- EL2 is using AArch64 and the value of [HCR_EL2.{DC, TGE}](#) is not {0, 0}.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing SCTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;

SDCR, Secure Debug Control Register

The SDCR characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug, trace, and the Performance Monitors Extension.

Configuration

AArch32 System register SDCR bits [31:0] can be mapped to AArch64 System register [MDCR_EL3\[31:0\]](#), but this is not architecturally mandated.

This register is present only when AArch32 is supported at **EL0**. ~~any Exception level.~~ Otherwise, direct accesses to SDCR are UNDEFINED.

Attributes

SDCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	MTPME	TDCC	RES0	SCCD	RES0	EPMA	EDAD	TTRF	STE	SPME	RES0	SPD	RES0																		

Bits [31:29]

Reserved, RES0.

MTPME, bit [28] When FEAT_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the [PMEVTYPER<n>](#).MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n> .MT is 0.
0b1	PMEVTYPER<n> .MT bits not affected by this bit.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0.

The reset behaviour of this field is:

- On a Cold reset, in a system where the PE resets into EL3, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27] When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel in modes other than Monitor mode to Monitor mode.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	Accesses to the DCC registers in modes other than Monitor mode generate a Monitor Trap exception, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

- [DBGDTRRXext](#), [DBGDTRTXext](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

When the PE is in Debug state, SDCR.TDCC does not trap any accesses to:

- [DBGDTRRXint](#) and [DBGDTRTXint](#).

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [26:24]

Reserved, RES0.

SCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

Secure Cycle Counter Disable. Prohibits [PMCCNTR](#) from counting in Secure state.

SCCD	Meaning
0b0	Cycle counting by PMCCNTR is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR is prohibited in Secure state.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [22]

Reserved, RES0.

EPMAAD, bit [21]

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Non-secure access disable. Controls Non-secure access to Performance Monitors registers by an external debugger.

EPMAD	Meaning
0b0	Non-secure access to the Performance Monitors registers from an external debugger is permitted.
0b1	Non-secure access to the Performance Monitors registers from an external debugger is not permitted.

If the Performance Monitors Extension does not support external debug interface accesses, this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

When FEAT_PMuV3 is implemented:

External Performance Monitors access disable. Controls access to Performance Monitors registers by an external debugger.

EPMAD	Meaning
0b0	Access to Performance Monitors registers from an external debugger is permitted.
0b1	Access to Performance Monitors registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension does not support external debug interface accesses, this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

EDAD, bit [20]

When FEAT_Debugv8p4 is implemented:

External debug Non-secure access disable. Controls Non-secure access to breakpoint, watchpoint, and [OSLAR_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Non-secure access to debug registers from an external debugger is permitted.
0b1	Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 from an external debugger is not permitted.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

When FEAT_Debugv8p2 is implemented:

External debug access disable. Controls access to breakpoint, watchpoint, and [OSLAR_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers from an external debugger is permitted.
0b1	Access to breakpoint registers, watchpoint registers, and OSLAR_EL1 from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

External debug access disable. Controls access to breakpoint, watchpoint, and optionally [OSLAR_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers from an external debugger is permitted.
0b1	Access to breakpoint registers and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

TTRF, bit [19]

When FEAT_TRF is implemented:

Trap Trace Filter controls. Controls whether accesses in modes other than Monitor mode to the trace filter control registers generate a Monitor Trap exception.

TTRF	Meaning
0b0	Accesses to HTTRFCR and TRFCR are not affected by this control bit.
0b1	When not in Monitor mode, accesses to HTTRFCR and TRFCR generate a Monitor Trap exception, unless the access generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

STE, bit [18]

When FEAT_TRF is implemented:

Secure Trace Enable. This bit enables tracing in Secure state and controls the level of authentication required by an external debugger to enable external tracing.

STE	Meaning
0b0	Trace is prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Secure state is not affected by this bit.

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, the PE behaves as if this bit is set to 1.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

SPME, bit [17]

When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
0b0	Event counting is prohibited in Secure state. If PMCR.DP is 1, PMCCNTR is disabled in Secure state. Otherwise, PMCCNTR is not affected by this mechanism.
0b1	Event counting and PMCCNTR are not affected by this mechanism.

