by one PARTID in relation to the costs of the bandwidths requested by each other PARTID also competing to use the bandwidth.

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG\\_PART\\_SEL.RIS](#) and the PARTID selected by [MPAMCFG\\_PART\\_SEL.PARTID\\_SEL](#).

## Configuration

The power domain of MPAMCFG\_MBW\_PROP is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented**, [MPAMF\\_IDR.HAS\\_MBW\\_PART](#) == 1 and [MPAMF\\_MBW\\_IDR.HAS\\_PROP](#) == 1. Otherwise, direct accesses to MPAMCFG\_MBW\_PROP are RES0.

## Attributes

MPAMCFG\_MBW\_PROP is a 32-bit register.

## Field descriptions

The MPAMCFG\_MBW\_PROP bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">EN</a>																<a href="#">STRIDEM1</a>															

### EN, bit [31]

Enable proportional stride bandwidth partitioning.

EN	Meaning
0b0	The selected partition is not regulated by proportional stride bandwidth partitioning.
0b1	The selected partition has bandwidth usage regulated by proportional stride bandwidth partitioning as controlled by STRIDEM1.

### Bits [30:16]

Reserved, RES0.

### STRIDEM1, bits [15:0]

Memory bandwidth stride minus 1 allocated to the partition selected by [MPAMCFG\\_PART\\_SEL](#). STRIDEM1 represents the normalized cost of bandwidth consumption by the partition.

The proportional stride partitioning control parameter is an unsigned integer representing the normalized cost to a partition for consuming bandwidth. Larger values have a larger cost and correspond to a lesser allocation of bandwidth while smaller values indicate a lesser cost and therefore a higher allocation of bandwidth.

The implemented width of STRIDEM1 is given in MPAMF MBW IDR.BWA WD.

## Accessing the MPAMCFG MBW PROP

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG\_MBW\_PROP\_s must be accessible from the Secure MPAM feature page. MPAMCFG\_MBW\_PROP\_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG\_MBW\_PROP\_s and MPAMCFG\_MBW\_PROP\_ns must be separate registers. The Secure instance (MPAMCFG\_MBW\_PROP\_s) accesses the memory proportional stride bandwidth partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG\_MBW\_PROP\_ns) accesses the memory proportional stride bandwidth partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG\_MBW\_PROP access the memory proportional stride bandwidth partitioning configuration settings for the bandwidth\_resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS and the PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL.

When RIS is not implemented, loads and stores to MPAMCFG\_MBW\_PROP access the memory proportional stride bandwidth partitioning configuration settings for the PARTID selected by [MPAMCFG PART\\_SEL](#).PARTID\_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG\_MBW\_PROP access the memory proportional stride bandwidth partitioning configuration settings for the internal PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL, and [MPAMCFG\\_PART\\_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG\_MBW\_PROP access the memory proportional stride bandwidth partitioning configuration settings for the request PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL, and [MPAMCFG\\_PART\\_SEL](#).INTERNAL must be 0.

**MPAMCFG MBW PROP** can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF BASE s	0x0500	MPAMCFG MBW PROP s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF BASE ns	0x0500	MPAMCFG MBW PROP ns

Accesses on this interface are **RW**.

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bcd2a

# MPAMCFG\_MBW\_WINWD, MPAM Memory Bandwidth Partitioning Window Width Configuration Register

The MPAMCFG\_MBW\_WINWD characteristics are:

## Purpose

MPAMCFG\_MBW\_WINWD is a 32-bit register that shows and sets the value of the window width for the PARTID in [MPAMCFG\\_PART\\_SEL](#). MPAMCFG\_MBW\_WINWD\_s reads and controls the bandwidth control window width for the Secure PARTID selected by the Secure instance of [MPAMCFG\\_PART\\_SEL](#). MPAMCFG\_MBW\_WINWD\_ns reads and controls the bandwidth control window for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG\\_PART\\_SEL](#).

MPAMCFG\_MBW\_WINWD is read-only if [MPAMF\\_MBW\\_IDR](#).WINDWR == 0, and the window width is set by the hardware, even if variable.

MPAMCFG\_MBW\_WINWD is read-write if [MPAMF\\_MBW\\_IDR](#).WINDWR == 1, permitting configuration of the window width for each PARTID independently on hardware that supports this functionality.

If [MPAMF\\_IDR](#).HAS\_RIS is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG\\_PART\\_SEL](#).RIS and the PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL.

## Configuration

The power domain of MPAMCFG\_MBW\_WINWD is IMPLEMENTATION DEFINED.

This register is present only when [FEAT\\_MPAM is implemented and](#) [MPAMF\\_IDR](#).HAS\_MBW\_PART == 1. Otherwise, direct accesses to MPAMCFG\_MBW\_WINWD are RES0.

## Attributes

MPAMCFG\_MBW\_WINWD is a 32-bit register.

## Field descriptions

The MPAMCFG\_MBW\_WINWD bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								US INT								US FRAC															

### Bits [31:24]

Reserved, RES0.

### US\_INT, bits [23:8]

Window width, integer microseconds.

This field reads (and sets) the integer part of the window width in microseconds for the PARTID selected by [MPAMCFG\\_PART\\_SEL](#).

### US\_FRAC, bits [7:0]

Window width, fractional microseconds.

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG\_MBW\_WINWD\_s must be accessible from the Secure MPAM feature page. MPAMCFG\_MBW\_WINWD\_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG\_MBW\_WINWD\_s and MPAMCFG\_MBW\_WINWD\_ns must be separate registers. The Secure instance (MPAMCFG\_MBW\_WINWD\_s) accesses the window width used for Secure PARTIDs, and the Non-secure instance (MPAMCFG\_MBW\_WINWD\_ns) accesses the window width used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG\_MBW\_WINWD access the window width configuration settings for the bandwidth resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS and the PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL.

When RIS is not implemented, loads and stores to MPAMCFG\_MBW\_WINWD access the window width configuration settings for the PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG\_MBW\_WINWD access the window width configuration settings for the internal PARTID selected by `MPAMCFG_PART_SEL.PARTID_SEL`, and `MPAMCFG_PART_SEL.INTERNAL` must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG\_MBW\_WINWD access the window width configuration settings for the request PARTID selected by `MPAMCFG_PART_SEL.PARTID_SEL`, and `MPAMCFG_PART_SEL.INTERNAL` must be 0.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0220	MPAMCFG_MBW_WINWD_s

- When MPAMF\_MBW\_IDR.WINDWR == 0 accesses to this register are **RO**.
- Otherwise accesses to this register are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0220	MPAMCFG_MBW_WINWD_ns

- When `MPAMF_MBW_IDR.WINDWR == 0` accesses to this register are **RO**.
- Otherwise accesses to this register are **RW**.

# MPAMCFG\_PART\_SEL, MPAM Partition Configuration Selection Register

The MPAMCFG\_PART\_SEL characteristics are:

## Purpose

Selects a partition ID to configure. MPAMCFG\_PART\_SEL\_s selects a Secure PARTID to configure. MPAMCFG\_PART\_SEL\_ns selects a Non-secure PARTID to configure.

After setting this register with a PARTID, software (usually a hypervisor) can perform a series of accesses to MPAMCFG registers to configure parameters for MPAM resource controls to use when requests have that PARTID.

## Configuration

The power domain of MPAMCFG\_PART\_SEL is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented and** (MPAMF\_IDR.HAS\_CCAP\_PART == 1, or MPAMF\_IDR.HAS\_CPOR\_PART == 1, or MPAMF\_IDR.HAS\_MBW\_PART == 1, or MPAMF\_IDR.HAS\_PRI\_PART == 1, or MPAMF\_IDR.HAS\_PARTID\_NRW == 1, or (MPAMF\_IDR.EXT == 0 and MPAMF\_IDR.HAS\_IMPL\_IDR == 1) or (MPAMF\_IDR.EXT == 1, MPAMF\_IDR.HAS\_IMPL\_IDR == 1 and MPAMF\_IDR.NO\_IMPL\_PART == 0)). Otherwise, direct accesses to MPAMCFG\_PART\_SEL are RES0.

## Attributes

MPAMCFG\_PART\_SEL is a 32-bit register.

## Field descriptions

The MPAMCFG\_PART\_SEL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				RIS				RES0				INTERNAL				PARTID_SEL															

### Bits [31:28]

Reserved, RES0.

### RIS, bits [27:24]

When (FEAT\_MPAMv0p1 is implemented or FEAT\_MPAMv1p1 is implemented), MPAMF\_IDR.EXT == 1 and MPAMF\_IDR.HAS\_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MPAMCFG registers and describe with MPAMF ID registers.

### Otherwise:

Reserved, RES0.

### Bits [23:17]

Reserved, RES0.

**INTERNAL, bit [16]**

Internal PARTID.

If [MPAMF\\_IDR.HAS\\_PARTID\\_NRW](#) = 0, this field is RAZ/WI.

If [MPAMF\\_IDR.HAS\\_PARTID\\_NRW](#) = 1:

INTERNAL	Meaning
0b0	PARTID_SEL is interpreted as a request PARTID and ignored except for use with <a href="#">MPAMCFG_INTPARTID</a> register access.
0b1	PARTID_SEL is interpreted as an internal PARTID and used for access to MPAMCFG control settings except for <a href="#">MPAMCFG_INTPARTID</a> .

If PARTID narrowing is implemented as indicated by [MPAMF\\_IDR.HAS\\_PARTID\\_NRW](#) = 1, when accessing other MPAMCFG registers the value of the MPAMCFG\_PART\_SEL.INTERNAL bit is checked for these conditions:

- When the [MPAMCFG\\_INTPARTID](#) register is read or written, if the value of MPAMCFG\_PART\_SEL.INTERNAL is not 0, an Unexpected\_INTERNAL error is set in [MPAMF\\_ESR](#).
- When an MPAMCFG register other than [MPAMCFG\\_INTPARTID](#) is read or written, if the value of MPAMCFG\_PART\_SEL.INTERNAL is not 1, [MPAMF\\_ESR](#) is set to indicate an intPARTID\_Range error.

In either error case listed here, the value returned by a read operation is UNPREDICTABLE, and the control settings are not affected by a write.

**PARTID\_SEL, bits [15:0]**

Selects the partition ID to configure.

Reads and writes to other MPAMCFG registers are indexed by PARTID\_SEL and by the NS bit used to access MPAMCFG\_PART\_SEL to access the configuration for a single partition.

**Accessing the MPAMCFG\_PART\_SEL**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG\_PART\_SEL\_s must be accessible from the Secure MPAM feature page. MPAMCFG\_PART\_SEL\_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG\_PART\_SEL\_s and MPAMCFG\_PART\_SEL\_ns must be separate registers. The Secure instance (MPAMCFG\_PART\_SEL\_s) accesses the PARTID selector used for Secure PARTIDs, and the Non-secure instance (MPAMCFG\_PART\_SEL\_ns) accesses the PARTID selector used for Non-secure PARTIDs.

**MPAMCFG\_PART\_SEL can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0100	MPAMCFG_PART_SEL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0100	MPAMCFG_PART_SEL_ns

Accesses on this interface are **RW**.

# MPAMCFG\_PRI, MPAM Priority Partition Configuration Register

The MPAMCFG\_PRI characteristics are:

## Purpose

Controls the internal and downstream priority of requests attributed to the PARTID selected by [MPAMCFG\\_PART\\_SEL](#). MPAMCFG\_PRI\_s controls the priorities for the Secure PARTID selected by the Secure instance of [MPAMCFG\\_PART\\_SEL](#). MPAMCFG\_PRI\_ns controls the priorities for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG\\_PART\\_SEL](#).

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG\\_PART\\_SEL.RIS](#) and the PARTID selected by [MPAMCFG\\_PART\\_SEL.PARTID\\_SEL](#).

## Configuration

The power domain of MPAMCFG\_PRI is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented and** [MPAMF\\_IDR.HAS\\_PRI\\_PART](#) == 1. Otherwise, direct accesses to MPAMCFG\_PRI are RES0.

## Attributes

MPAMCFG\_PRI is a 32-bit register.

## Field descriptions

The MPAMCFG\_PRI bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DSPRI																INTPRI															

### DSPRI, bits [31:16]

Downstream priority.

If [MPAMF\\_PRI\\_IDR.HAS\\_DSPRI](#) == 0, bits of this field are RES0 as this field is not used.

If [MPAMF\\_PRI\\_IDR.HAS\\_DSPRI](#) == 1, this field is a priority value applied to downstream communications from this MSC for transactions of the partition selected by [MPAMCFG\\_PART\\_SEL](#).

The implemented width of this field is [MPAMF\\_PRI\\_IDR.DSPRI\\_WD](#) bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of [MPAMF\\_PRI\\_IDR.DSPRI\\_0\\_IS\\_LOW](#).

### INTPRI, bits [15:0]

Internal priority.

If [MPAMF\\_PRI\\_IDR.HAS\\_INTPRI](#) == 0, bits of this field are RES0 as this field is not used.

If [MPAMF\\_PRI\\_IDR.HAS\\_INTPRI](#) == 1, this field is a priority value applied internally inside this MSC for transactions of the partition selected by [MPAMCFG\\_PART\\_SEL](#).

The implemented width of this field is [MPAMF\\_PRI\\_IDR](#).INTPRI\_WD bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of `MPAMF_PRI_IDR.INTPRI` 0 IS LOW.

## Accessing the MPAMCFG\_PRI

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG\_PRI\_s must be accessible from the Secure MPAM feature page. MPAMCFG\_PRI\_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG\_PRI\_s and MPAMCFG\_PRI\_ns must be separate registers. The Secure instance (MPAMCFG\_PRI\_s) accesses the priority partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG\_PRI\_ns) accesses the priority partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG\_PRI access the priority partitioning configuration settings for the priority resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS and the PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID SEL.

When RIS is not implemented, loads and stores to MPAMCFG\_PRI access the priority partitioning configuration settings for the PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG\_PRI access the priority partitioning configuration settings for the internal PARTID selected by [MPAMCFG\\_PART\\_SEL](#).PARTID\_SEL, and [MPAMCFG\\_PART\\_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG\_PRI access the priority partitioning configuration settings for the request PARTID selected by `MPAMCFG_PART_SEL.PARTID_SEL`, and `MPAMCFG_PART_SEL.INTERNAL` must be 0.

**MPAMCFG\_PRI can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF BASE s	0x0400	MPAMCFG PRI s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF BASE ns	0x0400	MPAMCFG PRI ns

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# MPAMF\_AIDR, MPAM Architecture Identification Register

The MPAMF\_AIDR characteristics are:

## Purpose

Identifies the version of the MPAM architecture that this MSC implements.

Note: The following values are defined for bits [7:0]:

- 0x01 == MPAM architecture v0.1
- 0x10 == MPAM architecture v1.0
- 0x11 == MPAM architecture v1.1

## Configuration

The power domain of MPAMF\_AIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT\_MPAM is implemented. Otherwise, direct accesses to MPAMF\_AIDR are RES0.

## Attributes

MPAMF\_AIDR is a 32-bit register.

## Field descriptions

The MPAMF\_AIDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												ArchMajorRev				ArchMinorRev			

### Bits [31:8]

Reserved, RES0.

### ArchMajorRev, bits [7:4]

Major revision of the MPAM architecture implemented by the MSC.

This table shows the only valid combinations of MPAM version numbers in an MSC. FORCE\_NS functionality is only available in MPAM v0.1.

ArchMajorRev	ArchMinorRev	MPAMv	Available
0	0		None.
0	1	v0.1	MPAMv1.0 + MPAMv1.1 + FORCE_NS
1	0	v1.0	MPAMv1.0
1	1	v1.1	MPAMv1.0 + MPAMv1.1 - FORCE_NS

Use of MPAMv0.1 in MSCs is restricted to limited circumstances. The MSC must be able to initiate requests in the secure address space which have MPAM PARTID forced to the Non-secure space with that forcing not controllable or

observable by the software that configures the the device for Secure requests. Please contact Arm before setting MPAMF\_AIDR to report MPAMv0.1.

### ArchMinorRev, bits [3:0]

Minor revision of the MPAM architecture implemented by the MSC.

See the table in the description of the ArchMajorRev field in this register.

## Accessing the MPAMF\_AIDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF\_AIDR is read-only.

MPAMF\_AIDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF\_AIDR must have the same contents in the Secure and Non-secure MPAM feature pages.

### MPAMF\_AIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0020	MPAMF_AIDR

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0020	MPAMF_AIDR

Accesses on this interface are **RO**.

# MPAMF\_CCAP\_IDR, MPAM Features Cache Capacity Partitioning ID register

The MPAMF\_CCAP\_IDR characteristics are:

## Purpose

Indicates the number of fractional bits in [MPAMCFG\\_CMAX](#).CMAX. MPAMF\_CCAP\_IDR\_s indicates the number of fractional bits in the Secure instance of [MPAMCFG\\_CMAX](#). MPAMF\_CCAP\_IDR\_ns indicates the number of fractional bits in the Non-secure instance of [MPAMCFG\\_CMAX](#).

When [MPAMF\\_IDR](#).HAS\_RIS is 1, some fields in this register give information for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS. The description of every field that is affected by [MPAMCFG\\_PART\\_SEL](#).RIS has information within the field description.

## Configuration

The power domain of MPAMF\_CCAP\_IDR is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented and** MPAMF\_IDR.HAS\_CCAP\_PART == 1. Otherwise, direct accesses to MPAMF\_CCAP\_IDR are RES0.

## Attributes

MPAMF\_CCAP\_IDR is a 32-bit register.

## Field descriptions

The MPAMF\_CCAP\_IDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																CMAX_WD															

### Bits [31:6]

Reserved, RES0.

### CMAX\_WD, bits [5:0]

Number of fractional bits implemented in the cache capacity partitioning control, [MPAMCFG\\_CMAX](#).CMAX, of this device. See [MPAMCFG\\_CMAX](#).

This field must contain a value from 1 to 16, inclusive.

If RIS is implemented, this field indicates the number of fractional bits in the cache capacity partitioning control for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

## Accessing the MPAMF\_CCAP\_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF\_CCAP\_IDR is read-only.

MPAMF\_CCAP\_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF\_CCAP\_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF\_CCAP\_IDR\_s) and Non-secure (MPAMF\_CCAP\_IDR\_ns) MPAM feature pages.

When [MPAMF\\_IDR](#).HAS\_RIS is 1, MPAMF\_CCAP\_IDR shows the configuration of cache capacity partitioning for the cache resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

**MPAMF CCAP IDR can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0038	MPAMF_CCAP_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF BASE ns	0x0038	MPAMF CCAP IDR ns

Accesses on this interface are **RO**.

# MPAMF\_CPOR\_IDR, MPAM Features Cache Portion Partitioning ID register

The MPAMF\_CPOR\_IDR characteristics are:

## Purpose

Indicates the number of bits in [MPAMCFG\\_CPBM<n>](#). MPAMF\_CPOR\_IDR\_s indicates the number of bits in the Secure instance of [MPAMCFG\\_CPBM<n>](#). MPAMF\_CPOR\_IDR\_ns indicates the number of bits in the Non-secure instance of [MPAMCFG\\_CPBM<n>](#).