This field affects the operation of all event counters in Secure state, and if [PMCR.DP](#) is 1, the operation of [PMCCNTR](#) in Secure state. When [PMCR.DP](#) is 0, [PMCCNTR](#) is not affected by this field.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

When FEAT_PMUv3 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
0b0	If ExternalSecureNoninvasiveDebugEnabled() is FALSE, event counting is prohibited in Secure state, and if PMCR.DP is 1, PMCCNTR is disabled in Secure state.
0b1	Event counting and PMCCNTR are not affected by this mechanism.

If ExternalSecureNoninvasiveDebugEnabled() is TRUE, the event counters and [PMCCNTR](#) are not affected by this field.

Otherwise, this field affects the operation of all event counters in Secure state, and if [PMCR.DP](#) is 1, the operation of [PMCCNTR](#) in Secure state. When [PMCR.DP](#) is 0, [PMCCNTR](#) is not affected by this field.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [16]

Reserved, RES0.

SPD, bits [15:14]

AArch32 Secure self-hosted Privileged Debug. Enables or disables debug exceptions from EL3, other than Breakpoint Instruction exceptions.

SPD	Meaning
0b00	Legacy mode. Debug exceptions from EL3 are enabled by the authentication interface.
0b10	Secure privileged debug disabled. Debug exceptions from EL3 are disabled.
0b11	Secure privileged debug enabled. Debug exceptions from EL3 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored in Non-secure state.

If debug exceptions from EL3 are enabled, then debug exceptions from Secure EL0 are also enabled.

Otherwise, debug exceptions from Secure EL0 are enabled only if the value of [SDER.SUIDEN](#) is 1.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 0b11.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Bits [13:0]

Reserved, RES0.

Accessing SDCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0011	0b001

```

SPSR, Saved Program Status Register

The SPSR characteristics are:

Purpose

Holds the saved process state for the current mode.

Configuration

This register is present only when AArch32 is supported at EL0. ~~any Exception level~~. Otherwise, direct accesses to SPSR are UNDEFINED.

Attributes

SPSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL		GE						IT[7:2]				E	A	I	F	T			M[4:0]		

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to the current mode, and copied to PSTATE.N on executing an exception return operation in the current mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to the current mode, and copied to PSTATE.Z on executing an exception return operation in the current mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to the current mode, and copied to PSTATE.C on executing an exception return operation in the current mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to the current mode, and copied to PSTATE.V on executing an exception return operation in the current mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to the current mode, and copied to PSTATE.Q on executing an exception return operation in the current mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to the current mode, and copied to PSTATE.IT on executing an exception return operation in the current mode.

SPSR.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR[26:25].
- IT[7:2] is SPSR[15:10].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to the current mode, and copied to PSTATE.SSBS on executing an exception return operation in the current mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to the current mode, and copied to PSTATE.PAN on executing an exception return operation in the current mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to the current mode, and copied to PSTATE.DIT on executing an exception return operation in the current mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to the current mode, and copied to PSTATE.IL on executing an exception return operation in the current mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to the current mode, and copied to PSTATE.GE on executing an exception return operation in the current mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to the current mode, and copied to PSTATE.E on executing an exception return operation in the current mode.

If the implementation does not support big-endian operation, SPSR.E is RES0. If the implementation does not support little-endian operation, SPSR.E is RES1. On executing an exception return operation in the current mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR.E is RES1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to the current mode, and copied to PSTATE.A on executing an exception return operation in the current mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to the current mode, and copied to PSTATE.I on executing an exception return operation in the current mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

Purpose

Holds the saved process state when an exception is taken to Abort mode.

Configuration

AArch32 System register SPSR_abt bits [31:0] are architecturally mapped to AArch64 System register [SPSR_abt\[31:0\]](#).

This register is present only when AArch32 is supported at **ELO**. ~~any Exception level.~~ Otherwise, direct accesses to SPSR_abt are UNDEFINED.

Attributes

SPSR_abt is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL		GE						IT[7:2]				E	A	I	F	T			M[4:0]		

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Abort mode, and copied to PSTATE.IT on executing an exception return operation in Abort mode.

SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_abt[26:25].
- IT[7:2] is SPSR_abt[15:10].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_abt

SPSR_abt is accessible in all modes other than User mode and Abort mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_abt

R	M	M1
0b1	0b1	0b0100

SPSR_abt, Saved Program Status Register (Abort mode)

MSR{<c>}{<q>} SPSR_abt, <Rn>

R	M	M1
0b1	0b1	0b0100

SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

Purpose

Holds the saved process state when an exception is taken to FIQ mode.

Configuration

AArch32 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch64 System register [SPSR_fiq\[31:0\]](#).

This register is present only when AArch32 is supported at **ELO.any Exception level**. Otherwise, direct accesses to SPSR_fiq are UNDEFINED.

Attributes

SPSR_fiq is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL		GE		IT[7:2]		E	A	I	F	T		M[4:0]									

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to FIQ mode, and copied to PSTATE.IT on executing an exception return operation in FIQ mode.

SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_fiq[26:25].
- IT[7:2] is SPSR_fiq[15:10].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_fiq

SPSR_fiq is accessible in all modes other than User mode and FIQ mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_fiq

R	M	M1
0b1	0b0	0b1110

SPSR_fiq, Saved Program Status Register (FIQ mode)

MSR{<c>}{<q>} SPSR_fiq, <Rn>

SPSR_hyp, Saved Program Status Register (Hyp mode)

The SPSR_hyp characteristics are:

Purpose

Holds the saved process state when an exception is taken to Hyp mode.

Configuration

AArch32 System register SPSR_hyp bits [31:0] are architecturally mapped to AArch64 System register [SPSR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at **ELO.any Exception level**. Otherwise, direct accesses to SPSR_hyp are UNDEFINED.

Attributes

SPSR_hyp is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL		GE						IT[7:2]				E	A	I	F	T			M[4:0]		

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Hyp mode, and copied to PSTATE.N on executing an exception return operation in Hyp mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Hyp mode, and copied to PSTATE.Z on executing an exception return operation in Hyp mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Hyp mode, and copied to PSTATE.C on executing an exception return operation in Hyp mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Hyp mode, and copied to PSTATE.V on executing an exception return operation in Hyp mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Hyp mode, and copied to PSTATE.Q on executing an exception return operation in Hyp mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Hyp mode, and copied to PSTATE.IT on executing an exception return operation in Hyp mode.

SPSR_hyp.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_hyp[26:25].