When [MPAMF\\_IDR.HAS\\_RIS](#) is 1, some fields in this register give information for the resource instance selector, [MPAMCFG\\_PART\\_SEL](#).RIS. The description of every field that is affected by [MPAMCFG\\_PART\\_SEL](#).RIS has information within the field description.

## Configuration

The power domain of MPAMF\_CPOR\_IDR is IMPLEMENTATION DEFINED.

This register is present only when [FEAT\\_MPAM is implemented and](#) [MPAMF\\_IDR.HAS\\_CPOR\\_PART](#) == 1. Otherwise, direct accesses to MPAMF\_CPOR\_IDR are RES0.

## Attributes

MPAMF\_CPOR\_IDR is a 32-bit register.

## Field descriptions

The MPAMF\_CPOR\_IDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																CPBM_WD															

### Bits [31:16]

Reserved, RES0.

### CPBM\_WD, bits [15:0]

Number of bits in the cache portion partitioning bit map of this device. See [MPAMCFG\\_CPBM<n>](#).

This field must contain a value from 1 to 32768, inclusive. Values greater than 32 require a group of 32-bit registers to access the CPBM, up to 1024 if CPBM\_WD is the largest value.

If RIS is implemented, this field indicates the number bits in the cache portion bitmap for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

## Accessing the MPAMF\_CPOR\_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF\_CPOR\_IDR is read-only.

MPAMF\_CPOR\_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF\_CPOR\_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF\_CPOR\_IDR\_s) and Non-secure (MPAMF\_CPOR\_IDR\_ns) MPAM feature pages.

When [MPAMF\\_IDR.HAS\\_RIS](#) is 1, MPAMF\_CPOR\_IDR shows the configuration of cache portion partitioning for the cache resource instance selected by [MPAMCFG\\_PART\\_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

**MPAMF\_CPOR\_IDR can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0030	MPAMF_CPOR_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0030	MPAMF_CPOR_IDR_ns

Accesses on this interface are **RO**.

The MPAMF CSUMON IDR characteristics are:

Indicates the number of cache storage usage monitor instances and other properties of the CSU monitoring.  
 MPAMF\_CSUMON\_IDR\_s indicates the number and properties of Secure cache storage usage monitoring.  
 MPAMF\_CSUMON\_IDR\_ns indicates the number and properties of Non-secure cache storage usage monitoring.

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by [MPAMCFG\\_PART\\_SEL.RIS](#). Fields that do not mention RIS are constant across all resource instances.

The power domain of MPAMF\_CSUMON\_IDR is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented**, MPAMF\_IDR.HAS\_MSMON == 1 and MPAMF\_MSMON\_IDR.MSMON\_CSU == 1. Otherwise, direct accesses to MPAMF\_CSUMON\_IDR are RES0.

MPAMF CSUMON IDR is a 32-bit register.

The MPAMF CSUMON IDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HAS_CAPTURE	CSU_RO	RES0														NUM_MON															

The implementation supports copying an `MSMON_CSU` to the corresponding `MSMON_CSU_CAPTURE` on a capture event.

<b>HAS_CAPTURE</b>	<b>Meaning</b>
0b0	<a href="#">MSMON_CSU_CAPTURE</a> is not implemented and there is no support for capture events in the CSU monitor.
0b1	The <a href="#">MSMON_CSU_CAPTURE</a> register is implemented and the CSU monitor supports the capture event behavior.

If RIS is implemented, this field indicates that CSU monitor capture is implemented for the resource instance selected by [MPAMCFG PART SEL](#).RIS.

The implementation of [MSMON CSU](#) is read-only.

CSU_RO	Meaning
0b0	<a href="#">MSMON_CSU</a> is read-write.
0b1	<a href="#">MSMON_CSU</a> is read-only.

If RIS is implemented, this field indicates that the [MSMON\\_CSU](#) monitor register is read-only for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

**Bits [29:16]**

Reserved, RES0.

**NUM MON, bits [15:0]**

The number of cache storage usage monitor instances implemented.

The largest [MSMON CFG MON SEL](#).MON SEL value is NUM MON minus 1.

If RIS is implemented, this field indicates the number of CSU monitor instances implemented for the resource instance selected by `MPAMCFG.PART_SEL`.RIS.

## Accessing the MPAMF CSUMON IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF CSUMON IDR is read-only.

MPAMF CSUMON IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF\_CSUMON\_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF\_CSUMON\_IDR\_s) and Non-secure (MPAMF\_CSUMON\_IDR\_ns) MPAM feature pages.

When [MPAMF\\_IDR](#).HAS\_RIS is 1, MPAMF\_CSUMON\_IDR shows the configuration of cache storage usage monitoring for the cache resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF CSUMON IDR is not affected by [MSMON CFG MON SEL](#).RIS.

**MPAMF\_CSUMON\_IDR can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF BASE s	0x0088	MPAMF CSUMON IDR s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF BASE ns	0x0088	MPAMF CSUMON IDR ns

Accesses on this interface are **RO**.

The MPAMF\_ECR characteristics are:

## Purpose

MPAMF\_ECR is a 32-bit read-write register that controls MPAM error interrupts for this MSC. MPAMF\_ECR\_s controls Secure MPAM error handling. MPAMF\_ECR\_ns controls Non-secure MPAM error handling.

## Configuration

The power domain of MPAMF\_ECR is IMPLEMENTATION DEFINED.

This register is present only when FEAT\_MPAM is implemented. Otherwise, direct accesses to MPAMF\_ECR are RES0.

If a MSC cannot encounter any of the error conditions listed in section 15.1, both the [MPAMF\\_ESR](#) and MPAMF\_ECR must be RAZ/WI.

## Attributes

MPAMF ECR is a 32-bit register.

## Field descriptions

The MPAMF\_ECR bit assignments are:

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

RES0 INTEN

**Bits [31:1]**

Reserved, RES0.

### INTEN, bit [0]

Interrupt Enable.

INTEN	Meaning
0b0	MPAM error interrupts are not generated.
0b1	MPAM error interrupts are generated.

## Accessing the MPAMF ECR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF\_ECR\_s must be accessible from the Secure MPAM feature page. MPAMF\_ECR\_ns must be accessible from the Non-secure MPAM feature page.

MPAMF\_ECR\_s and MPAMF\_ECR\_ns must be separate registers. The Secure instance (MPAMF\_ECR\_s) accesses the error interrupt controls used for Secure PARTIDs, and the Non-secure instance (MPAMF\_ECR\_ns) accesses the error interrupt controls used for Non-secure PARTIDs.

Accesses on this interface are **RW**.

Accesses on this interface are **RW**.

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

**(new)**

The MPAMF\_ESR characteristics are:

## Purpose

Indicates MPAM error status for this MSC. MPAMF\_ESR\_s reports Secure MPAM errors. MPAMF\_ESR\_ns reports Non-secure MPAM errors.

Software should write this register after reading the status of an error to reset ERRCODE to 0x0000 and OVRWR to 0 so that future errors are not reported with OVRWR set.

## Configuration

The power domain of MPAMF\_ESR is IMPLEMENTATION DEFINED.

## Attributes

ThisIf register is MSC present cannot only encounter when any FEAT\_MPAM of is the implemented. error  
Otherwise, conditions directlisted accesses to MPAMF\_ESR arein , both the MPAMF\_ESR and  
MPAMF\_ECRRES0'ERRORS IN MSCS' IN ARM® ARCHITECTURE REFERENCE MANUAL SUPPLEMENT, MEMORY SYSTEM RESOURCE  
PARTITIONING AND MONITORING (MPAM), FOR ARMV8-A (ARM DDI 0598).must be RAZ/WI.

MAMPF\_ESR is 64-bit register when MPAM v0.1 or v1.1 is implemented and MPAMF\_IDR.HAS\_EXTD\_ESR == 1.

Otherwise, MAMPF ESR is a 32-bit register.

If a MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the MPAMF ESR and [MPAMF ECR](#) must be RAZ/WI.

## Attributes

MPAMF ESR is a:

- 64-bit register when (FEAT\_MPAMv0p1 is implemented or FEAT\_MPAMv1p1 is implemented) and MPAMF\_IDR.HAS\_EXTD\_ESR == 1
- 32-bit register otherwise

## Field descriptions

The MPAMF\_ESR bit assignments are:

**When (FEAT\_MPAMv0p1 is implemented or FEAT\_MPAMv1p1 is implemented) and MPAMF IDR.HAS EXT D ESR == 1:**

<div> <div>6362616059585756555453525150494847464544434241403938373635343332</div> <div> <div>RES0</div> <div>RIS</div> </div> <div> <div>OVRWR</div> <div>RES0</div> <div>ERRCODE</div> <div>PMG</div> <div>PARTID_MON</div> </div> <div> <div>313029282726252423222120191817161514131211109876543210</div> </div> </div>

**Bits [63:36]**

Reserved, RES0.

**RIS, bits [35:32]**

When MPAMF\_IDR.HAS\_RIS == 1:

Resource Instance Selector. Where applicable to the ERRCODE, captures the RIS value for the error.

**Otherwise:**

Reserved, RES0.

**OVRWR, bit [31]**

Overwritten.

If 0 and ERRCODE == 0b0000, no errors have occurred.

If 0 and ERRCODE is non-zero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is non-zero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is zero must not be produced by hardware and is only reached when software writes this combination into this register.

**Bits [30:28]**

Reserved, RES0.

**ERRCODE, bits [27:24]**

Error code.

ERRCODE	Meaning
0b0000	No error.
0b0001	PARTID_SEL_Range.
0b0010	Req_PARTID_Range.
0b0011	MSMONCFG_ID_RANGE.
0b0100	Req_PMG_Range.
0b0101	Monitor_Range.
0b0110	intPARTID_Range.
0b0111	Unexpected_INTERNAL.
0b1000	Undefined_RIS_PART_SEL.
0b1001	RIS_No_Control.
0b1010	Undefined_RIS_MON_SEL.
0b1011	RIS_No_Monitor.
0b1100	Reserved.
0b1101	Reserved.
0b1110	Reserved.
0b1111	Reserved.

**PMG, bits [23:16]**

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to 0x00 on an error that does not capture PMG.

**PARTID\_MON, bits [15:0]**

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OVRWR	RES0	ERRCODE	PMG						PARTID_MON																						

OVRWR, bit [31]

Overwritten.

If 0 and ERRCODE == 0b0000, no errors have occurred.

If 0 and ERRCODE is non-zero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is non-zero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is 0 must not be produced by hardware and is only reached when software writes this combination into this register.

Bits [30:28]

Reserved, RES0.

ERRCODE, bits [27:24]

Error code.

ERRCODE	Meaning
0b0000	No error.
0b0001	PARTID_SEL_Range.
0b0010	Req_PARTID_Range.
0b0011	MSMONCFG_ID_RANGE.
0b0100	Req_PMG_Range.
0b0101	Monitor_Range.
0b0110	intPARTID_Range.
0b0111	Unexpected_INTERNAL.
0b1000	Reserved.
0b1001	Reserved.
0b1010	Reserved.
0b1011	Reserved.
0b1100	Reserved.
0b1101	Reserved.
0b1110	Reserved.
0b1111	Reserved.

PMG, bits [23:16]

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to 0x00 on an error that does not capture PMG.

PARTID\_MON, bits [15:0]

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0x0000.

# MPAMF\_IDR, MPAM Features Identification Register

The MPAMF\_IDR characteristics are:

## Purpose

Indicates which memory partitioning and monitoring features are present on this MSC. MPAMF\_IDR\_s indicates the MPAM features accessed from the Secure MPAM feature page. MPAMF\_IDR\_ns indicates the MPAM features accessed from the Non-secure MPAM feature page.

When MPAMF\_IDR.HAS\_RIS is 1, some fields in this register give information for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS. The description of every field that is affected by [MPAMCFG\\_PART\\_SEL](#).RIS has that information within the field description.

## Configuration

The power domain of MPAMF\_IDR is IMPLEMENTATION DEFINED.

## Attributes

This register is present only when FEAT\_MPAM is implemented. Otherwise, direct accesses to MPAMF\_IDR are RES0.

MAMPF\_IDR is 64-bit register when MPAM v0.1 or v1.1 is implemented.

Otherwise, MAMPF\_IDR is a 32-bit register.

## Attributes

MPAMF\_IDR is a:

- 64-bit register when FEAT\_MPAMv0p1 is implemented or FEAT\_MPAMv1p1 is implemented
- 32-bit register otherwise

## Field descriptions

The MPAMF\_IDR bit assignments are:

### When FEAT\_MPAMv0p1 is implemented or FEAT\_MPAMv1p1 is implemented:

63	62	61	60	59	58	57	56	55
RES0				RIS_MAX				
HAS_PARTID_NRW	HAS_MSMON	HAS_IMPL_IDR	EXT	HAS_PRI_PART	HAS_MBW_PART	HAS_CPOR_PART	HAS_CCAP_PART	
31	30	29	28	27	26	25	24	23

#### Bits [63:60]

Reserved, RES0.

#### RIS\_MAX, bits [59:56]

When MPAMF\_IDR.EXT == 1 and MPAMF\_IDR.HAS\_RIS == 1:

Maximum RIS value supported in [MPAMCFG\\_PART\\_SEL](#). Must be 0b0000 if [MPAMF\\_IDR](#).HAS\_RIS == 0.

**Otherwise:**

Reserved, RES0.

**Bits [55:40]**

Reserved, RES0.

**HAS\_ESR, bit [39]**

When **MPAMF\_IDR.EXT == 1**:

[MPAMF\\_ESR](#) is implemented.

HAS_ESR	Meaning
0b0	<a href="#">MPAMF_ESR</a> , <a href="#">MPAMF_ECR</a> , and MPAM error handling are not implemented.
0b1	<a href="#">MPAMF_ESR</a> , <a href="#">MPAMF_ECR</a> , and MPAM error handling are implemented.

**Otherwise:**

Reserved, RES0.

**HAS\_EXTD\_ESR, bit [38]**

When **MPAMF\_IDR.EXT == 1**:

[MPAMF\\_ESR](#) is 64 bits.

HAS_EXTD_ESR	Meaning
0b0	<a href="#">MPAMF_ESR</a> is 32 bits.
0b1	<a href="#">MPAMF_ESR</a> is 64 bits.

When [MPAMF\\_IDR.HAS\\_RIS](#) and [MPAMF\\_IDR.HAS\\_ESR](#), this field must be 1.

**Otherwise:**

Reserved, RES0.

**NO\_IMPL\_MSMON, bit [37]**

When **MPAMF\_IDR.EXT == 1** and **MPAMF\_IDR.HAS\_IMPL\_IDR == 1**:

[MPAMF\\_IMPL\\_IDR](#) defines no IMPLEMENTATION DEFINED resource monitors.

NO_IMPL_MSMON	Meaning
0b0	<a href="#">MPAMF_IMPL_IDR</a> defines at least one IMPLEMENTATION DEFINED resource monitor.
0b1	<a href="#">MPAMF_IMPL_IDR</a> does not define any IMPLEMENTATION DEFINED resource monitors.

If RIS is implemented, this field indicates the presence of IMPLEMENTATION DEFINED resource monitors described in [MPAMF\\_IMPL\\_IDR](#) for the selected resource instance.

**Otherwise:**

Reserved, RES0.

**NO\_IMPL\_PART, bit [36]**

When **MPAMF\_IDR.EXT == 1** and **MPAMF\_IDR.HAS\_IMPL\_IDR == 1**:

[MPAMF\\_IMPL\\_IDR](#) defines no IMPLEMENTATION DEFINED resource controls.

NO_IMPL_PART	Meaning
0b0	<a href="#">MPAMF_IMPL_IDR</a> defines at least one IMPLEMENTATION DEFINED resource control.
0b1	<a href="#">MPAMF_IMPL_IDR</a> does not define any IMPLEMENTATION DEFINED resource controls.

If RIS is implemented, this field indicates the presence of IMPLEMENTATION DEFINED resource controls described in [MPAMF\\_IMPL\\_IDR](#) for the selected resource instance.

Otherwise:

Reserved, RES0.

**Bits [35:33]**

Reserved, RES0.

**HAS\_RIS, bit [32]**

When **MPAMF\_IDR.EXT == 1**:

Has resource instance selector. Indicates that [MPAMCFG\\_PART\\_SEL](#) contains the RIS field that selects a resource instance to control.

HAS_RIS	Meaning
0b0	<a href="#">MPAMCFG_PART_SEL</a> does not implement the <a href="#">MPAMCFG_PART_SEL</a> .RIS field or multiple resource instance support.
0b1	<a href="#">MPAMCFG_PART_SEL</a> implements the <a href="#">MPAMCFG_PART_SEL</a> .RIS field and MPAM resource instance numbers up to and including <a href="#">MPAMF_IDR.RIS_MAX</a> .

Otherwise:

Reserved, RES0.

**HAS\_PARTID\_NRW, bit [31]**

Has PARTID narrowing.

HAS_PARTID_NRW	Meaning
0b0	Does not have <a href="#">MPAMF_PARTID_NRW_IDR</a> , <a href="#">MPAMCFG_INTPARTID</a> or intPARTID mapping support.
0b1	Supports the <a href="#">MPAMF_PARTID_NRW_IDR</a> , <a href="#">MPAMCFG_INTPARTID</a> registers.

**HAS\_MSMON, bit [30]**

Has resource monitors. Indicates whether this MSC has MPAM resource monitors.

HAS_MSMON	Meaning
0b0	Does not support MPAM resource monitoring by groups or <a href="#">MPAMF_MSMON_IDR</a> .
0b1	Supports resource monitoring by matching a combination of PARTID and PMG. See <a href="#">MPAMF_MSMON_IDR</a> .

**HAS\_IMPL\_IDR, bit [29]**

Has [MPAMF\\_IMPL\\_IDR](#). Indicates whether this MSC has the implementation-specific MPAM features register, [MPAMF\\_IMPL\\_IDR](#).

HAS_IMPL_IDR	Meaning
0b0	Does not have <a href="#">MPAMF_IMPL_IDR</a> .
0b1	Has <a href="#">MPAMF_IMPL_IDR</a> .

**EXT, bit [28]**

When **FEAT\_MPAMv0p1** is implemented or **FEAT\_MPAMv1p1** is implemented:

Extended MPAMF\_IDR.

EXT	Meaning
0b0	MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits.
0b1	MPAMF_IDR has bits defined in [63:32]. The register is 64-bits.

Otherwise:

Reserved, RES0.

**HAS\_PRI\_PART, bit [27]**

Has priority partitioning. Indicates that MPAM priority partitioning is implemented and [MPAMF\\_PRI\\_IDR](#) exists.

HAS_PRI_PART	Meaning
0b0	Does not support priority partitioning or have <a href="#">MPAMF_PRI_IDR</a> .
0b1	Has priority partitioning and <a href="#">MPAMF_PRI_IDR</a> .

If RIS is implemented, this field indicates the presence of priority partitioning resource controls as described in [MPAMF\\_PRI\\_IDR](#) for the selected resource instance.

**HAS\_MBW\_PART, bit [26]**

Has memory bandwidth partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and [MPAMF\\_MBW\\_IDR](#).