- IT[7:2] is SPSR_hyp[15:10].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Hyp mode, and copied to PSTATE.SSBS on executing an exception return operation in Hyp mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Hyp mode, and copied to PSTATE.PAN on executing an exception return operation in Hyp mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Hyp mode, and copied to PSTATE.DIT on executing an exception return operation in Hyp mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Hyp mode, and copied to PSTATE.IL on executing an exception return operation in Hyp mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Hyp mode, and copied to PSTATE.GE on executing an exception return operation in Hyp mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Hyp mode, and copied to PSTATE.E on executing an exception return operation in Hyp mode.

If the implementation does not support big-endian operation, SPSR_hyp.E is RES0. If the implementation does not support little-endian operation, SPSR_hyp.E is RES1. On executing an exception return operation in Hyp mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_hyp.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_hyp.E is RES1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Hyp mode, and copied to PSTATE.A on executing an exception return operation in Hyp mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Hyp mode, and copied to PSTATE.I on executing an exception return operation in Hyp mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Hyp mode, and copied to PSTATE.F on executing an exception return operation in Hyp mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Hyp mode, and copied to PSTATE.T on executing an exception return operation in Hyp mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Hyp mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Hyp mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_hyp.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Hyp mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_hyp

SPSR_hyp is accessible only in Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_hyp

R	M	M1
0b1	0b1	0b1110

MSR{<c>}{<q>} SPSR_hyp, <Rn>

R	M	M1
0b1	0b1	0b1110

SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

Purpose

Holds the saved process state when an exception is taken to IRQ mode.

Configuration

AArch32 System register SPSR_irq bits [31:0] are architecturally mapped to AArch64 System register [SPSR_irq\[31:0\]](#).

This register is present only when AArch32 is supported at **ELO.any Exception level**. Otherwise, direct accesses to SPSR_irq are UNDEFINED.

Attributes

SPSR_irq is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL		GE		IT[7:2]		E	A	I	F	T		M[4:0]									

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to IRQ mode, and copied to PSTATE.IT on executing an exception return operation in IRQ mode.

SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_irq[26:25].
- IT[7:2] is SPSR_irq[15:10].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_irq

SPSR_irq is accessible in all modes other than User mode and IRQ mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_irq

R	M	M1
0b1	0b1	0b0000

SPSR_irq, Saved Program Status Register (IRQ mode)

MSR{<c>}{<q>} SPSR_irq, <Rn>

R	M	M1
0b1	0b1	0b0000

SPSR_mon, Saved Program Status Register (Monitor mode)

The SPSR_mon characteristics are:

Purpose

Holds the saved process state when an exception is taken to Monitor mode.

Configuration

AArch32 System register SPSR_mon bits [31:0] can be mapped to AArch64 System register [SPSR_EL3\[31:0\]](#), but this is not architecturally mandated.

This register is present only when AArch32 is supported at **EL0.any Exception level**. Otherwise, direct accesses to SPSR_mon are UNDEFINED.

Attributes

SPSR_mon is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAND	IT	IL			GE					IT[7:2]				E	A	I	F	T			M[4:0]		

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Monitor mode, and copied to PSTATE.N on executing an exception return operation in Monitor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Monitor mode, and copied to PSTATE.Z on executing an exception return operation in Monitor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Monitor mode, and copied to PSTATE.C on executing an exception return operation in Monitor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Monitor mode, and copied to PSTATE.V on executing an exception return operation in Monitor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Monitor mode, and copied to PSTATE.Q on executing an exception return operation in Monitor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Monitor mode, and copied to PSTATE.IT on executing an exception return operation in Monitor mode.

SPSR_mon.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_mon[26:25].
- IT[7:2] is SPSR_mon[15:10].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Monitor mode, and copied to PSTATE.SSBS on executing an exception return operation in Monitor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Monitor mode, and copied to PSTATE.PAN on executing an exception return operation in Monitor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Monitor mode, and copied to PSTATE.DIT on executing an exception return operation in Monitor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Monitor mode, and copied to PSTATE.IL on executing an exception return operation in Monitor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Monitor mode, and copied to PSTATE.GE on executing an exception return operation in Monitor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Monitor mode, and copied to PSTATE.E on executing an exception return operation in Monitor mode.

If the implementation does not support big-endian operation, SPSR_mon.E is RES0. If the implementation does not support little-endian operation, SPSR_mon.E is RES1. On executing an exception return operation in Monitor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_mon.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_mon.E is RES1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Monitor mode, and copied to PSTATE.A on executing an exception return operation in Monitor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Monitor mode, and copied to PSTATE.I on executing an exception return operation in Monitor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Monitor mode, and copied to PSTATE.F on executing an exception return operation in Monitor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Monitor mode, and copied to PSTATE.T on executing an exception return operation in Monitor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Monitor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Monitor mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10110	Monitor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_mon.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Monitor mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_mon