HAS_MBW_PART	Meaning
0b0	Does not support memory bandwidth partitioning or have <a href="#">MPAMF_MBW_IDR</a> register.
0b1	Has <a href="#">MPAMF_MBW_IDR</a> register.

If RIS is implemented, this field indicates the presence of memory bandwidth partitioning resource controls as described in [MPAMF\\_MBW\\_IDR](#) for the selected resource instance.

**HAS\_CPOR\_PART, bit [25]**

Has cache portion partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and [MPAMF\\_CPOR\\_IDR](#).

HAS_CPOR_PART	Meaning
0b0	Does not support cache portion partitioning or have <a href="#">MPAMF_CPOR_IDR</a> or <a href="#">MPAMCFG_CPBM&lt;n&gt;</a> registers.
0b1	Has <a href="#">MPAMF_CPOR_IDR</a> and <a href="#">MPAMCFG_CPBM&lt;n&gt;</a> registers.

If RIS is implemented, this field indicates the presence of cache portion partitioning resource controls as described in [MPAMF\\_CPOR\\_IDR](#) for the selected resource instance.

**HAS\_CCAP\_PART, bit [24]**

Has cache capacity partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the [MPAMF\\_CCAP\\_IDR](#) and [MPAMCFG\\_CMAX](#) registers.

HAS_CCAP_PART	Meaning
0b0	Does not support cache capacity partitioning or have <a href="#">MPAMF_CCAP_IDR</a> and <a href="#">MPAMCFG_CMAX</a> registers.
0b1	Has <a href="#">MPAMF_CCAP_IDR</a> and <a href="#">MPAMCFG_CMAX</a> registers.

If RIS is implemented, this field indicates the presence of cache capacity partitioning resource controls as described in [MPAMF\\_CPOR\\_IDR](#) for the selected resource instance.

**PMG\_MAX, bits [23:16]**

Maximum value of Non-secure PMG supported by this component.

**PARTID\_MAX, bits [15:0]**

Maximum value of Non-secure PARTID supported by this component.

**Otherwise:**

31	30	29	28	27	26	25	24	23
<a href="#">HAS_PARTID_NRW</a>	<a href="#">HAS_MSMON</a>	<a href="#">HAS_IMPL_IDR</a>	<a href="#">EXT</a>	<a href="#">HAS_PRI_PART</a>	<a href="#">HAS_MBW_PART</a>	<a href="#">HAS_CPOR_PART</a>	<a href="#">HAS_CCAP_PART</a>	

**HAS\_PARTID\_NRW, bit [31]**

Has PARTID narrowing.

HAS_PARTID_NRW	Meaning
0b0	Does not have <a href="#">MPAMF_PARTID_NRW_IDR</a> , <a href="#">MPAMCFG_INTPARTID</a> or intPARTID mapping support.
0b1	Supports the <a href="#">MPAMF_PARTID_NRW_IDR</a> , <a href="#">MPAMCFG_INTPARTID</a> registers.

**HAS\_MSMON, bit [30]**

Has resource monitors. Indicates whether this MSC has MPAM resource monitors.

HAS_MSMON	Meaning
0b0	Does not support MPAM resource monitoring by groups or <a href="#">MPAMF_MSMON_IDR</a> .
0b1	Supports resource monitoring by matching a combination of PARTID and PMG. See <a href="#">MPAMF_MSMON_IDR</a> .

**HAS\_IMPL\_IDR, bit [29]**

Has [MPAMF\\_IMPL\\_IDR](#). Indicates whether this MSC has the implementation-specific MPAM features register, [MPAMF\\_IMPL\\_IDR](#).

HAS_IMPL_IDR	Meaning
0b0	Does not have <a href="#">MPAMF_IMPL_IDR</a> .
0b1	Has <a href="#">MPAMF_IMPL_IDR</a> .

**EXT, bit [28]**

When **FEAT\_MPAMv0p1** is implemented or **FEAT\_MPAMv1p1** is implemented:

Extended MPAMF\_IDR.

EXT	Meaning
0b0	MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits.
0b1	MPAMF_IDR has bits defined in [63:32]. The register is 64-bits.

Otherwise:

Reserved, RES0.

**HAS\_PRI\_PART, bit [27]**

Has priority partitioning. Indicates whether this MSC implements MPAM priority partitioning and [MPAMF\\_PRI\\_IDR](#).

HAS_PRI_PART	Meaning
0b0	Does not support priority partitioning or have <a href="#">MPAMF_PRI_IDR</a> .
0b1	Has <a href="#">MPAMF_PRI_IDR</a> .

**HAS\_MBW\_PART, bit [26]**

Has memory bandwidth partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and MPAMF\_MBW\_IDR.

HAS_MBW_PART	Meaning
0b0	Does not support memory bandwidth partitioning or have <a href="#">MPAMF_MBW_IDR</a> register.
0b1	Has <a href="#">MPAMF_MBW_IDR</a> register.

**HAS\_CPOR\_PART, bit [25]**

Has cache portion partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and [MPAMF\\_CPOR\\_IDR](#).

HAS_CPOR_PART	Meaning
0b0	Does not support cache portion partitioning or have <a href="#">MPAMF_CPOR_IDR</a> or <a href="#">MPAMCFG_CPBM&lt;n&gt;</a> registers.
0b1	Has <a href="#">MPAMF_CPOR_IDR</a> and <a href="#">MPAMCFG_CPBM&lt;n&gt;</a> registers.

**HAS\_CCAP\_PART, bit [24]**

Has cache capacity partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the MPAMF\_CCAP\_IDR and MPAMCFG\_CMAX registers.

HAS_CCAP_PART	Meaning
0b0	Does not support cache capacity partitioning or have <a href="#">MPAMF_CCAP_IDR</a> and <a href="#">MPAMCFG_CMAX</a> registers.
0b1	Has <a href="#">MPAMF_CCAP_IDR</a> and <a href="#">MPAMCFG_CMAX</a> registers.

**PMG\_MAX, bits [23:16]**

Maximum value of Non-secure PMG supported by this component.

# MPAMF\_IIDR, MPAM Implementation Identification Register

The MPAMF\_IIDR characteristics are:

## Purpose

Uniquely identifies the MSC implementation by the combination of implementer, product ID, variant and revision.

## Configuration

The power domain of MPAMF\_IIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT\_MPAM is implemented. Otherwise, direct accesses to MPAMF\_IIDR are RES0.

## Attributes

MPAMF\_IIDR is a 32-bit register.

## Field descriptions

The MPAMF\_IIDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ProductID												Variant				Revision				Implementer											

### ProductID, bits [31:20]

IMPLEMENTATION DEFINED value identifying the MPAM MSC.

The MSC implementer as identified in the MPAMF\_IIDR.Implementer field must assure each product has a unique ProductID from any other with the same Implementer value.

### Variant, bits [19:16]

IMPLEMENTATION DEFINED value used to distinguish product variants, or major revisions of the product.

#### Note

Implementations of ProductID with differing software interfaces are expected to have different values in the MPAMF\_IIDR.Variant field.

### Revision, bits [15:12]

IMPLEMENTATION DEFINED value used to distinguish minor revisions of the product.

#### Note

This field is intended to differentiate product revisions that are minor changes and are largely software compatible with previous revisions.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the MPAM MSC.

[11:8] must contain the JEP106 continuation code of the implementer.

[7] must always be 0.

[6:0] must contain the JEP106 identity code of the implementer.

For an Arm implementation, bits[11:0] are 0x43B.

Accessing the MPAMF\_IIDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF\_IIDR is read-only.

MPAMF\_IIDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF\_IIDR must have the same contents in the Secure and Non-secure MPAM feature pages.

MPAMF\_IIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0018	MPAMF_IIDR

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0018	MPAMF_IIDR

Accesses on this interface are **RO**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bcd2a

# MPAMF\_IMPL\_IDR, MPAM Implementation-Specific Partitioning Feature Identification Register

The MPAMF\_IMPL\_IDR characteristics are:

## Purpose

Indicates the implementation-defined partitioning and monitoring features and parameters of the MSC. MPAMF\_IMPL\_IDR\_s indicates IMPLEMENTATION DEFINED partitioning and monitoring features accessed from the Secure MPAM feature page. MPAMF\_IMPL\_IDR\_ns indicates those accessed from the Non-secure MPAM feature page.

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, this register gives the implementation-specific features and parameters of the resource instance selected by [MPAMCFG\\_PART\\_SEL.RIS](#) for any features that are specific to the resource.

## Configuration

The power domain of MPAMF\_IMPL\_IDR is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented and** [MPAMF\\_IDR.HAS\\_IMPL\\_IDR](#) == 1. Otherwise, direct accesses to MPAMF\_IMPL\_IDR are RES0.

## Attributes

MPAMF\_IMPL\_IDR is a 32-bit register.

## Field descriptions

The MPAMF\_IMPL\_IDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																IMPLFEAT															

### IMPLFEAT, bits [31:0]

All 32 bits of this register are available to be used as the implementer sees fit to indicate the presence of IMPLEMENTATION DEFINED MPAM features in this MSC and to give additional implementation-specific read-only information about the parameters of implementation-specific MPAM features to software.

If RIS is implemented, this register indicates the implementation-specific features and parameters of the resource instance selected by [MPAMCFG\\_PART\\_SEL.RIS](#).

## Accessing the MPAMF\_IMPL\_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF\_IMPL\_IDR is read-only.

MPAMF\_IMPL\_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF\_IMPL\_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF\_IMPL\_IDR\_s) and Non-secure (MPAMF\_IMPL\_IDR\_ns) MPAM feature pages.

When [MPAMF\\_IDR.HAS\\_RIS](#) is 1, MPAMF\_IMPL\_IDR shows the configuration of implementation-specific features for the resource instance selected by [MPAMCFG\\_PART\\_SEL.RIS](#). Fields that mention RIS in their field descriptions have

values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

**MPAMF\_IMPL\_IDR can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0028	MPAMF_IMPL_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0028	MPAMF_IMPL_IDR_ns

Accesses on this interface are **RO**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

(old)	htmldiff from-	(new)
-------	----------------	-------

**WINDWR, bit [14]**

Indicates the bandwidth accounting period register is writable.

<b>WINDWR</b>	<b>Meaning</b>
0b0	The bandwidth accounting period is readable from <a href="#">MPAMCFG_MBW_WINWD</a> which might be fixed or vary due to clock rate reconfiguration of the memory channel or memory controller.
0b1	The bandwidth accounting width is readable and writable per partition in <a href="#">MPAMCFG_MBW_WINWD</a> .

**HAS\_PROP, bit [13]**

Indicates that this MSC implements proportional stride bandwidth partitioning and the [MPAMCFG\\_MBW\\_PROP](#) register can be accessed..

<b>HAS_PROP</b>	<b>Meaning</b>
0b0	There is no memory bandwidth proportional stride control and the <a href="#">MPAMCFG_MBW_PROP</a> register is RES0.
0b1	The proportional stride memory bandwidth partitioning scheme is supported and the <a href="#">MPAMCFG_MBW_PROP</a> register can be accessed.

If RIS is implemented, this field indicates the presence of the memory bandwidth proportional stride partitioning control for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

**HAS\_PBM, bit [12]**

Indicates that bandwidth portion partitioning is implemented and the [MPAMCFG\\_MBW\\_PBM<n>](#) register array can be accessed.

<b>HAS_PBM</b>	<b>Meaning</b>
0b0	There is no memory bandwidth portion control and the <a href="#">MPAMCFG_MBW_PBM</a> is RES0.
0b1	The memory bandwidth portion allocation scheme exists and the <a href="#">MPAMCFG_MBW_PBM</a> register can be accessed.

If RIS is implemented, this field indicates the presence of the memory bandwidth portion partitioning control for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

**HAS\_MAX, bit [11]**

Indicates that this MSC implements maximum bandwidth partitioning and the [MPAMCFG\\_MBW\\_MAX](#) register can be accessed.

<b>HAS_MAX</b>	<b>Meaning</b>
0b0	There is no maximum memory bandwidth control and the <a href="#">MPAMCFG_MBW_MAX</a> register is RES0.
0b1	The maximum memory bandwidth allocation scheme is supported and the <a href="#">MPAMCFG_MBW_MAX</a> register can be accessed.

If RIS is implemented, this field indicates the presence of the maximum bandwidth partitioning control for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

**HAS\_MIN, bit [10]**

Indicates that this MSC implements minimum bandwidth partitioning and the [MPAMCFG\\_MBW\\_MIN](#) register can be accessed.

HAS_MIN	Meaning
0b0	There is no minimum memory bandwidth control and the <a href="#">MPAMCFG_MBW_MIN</a> register is RES0.
0b1	The minimum memory bandwidth allocation scheme is supported and the <a href="#">MPAMCFG_MBW_MIN</a> register can be accessed.

If RIS is implemented, this field indicates the presence of the minimum bandwidth partitioning control for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

#### Bits [9:6]

Reserved, RES0.

#### BWA\_WD, bits [5:0]

Number of implemented bits in the bandwidth allocation fields: MIN, MAX and STRIDE. See [MPAMCFG\\_MBW\\_MIN](#), [MPAMCFG\\_MBW\\_MAX](#) and [MPAMCFG\\_MBW\\_PROP](#).

In any of these bandwidth allocation fields exist, this field must have a value from 1 to 16, inclusive. Otherwise, it is permitted to be 0.

If RIS is implemented, this field indicates the number of implemented bits in the bandwidth allocation control fields for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

## Accessing the MPAMF\_MBW\_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF\_MBW\_IDR is read-only.

MPAMF\_MBW\_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF\_MBW\_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF\_MBW\_IDR\_s) and Non-secure (MPAMF\_MBW\_IDR\_ns) MPAM feature pages.

When [MPAMF\\_IDR](#).HAS\_RIS is 1, MPAMF\_MBW\_IDR shows the configuration of memory bandwidth partitioning for the bandwidth resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

#### MPAMF\_MBW\_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0040	MPAMF_MBW_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0040	MPAMF_MBW_IDR_ns

Accesses on this interface are **RO**.

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# MPAMF\_MBWUMON\_IDR, MPAM Features Memory Bandwidth Usage Monitoring ID register

The MPAMF\_MBWUMON\_IDR characteristics are:

## Purpose

Indicates the number of memory bandwidth usage monitor instances implemented. This register also indicates several properties of MBWU monitoring, including whether the implementation supports capture, scaling or long counters.

MPAMF\_MBWUMON\_IDR\_s indicates the number of Secure memory bandwidth usage monitor instances.

MPAMF\_MBWUMON\_IDR\_ns indicates the number of Non-secure memory bandwidth usage monitor instances.

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by [MPAMCFG\\_PART\\_SEL.RIS](#). Fields that do not mention RIS are constant across all resource instances.

## Configuration

The power domain of MPAMF\_MBWUMON\_IDR is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented**, MPAMF\_IDR.HAS\_MSMON == 1 and MPAMF\_MSMON\_IDR.MSMON\_MBWU == 1. Otherwise, direct accesses to MPAMF\_MBWUMON\_IDR are RES0.

## Attributes

MPAMF\_MBWUMON\_IDR is a 32-bit register.

## Field descriptions

The MPAMF\_MBWUMON\_IDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
<a href="#">HAS_CAPTURE</a>	<a href="#">HAS_LONG</a>	<a href="#">LWD</a>	<a href="#">HAS_RWBW</a>	RES0				SCALE				NUM_MON																			

### HAS\_CAPTURE, bit [31]

The implementation supports copying an [MSMON\\_MBWU](#) to the corresponding [MSMON\\_MBWU\\_CAPTURE](#) on a capture event.

HAS_CAPTURE	Meaning
0b0	<a href="#">MSMON_MBWU_CAPTURE</a> is not implemented and there is no support for capture events in the MBWU monitor.
0b1	The <a href="#">MSMON_MBWU_CAPTURE</a> register is implemented and the MBWU monitor supports the capture event behavior.

If RIS is implemented, this field indicates that MBWU monitor capture is implemented for the resource instance selected by [MPAMCFG\\_PART\\_SEL.RIS](#).

If MPAMF\_MBWUMON\_IDR.HAS\_LONG is 1, this also indicates that [MSMON\\_MBWU\\_L\\_CAPTURE](#) is implemented.

### HAS\_LONG, bit [30]

When **FEAT\_MPAMv0p1** is implemented or **FEAT\_MPAMv1p1** is implemented:

Indicates whether [MSMON\\_MBWU\\_L](#) is implemented.

If HAS\_CAPTURE is 1, indicates whether [MSMON\\_MBWU\\_L\\_CAPTURE](#) is implemented.

HAS_LONG	Meaning
0b0	Does not implement <a href="#">MSMON_MBWU_L</a> or <a href="#">MSMON_MBWU_L_CAPTURE</a> .
0b1	Implements <a href="#">MSMON_MBWU_L</a> . If HAS_CAPTURE == 1, <a href="#">MSMON_MBWU_L_CAPTURE</a> is also implemented.

If RIS is implemented, this field indicates that the long MBWU monitor is implemented for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

If MPAMF\_MBWUMON\_IDR.HAS\_CAPTURE is 1, this also indicates that [MSMON\\_MBWU\\_L\\_CAPTURE](#) is implemented.

#### Otherwise:

Reserved, RES0.

#### LWD, bit [29]

When FEAT\_MPAMv0p1 is implemented or FEAT\_MPAMv1p1 is implemented:

Long register VALUE width.

If [MPAMF\\_MBWUMON\\_IDR](#).HAS\_LONG is 0, [MPAMF\\_MBWUMON\\_IDR](#).LWD must also be 0.

LWD	Meaning
0b0	If <a href="#">MPAMF_MBWUMON_IDR</a> .HAS_LONG is 1, <a href="#">MSMON_MBWU_L</a> has 44-bit VALUE field in bits [43:0]. Bits [62:44] are RES0. If HAS_LONG is 1 and <a href="#">MPAMF_MBWUMON_IDR</a> .HAS_CAPTURE is 1, <a href="#">MSMON_MBWU_L_CAPTURE</a> also has 44-bit VALUE field in bits [43:0].
0b1	<a href="#">MSMON_MBWU_L</a> has 63-bit VALUE field in bits [62:0]. If <a href="#">MPAMF_MBWUMON_IDR</a> .HAS_CAPTURE == 1, <a href="#">MSMON_MBWU_L_CAPTURE</a> also has 63-bit VALUE field in bits [62:0].

If RIS is implemented, this field indicates the length of the [MSMON\\_MBWU\\_L](#).VALUE field implemented for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

#### Otherwise:

Reserved, RES0.

#### HAS\_RWBW, bit [28]

When FEAT\_MPAMv0p1 is implemented or FEAT\_MPAMv1p1 is implemented:

Read/write bandwidth selection is implemented in [MSMON\\_CFG\\_MBWU\\_FLT](#)

HAS_RWBW	Meaning
0b0	Read/write bandwidth selection is not implemented.
0b1	Read/write bandwidth selection is implemented

If RIS is implemented, this field indicates whether read/write bandwidth collection selection is available in [MSMON\\_CFG\\_MBWU\\_FLT](#) for resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

#### Otherwise:

Reserved, RES0.