SPSR_mon is only accessible in EL3 modes other than Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_mon

R	M	M1
0b1	0b1	0b1100

MSR{<c>}{<q>} SPSR_mon, <Rn>

R	M	M1
0b1	0b1	0b1100

SPSR_svc, Saved Program Status Register (Supervisor mode)

The SPSR_svc characteristics are:

Purpose

Holds the saved process state when an exception is taken to Supervisor mode.

Configuration

AArch32 System register SPSR_svc bits [31:0] are architecturally mapped to AArch64 System register [SPSR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at **ELO.any Exception level**. Otherwise, direct accesses to SPSR_svc are UNDEFINED.

Attributes

SPSR_svc is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL		GE						IT[7:2]				E	A	I	F	T			M[4:0]		

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Supervisor mode, and copied to PSTATE.N on executing an exception return operation in Supervisor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Supervisor mode, and copied to PSTATE.Z on executing an exception return operation in Supervisor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Supervisor mode, and copied to PSTATE.C on executing an exception return operation in Supervisor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Supervisor mode, and copied to PSTATE.V on executing an exception return operation in Supervisor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Supervisor mode, and copied to PSTATE.Q on executing an exception return operation in Supervisor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Supervisor mode, and copied to PSTATE.IT on executing an exception return operation in Supervisor mode.

SPSR_svc.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_svc[26:25].
- IT[7:2] is SPSR_svc[15:10].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Supervisor mode, and copied to PSTATE.SSBS on executing an exception return operation in Supervisor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Supervisor mode, and copied to PSTATE.PAN on executing an exception return operation in Supervisor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Supervisor mode, and copied to PSTATE.DIT on executing an exception return operation in Supervisor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Supervisor mode, and copied to PSTATE.IL on executing an exception return operation in Supervisor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Supervisor mode, and copied to PSTATE.GE on executing an exception return operation in Supervisor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Supervisor mode, and copied to PSTATE.E on executing an exception return operation in Supervisor mode.

If the implementation does not support big-endian operation, SPSR_svc.E is RES0. If the implementation does not support little-endian operation, SPSR_svc.E is RES1. On executing an exception return operation in Supervisor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_svc.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_svc.E is RES1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Supervisor mode, and copied to PSTATE.A on executing an exception return operation in Supervisor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Supervisor mode, and copied to PSTATE.I on executing an exception return operation in Supervisor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Supervisor mode, and copied to PSTATE.F on executing an exception return operation in Supervisor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Supervisor mode, and copied to PSTATE.T on executing an exception return operation in Supervisor mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Supervisor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Supervisor mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_svc.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Supervisor mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_svc

SPSR_svc is accessible in all modes other than User mode and Supervisor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_svc

R	M	M1
0b1	0b1	0b0010

SPSR_svc, Saved Program Status Register (Supervisor mode)

MSR{<c>}{<q>} SPSR_svc, <Rn>

SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

Purpose

Holds the saved process state when an exception is taken to Undefined mode.

Configuration

AArch32 System register SPSR_und bits [31:0] are architecturally mapped to AArch64 System register [SPSR_und\[31:0\]](#).

This register is present only when AArch32 is supported at **ELO.any Exception level**. Otherwise, direct accesses to SPSR_und are UNDEFINED.

Attributes

SPSR_und is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAND	IT	IL	GE			IT[7:2]				E	A	I	F	T	M[4:0]								

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Undefined mode, and copied to PSTATE.IT on executing an exception return operation in Undefined mode.

SPSR_und.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_und[26:25].
- IT[7:2] is SPSR_und[15:10].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is RES1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_und

SPSR_und is accessible in all modes other than User mode and Undefined mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_und

R	M	M1
0b1	0b1	0b0110

SPSR_und, Saved Program Status Register (Undefined mode)

MSR{<c>}{<q>} SPSR_und, <Rn>

TCMTR, TCM Type Register

The TCMTR characteristics are:

Purpose

Provides information about the implementation of the TCM.

Configuration

This register is present only when AArch32 is supported at **EL0**. ~~any Exception level.~~ Otherwise, direct accesses to TCMTR are UNDEFINED.

If EL1 or above can use AArch32 then this register must be implemented.

Attributes

TCMTR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing TCMTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);

TLBIALL, TLB Invalidate All

The TLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
 - Would be required for the EL1&0 translation regime.
 - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported at **EL0**.~~any Exception level~~. Otherwise, direct accesses to TLBIALL are UNDEFINED.

Attributes

TLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the TLBIALL instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b000