**Bits [27:21]**

Reserved, RES0.

**SCALE, bits [20:16]**

Scaling of [MSMON\\_MBWU.VALUE](#) in bits. If scaling is enabled by [MSMON\\_CFG\\_MBWU\\_CTL.SCLEN](#), the byte count in the VALUE field has been shifted by SCALE bits to the right.

SCALE	Meaning
0b00000	Scaling is not implemented.
0bxxxxx	Other values are right shift count when scaling is enabled.

If RIS is implemented, this field indicates the scale value for [MSMON\\_MBWU.VALUE](#) field for the resource instance selected by [MPAMCFG\\_PART\\_SEL.RIS](#).

**NUM\_MON, bits [15:0]**

The number of memory bandwidth usage monitor instances implemented. The largest monitor instance selector, [MSMON\\_CFG\\_MON\\_SEL.MON\\_SEL](#), is NUM\_MON minus 1.

If RIS is implemented, this field indicates the number of MBWU monitor instances for [MSMON\\_MBWU.VALUE](#) field for the resource instance selected by [MPAMCFG\\_PART\\_SEL.RIS](#).

**Accessing the MPAMF\_MBWUMON\_IDR**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF\_MBWUMON\_IDR is read-only.

MPAMF\_MBWUMON\_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF\_MBWUMON\_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF\_MBWUMON\_IDR\_s) and Non-secure (MPAMF\_MBWUMON\_IDR\_ns) MPAM feature pages.

When [MPAMF\\_IDR.HAS\\_RIS](#) is 1, MPAMF\_MBWUMON\_IDR shows the configuration of memory bandwidth monitoring for the bandwidth resource instance selected by [MPAMCFG\\_PART\\_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF\_MBWUMON\_IDR is not affected by [MSMON\\_CFG\\_MON\\_SEL.RIS](#).

**MPAMF\_MBWUMON\_IDR can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0090	MPAMF_MBWUMON_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0090	MPAMF_MBWUMON_IDR_ns

Accesses on this interface are **RO**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489ec15ad1565345720bed2a

# MPAMF\_MSMON\_IDR, MPAM Resource Monitoring Identification Register

The MPAMF\_MSMON\_IDR characteristics are:

## Purpose

Indicates which MPAM monitoring features are present on this MSC. MPAMF\_MSMON\_IDR\_s indicates Secure monitoring features. MPAMF\_MSMON\_IDR\_ns indicates Non-secure monitoring features.

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by [MPAMCFG\\_PART\\_SEL.RIS](#). Fields that do not mention RIS are constant across all resource instances.

## Configuration

The power domain of MPAMF\_MSMON\_IDR is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented and** [MPAMF\\_IDR.HAS\\_MSMON](#) == 1. Otherwise, direct accesses to MPAMF\_MSMON\_IDR are RES0.

## Attributes

MPAMF\_MSMON\_IDR is a 32-bit register.

## Field descriptions

The MPAMF\_MSMON\_IDR bit assignments are:

31	30292827262524232221201918	17	16	1514131211109876543210
<a href="#">HAS_LOCAL_CAPT_EVNT</a>	<a href="#">RES0</a>	<a href="#">MSMON_MBWU</a>	<a href="#">MSMON_CSU</a>	<a href="#">RES0</a>

### HAS\_LOCAL\_CAPT\_EVNT, bit [31]

Has local capture event generator. Indicates whether this MSC has the MPAM local capture event generator and the [MSMON\\_CAPT\\_EVNT](#) register.

HAS_LOCAL_CAPT_EVNT	Meaning
0b0	Does not support MPAM local capture event generator or <a href="#">MSMON_CAPT_EVNT</a> .
0b1	Supports the MPAM local capture event generator and the <a href="#">MSMON_CAPT_EVNT</a> register.

### Bits [30:18]

Reserved, RES0.

### MSMON\_MBWU, bit [17]

Memory bandwidth usage monitoring. Indicates whether MPAM monitoring for Memory Bandwidth Usage by PARTID and PMG is implemented and whether the following bandwidth usage registers are accessible:

- [MPAMF\\_MBWUMON\\_IDR](#), [MSMON\\_CFG\\_MBWU\\_CTL](#), [MSMON\\_CFG\\_MBWU\\_FLT](#), [MSMON\\_MBWU](#).
- The optional [MSMON\\_MBWU\\_CAPTURE](#).

- If MPAM v0.1 or MPAM v1.1 is implemented, the optional [MSMON\\_MBWU\\_L](#) and the optional [MSMON\\_MBWU\\_L\\_CAPTURE](#).

MSMON_MBWU	Meaning
0b0	Does not have monitoring for memory bandwidth usage and does not use the bandwidth usage registers.
0b1	Has monitoring of memory bandwidth usage and uses the bandwidth usage registers.

If RIS is implemented, this field indicates that memory bandwidth usage monitoring is implemented for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS as described in [MPAMF\\_MBWUMON\\_IDR](#).

### MSMON\_CSU, bit [16]

Cache storage usage monitoring. Indicates whether MPAM monitoring of cache storage usage by PARTID and PMG is implemented and the following registers are accessible:

- [MPAMF\\_CSUMON\\_IDR](#), [MSMON\\_CFG\\_CSU\\_CTL](#), [MSMON\\_CFG\\_CSU\\_FLT](#), [MSMON\\_CSU](#).
- The optional [MSMON\\_CSU\\_CAPTURE](#).

MSMON_CSU	Meaning
0b0	Does not have monitoring for cache storage usage or the <a href="#">MPAMF_CSUMON_IDR</a> , <a href="#">MSMON_CFG_CSU_CTL</a> , <a href="#">MSMON_CFG_CSU_FLT</a> , <a href="#">MSMON_CSU</a> or <a href="#">MSMON_CSU_CAPTURE</a> registers.
0b1	Has monitoring of cache storage usage and the <a href="#">MPAMF_CSUMON_IDR</a> , <a href="#">MSMON_CFG_CSU_CTL</a> , <a href="#">MSMON_CFG_CSU_FLT</a> , <a href="#">MSMON_CSU</a> and optional <a href="#">MSMON_CSU_CAPTURE</a> registers.

If RIS is implemented, this field indicates that cache storage usage monitoring is implemented for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS as described in [MPAMF\\_CSUMON\\_IDR](#).

### Bits [15:0]

Reserved, RES0.

## Accessing the MPAMF\_MSMON\_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF\_MSMON\_IDR is read-only.

MPAMF\_MSMON\_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF\_MSMON\_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF\_MSMON\_IDR\_s) and Non-secure (MPAMF\_MSMON\_IDR\_ns) MPAM feature pages.

When [MPAMF\\_IDR](#).HAS\_RIS is 1, MPAMF\_MSMON\_IDR shows the configuration of memory system monitoring for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF\_MSMON\_IDR is not affected by [MSMON\\_CFG\\_MON\\_SEL](#).RIS.

### MPAMF\_MSMON\_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0080	MPAMF_MSMON_IDR_s

Accesses on this interface are **RO**.

## MPAMF\_MSMON\_IDR, MPAM Resource Monitoring Identification Register

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0080	MPAMF_MSMON_IDR_ns

Accesses on this interface are **RO**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bcd2a

-------	----------------	-------

# MPAMF\_PARTID\_NRW\_IDR, MPAM PARTID Narrowing ID register

The MPAMF\_PARTID\_NRW\_IDR characteristics are:

## Purpose

Indicates the largest internal PARTID for this MSC. MPAMF\_PARTID\_NRW\_IDR\_s indicates the largest Secure internal PARTID. MPAMF\_PARTID\_NRW\_IDR\_ns indicates the largest Non-secure internal PARTID.

PARTID narrowing is global to the MSC and does not vary by resource instance.

## Configuration

The power domain of MPAMF\_PARTID\_NRW\_IDR is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented and** MPAMF\_IDR.HAS\_PARTID\_NRW == 1. Otherwise, direct accesses to MPAMF\_PARTID\_NRW\_IDR are RES0.

## Attributes

MPAMF\_PARTID\_NRW\_IDR is a 32-bit register.

## Field descriptions

The MPAMF\_PARTID\_NRW\_IDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																INTPARTID_MAX															

### Bits [31:16]

Reserved, RES0.

### INTPARTID\_MAX, bits [15:0]

The largest intPARTID supported in this MSC.

## Accessing the MPAMF\_PARTID\_NRW\_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF\_PARTID\_NRW\_IDR is read-only.

MPAMF\_PARTID\_NRW\_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF\_PARTID\_NRW\_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF\_PARTID\_NRW\_IDR\_s) and Non-secure (MPAMF\_PARTID\_NRW\_IDR\_ns) MPAM feature pages.

Accesses on this interface are **RO**.

Accesses on this interface are **RO**.

# MPAMF\_PRI\_IDR, MPAM Priority Partitioning Identification Register

The MPAMF\_PRI\_IDR characteristics are:

## Purpose

Indicates which MPAM priority partitioning features are present on this MSC. MPAMF\_PRI\_IDR\_s indicates priority partitioning features accessed from the Secure MPAM feature page. MPAMF\_PRI\_IDR\_ns indicates priority partitioning features accessed from the Non-secure MPAM feature page.

When MPAMF\_IDR.HAS\_RIS is 1, some fields in this register give information for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS. The description of every field that is affected by [MPAMCFG\\_PART\\_SEL](#).RIS has that information within the field description.

## Configuration

The power domain of MPAMF\_PRI\_IDR is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented and** MPAMF\_IDR.HAS\_PRI\_PART == 1. Otherwise, direct accesses to MPAMF\_PRI\_IDR are RES0.

## Attributes

MPAMF\_PRI\_IDR is a 32-bit register.

## Field descriptions

The MPAMF\_PRI\_IDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0		DSPRI WD		RES0		DSPRI 0 IS LOW		HAS DSPRI		RES0		INTPRI WD		RES0		INTPRI 0 IS LOW		HAS INTPRI													

### Bits [31:26]

Reserved, RES0.

### DSPRI\_WD, bits [25:20]

Number of implemented bits in the downstream priority field (DSPRI) of [MPAMCFG\\_PRI](#).

If HAS\_DSPRI == 1, this field must contain a value from 1 to 16, inclusive.

If HAS\_DSPRI == 0, this field must be 0.

If RIS is implemented, this field indicates the number of downstream priority bits for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

### Bits [19:18]

Reserved, RES0.

### DSPRI\_0\_IS\_LOW, bit [17]

Indicates whether 0 in [MPAMCFG\\_PRI](#).DSPRI is the lowest or the highest downstream priority.

DSPRI_0_IS_LOW	Meaning
0b0	In the <a href="#">MPAMCFG_PRI</a> .DSPRI field, a value of 0 means the highest priority.
0b1	In the <a href="#">MPAMCFG_PRI</a> .DSPRI field, a value of 0 means the lowest priority.

If RIS is implemented, this field indicates that 0 is the lowest downstream priority for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

#### HAS\_DSPRI, bit [16]

Indicates that the [MPAMCFG\\_PRI](#) register implements the DSPRI field.

HAS_DSPRI	Meaning
0b0	This MSC supports priority partitioning, but does not implement a downstream priority (DSPRI) field in the <a href="#">MPAMCFG_PRI</a> register.
0b1	This MSC supports downstream priority partitioning and implements the downstream priority (DSPRI) field in the <a href="#">MPAMCFG_PRI</a> register.

If RIS is implemented, this field indicates that downstream priority is implemented for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

#### Bits [15:10]

Reserved, RES0.

#### INTPRI\_WD, bits [9:4]

Number of implemented bits in the internal priority field (INTPRI) in the [MPAMCFG\\_PRI](#) register.

If HAS\_INTPRI == 1, this field must contain a value from 1 to 16, inclusive.

If HAS\_INTPRI == 0, this field must be 0.

If RIS is implemented, this field indicates the number of internal priority bits for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

#### Bits [3:2]

Reserved, RES0.

#### INTPRI\_0\_IS\_LOW, bit [1]

Indicates whether 0 in [MPAMCFG\\_PRI](#).INTPRI is the lowest or the highest internal priority.

INTPRI_0_IS_LOW	Meaning
0b0	In the <a href="#">MPAMCFG_PRI</a> .INTPRI field, a value of 0 means the highest priority.
0b1	In the <a href="#">MPAMCFG_PRI</a> .INTPRI field, a value of 0 means the lowest priority.

If RIS is implemented, this field indicates that 0 is the lowest internal priority for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

#### HAS\_INTPRI, bit [0]

Indicates that this MSC implements the INTPRI field in the [MPAMCFG\\_PRI](#) register.

HAS_INTPRI	Meaning
0b0	This MSC supports priority partitioning, but does not implement the internal priority (INTPRI) field in the <a href="#">MPAMCFG_PRI</a> register.
0b1	This MSC supports internal priority partitioning and implements the internal priority (INTPRI) field in the <a href="#">MPAMCFG_PRI</a> register.

If RIS is implemented, this field indicates that internal priority is implemented for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS.

## Accessing the MPAMF\_PRI\_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF\_PRI\_IDR is read-only.

MPAMF\_PRI\_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF\_PRI\_IDR is permitted to have the same contents when read from either the Secure and Non-secure MPAM feature pages unless the register contents is different for Secure and Non-secure versions, when there must be separate registers in the Secure (MPAMF\_PRI\_IDR\_s) and Non-secure (MPAMF\_PRI\_IDR\_ns) MPAM feature pages.

When [MPAMF\\_IDR](#).HAS\_RIS is 1, MPAMF\_PRI\_IDR shows the configuration of priority partitioning for the resource instance selected by [MPAMCFG\\_PART\\_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

**MPAMF\_PRI\_IDR can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0048	MPAMF_PRI_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0048	MPAMF_PRI_IDR_ns

Accesses on this interface are **RO**.

# MPAMF\_SIDR, MPAM Features Secure Identification Register

The MPAMF\_SIDR characteristics are:

## Purpose

The MPAMF\_SIDR is a 32-bit read-only register that indicates the maximum Secure PARTID and Secure PMG on this MSC.

## Configuration

The power domain of MPAMF\_SIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT\_MPAM is implemented. Otherwise, direct accesses to MPAMF\_SIDR are RES0.

## Attributes

MPAMF\_SIDR is a 32-bit register.

## Field descriptions

The MPAMF\_SIDR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								S_PMG_MAX								S_PARTID_MAX															

### Bits [31:24]

Reserved, RES0.

### S\_PMG\_MAX, bits [23:16]

Maximum value of Secure PMG supported by this component.

### S\_PARTID\_MAX, bits [15:0]

Maximum value of Secure PARTID supported by this component.

## Accessing the MPAMF\_SIDR

This register is only within the Secure MPAM feature page memory frame.

MPAMF\_SIDR is read-only.

MPAMF\_SIDR must only be readable from the Secure MPAM feature page. If the system or the MSC does not support the Secure address map, this register must not be accessible.

MPAMF\_SIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0008	MPAMF_SIDR_s

Accesses on this interface are **RO**.

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# MSMON\_CAPT\_EVNT, MPAM Capture Event Generation Register

The MSMON\_CAPT\_EVNT characteristics are:

## Purpose

Generates a local capture event when written with bit[0] as 1. MSMON\_CAPT\_EVNT\_s generates local capture events for Secure monitors only or for Secure and Non-secure monitors. MSMON\_CAPT\_EVNT\_ns generates local capture events for Non-secure monitors only.

## Configuration

The power domain of MSMON\_CAPT\_EVNT is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented**, MPAMF\_IDR.HAS\_MSMON == 1 and MPAMF\_MSMON\_IDR.HAS\_LOCAL\_CAPT\_EVNT == 1. Otherwise, direct accesses to MSMON\_CAPT\_EVNT are RES0.

## Attributes

MSMON\_CAPT\_EVNT is a 32-bit register.

## Field descriptions

The MSMON\_CAPT\_EVNT bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																ALL		NOW													

### Bits [31:2]

Reserved, RES0.

### ALL, bit [1]

In the Secure instance of this register, if ALL written as 1 and NOW is also written as 1, signal a capture event to Secure and Non-secure monitor instances in this MSC that are configured with CAPT\_EVNT = 7.

If written as 0 and NOW is written as 1, signal a capture event to Secure monitor instances in this MSC that are configured with CAPT\_EVNT = 7.

In the Non-secure instance of this register, this bit is RAZ/WI.

This bit always reads as zero.

ALL	Meaning
0b0	Send capture event to Secure monitors only.
0b1	Send capture event to both Secure and Non-secure monitors.

### NOW, bit [0]

When written as 1, this bit causes an event to all monitors in this MSC with CAPT\_EVNT set to the value of 7.

When this bit is written as 0, no event is signaled.

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON\_CAPT\_EVNT\_s must be accessible from the Secure MPAM feature page. MSMON\_CAPT\_EVENT\_ns must be accessible from the Non-secure MPAM feature page.

The two instances of MSMON\_CAPT\_EVNT must be separate registers. The Secure instance (MSMON\_CAPT\_EVNT\_s) can generate capture events for both Secure and Non-secure PARTID monitors, and the Non-secure instance (MSMON\_CAPT\_EVNT\_ns) can generate capture events for Non-secure PARTID monitors only.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0808	MSMON_CAPT_EVNT_s

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0808	MSMON_CAPT_EVNT_ns

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bcd2a

# MSMON\_CFG\_CSU\_CTL, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Control Register

The MSMON\_CFG\_CSU\_CTL characteristics are:

## Purpose

Controls the CSU monitor selected by [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_CFG\_CSU\_CTL\_s controls the Secure cache storage usage monitor instance selected by the Secure instance of [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_CFG\_CSU\_CTL\_ns controls Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON\\_CFG\\_MON\\_SEL](#).

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, the monitor instance configuration accessed is for the resource instance currently selected by [MSMON\\_CFG\\_MON\\_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON\\_CFG\\_MON\\_SEL.MON\\_SEL](#).

## Configuration

The power domain of MSMON\_CFG\_CSU\_CTL is IMPLEMENTATION DEFINED.

This register is present only when [FEAT\\_MPAM is implemented](#), [MPAMF\\_IDR.HAS\\_MSMON == 1](#) and [MPAMF\\_MSMON\\_IDR.MSMON\\_CSU == 1](#). Otherwise, direct accesses to MSMON\_CFG\_CSU\_CTL are RES0.

## Attributes

MSMON\_CFG\_CSU\_CTL is a 32-bit register.

## Field descriptions

The MSMON\_CFG\_CSU\_CTL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
EN	CAPT_EVNT	CAPT_EVNT	CAPT_EVNT	CAPT_RESET	OFLOW_STATUS	OFLOW_INTR	OFLOW_FRZ	SUBTYPE	RES0	MATCH_PMG	MATCH_PARTID						

### EN, bit [31]

Enabled.

EN	Meaning
0b0	The monitor instance is disabled and must not collect any information.
0b1	The monitor instance is enabled to collect information according to the configuration of the instance.

### CAPT\_EVNT, bits [30:28]

Capture event selector.