```

TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported at **EL0**. Otherwise, direct accesses to TLBIASID are UNDEFINED.

Attributes

TLBIASID is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								ASID							

Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing the TLBIASID instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

TLBIASIDIS, TLB Invalidate by ASID match, Inner Shareable

The TLBIASIDIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported at **EL0**. ~~any Exception level~~. Otherwise, direct accesses to TLBIASIDIS are UNDEFINED.

Attributes

TLBIASIDIS is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

TLBIIPAS2, TLB Invalidate by Intermediate Physical Address, Stage 2

The TLBIIPAS2 characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- [SCR.NS](#) is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported at [EL0](#). Otherwise, direct accesses to TLBIIPAS2 are UNDEFINED.

Note

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIIPAS2 is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				IPA[39:12]																											

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing the TLBIIPAS2 instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0100	0b001

```

TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported at **EL0**. Otherwise, direct accesses to TLBIMVA are UNDEFINED.

Attributes

TLBIMVA is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA												RES0				ASID															

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing the TLBIMVA instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

TLBIMVAA, TLB Invalidate by VA, All ASID

The TLBIMVAA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported at **EL0**.~~any Exception level~~. Otherwise, direct accesses to TLBIMVAA are UNDEFINED.

Attributes

TLBIMVAA is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA																				RES0											

VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

TLBIMVAH, TLB Invalidate by VA, Hyp mode

The TLBIMVAH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported at **EL0**.~~any Exception level.~~ Otherwise, direct accesses to TLBIMVAH are UNDEFINED.

Attributes

TLBIMVAH is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA																				RES0											

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVAH instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0111	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

TLBIMVAHIS, TLB Invalidate by VA, Hyp mode, Inner Shareable

The TLBIMVAHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported at **EL0**.~~any Exception level.~~ Otherwise, direct accesses to TLBIMVAHIS are UNDEFINED.

Attributes

TLBIMVAHIS is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA																				RES0											

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVAHIS instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0011	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    AArch32.TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID_NONE, Shareability_ISH,
    TLBIlevel_Any, TLBI_AllAttr, R[t]);
elsif PSTATE.EL == EL3 then
    if !HaveEL(EL2) then
        UNDEFINED;
    else
        AArch32.TLBI_VA(SS_NonSecure, Regime_EL2, VMID[], Shareability_ISH, TLBIlevel_Any,
        TLBI_AllAttr, R[t]);

```

TLBIMVAIS, TLB Invalidate by VA, Inner Shareable

The TLBIMVAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported at **EL0**, ~~any Exception level~~. Otherwise, direct accesses to TLBIMVAIS are UNDEFINED.

Attributes

TLBIMVAIS is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA												RES0				ASID															

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing the TLBIMVAIS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

TLBTR, TLB Type Register

The TLBTR characteristics are:

Purpose

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

Configuration

This register is present only when AArch32 is supported at **ELO**. ~~any Exception level~~. Otherwise, direct accesses to TLBTR are UNDEFINED.

Attributes

TLBTR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															nU

IMPLEMENTATION DEFINED, bits [31:1]

IMPLEMENTATION DEFINED.

nU, bit [0]

Not Unified TLB. Indicates whether the implementation has a unified TLB:

nU	Meaning
0b0	Unified TLB.
0b1	Separate Instruction and Data TLBs.