Select the event that triggers capture from the following:

<b>CAPT_EVNT</b>	<b>Meaning</b>
0b000	No capture event is triggered.
0b001	External capture event 1 (optional but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a <a href="#">MSMON_CAPT_EVNT</a> register in this MSC is written and causes a capture event for the security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

If capture is not implemented for the CSU monitor type as indicated by [MPAMF\\_CSUMON\\_IDR](#).HAS\_CAPTURE = 0, this field is RAZ/WI.

### **CAPT\_RESET, bit [27]**

Reset after capture.

Controls whether the value of [MSMON\\_CSU](#) is reset to zero immediately after being copied to [MSMON\\_CSU\\_CAPTURE](#).

<b>CAPT_RESET</b>	<b>Meaning</b>
0b0	Monitor is not reset on capture.
0b1	Monitor is reset on capture.

If capture is not implemented for the CSU monitor type as indicated by [MPAMF\\_CSUMON\\_IDR](#).HAS\_CAPTURE = 0, this field is RAZ/WI.

Because the CSU monitor type produces a measurement rather than a count, it might not make sense to ever reset the value after a capture. If there is no reason to ever reset a CSU monitor, this field is RAZ/WI.

### **OFLOW\_STATUS, bit [26]**

Overflow status.

Indicates whether the value of [MSMON\\_CSU](#) has overflowed.

<b>OFLOW_STATUS</b>	<b>Meaning</b>
0b0	No overflow has occurred.
0b1	At least one overflow has occurred since this bit was last written to zero.

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

### **OFLOW\_INTR, bit [25]**

Overflow Interrupt.

Controls whether an overflow interrupt is generated when the value of [MSMON\\_CSU](#) has overflowed.

<b>OFLOW_INTR</b>	<b>Meaning</b>
0b0	No interrupt is signaled on an overflow of <a href="#">MSMON_CSU</a> .
0b1	On overflow, an implementation-specific interrupt is signaled.

If OFLOW\_INTR is not supported by the implementation, this field is RAZ/WI.

### **OFLOW\_FRZ, bit [24]**

Freeze Monitor on Overflow.

Controls whether the value of [MSMON\\_CSU](#) freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	Monitor count wraps on overflow.
0b1	Monitor count freezes on overflow. The frozen value might be 0 or another value if the monitor overflowed with an increment larger than 1.

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

### SUBTYPE, bits [23:20]

Subtype. Type of [cache storage usage](#)~~bandwidth~~ counted by this monitor.

This field is not currently used for CSU monitors, but reserved for future use.

This field is RAZ/WI.

### Bits [19:18]

Reserved, RES0.

### MATCH\_PMG, bit [17]

Match PMG.

Controls whether the monitor measures only storage used with PMG matching [MSMON\\_CFG\\_CSU\\_FLT](#).PMG.

MATCH_PMG	Meaning
0b0	The monitor measures storage used with any PMG value.
0b1	The monitor only measures storage used with the PMG value matching <a href="#">MSMON_CFG_CSU_FLT</a> .PMG.

If MATCH\_PMG == 1 and MATCH\_PARTID == 0, it is CONSTRAINED UNPREDICTABLE whether the monitor instance:

- Measures the storage used with matching PMG and with any PARTID.
- Measures no storage usage, that is, [MSMON\\_CSU](#).VALUE is zero.
- Measures the storage used with matching PMG and PARTID, that is, treats MATCH\_PARTID as == 1.

### MATCH\_PARTID, bit [16]

Match PARTID.

Controls whether the monitor measures only storage used with PARTID matching [MSMON\\_CFG\\_CSU\\_FLT](#).PARTID.

MATCH_PARTID	Meaning
0b0	The monitor measures storage used with any PARTID value.
0b1	The monitor only measures storage used with the PARTID value matching <a href="#">MSMON_CFG_CSU_FLT</a> .PARTID.

### Bits [15:8]

Reserved, RES0.

### TYPE, bits [7:0]

Monitor Type Code. The CSU monitor is TYPE = 0x43.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x43.

MSMON\_CFG\_CSU\_CTL\_s must be accessible from the Secure MPAM feature page. MSMON\_CFG\_CSU\_CTL\_ns must be accessible from the Non-secure MPAM feature page.

MSMON\_CFG\_CSU\_CTL\_s and MSMON\_CFG\_CSU\_CTL\_ns must be separate registers. The Secure instance (MSMON\_CFG\_CSU\_CTL\_s) accesses the cache storage usage monitor controls used for Secure PARTIDs, and the Non-secure instance (MSMON\_CFG\_CSU\_CTL\_ns) accesses the cache storage usage monitor controls used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MSMON\_CFG\_CSU\_CTL access the cache storage usage monitor configuration settings for the cache resource instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).RIS and the cache storage usage monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).MON\_SEL.

When RIS is not implemented, loads and stores to `MSMON_CFG_CSU_CTL` access the cache storage usage monitor configuration settings for the cache storage usage monitor instance selected by `MSMON_CFG_MON_SEL.MON_SEL`.

**MSMON\_CFG\_CSU\_CTL can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0818	MSMON_CFG_CSU_CTL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0818	MSMON_CFG_CSU_CTL_ns

Accesses on this interface are **RW**.

The MSMON CFG CSU FLT characteristics are:

## Purpose

Configures PARTID and PMG to measure or count in the CSU monitor selected by [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_CFG\_CSU\_FLT\_s sets filter conditions for the Secure cache storage usage monitor instance selected by the Secure instance of [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_CFG\_CSU\_CTL\_ns sets filter conditions for the Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON\\_CFG\\_MON\\_SEL](#).

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by [MSMON\\_CFG\\_MON\\_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON\\_CFG\\_MON\\_SEL.MON\\_SEL](#).

## Configuration

The power domain of MSMON\_CFG\_CSU\_FLT is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented**, MPAMF\_IDR.HAS\_MSMON == 1 and MPAMF\_MSMON\_IDR.MSMON\_CSU == 1. Otherwise, direct accesses to MSMON\_CFG\_CSU\_FLT are RES0.

## Attributes

MSMON CFG CSU FLT is a 32-bit register.

## Field descriptions

The MSMON CFG CSU FLT bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMG								PARTID															

### Bits [31:24]

Reserved, RES0.

**PMG, bits [23:16]**

Performance monitoring group to filter cache storage usage monitoring.

If `MSMON_CFG_CSU_CTL.MATCH_PMG == 0`, this field is not used to match cache storage to a PMG and the contents of this field is ignored.

If `MSMON_CFG_CSU_CTL.MATCH_PMG == 1` and `MSMON_CFG_CSU_CTL.MATCH_PARTID == 1`, the monitor instance selected by `MSMON_CFG_MON_SEL` measures or counts cache storage labeled with PMG equal to this field and PARTID equal to the PARTID field.

If [MSMON\\_CFG\\_CSU\\_CTL.MATCH\\_PMG](#) == 1 and [MSMON\\_CFG\\_CSU\\_CTL.MATCH\\_PARTID](#) == 0, the behavior of the monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#) is CONSTRAINED UNPREDICTABLE. See [MSMON\\_CFG\\_CSU\\_CTL.MATCH\\_PMG](#) for more information.

**PARTID, bits [15:0]**

Partition ID to filter cache storage usage monitoring.

If [MSMON\\_CFG\\_CSU\\_CTL.MATCH\\_PARTID](#) == 0 and [MSMON\\_CFG\\_CSU\\_CTL.MATCH\\_PMG](#) == 0, the monitor measures all allocated cache storage.

If [MSMON\\_CFG\\_CSU\\_CTL.MATCH\\_PARTID](#) == 0 and [MSMON\\_CFG\\_CSU\\_CTL.MATCH\\_PMG](#) == 1, the behavior of the monitor is CONSTRAINED UNPREDICTABLE. See the description of [MSMON\\_CFG\\_CSU\\_CTL.MATCH\\_PMG](#).

If [MSMON\\_CFG\\_CSU\\_CTL.MATCH\\_PARTID](#) == 1 and [MSMON\\_CFG\\_CSU\\_CTL.MATCH\\_PMG](#) == 0, the monitor selected by [MSMON\\_CFG\\_MON\\_SEL](#) measures or counts cache storage labeled with PARTID equal to this field.

If [MSMON\\_CFG\\_CSU\\_CTL.MATCH\\_PARTID](#) == 1 and [MSMON\\_CFG\\_CSU\\_CTL.MATCH\\_PMG](#) == 1, the monitor selected by [MSMON\\_CFG\\_MON\\_SEL](#) measures or counts cache storage labeled with PARTID equal to this field and PMG equal to the PMG field.

**Accessing the MSMON\_CFG\_CSU\_FLT**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON\_CFG\_CSU\_FLT\_s must be accessible from the Secure MPAM feature page. MSMON\_CFG\_CSU\_FLT\_ns must be accessible from the Non-secure MPAM feature page.

MSMON\_CFG\_CSU\_FLT\_s and MSMON\_CFG\_CSU\_FLT\_ns must be separate registers. The Secure instance (MSMON\_CFG\_CSU\_FLT\_s) accesses the PARTID and PMG matching for a cache storage usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON\_CFG\_CSU\_FLT\_ns) accesses the PARTID and PMG matching for a cache storage usage monitor used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MSMON\_CFG\_CSU\_FLT access the monitor configuration settings for the resource instance selected by [MSMON\\_CFG\\_MON\\_SEL.RIS](#) and the cache storage usage monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL.MON\\_SEL](#).

When RIS is not implemented, loads and stores to MSMON\_CFG\_CSU\_FLT access the monitor configuration settings for the cache storage usage monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL.MON\\_SEL](#).

**MSMON\_CFG\_CSU\_FLT can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0810	MSMON_CFG_CSU_FLT_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0810	MSMON_CFG_CSU_FLT_ns

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CAPT_EVNT	Meaning
0b000	No capture event is triggered.
0b001	External capture event 1 (optional but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a <a href="#">MSMON_CAPT_EVNT</a> register in this MSC is written and causes a capture event for the security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

If capture is not implemented for the MBWU monitor type as indicated by [MPAMF\\_MBWUMON\\_IDR](#).HAS\_CAPTURE = 0, this field is RAZ/WI.

### CAPT\_RESET, bit [27]

Reset [MSMON\\_MBWU](#).VALUE after capture.

Controls whether the VALUE field of the monitor instance is reset to zero immediately after being copied to the corresponding capture register.

CAPT_RESET	Meaning
0b0	<a href="#">MSMON_MBWU</a> .VALUE field of the monitor instance is not reset on capture.
0b1	<a href="#">MSMON_MBWU</a> .VALUE field of the monitor instance is reset on capture.

If capture is not implemented for the MBWU monitor type as indicated by [MPAMF\\_MBWUMON\\_IDR](#).HAS\_CAPTURE = 0, this field is RAZ/WI.

This control bit affects both [MSMON\\_MBWU](#) and [MSMON\\_MBWU\\_L](#) in implementations that include [MSMON\\_MBWU\\_L](#).

### OFLOW\_STATUS, bit [26]

Overflow status.

Indicates whether the value of [MSMON\\_MBWU](#) has overflowed.

OFLOW_STATUS	Meaning
0b0	<a href="#">MSMON_MBWU</a> .VALUE has not overflowed.
0b1	<a href="#">MSMON_MBWU</a> .VALUE has overflowed at least once since this bit was last written to zero.

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

Overflow status for [MSMON\\_MBWU\\_L](#).VALUE is reported in [MSMON\\_CFG\\_MBWU\\_CTL](#).OFLOW\_STATUS\_L.

### OFLOW\_INTR, bit [25]

Enable interrupt on overflow of [MSMON\\_MBWU](#).VALUE.

OFLOW_INTR	Meaning
0b0	No interrupt is signaled on an overflow of <a href="#">MSMON_MBWU</a> .VALUE.
0b1	An implementation-specific interrupt is signaled on an overflow of <a href="#">MSMON_MBWU</a> .VALUE.

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

If overflow interrupt is not supported by the MSC implementation, this field is RAZ/WI.

Interrupt enable for overflow of [MSMON\\_MBWU\\_L.VALUE](#) is controlled by [MSMON\\_CFG\\_MBWU\\_CTL.OFLOW\\_INTR\\_L](#).

**OFLOW\_FRZ, bit [24]**

Freeze monitor instance on overflow.

Controls whether [MSMON\\_MBWU.VALUE](#) field of the monitor instance freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	<a href="#">MSMON_MBWU.VALUE</a> field of the monitor instance wraps on overflow.
0b1	<a href="#">MSMON_MBWU.VALUE</a> field of the monitor instance freezes on overflow. If the increment that caused the overflow was 1, the frozen value is the post-increment value of 0. If the increment that caused the overflow was larger than 1, the frozen value of the monitor might be 0 or a larger value less than the final increment.

If overflow is not possible for the instance of the MBWU monitor in the implementation, this field is RAZ/WI.

This control bit affects both [MSMON\\_MBWU](#) and [MSMON\\_MBWU\\_L](#) in implementations that include [MSMON\\_MBWU\\_L](#).

**SUBTYPE, bits [23:20]**

Subtype. Type of bandwidth counted by this monitor.

This field is not currently used for MBWU monitors, but reserved for future use.

This field is RAZ/WI.

**SCLEN, bit [19]**

[MSMON\\_MBWU.VALUE](#) Scaling Enable.

Enables scaling of [MSMON\\_MBWU.VALUE](#) by [MPAMF\\_MBWUMON\\_IDR.SCALE](#).

SCLEN	Meaning
0b0	<a href="#">MSMON_MBWU.VALUE</a> has bytes counted by the monitor instance.
0b1	<a href="#">MSMON_MBWU.VALUE</a> has bytes counted by the monitor instance, shifted right by <a href="#">MPAMF_MBWUMON_IDR.SCALE</a> .

**Bit [18]**

Reserved, RES0.

**MATCH\_PMG, bit [17]**

Match PMG.

Controls whether the monitor instance only counts data transferred with PMG matching [MSMON\\_CFG\\_MBWU\\_FLT.PMG](#).

MATCH_PMG	Meaning
0b0	The monitor instance counts data transferred with any PMG value.
0b1	The monitor instance only counts data transferred with the PMG value matching <a href="#">MSMON_CFG_MBWU_FLT.PMG</a> .

### MATCH\_PARTID, bit [16]

Match PARTID.

Controls whether the monitor instance counts only data transferred with PARTID matching [MSMON\\_CFG\\_MBWU\\_FLT](#).PARTID.

MATCH_PARTID	Meaning
0b0	The monitor instance counts data transferred with any PARTID value.
0b1	The monitor instance only counts data transferred with the PARTID value matching <a href="#">MSMON_CFG_MBWU_FLT</a> .PARTID.

### OFLOW\_STATUS\_L, bit [15]

When FEAT\_MPAMv0p1 is implemented or FEAT\_MPAMv1p1 is implemented:

Overflow Status of [MSMON\\_MBWU\\_L](#).VALUE of the monitor instance.

Indicates whether [MSMON\\_MBWU\\_L](#).VALUE has overflowed.

OFLOW_STATUS_L	Meaning
0b0	<a href="#">MSMON_MBWU_L</a> .VALUE has not overflowed.
0b1	<a href="#">MSMON_MBWU_L</a> .VALUE has overflowed at least once since this bit was last written to zero.

If [MPAMF\\_MBWUMON\\_IDR](#).HAS\_LONG == 0, this bit is RES0.

Overflow status of [MSMON\\_MBWU](#).VALUE is reported in [MSMON\\_CFG\\_MBWU\\_CTL](#).OFLOW\_STATUS.

Otherwise:

Reserved, RES0.

### OFLOW\_INTR\_L, bit [14]

When FEAT\_MPAMv0p1 is implemented or FEAT\_MPAMv1p1 is implemented:

Overflow Interrupt for [MSMON\\_MBWU\\_L](#).

Controls whether an MPAM overflow interrupt is generated when [MSMON\\_MBWU\\_L](#).VALUE overflows.

OFLOW_INTR_L	Meaning
0b0	No interrupt is signaled on an overflow of <a href="#">MSMON_MBWU_L</a> .VALUE.
0b1	An implementation-specific interrupt is signalled on overflow of <a href="#">MSMON_MBWU_L</a> .VALUE.

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

If the overflow interrupt is not supported by the MSC implementation, this field is RAZ/WI.

If [MPAMF\\_MBWUMON\\_IDR](#).HAS\_LONG == 0, this bit is RES0.

Otherwise:

Reserved, RES0.

### Bits [13:8]

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code. The MBWU monitor is TYPE = 0x42.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x42.

Accessing the MSMON\_CFG\_MBWU\_CTL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON\_CFG\_MBWU\_CTL\_s must be accessible from the Secure MPAM feature page. MSMON\_CFG\_MBWU\_CTL\_ns must be accessible from the Non-secure MPAM feature page.

MSMON\_CFG\_MBWU\_CTL\_s and MSMON\_CFG\_MBWU\_CTL\_ns must be separate registers. The Secure instance (MSMON\_CFG\_MBWU\_CTL\_s) accesses the memory bandwidth usage monitor controls used for Secure PARTIDs, and the Non-secure instance (MSMON\_CFG\_MBWU\_CTL\_ns) accesses the memory bandwidth usage monitor controls used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MSMON\_CFG\_MBWU\_CTL access the monitor configuration settings for the bandwidth resource instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).MON\_SEL.

When RIS is not implemented, loads and stores to MSMON\_CFG\_MBWU\_CTL access the monitor configuration settings for the memory bandwidth usage monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).MON\_SEL.

MSMON\_CFG\_MBWU\_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0828	MSMON_CFG_MBWU_CTL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0828	MSMON_CFG_MBWU_CTL_ns

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

Copyright © 2010-2020 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

The MSMON CFG MBWU FLT characteristics are:

Controls PARTID and PMG to measure or count in the MBWU monitor selected by [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_CFG\_MBWU\_FLT\_s sets filter conditions for the Secure memory bandwidth usage monitor instance selected by the Secure instance of [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_CFG\_MBWU\_CTL\_ns sets filter conditions for the Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON\\_CFG\\_MON\\_SEL](#).

If `MPAMF_IDR.HAS_RIS` is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by `MSMON_CFG_MON_SEL.RIS` and the monitor instance of that resource instance selected by `MSMON_CFG_MON_SEL.MON_SEL`.

The power domain of MSMON\_CFG\_MBWU\_FLT is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented**, MPAMF\_IDR.HAS\_MSMON == 1 and MPAMF\_MSMON\_IDR.MSMON\_MBWU == 1. Otherwise, direct accesses to MSMON\_CFG\_MBWU\_FLT are RES0.

MSMON\_CFG\_MBWU\_FLT is a 32-bit register.

The MSMON\_CFG\_MBWU\_FLT bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RWBW		RES0						PMG						PARTID																	

RW filtering.

**RWBW, bits [31:30]**

**When MPAMF\_MBWUMON\_IDR.HAS\_RWBW == 1:**

Read/write bandwidth filter. Configures the selected monitor instance to count all bandwidth, only read bandwidth or only write bandwidth.

RWBW	Meaning
0b00	Monitor instance counts read bandwidth and write bandwidth.
0b01	Monitor instance counts write bandwidth only.
0b10	Monitor instance counts read bandwidth only.
0b11	Reserved.

#### Otherwise:

Reserved, RES0.