Accessing TLBTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b011

```

if PSTATE.EL == EL0 then

TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configuration

AArch32 System register TPIDRPRW bits [31:0] are architecturally mapped to AArch64 System register [TPIDR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at **EL0.any Exception level**. Otherwise, direct accesses to TPIDRPRW are UNDEFINED.

Note

The PE never updates this register.

Attributes

TPIDRPRW is a 32-bit register.

Field descriptions

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRPRW

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b100

TRFCR, Trace Filter Control Register

The TRFCR characteristics are:

Purpose

Provides EL1 controls for Trace.

Configuration

AArch32 System register TRFCR bits [31:0] are architecturally mapped to AArch64 System register [TRFCR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at [EL0](#) ~~any Exception level~~ and FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR are UNDEFINED.

Attributes

TRFCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0														TS		RES0		E1TRE		E0TRE											

Bits [31:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

TS	Meaning	Applies when
0b01	Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF .	
0b10	Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2 : <ul style="list-style-type: none"> EL3 is implemented and is using AArch32. EL3 is implemented, using AArch64, and SCR_EL3.ECVEn == 0b0. EL2 is using AArch32. EL2 is using AArch64 and CNTHCTL_EL2.ECV == 0b0. 	When FEAT_ECV is implemented
0b11	Physical timestamp. The traced timestamp is the physical counter value.	

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- EL2 is implemented and [HTRFCR.TS](#) != 0b00.

- SelfHostedTraceEnabled() == FALSE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

E1TRE	Meaning
0b0	Tracing is prohibited in PL1 modes.
0b1	Tracing is allowed in PL1 modes.

This field is ignored if SelfHostedTraceEnabled() == FALSE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

E0TRE, bit [0]

EL0 Trace Enable.

E0TRE	Meaning
0b0	Tracing is prohibited at EL0.
0b1	Tracing is allowed at EL0.

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and enabled in the current security state and [HCR](#).TGE == 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing TRFCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

Purpose

The control register for stage 1 of the PL1&0 translation regime. Its controls include:

- Where the VA range is split between addresses translated using [TTBR0](#) and addresses translated using [TTBR1](#).
- The translation table format used by this stage of translation.

From Armv8.2, when the value of TTBCR.{EAE, T2E} is {1, 1}, TTBCR is used with [TTBCR2](#).

Configuration

AArch32 System register TTBCR bits [31:0] are architecturally mapped to AArch64 System register [TCR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at [EL0](#).~~any Exception level.~~ Otherwise, direct accesses to TTBCR are UNDEFINED.

The current translation table format determines which format of the register is used.

Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

Attributes

TTBCR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EAE	RES0																								PD1PD0		RES0	N			

EAE, bit [31]

Extended Address Enable.

EAE	Meaning
0b0	Use the VMSAv8-32 translation system with the Short-descriptor translation table format.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Bits [30:6]

Reserved, RES0.

PD1, bit [5]

Translation table walk disable for translations using [TTBR1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1](#).

PD1	Meaning
0b0	Perform translation table walks using TTBR1 .
0b1	A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

PD0, bit [4]

Translation table walk disable for translations using [TTBR0](#). This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using [TTBR0](#).

PD0	Meaning
0b0	Perform translation table walks using TTBR0 .
0b1	A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Bit [3]

Reserved, RES0.

N, bits [2:0]

Indicate the width of the base address held in [TTBR0](#). In [TTBR0](#), the base address field is bits[31:14-N]. The value of N also determines:

- Whether [TTBR0](#) or [TTBR1](#) is used as the base address for translation table walks.
- The size of the translation table pointed to by [TTBR0](#).

N can take any value from 0 to 7, that is, from 0b000 to 0b111.

When N has its reset value of 0, the translation table base is compatible with Armv5 and Armv6.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

When TTBCR.EAE == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EAE	IMPLEMENTATION DEFINED		SH1	ORGN1	IRGN1	EPD1	A1	RES0	T1SZ	RES0	SH0	ORGN0	IRGN0	EPD0	T2E	RES0	T0SZ														

EAE, bit [31]

Extended Address Enable.

EAE	Meaning
0b1	Use the VMSAv8-32 translation system with the Long-descriptor translation table format.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

IMPLEMENTATION DEFINED, bit [30]

IMPLEMENTATION DEFINED.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1](#).

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1](#).

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1](#).

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

EPD1, bit [23]

Translation table walk disable for translations using [TTBR1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1](#).

EPD1	Meaning
0b0	Perform translation table walks using TTBR1 .
0b1	A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

A1, bit [22]

Selects whether [TTBR0](#) or [TTBR1](#) defines the ASID.

A1	Meaning
0b0	TTBR0 .ASID defines the ASID.
0b1	TTBR1 .ASID defines the ASID.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Bits [21:19]

Reserved, RES0.

T1SZ, bits [18:16]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using [TTBR0](#) and [TTBR1](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Bits [15:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0](#).

SH0	Meaning
0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0](#).

ORGNO	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

EPD0, bit [7]

Translation table walk disable for translations using [TTBR0](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0](#).

EPD0	Meaning
0b0	Perform translation table walks using TTBR0 .