#### Bits [29:24]

Reserved, RES0.

#### PMG, bits [23:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If [MSMON\\_CFG\\_MBWU\\_CTL.MATCH\\_PMG](#) == 0, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If [MSMON\\_CFG\\_MBWU\\_CTL.MATCH\\_PMG](#) == 1, the monitor selected by [MSMON\\_CFG\\_MON\\_SEL](#) measures or counts memory bandwidth labeled with PMG equal to this field.

#### PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If [MSMON\\_CFG\\_MBWU\\_CTL.MATCH\\_PARTID](#) == 0, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If [MSMON\\_CFG\\_MBWU\\_CTL.MATCH\\_PARTID](#) == 1, the monitor selected by [MSMON\\_CFG\\_MON\\_SEL](#) measures or counts memory bandwidth labeled with PARTID equal to this field.

#### Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMG								PARTID															

#### Bits [31:24]

Reserved, RES0.

#### PMG, bits [23:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If [MSMON\\_CFG\\_MBWU\\_CTL.MATCH\\_PMG](#) == 0, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If [MSMON\\_CFG\\_MBWU\\_CTL.MATCH\\_PMG](#) == 1, the monitor selected by [MSMON\\_CFG\\_MON\\_SEL](#) measures or counts memory bandwidth labeled with PMG equal to this field.

#### PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If [MSMON\\_CFG\\_MBWU\\_CTL.MATCH\\_PARTID](#) == 0, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If [MSMON\\_CFG\\_MBWU\\_CTL.MATCH\\_PARTID](#) == 1, the monitor selected by [MSMON\\_CFG\\_MON\\_SEL](#) measures or counts memory bandwidth labeled with PARTID equal to this field.

## Accessing the MSMON\_CFG\_MBWU\_FLT

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON\_CFG\_MBWU\_FLT\_s must be accessible from the Secure MPAM feature page. MSMON\_CFG\_MBWU\_FLT\_ns must be accessible from the Non-secure MPAM feature page.

MSMON\_CFG\_MBWU\_FLT\_s and MSMON\_CFG\_MBWU\_FLT\_ns must be separate registers. The Secure instance (MSMON\_CFG\_MBWU\_FLT\_s) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON\_CFG\_MBWU\_FLT\_ns) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to `MSMON_CFG_MBWU_FLT` access the monitor configuration settings for the bandwidth resource instance selected by `MSMON_CFG_MON_SEL`. RIS and the memory bandwidth usage monitor instance selected by `MSMON_CFG_MON_SEL.MON_SEL`.

When RIS is not implemented, loads and stores to `MSMON_CFG_MBWU_FLT` access the monitor configuration settings for the memory bandwidth usage monitor instance selected by `MSMON_CFG_MON_SEL.MON_SEL`.

**MSMON\_CFG\_MBWU\_FLT can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0820	MSMON_CFG_MBWU_FLT_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0820	MSMON_CFG_MBWU_FLT_ns

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# MSMON\_CFG\_MON\_SEL, MPAM Monitor Instance Selection Register

The MSMON\_CFG\_MON\_SEL characteristics are:

## Purpose

Selects a monitor instance to access through the MSMON configuration and counter registers.  
MSMON\_CFG\_MON\_SEL\_s selects a Secure monitor instance to access via the Secure MPAM feature page.  
MSMON\_CFG\_MON\_SEL\_ns selects a Non-secure monitor instance to access via the Non-secure MPAM feature page.

### Note

Different performance monitoring features within a MSC could have different numbers of monitor instances. See the NUM\_MON field in the corresponding ID register. This means that a monitor out-of-bounds error might be signaled when an MSMON\_CFG register is accessed because the value in MSMON\_CFG\_MON\_SEL.MON\_SEL is too large for the particular monitoring feature.

To configure a monitor, set MON\_SEL in this register to the index of the monitor instance to configure, then write to the MSMON\_CFG\_x register to set the configuration of the monitor. At a later time, read the monitor register (for example MSMON\_MBWU) to get the value of the monitor.

## Configuration

The power domain of MSMON\_CFG\_MON\_SEL is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented and** (MPAMF\_IDR.HAS\_MSMON == 1, or (MPAMF\_IDR.HAS\_IMPL\_IDR == 1 and MPAMF\_IDR.EXT == 0) or (MPAMF\_IDR.HAS\_IMPL\_IDR == 1, MPAMF\_IDR.EXT == 1 and MPAMF\_IDR.NO\_IMPL\_MSMON == 0)). Otherwise, direct accesses to MSMON\_CFG\_MON\_SEL are RES0.

## Attributes

MSMON\_CFG\_MON\_SEL is a 32-bit register.

## Field descriptions

The MSMON\_CFG\_MON\_SEL bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				RIS				RES0								MON_SEL															

### Bits [31:28]

Reserved, RES0.

### RIS, bits [27:24]

When (FEAT\_MPAMv0p1 is implemented or FEAT\_MPAMv1p1 is implemented), MPAMF\_IDR.EXT == 1 and MPAMF\_IDR.HAS\_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MSMON\_CFG registers.

**Otherwise:**

Reserved, RES0.

**Bits [23:16]**

Reserved, RES0.

**MON\_SEL, bits [15:0]**

Selects the monitor instance to configure or read.

Reads and writes to other MSMON registers are indexed by MON\_SEL and by the NS bit used to access MSMON\_CFG\_MON\_SEL to access the configuration for a single monitor.

**Accessing the MSMON\_CFG\_MON\_SEL**

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON\_CFG\_MON\_SEL\_s must be accessible from the Secure MPAM feature page. MSMON\_CFG\_MON\_SEL\_ns must be accessible from the Non-secure MPAM feature page.

MSMON\_CFG\_MON\_SEL\_s and MSMON\_CFG\_MON\_SEL\_ns must be separate registers. The Secure instance (MSMON\_CFG\_MON\_SEL\_s) accesses the monitor instance selector used for Secure PARTIDs, and the Non-secure instance (MSMON\_CFG\_MON\_SEL\_ns) accesses the monitor instance selector used for Non-secure PARTIDs.

**MSMON\_CFG\_MON\_SEL can be accessed through the memory-mapped interfaces:**

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0800	MSMON_CFG_MON_SEL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0800	MSMON_CFG_MON_SEL_ns

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489ec15ad1565345720bed2a

# MSMON\_CSU, MPAM Cache Storage Usage Monitor Register

The MSMON\_CSU characteristics are:

## Purpose

Accesses the CSU monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_CSU\_s is a Secure cache storage usage monitor instance selected by the Secure instance of [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_CSU\_ns is a Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON\\_CFG\\_MON\\_SEL](#).

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, the monitor instance accessed is for the resource instance currently selected by [MSMON\\_CFG\\_MON\\_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON\\_CFG\\_MON\\_SEL.MON\\_SEL](#).

## Configuration

The power domain of MSMON\_CSU is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented**, [MPAMF\\_IDR.HAS\\_MSMON](#) == 1 and [MPAMF\\_MSMON\\_IDR.MSMON\\_CSU](#) == 1. Otherwise, direct accesses to MSMON\_CSU are RES0.

## Attributes

MSMON\_CSU is a 32-bit register.

## Field descriptions

The MSMON\_CSU bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NRDY	VALUE																														

### NRDY, bit [31]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_CSU.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_CSU.VALUE field might be inaccurate or otherwise not represent the actual cache storage usage.

### VALUE, bits [30:0]

Cache storage usage measurement value if MSMON\_CSU.NRDY is 0. Invalid if MSMON\_CSU.NRDY is 1.

VALUE is the cache storage usage measured in bytes meeting the criteria set in [MSMON\\_CFG\\_CSU\\_FLT](#) and [MSMON\\_CFG\\_CSU\\_CTL](#) for the monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).

## Accessing the MSMON\_CSU

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON\_CSU\_s must be accessible from the Secure MPAM feature page. MSMON\_CSU\_ns must be accessible from the Non-secure MPAM feature page.

MSMON\_CSU\_s and MSMON\_CSU\_ns must be separate registers. The Secure instance (MSMON\_CSU\_s) accesses the cache storage usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON\_CSU\_ns) accesses the cache storage usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to MSMON\_CSU access the cache storage usage monitor monitor instance for the cache resource instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).RIS and the cache storage usage monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).MON\_SEL.

When RIS is not implemented, reads and writes to MSMON\_CSU access the cache storage usage monitor monitor instance for the cache storage usage monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).MON\_SEL.

MSMON\_CSU can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0840	MSMON_CSU_s

This interface is accessible as follows:

- When MPAMF\_CSUMON\_IDR.CSU\_RO == 0 accesses to this register are **RW**.
- When MPAMF\_CSUMON\_IDR.CSU\_RO == 1 accesses to this register are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0840	MSMON_CSU_ns

This interface is accessible as follows:

- When MPAMF\_CSUMON\_IDR.CSU\_RO == 0 accesses to this register are **RW**.
- When MPAMF\_CSUMON\_IDR.CSU\_RO == 1 accesses to this register are **RO**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# MSMON\_CSU\_CAPTURE, MPAM Cache Storage Usage Monitor Capture Register

The MSMON\_CSU\_CAPTURE characteristics are:

## Purpose

MSMON\_CSU\_CAPTURE is a 32-bit read-write register that accesses the captured [MSMON\\_CSU](#) monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_CSU\_CAPTURE\_s is the Secure cache storage usage monitor capture instance selected by the Secure instance of [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_CSU\_CAPTURE\_ns is the Non-secure cache storage usage monitor capture instance selected by the Non-secure instance of [MSMON\\_CFG\\_MON\\_SEL](#).

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, the monitor instance capture register accessed is for the resource instance currently selected by [MSMON\\_CFG\\_MON\\_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON\\_CFG\\_MON\\_SEL.MON\\_SEL](#).

## Configuration

The power domain of MSMON\_CSU\_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when [FEAT\\_MPAM is implemented](#), [MPAMF\\_IDR.HAS\\_MSMON](#) == 1, [MPAMF\\_MSMON\\_IDR.MSMON\\_CSU](#) == 1 and [MPAMF\\_CSUMON\\_IDR.HAS\\_CAPTURE](#) == 1. Otherwise, direct accesses to MSMON\_CSU\_CAPTURE are RES0.

## Attributes

MSMON\_CSU\_CAPTURE is a 32-bit register.

## Field descriptions

The MSMON\_CSU\_CAPTURE bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NRDY																VALUE															

### NRDY, bit [31]

Not Ready. Indicates whether the captured monitor value has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_CSU_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_CSU_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual cache storage usage.

### VALUE, bits [30:0]

Captured cache storage usage measurement if MSMON\_CSU\_CAPTURE.NRDY is 0. Invalid if MSMON\_CSU\_CAPTURE.NRDY is 1.

VALUE is the captured cache storage usage measurement in bytes meeting the criteria set in [MSMON\\_CFG\\_CSU\\_FLT](#) and [MSMON\\_CFG\\_CSU\\_CTL](#) for the monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).

MSMON\_CSU\_CAPTURE\_s must be accessible from the Secure MPAM feature page. MSMON\_CSU\_CAPTURE\_ns must be accessible from the Non-secure MPAM feature page.

MSMON\_CSU\_CAPTURE\_s and MSMON\_CSU\_CAPTURE\_ns must be separate registers. The Secure instance (MSMON\_CSU\_CAPTURE\_s) accesses the captured cache storage usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON\_CSU\_CAPTURE\_ns) accesses the captured cache storage usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to MSMON\_CSU\_CAPTURE access the monitor instance for the cache resource instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).RIS and the cache storage usage monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).MON\_SEL.

When RIS is not implemented, reads and writes to MSMON\_CSU\_CAPTURE access the monitor instance for the cache storage usage monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL.MON\\_SEL](#).

**MSMON\_CSU\_CAPTURE** can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0848	MSMON_CSU_CAPTURE_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0848	MSMON_CSU_CAPTURE_ns

Accesses on this interface are **RW**.

# MSMON\_MBWU, MPAM Memory Bandwidth Usage Monitor Register

The MSMON\_MBWU characteristics are:

## Purpose

Accesses the monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_MBWU\_s is the Secure memory bandwidth usage monitor instance selected by MSMON\_CFG\_MON\_SEL\_s. MSMON\_MBWU\_ns is the Non-secure memory bandwidth usage monitor instance selected by MSMON\_CFG\_MON\_SEL\_ns.

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, the monitor instance register accessed is for the resource instance currently selected by [MSMON\\_CFG\\_MON\\_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON\\_CFG\\_MON\\_SEL.MON\\_SEL](#).

## Configuration

The power domain of MSMON\_MBWU is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented**, [MPAMF\\_IDR.HAS\\_MSMON](#) == 1 and [MPAMF\\_MSMON\\_IDR.MSMON\\_MBWU](#) == 1. Otherwise, direct accesses to MSMON\_MBWU are RES0.

## Attributes

MSMON\_MBWU is a 32-bit register.

## Field descriptions

The MSMON\_MBWU bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NRDY	VALUE																														

### NRDY, bit [31]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_MBWU.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_MBWU.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

### VALUE, bits [30:0]

Memory bandwidth usage counter value if MSMON\_MBWU.NRDY is 0. Invalid if MSMON\_MBWU.NRDY is 1.

VALUE is the scaled count of bytes transferred since the monitor was last reset that meet the criteria set in [MSMON\\_CFG\\_MBWU\\_FLT](#) and [MSMON\\_CFG\\_MBWU\\_CTL](#) for the monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).

If [MSMON\\_CFG\\_MBWU\\_CTL.SCLEN](#) enables scaling, the count in VALUE is the number of bytes shifted right by [MPAMF\\_MBWUMON\\_IDR.SCALE](#) bit positions and rounded.

(old)

htmldiff from-

# MSMON\_MBWU\_CAPTURE, MPAM Memory Bandwidth Usage Monitor Capture Register

The MSMON\_MBWU\_CAPTURE characteristics are:

## Purpose

Accesses the captured MSMON\_MBWU monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_MBWU\_CAPTURE\_s is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_MBWU\_CAPTURE\_ns is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of [MSMON\\_CFG\\_MON\\_SEL](#).

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, the monitor instance capture register accessed is for the resource instance currently selected by [MSMON\\_CFG\\_MON\\_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON\\_CFG\\_MON\\_SEL.MON\\_SEL](#).

## Configuration

The power domain of MSMON\_MBWU\_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when [FEAT\\_MPAM is implemented](#), [MPAMF\\_IDR.HAS\\_MSMON](#) == 1, [MPAMF\\_MSMON\\_IDR.MSMON\\_MBWU](#) == 1 and [MPAMF\\_MBWUMON\\_IDR.HAS\\_CAPTURE](#) == 1. Otherwise, direct accesses to MSMON\_MBWU\_CAPTURE are RES0.

## Attributes

MSMON\_MBWU\_CAPTURE is a 32-bit register.

## Field descriptions

The MSMON\_MBWU\_CAPTURE bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NRDY																VALUE															

### NRDY, bit [31]

Not Ready. The captured NRDY bit from the corresponding instance of [MSMON\\_MBWU](#). This bit indicates whether the captured monitor value has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_MBWU_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_MBWU_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

### VALUE, bits [30:0]

Captured memory bandwidth usage counter value if MSMON\_MBWU\_CAPTURE.NRDY is 0. Invalid if MSMON\_MBWU\_CAPTURE.NRDY is 1.

VALUE is the captured VALUE field from the corresponding instance of [MSMON\\_MBWU](#), the count of bytes transferred since the monitor was last reset that meet the criteria set in [MSMON\\_CFG\\_MBWU\\_FLT](#) and [MSMON\\_CFG\\_MBWU\\_CTL](#) for the monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).

VALUE captures the [MSMON\\_MBWU](#).VALUE and preserves any scaling that had been performed on the VALUE field in that register.

## Accessing the MSMON\_MBWU\_CAPTURE

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON\_MBWU\_CAPTURE\_s must be accessible from the Secure MPAM feature page. MSMON\_MBWU\_CAPTURE\_n must be accessible from the Non-secure MPAM feature page.

MSMON\_MBWU\_CAPTURE\_s and MSMON\_MBWU\_CAPTURE\_ns must be separate registers. The Secure instance (MSMON\_MBWU\_CAPTURE\_s) accesses the captured memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON\_MBWU\_CAPTURE\_ns) accesses the captured memory bandwidth usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to `MSMON_MBWU_CAPTURE` access the monitor instance for the bandwidth resource instance selected by `MSMON_CFG_MON_SEL`.RIS and the memory bandwidth usage monitor instance selected by `MSMON_CFG_MON_SEL`.MON\_SEL.

When RIS is not implemented, reads and writes to `MSMON_MBWU_CAPTURE` access the monitor instance for the memory bandwidth usage monitor instance selected by `MSMON_CFG_MON_SEL.MON_SEL`.

**MSMON\_MBWU\_CAPTURE** can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0868	MSMON_MBWU_CAPTURE_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0868	MSMON_MBWU_CAPTURE_ns

Accesses on this interface are **RW**.

(old)

htmldiff from-

(new)

# MSMON\_MBWU\_L, MPAM Long Memory Bandwidth Usage Monitor Register

The MSMON\_MBWU\_L characteristics are:

## Purpose

Accesses the monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_MBWU\_L\_s is the Secure memory bandwidth usage monitor instance selected by the Secure instance of [MSMON\\_CFG\\_MON\\_SEL](#). MSMON\_MBWU\_L\_ns is the Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON\\_CFG\\_MON\\_SEL](#).

If [MPAMF\\_IDR.HAS\\_RIS](#) is 1, the monitor instance long monitor register accessed is for the resource instance currently selected by [MSMON\\_CFG\\_MON\\_SEL](#).RIS and the monitor instance of that resource instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).MON\_SEL.

## Configuration

The power domain of MSMON\_MBWU\_L is IMPLEMENTATION DEFINED.

This register is present only when [FEAT\\_MPAM is implemented](#), [MPAMF\\_IDR.HAS\\_MSMON](#) == 1, [MPAMF\\_MSMON\\_IDR.MSMON\\_MBWU](#) == 1 and [MPAMF\\_MBWUMON\\_IDR.HAS\\_LONG](#) == 1. Otherwise, direct accesses to MSMON\_MBWU\_L are RES0.

## Attributes

MSMON\_MBWU\_L is a 64-bit register.

## Field descriptions

The MSMON\_MBWU\_L bit assignments are:

### When MPAMF\_MBWUMON\_IDR.LWD == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NRDY	RES0																VALUE														
VALUE																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### NRDY, bit [63]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_MBWU_L.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_MBWU_L.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

### Bits [62:44]

Reserved, RES0.

VALUE, bits [43:0]

Long (44-bit) memory bandwidth usage counter value if MSMON\_MBWU\_L.NRDY is 0. Invalid if MSMON\_MBWU\_L.NRDY is 1.

VALUE is the long count of bytes transferred since the monitor was last reset that meet the criteria set in [MSMON\\_CFG\\_MBWU\\_FLT](#) and [MSMON\\_CFG\\_MBWU\\_CTL](#) for the monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).

When MPAMF\_MBWUMON\_IDR.LWD == 1:

NRDY, bit [63]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_MBWU_L.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_MBWU_L.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [62:0]

Long (63-bit) memory bandwidth usage counter value if MSMON\_MBWU\_L.NRDY is 0. Invalid if MSMON\_MBWU\_L.NRDY is 1.

VALUE is the long count of bytes transferred since the monitor instance was last reset that meet the criteria set in [MSMON\\_CFG\\_MBWU\\_FLT](#) and [MSMON\\_CFG\\_MBWU\\_CTL](#) for the monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).

Accessing the MSMON\_MBWU\_L

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON\_MBWU\_L\_s must be accessible from the Secure MPAM feature page. MSMON\_MBWU\_L\_ns must be accessible from the Non-secure MPAM feature page.

MSMON\_MBWU\_L\_s and MSMON\_MBWU\_L\_ns must be separate registers. The Secure instance (MSMON\_MBWU\_L\_s) accesses the long memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON\_MBWU\_L\_ns) accesses the long memory bandwidth usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to MSMON\_MBWU\_L access the long memory bandwidth usage monitor instance for the bandwidth resource instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).RIS and the monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).MON\_SEL.

When RIS is not implemented, reads and writes to MSMON\_MBWU\_L access the long memory bandwidth usage monitor instance for the monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).MON\_SEL.

MSMON\_MBWU\_L can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0880	MSMON_MBWU_s

Accesses on this interface are **RW**.

## MSMON\_MBWU\_L, MPAM Long Memory Bandwidth Usage Monitor Register

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0880	MSMON_MBWU_ns

Accesses on this interface are **RW**.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bcd2a

(old)	htmldiff from-	(new)
-------	----------------	-------

The MSMON MBWU L CAPTURE characteristics are:

## Purpose

Accesses the captured [MSMON MBWU L](#) monitor instance selected by [MSMON CFG MON SEL](#).

MSMON\_MBWU\_L\_CAPTURE\_s is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of [MSMON\\_CFG\\_MON\\_SEL](#).

MSMON\_MBWU\_L\_CAPTURE\_ns is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of [MSMON\\_CFG\\_MON\\_SEL](#).

If [MPAMF\\_IDR](#).HAS\_RIS is 1, the monitor instance long capture register accessed is for the resource instance currently selected by [MSMON\\_CFG\\_MON\\_SEL](#).RIS and the monitor instance of that resource instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).MON\_SEL.

## Configuration

The power domain of MSMON MBWU L CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when **FEAT\_MPAM is implemented**, MPAMF\_IDR.HAS\_MSMON == 1, MPAMF\_MSMON\_IDR.MSMON\_MBWU == 1, MPAMF\_MBWUMON\_IDR.HAS\_CAPTURE == 1 and MPAMF\_MBWUMON\_IDR.HAS\_LONG == 1. Otherwise, direct accesses to MSMON MBWU L CAPTURE are RES0.

## Attributes

MSMON MBWU L CAPTURE is a 64-bit register.

## Field descriptions

The MSMON MBWU L CAPTURE bit assignments are:

### When MPAMF MBWUMON IDR.LWD == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
NRDY	RES0																			VALUE												
VALUE																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

**NRDY, bit [63]**

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_MBWU_L_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

**Bits [62:44]**

Reserved, RES0.

**VALUE, bits [43:0]**

Captured long memory bandwidth usage counter value if MSMON\_MBWU\_L\_CAPTURE.NRDY is 0. Invalid if MSMON\_MBWU\_L\_CAPTURE.NRDY is 1.

VALUE is the captured 44-bit count of bytes transferred since the monitor instance was last reset that meet the criteria set in [MSMON\\_CFG\\_MBWU\\_FLT](#) and [MSMON\\_CFG\\_MBWU\\_CTL](#) for the monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).

### When MPAMF MBWUMON IDR.LWD == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NRDY	VALUE																														
VALUE																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**NRDY, bit [63]**

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_MBWU_L_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

**VALUE, bits [62:0]**

The captured long memory bandwidth usage counter value if MSMON\_MBWU\_L\_CAPTURE.NRDY is 0. Invalid if MSMON\_MBWU\_L\_CAPTURE.NRDY is 1.

VALUE is the captured 63-bit count of bytes transferred since the monitor instance was last reset that meet the criteria set in [MSMON\\_CFG\\_MBWU\\_FLT](#) and [MSMON\\_CFG\\_MBWU\\_CTL](#) for the monitor instance selected by [MSMON\\_CFG\\_MON\\_SEL](#).

## Accessing the MSMON MBWU L CAPTURE

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON\_MBWU\_L\_CAPTURE\_s must be accessible from the Secure MPAM feature page.  
MSMON\_MBWU\_L\_CAPTURE\_ns must be accessible from the Non-secure MPAM feature page.

MSMON\_MBWU\_L\_CAPTURE\_s and MSMON\_MBWU\_L\_CAPTURE\_ns must be separate registers. The Secure instance (MSMON\_MBWU\_L\_CAPTURE\_s) accesses the captured long memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON\_MBWU\_L\_CAPTURE\_ns) accesses the captured long memory bandwidth usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to `MSMON_MBWU_L_CAPTURE` access the monitor instance for the bandwidth resource instance selected by `MSMON_CFG_MON_SEL`.RIS and the memory bandwidth usage monitor instance selected by `MSMON_CFG_MON_SEL`.MON\_SEL.

When RIS is not implemented, reads and writes to `MSMON_MBWU_L_CAPTURE` access the monitor instance for the memory bandwidth usage monitor instance selected by `MSMON_CFG_MON_SEL.MON_SEL`.

Accesses on this interface are **RW**.

Accesses on this interface are **RW**.

# PMCCFILTR\_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR\_EL0 characteristics are:

## Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR\\_EL0](#), increments.

## Configuration

External register PMCCFILTR\_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMCCFILTR\\_EL0\[31:0\]](#).

External register PMCCFILTR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCCFILTR\[31:0\]](#).

PMCCFILTR\_EL0 is in the Core power domain.

On a Warm or Cold reset, RW fields in this register reset:

- To architecturally UNKNOWN values if the reset is to an Exception level that is using AArch64.
- To 0 if the reset is to an Exception level that is using AArch32.

The register is not affected by an External debug reset.

## Attributes

PMCCFILTR\_EL0 is a 32-bit register.

## Field descriptions

The PMCCFILTR\_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P	U	NSK	NS	UN	SH	M	RES	SH	RES0																						

### P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR\_EL0.NSK bit.

P	Meaning
0b0	Count cycles in EL1.
0b1	Do not count cycles in EL1.

### U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR\_EL0.NSU bit.

U	Meaning
0b0	Count cycles in EL0.
0b1	Do not count cycles in EL0.

**NSK, bit [29]****When EL3 is implemented:**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR\_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

**Otherwise:**

Reserved, RES0.

**NSU, bit [28]****When EL3 is implemented:**

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR\_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

**Otherwise:**

Reserved, RES0.

**NSH, bit [27]****When EL2 is implemented:**

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR\_EL0.SH bit. If FEAT\_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMCCFILTR\_EL0.SH bit.

NSH	Meaning
0b0	Do not count cycles in EL2.
0b1	Count cycles in EL2.

**Otherwise:**

Reserved, RES0.

**M, bit [26]****When EL3 is implemented:**

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR\_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

**Note**

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

**Otherwise:**

Reserved, RES0.

**Bit [25]**

Reserved, RES0.

**SH, bit [24]**

When FEAT\_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR\_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is disabled, this field is RES0.

**Note**

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

**Otherwise:**

Reserved, RES0.

**Bits [23:0]**

Reserved, RES0.

**Accessing the PMCCFILTR\_EL0**

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMCCFILTR\_EL0 can be accessed through the external debug interface:**

Component	Offset	Instance
PMU	0x47C	PMCCFILTR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489ec15ad1565345720bed2a

# PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

## Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

For more information about the common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

### Note

- Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.
- This view of the register was previously called PMCEID0\_EL0.

## Configuration

External register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID0\\_EL0\[31:0\]](#).

External register PMCEID0 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID0\[31:0\]](#).

PMCEID0 is in the Core power domain.

## Attributes

PMCEID0 is a 32-bit register.

## Field descriptions

The PMCEID0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7
<a href="#">ID31</a>	<a href="#">ID30</a>	<a href="#">ID29</a>	<a href="#">ID28</a>	<a href="#">ID27</a>	<a href="#">ID26</a>	<a href="#">ID25</a>	<a href="#">ID24</a>	<a href="#">ID23</a>	<a href="#">ID22</a>	<a href="#">ID21</a>	<a href="#">ID20</a>	<a href="#">ID19</a>	<a href="#">ID18</a>	<a href="#">ID17</a>	<a href="#">ID16</a>	<a href="#">ID15</a>	<a href="#">ID14</a>	<a href="#">ID13</a>	<a href="#">ID12</a>	<a href="#">ID11</a>	<a href="#">ID10</a>	<a href="#">ID9</a>	<a href="#">ID8</a>	<a href="#">ID7</a>

**ID<n>, bit [n], for n = 0 to 31**

**ID<n>, bit [n], for n = 31 to 0**

ID[n] corresponds to common event n.

For each bit:

ID<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

### Note

**Note**

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Component	Offset	Instance
PMU	0xE20	PMCEID0

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

# PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

## Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x020 to 0x03F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

For more information about the common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

### Note

- Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.
- This view of the register was previously called PMCEID1\_EL0.

## Configuration

External register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID1\\_EL0\[31:0\]](#).

External register PMCEID1 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID1\[31:0\]](#).

PMCEID1 is in the Core power domain.

## Attributes

PMCEID1 is a 32-bit register.

## Field descriptions

The PMCEID1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7
<a href="#">ID31</a>	<a href="#">ID30</a>	<a href="#">ID29</a>	<a href="#">ID28</a>	<a href="#">ID27</a>	<a href="#">ID26</a>	<a href="#">ID25</a>	<a href="#">ID24</a>	<a href="#">ID23</a>	<a href="#">ID22</a>	<a href="#">ID21</a>	<a href="#">ID20</a>	<a href="#">ID19</a>	<a href="#">ID18</a>	<a href="#">ID17</a>	<a href="#">ID16</a>	<a href="#">ID15</a>	<a href="#">ID14</a>	<a href="#">ID13</a>	<a href="#">ID12</a>	<a href="#">ID11</a>	<a href="#">ID10</a>	<a href="#">ID9</a>	<a href="#">ID8</a>	<a href="#">ID7</a>

**ID<n>, bit [n], for n = 0 to 31**

**ID<n>, bit [n], for n = 31 to 0**

ID[n] corresponds to common event (0x0020 + n).

For each bit:

ID<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

### Note

**Note**

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Component	Offset	Instance
PMU	0xE24	PMCEID1

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

# PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

## Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

### Note

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

## Configuration

External register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID0\\_EL0\[63:32\]](#).

External register PMCEID2 bits [63:32] are architecturally mapped to AArch32 System register [PMCEID2\[31:0\]](#).

PMCEID2 is in the Core power domain.

This register is present only when FEAT\_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are RES0.

## Attributes

PMCEID2 is a 32-bit register.

## Field descriptions

The PMCEID2 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IDhi31IDhi<n>, bit [n], for n = 0 to 31															

**IDhi<n>, bit [n], for n = 0 to 31**

**IDhi<n>, bit [n], for n = 31 to 0**

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:

IDhi<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

## Accessing the PMCEID2

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMCEID2 can be accessed through the external debug interface:**

Component	Offset	Instance
PMU	0xE28	PMCEID2

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

## Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

### Note

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

## Configuration

External register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID1\\_EL0\[63:32\]](#).

External register PMCEID3 bits [63:32] are architecturally mapped to AArch32 System register [PMCEID3\[31:0\]](#).

PMCEID3 is in the Core power domain.

This register is present only when FEAT\_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are RES0.

## Attributes

PMCEID3 is a 32-bit register.

## Field descriptions

The PMCEID3 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IDhi31IDhi<n>, bit [n], for n = 0 to 31															

**IDhi<n>, bit [n], for n = 0 to 31**

**IDhi<n>, bit [n], for n = 31 to 0**

IDhi[n] corresponds to common event (0x4020 + n).

For each bit:

IDhi<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

### Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMCEID3 can be accessed through the external debug interface:**

Component	Offset	Instance
PMU	0xE2C	PMCEID3

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

## Purpose

Contains PMU-specific configuration data.

## Configuration

PMCFGR is in the Core power domain.

## Attributes

PMCFGR is a 32-bit register.

## Field descriptions

The PMCFGR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
NCG										RES0		FZOUEN	RES0WT	UENNA	WTEX	NACCD	EXCC	CCD	SIZE	CCN												N

### NCG, bits [31:28]

This feature is not supported, so this field is RAZ.

### Bits [27:22:20]

Reserved, RES0.

### FZO, bit [21]

Freeze-on-overflow supported. Defined values are:

FZO	Meaning
0b0	Freeze-on-overflow mechanism not supported. <a href="#">PMCR_EL0.FZO</a> is RES0.
0b1	Freeze-on-overflow mechanism supported. <a href="#">PMCR_EL0.FZO</a> is RW.

Accessing this field has the following behavior:

- When FEAT\_PMUv3p7 is implemented, access to this field is **RAO/WI**.
- When FEAT\_PMUv3p7 is not implemented, access to this field is **RAZ/WI**.

### Bit [20]

Reserved, RES0.

**UEN, bit [19]**

User-mode Enable Register supported. [PMUSERENR\\_ELO](#) is not visible in the external debug interface, so this bit is RAZ.

**WT, bit [18]**

This feature is not supported, so this bit is RAZ.

**NA, bit [17]**

This feature is not supported, so this bit is RAZ.

**EX, bit [16]**

Export supported. Value is IMPLEMENTATION DEFINED.

EX	Meaning
0b0	<a href="#">PMCR_ELO</a> .X is RES0.
0b1	<a href="#">PMCR_ELO</a> .X is read/write.

**CCD, bit [15]**

Cycle counter has prescale.

This is RES1 if AArch32 is supported at any Exception level, and RAZ otherwise.

CCD	Meaning
0b0	<a href="#">PMCR_ELO</a> .D is RES0.
0b1	<a href="#">PMCR_ELO</a> .D is read/write.

**CC, bit [14]**

Dedicated cycle counter (counter 31) supported. This bit is RAO.

**SIZE, bits [13:8]**

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8, the largest counter is 64-bits, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8, the counters are a doubleword-aligned addresses.

**N, bits [7:0]**

Number of counters implemented in addition to the cycle counter, [PMCCNTR\\_ELO](#). The maximum number of event counters is 31.

N	Meaning
0x00	Only <a href="#">PMCCNTR_ELO</a> implemented.
0x01	<a href="#">PMCCNTR_ELO</a> plus one event counter implemented.

and so on up to 0b00011111, which indicates [PMCCNTR\\_ELO](#) and 31 event counters implemented.

**Accessing the PMCFGR****Note**

Component	Offset	Instance
PMU	0xE00	PMCFGR

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

# PMCNTENCLR\_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR\_EL0 characteristics are:

## Purpose

Disables the Cycle Count Register, [PMCCNTR\\_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

## Configuration

External register PMCNTENCLR\_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENCLR\\_EL0\[31:0\]](#).

External register PMCNTENCLR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENCLR\[31:0\]](#).

PMCNTENCLR\_EL0 is in the Core power domain.

## Attributes

PMCNTENCLR\_EL0 is a 32-bit register.

## Field descriptions

The PMCNTENCLR\_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
C	P30P<n>, bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1

### C, bit [31]

[PMCCNTR\\_EL0](#) disable bit. Disables the cycle counter register. Possible values are:

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, disables the cycle counter.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### P<n>, bit [n], for n = 300 to 030

Event counter disable bit for [PMEVCNTR<n>\\_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> is disabled. When written, has no effect.
0b1	When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> is enabled. When written, disables <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> .

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMCNTENCLR\_ELO

### Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMCNTENCLR\_ELO can be accessed through the external debug interface:**

Component	Offset	Instance
PMU	0xC20	PMCNTENCLR_ELO

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# PMCNTENSET\_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET\_EL0 characteristics are:

## Purpose

Enables the Cycle Count Register, [PMCCNTR\\_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

## Configuration

External register PMCNTENSET\_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENSET\\_EL0\[31:0\]](#).

External register PMCNTENSET\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENSET\[31:0\]](#).

PMCNTENSET\_EL0 is in the Core power domain.

## Attributes

PMCNTENSET\_EL0 is a 32-bit register.

## Field descriptions

The PMCNTENSET\_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
C	P30P<n>, bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1

### C, bit [31]

[PMCCNTR\\_EL0](#) enable bit. Enables the cycle counter register. Possible values are:

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, enables the cycle counter.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### P<n>, bit [n], for n = 300 to 030

Event counter enable bit for [PMEVCNTR<n>\\_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> is disabled. When written, has no effect.
0b1	When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> event counter is enabled. When written, enables <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> .

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMCNTENSET\_ELO

### Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMCNTENSET\_ELO can be accessed through the external debug interface:**

Component	Offset	Instance
PMU	0xC00	PMCNTENSET_ELO

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# PMCR\_EL0, Performance Monitors Control Register

The PMCR\_EL0 characteristics are:

## Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

## Configuration

External register PMCR\_EL0 bits [7:0] are architecturally mapped to AArch32 System register [PMCR\[7:0\]](#).

External register PMCR\_EL0 bits [7:0] are architecturally mapped to AArch64 System register [PMCR\\_EL0\[7:0\]](#).

PMCR\_EL0 is in the Core power domain.

This register is only partially mapped to the internal [PMCR](#) System register. An external agent must use other means to discover the information held in [PMCR](#)[31:11], such as accessing [PMCFGR](#) and the ID registers.

## Attributes

PMCR\_EL0 is a 32-bit register.

## Field descriptions

The PMCR\_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RAZ/WI											RES0	FZOLP	RES0	LC	LP	DP	LCX	DP	X	CD	P	C	E	P	E						

### Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

### Bit [10]

Reserved, RES0.

### FZOLP, bit [9]

When [FEAT\\_PMUv3p7](#) is implemented:

Freeze-on-overflow. Stop event counters on overflow.

FZO	Meaning
0b0	Do not freeze on overflow.
0b1	Event counters do not count when <a href="#">PMOVSCLR_EL0</a> [(N-1):0] is nonzero, where N is the value of <a href="#">MDCR_EL2</a> .HPMN if EL2 is implemented, and PMCR_EL0.N otherwise.

If EL2 is implemented, then:

- This bit affects the operation of event counters in the range [0 .. ([MDCR\\_EL2](#).HPMN-1)].

- If [MDCR\\_EL2.HPMN](#) is less than [PMCR\\_EL0.N](#):
  - This bit does not affect the operation of event counters in the range [[MDCR\\_EL2.HPMN](#) .. ([PMCR\\_EL0.N-1](#))].
  - The operation of this bit ignores the values of [PMOVSCLR\\_EL0](#)[([PMCR\\_EL0.N-1](#)):[MDCR\\_EL2.HPMN](#)].
- This applies even when EL2 is disabled in the current Security state.

This bit does not affect the operation of [PMCCNTR\\_EL0](#).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### Bit [8]

Reserved, RES0.

#### LP, bit [7]

##### When FEAT\_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> [31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> [63:0].

If EL2 is implemented and [MDCR\\_EL2.HPMN](#) is less than [PMCR\\_EL0.N](#), this bit does not affect the operation of event counters in the range [[MDCR\\_EL2.HPMN](#):([PMCR\\_EL0.N-1](#))].

If EL2 is implemented and [HDCR.HPMN](#) is less than [PMCR\\_EL0.N](#), this bit does not affect the operation of event counters in the range [[HDCR.HPMN](#):([PMCR\\_EL0.N-1](#))].

#### Note

The effect of [MDCR\\_EL2.HPMN](#) or [HDCR.HPMN](#) on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of [MDCR\\_EL2.HPMN](#) or [HDCR.HPMN](#).

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

#### Otherwise:

Reserved, RES0.

#### LC, bit [6]

##### When AArch32 is supported at any Exception level:

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of <a href="#">PMCCNTR_EL0</a> [31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of <a href="#">PMCCNTR_EL0</a> [63:0].

Arm deprecates use of [PMCR\\_EL0.LC](#) = 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**DP, bit [5]**

**When EL3 is implemented or (FEAT\_PMUv3p1 is implemented and EL2 is implemented):**

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

DP	Meaning
0b0	Cycle counting by <a href="#">PMCCNTR_EL0</a> is not affected by this bit.
0b1	When event counting for counters in the range [0.. <a href="#">MDCR_EL2</a> .HPMN-1]) is prohibited, cycle counting by <a href="#">PMCCNTR_EL0</a> is disabled.

For more information, see 'Prohibiting event counting'.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

**Otherwise:**

Reserved, RES0.

**X, bit [4]**

**When the implementation includes a PMU event export bus:**

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

**Otherwise:**

Reserved, RAZ/WI.

**D, bit [3]**

**When AArch32 is supported at any Exception level:**

Clock divider.

D	Meaning
0b0	When enabled, <a href="#">PMCCNTR_EL0</a> counts every clock cycle.
0b1	When enabled, <a href="#">PMCCNTR_EL0</a> counts once every 64 clock cycles.

If PMCR\_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR\_EL0.D = 1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

#### Otherwise:

Reserved, RES0.

#### C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

C	Meaning
0b0	No action.
0b1	Reset <a href="#">PMCCNTR_EL0</a> to zero.

~~This bit is always RAZ.~~

#### Note

Resetting [PMCCNTR\\_EL0](#) does not change the cycle counter overflow bit.

Access to this field is **WO/RAZ**.

#### P, bit [1]

Event counter reset. The effects of writing to this bit are:

P	Meaning
0b0	No action.
0b1	Reset all event counters, not including <a href="#">PMCCNTR_EL0</a> , to zero.

~~This bit is always RAZ.~~

#### Note

Resetting the event counters does not change the event counter overflow bits.

If FEAT\_PMUv3p5 is implemented, the value of [MDCR\\_EL2.HLP](#), or PMCR\_EL0.LP is ignored and bits [63:0] of all event counters are reset.

Access to this field is **WO/RAZ**.

#### E, bit [0]

Enable.

E	Meaning
0b0	All event counters in the range [0..(PMN-1)] and <a href="#">PMCCNTR_EL0</a> , are disabled.
0b1	All event counters in the range [0..(PMN-1)] and <a href="#">PMCCNTR_EL0</a> , are enabled by <a href="#">PMCNTENSET_EL0</a> .

If EL2 is implemented then:

- If EL2 is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is using AArch64, PMN is [MDCR\\_EL2](#).HPMN.
- If PMN is less than PMCR\_EL0.N, this bit does not affect the operation of event counters in the range [PMN..(PMCR\_EL0.N-1)].

If EL2 is not implemented, PMN is PMCR\_EL0.N.

---

#### Note

The effect of the following fields on the operation of this bit applies if EL2 is implemented regardless of whether EL2 is enabled in the current Security state:

- [HDCR](#).HPMN. See the description of [HDCR](#).HPMN for more information.
  - [MDCR\\_EL2](#).HPMN. See the description of [MDCR\\_EL2](#).HPMN for more information.
- 

On a Warm reset, this field resets to 0.

## Accessing the PMCR\_EL0

---

#### Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

---

**PMCR\_EL0 can be accessed through the external debug interface:**

Component	Offset	Instance
PMU	0xE04	PMCR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757: ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bde489cc15ad1565345720bed2a

(old)

htmldiff from-

(new)

The PMEVCNTR<n>\_EL0 characteristics are:

## Purpose

Holds event counter n, which counts events, where n is 0 to 30.

## Configuration

External register `PMEVCNTR<n>_EL0` bits [31:0] are architecturally mapped to AArch64 System register `PMEVCNTR<n>_EL0[31:0]`.

External register PMEVCNTR<n>\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVCNTR<n>\[31:0\]](#).

PMEVCNTR<n>>\_EL0 is in the Core power domain.

## Attributes

PMEVCNTR<n>\_EL0 is a 64-bit register.

- 64-bit register when FEAT\_PMUv3p5 is implemented
- 32-bit register otherwise

## Field descriptions

The PMEVCNTR<n>>\_EL0 bit assignments are:

### When FEAT\_PMuV3p5 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																Event counter n																
																Event counter n																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

**Bits [63:0]**

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If the highest implemented Exception level is using AArch32, the optional external interface to the performance monitors is implemented, and the [PMCR.LP](#) and [HDCR.HLP](#) bits are RAZ/WI, then locations in the external interface to the performance monitors that map to `PMEVCNTR<n> EL0[63:32]` return UNKNOWN values on reads.

If the implementation does not support AArch64 at any Exception level, bits [63:32] of the event counters are not required to be implemented.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Event counter n

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMEVCNTR<n>\_EL0

External accesses to the performance monitors ignore PMUSERENR\_EL0 and, if implemented, MDCR\_EL2.{TPM, TPMCR, HPMN} and MDCR\_EL3.TPM. This means that all counters are accessible regardless of the current Exception level or privilege of the access.

If FEAT\_PMUv3p5 is not implemented, when IsCorePowered(), DoubleLockStatus(), OSLockStatus() or !AllowExternalPMUAccess(), 32-bit accesses to 0x004+8×n have a CONSTRAINED UNPREDICTABLE behavior.

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVCNTR<n>\_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x000 + (8 * n)	PMEVCNTR<n>_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

(old)htmldiff from-(new)

# PMEVTYPEPER<n>\_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>\_EL0 characteristics are:

## Purpose

Configures event counter n, where n is 0 to 30.

## Configuration

External register PMEVTYPER<n>\_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMEVTYPER<n>\\_EL0\[31:0\]](#).

External register PMEVTYPER<n>\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVTYPER<n>\[31:0\]](#).

PMEVTYPER<n>\_EL0 is in the Core power domain.

If event counter n is not implemented ~~then accesses to this register are:~~

- ~~When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess(), accesses are RES0.~~~~when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess().~~
- ~~Otherwise, it is a CONSTRAINED UNPREDICTABLE whether choice accesses to this register are of RES0 or generate ERROR an error response. otherwise.~~

## Attributes

PMEVTYPER<n>\_EL0 is a 32-bit register.

## Field descriptions

The PMEVTYPER<n>\_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P	U	NSK	NSU	NSH	M	MT	SH	RES0								evtCount[15:10]						evtCount[9:0]									

### P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>\_EL0.NSK bit.

P	Meaning
0b0	Count events in EL1.
0b1	Do not count events in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>\_EL0.NSU bit.

U	Meaning
0b0	Count events in EL0.
0b1	Do not count events in EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### NSK, bit [29]

#### When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>\_EL0.P bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### NSU, bit [28]

#### When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>\_EL0.U bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### NSH, bit [27]

#### When EL2 is implemented:

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>\_EL0.SH bit. FEAT\_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>\_EL0.SH bit.

NSH	Meaning
0b0	Do not count events in EL2.
0b1	Count events in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

### M, bit [26]

#### When EL3 is implemented:

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMEVTYPER<n>\_EL0.P bit, events in Secure EL3 are counted.

Otherwise, events in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0b0.

---

#### Note

This field is not visible in the AArch32 [PMEVTYPER<n>](#) System register.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### MT, bit [25]

**When (FEAT\_MTPMU is implemented and enabled) or an IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:**

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

---

#### Note

- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
  - Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.
- 

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

#### SH, bit [24]

**When FEAT\_SEL2 is implemented and EL3 is implemented:**

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>\_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

---

#### Note

This field is not visible in the AArch32 [PMEVTYPER<n>](#) System register.

---

On a Warm reset, this field resets to an architecturally UNKNOWN value.

#### Otherwise:

Reserved, RES0.

**Bits [23:16]**

Reserved, RES0.

**evtCount[15:10], bits [15:10]**

**When FEAT\_PMUv3p1 is implemented:**

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**evtCount[9:0], bits [9:0]**

Event to count. The event number of the event that is counted by event counter [PMEVCNTR<n>\\_EL0](#).

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

**Note**

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMEVTYPER<n>\_EL0****Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMEVTYPER<n>\_EL0 can be accessed through the external debug interface:**

Component	Offset	Instance
PMU	0x400 + (4 * n)	PMEVTYPER<n>_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489ec15ad1565345720bed2a

# PMINTENCLR\_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR\_EL1 characteristics are:

## Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR\\_EL0](#), and the event counters [PMEVCNTR<n>\\_EL0](#). Reading the register shows which overflow interrupt requests are enabled.

## Configuration

External register PMINTENCLR\_EL1 bits [31:0] are architecturally mapped to AArch64 System register [PMINTENCLR\\_EL1\[31:0\]](#).

External register PMINTENCLR\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENCLR\[31:0\]](#).

PMINTENCLR\_EL1 is in the Core power domain.

## Attributes

PMINTENCLR\_EL1 is a 32-bit register.

## Field descriptions

The PMINTENCLR\_EL1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
C	P30P<n>, bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1

### C, bit [31]

[PMCCNTR\\_EL0](#) overflow interrupt request disable bit. Possible values are:

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### P<n>, bit [n], for n = 300 to 030

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>\\_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> event counter interrupt request is enabled. When written, disables the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMINTENCLR\_EL1

### Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMINTENCLR\_EL1 can be accessed through the external debug interface:**

Component	Offset	Instance
PMU	0xC60	PMINTENCLR_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

# PMINTENSET\_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET\_EL1 characteristics are:

## Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR\\_EL0](#), and the event counters [PMEVCNTR<n>\\_EL0](#). Reading the register shows which overflow interrupt requests are enabled.

## Configuration

External register PMINTENSET\_EL1 bits [31:0] are architecturally mapped to AArch64 System register [PMINTENSET\\_EL1\[31:0\]](#).

External register PMINTENSET\_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENSET\[31:0\]](#).

PMINTENSET\_EL1 is in the Core power domain.

## Attributes

PMINTENSET\_EL1 is a 32-bit register.

## Field descriptions

The PMINTENSET\_EL1 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
C	P30P<n>, bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1

### C, bit [31]

[PMCCNTR\\_EL0](#) overflow interrupt request enable bit. Possible values are:

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### P<n>, bit [n], for n = 300 to 030

Event counter overflow interrupt request enable bit for [PMEVCNTR<n>\\_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> event counter interrupt request is enabled. When written, enables the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMINTENSET\_EL1

### Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMINTENSET\_EL1 can be accessed through the external debug interface:**

Component	Offset	Instance
PMU	0xC40	PMINTENSET_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

# PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

## Purpose

Indicates the current status of the software lock for Performance Monitors registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

## Configuration

If FEAT\_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT\_DoPD is not implemented, this register is in the Debug power domain.

Software uses [PMLAR](#) to set or clear the lock, and PMLSR to check the current status of the lock.

## Attributes

PMLSR is a 32-bit register.

## Field descriptions

The PMLSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																													nTT	SLK	SLI

### Bits [31:3]

Reserved, RES0.

### nTT, bit [2]

Not thirty-two bit access required. RAZ.

### SLK, bit [1]

**When Software Lock is implemented and FEAT\_DoPD is not implemented:**

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

**On a Cold reset, the value of this field is unchanged.**

On an External debug reset, this field resets to 1.

On a Warm reset, the value of this field is unchanged.

#### Otherwise:

Reserved, RAZ.

#### SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

## Accessing the PMLSR

PMLSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
PMU	0xFB4	PMLSR

This interface is accessible as follows:

- When FEAT\_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# PMOVSLR\_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSLR\_EL0 characteristics are:

## Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR\\_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

## Configuration

External register PMOVSLR\_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMOVSLR\\_EL0\[31:0\]](#).

External register PMOVSLR\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSR\[31:0\]](#).

PMOVSLR\_EL0 is in the Core power domain.

## Attributes

PMOVSLR\_EL0 is a 32-bit register.

## Field descriptions

The PMOVSLR\_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
C	P30P<n>, bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1

### C, bit [31]

Cycle counter overflow clear bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

[PMCR\\_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR\\_EL0](#)[31:0] or unsigned overflow of [PMCCNTR\\_EL0](#)[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### P<n>, bit [n], for n = 300 to 030

Event counter overflow clear bit for [PMEVCNTR<n>\\_EL0](#).

If [PMCFGR](#).N is less than 31, bits [30:[PMCFGR](#).N] are RAZ/WI.

<b>P&lt;n&gt;</b>	<b>Meaning</b>
0b0	When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> has overflowed since this bit was last cleared. When written, clears the <a href="#">PMEVCNTR&lt;n&gt;_EL0</a> overflow bit to 0.

If FEAT\_PMuV3p5 is implemented, [MDCR\\_EL2](#).HLP and [PMCR\\_EL0](#).LP control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>\\_EL0](#)[31:0] or unsigned overflow of [PMEVCNTR<n>\\_EL0](#)[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Accessing the PMOVSLR\_ELO

### Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMOVSLR\_EL0 can be accessed through the external debug interface:**

Component	Offset	Instance
PMU	0xC80	PMOVSLR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0657; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# PMOVSSET\_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET\_EL0 characteristics are:

## Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR\\_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#).

## Configuration

External register PMOVSSET\_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMOVSSET\\_EL0\[31:0\]](#).

External register PMOVSSET\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSSETI\[31:0\]](#).

PMOVSSET\_EL0 is in the Core power domain.

## Attributes

PMOVSSET\_EL0 is a 32-bit register.

## Field descriptions

The PMOVSSET\_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
C	P30P<n>, bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1

### C, bit [31]

Cycle counter overflow set bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

[PMCR\\_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR\\_EL0](#)[31:0] or unsigned overflow of [PMCCNTR\\_EL0](#)[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 300 to 030

Event counter overflow set bit for [PMEVCNTR<n>\\_EL0](#).

If [PMCFGR](#).N is less than 31, bits [30:[PMCFGR](#).N] are RAZ/WI.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

## Note

**PMOVSSET\_EL0 can be accessed through the external debug interface:**

Component	Offset	Instance
PMU	0xCC0	PMOVSSET_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997bede489cc15ad1565345720bed2a

# PMPCSR, Program Counter Sample Register

The PMPCSR characteristics are:

## Purpose

Holds a sampled instruction address value.

## Configuration

PMPCSR is in the Core power domain.

This register is present only when FEAT\_PCSRv8p2 is implemented. Otherwise, direct accesses to PMPCSR are RES0.

### Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID.PCSample](#).

Support for 64-bit atomic reads is IMPLEMENTATION DEFINED. If 64-bit atomic reads are implemented, a 64-bit read of PMPCSR has the same side-effect as a 32-bit read of PMCSR[31:0] followed by a 32-bit read of PMPCSR[63:32], returning the combined value. For example, if the PE is in Debug state then a 64-bit atomic read returns bits[31:0] == 0xFFFFFFFF and bits[63:32] UNKNOWN.

## Attributes

PMPCSR is a 64-bit register.

## Field descriptions

The PMPCSR bit assignments are:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
NS	EL	RES0						PCSample[55:32]																								
PCSample[31:0]																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

### NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**EL, bits [62:61]**

Exception level status sample. Indicates the Exception level that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

EL	Meaning
0b00	Sample is from EL0.
0b01	Sample is from EL1.
0b10	Sample is from EL2.
0b11	Sample is from EL3.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**Bits [60:56]**

Reserved, RES0.

**PCSample[55:32], bits [55:32]**

Bits[55:32] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**PCSample[31:0], bits [31:0]**

Bits[31:0] of the sampled instruction address value.

PMPCSR[31:0] reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of PMPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

PMPCSR[31:0] reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of PMPCSR[31:0].

For the cases where a read of PMPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#) to UNKNOWN values.

Otherwise, a read of PMPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#). The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

For a read of PMPCSR[31:0] from the memory-mapped interface, if PMLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#) are unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

## Accessing the PMPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

**PMPCSR can be accessed through the external debug interface:**

Component	Offset	Instance	Range
PMU	0x200	PMPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x204	PMPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x220	PMPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x224	PMPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

# PMSWINC\_EL0, Performance Monitors Software Increment register

The PMSWINC\_EL0 characteristics are:

## Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see SW\_INCR.

## Configuration

External register PMSWINC\_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMSWINC\\_EL0\[31:0\]](#).

External register PMSWINC\_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMSWINC\[31:0\]](#).

PMSWINC\_EL0 is in the Core power domain.

Implementation of this register is OPTIONAL.

If this register is implemented, use of it is deprecated.

If 1 is written to bit [n] from the external debug interface, it is CONSTRAINED UNPREDICTABLE whether or not a SW\_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

## Attributes

PMSWINC\_EL0 is a 32-bit register.

## Field descriptions

The PMSWINC\_EL0 bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2
RES0	P30P<n> bit [n]	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2

### Bit [31]

Reserved, RES0.

### P<n>, bit [n], for n = 300 to 030

Event counter software increment bit for [PMEVCNTR<n>\\_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:PMCFGR.N] are WI.

P<n>	Meaning
0b0	No action. The write to this bit is ignored.
0b1	It is CONSTRAINED UNPREDICTABLE whether a SW_INCR event is generated for event counter n.

## Accessing the PMSWINC\_ELO

### Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

**PMSWINC\_ELO can be accessed through the external debug interface:**

Component	Offset	Instance
PMU	0xCA0	PMSWINC_ELO

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

3001/0907/2020 15:0757; ccead0cb9f089f9ceec50268e82aec9e7104721180324f0b9997b0de489cc15ad1565345720bed2a

# PMVIDSR, VMID Sample Register

The PMVIDSR characteristics are:

## Purpose

Contains the sampled VMID value that is captured on reading [PMPCSR](#)[31:0].

## Configuration

PMVIDSR is in the Core power domain.

This register is present only when FEAT\_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMVIDSR are RES0.

### Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID](#).PCSample.

## Attributes

PMVIDSR is a 32-bit register.

## Field descriptions

The PMVIDSR bit assignments are:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																VMID[15:8]								VMID							

### Bits [31:16]

Reserved, RES0.

### VMID[15:8], bits [15:8]

#### When FEAT\_VMID16 is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

#### Otherwise:

Reserved, RES0.