0b1	A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

T2E, bit [6]

When FEAT_AA32HPD is implemented:

TTBCR2 Enable.

T2E	Meaning
0b0	TTBCR2 is disabled. The contents of TTBCR2 are treated as 0 for all purposes other than reading or writing the register.
0b1	TTBCR2 is enabled.

If TTBCR.EAE==0, then the behavior is as if the bit is 0.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

Bits [5:3]

Reserved, RES0.

T0SZ, bits [2:0]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using [TTBR0](#) and [TTBR1](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing TTBCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;

TTBCR2, Translation Table Base Control Register 2

The TTBCR2 characteristics are:

Purpose

The second control register for stage 1 of the PL1&0 translation regime.

If FEAT_AA32HPD is not implemented then this register is not implemented and its encoding is UNDEFINED. Otherwise:

- When the value of [TTBCR](#).{EAE, T2E} is not {1, 1} the contents of TTBCR2 are treated as zero for all purposes other than reading or writing the register.
- When the value of [TTBCR](#).{EAE, T2E} is {1, 1} TTBCR2 is used with [TTBCR](#).

Configuration

AArch32 System register TTBCR2 bits [31:0] are architecturally mapped to AArch64 System register [TCR_EL1\[63:32\]](#).

This register is present only when AArch32 is supported at **ELOany Exception level** and FEAT_AA32HPD is implemented. Otherwise, direct accesses to TTBCR2 are UNDEFINED.

Attributes

TTBCR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [31:19]

Reserved, RES0.

HWU162, bit [18]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

HWU162	Meaning
0b0	For translations using TTBR1 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU161, bit [17]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

HWU161	Meaning
0b0	For translations using TTBR1 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU160, bit [16]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

HWU160	Meaning
0b0	For translations using TTBR1 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU159, bit [15]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

HWU159	Meaning
0b0	For translations using TTBR1 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR.T2E](#) is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU062, bit [14]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

HWU062	Meaning
0b0	For translations using TTBR0 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR.T2E](#) is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU061, bit [13]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

HWU061	Meaning
0b0	For translations using TTBR0 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR.T2E](#) is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU060, bit [12]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

HWU060	Meaning
0b0	For translations using TTBR0 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR.T2E](#) is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU059, bit [11]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

HWU059	Meaning
0b0	For translations using TTBR0 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR.T2E](#) is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HPD1, bit [10]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by [TTBR1](#).

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled if TTBCR.T2E == 1.

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of [TTBCR.T2E](#) is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPD0, bit [9]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by [TTBR0](#).

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled if TTBCR.T2E == 1.

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of [TTBCR.T2E](#) is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:0]

Reserved, RES0.

Accessing TTBCR2

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register TTBR0 bits [63:0] are architecturally mapped to AArch64 System register [TTBR0_EL1\[63:0\]](#).

This register is present only when AArch32 is supported at [EL0](#). ~~any Exception level~~. Otherwise, direct accesses to TTBR0 are UNDEFINED.

TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

[TTBCR](#).EAE determines which TTBR0 format is used:

- [TTBCR](#).EAE == 0b0: 32-bit format is used. TTBR0[63:32] are ignored.
- [TTBCR](#).EAE == 0b1: 64-bit format is used.

When EL3 is using AArch32, write access to TTBR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Used in conjunction with the [TTBCR](#). When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the [TTBCR](#), not in TTBR0.

Attributes

TTBR0 is a 64-bit register.

Field descriptions

When TTBCR.EAE == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																																			
TTB0																								IRGN[0]		NOS		RGN		IMP		S		IRGN[1]	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Bits [63:32]

Reserved, RES0.

TTB0, bits [31:7]

Translation table base address, bits[31:x], where x is 14-(TTBCR.N). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [0, 6]

Inner region bits. Bits [0,6] of this register together indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

IRGN	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Cacheable.
0b11	Normal memory, Inner Write-Back no Write-Allocate Cacheable.

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[0] is TTBR0[6].
- IRGN[1] is TTBR0[0].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR0.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

NOS	Meaning
0b0	Memory is Outer Shareable.
0b1	Memory is Inner Shareable.

This bit is ignored when the value of TTBR0.S is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

RGN	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Cacheable.
0b11	Normal memory, Outer Write-Back no Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is **Shareable**~~Non-shareable~~:

S	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is Shareable shareable . The TTBR0.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								ASID								BADDR															
BADDR																CnP															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The [TTBCR.A1](#) field selects either TTBR0.ASID or [TTBR1.ASID](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [TTBCR.T0SZ](#) as follows:

- If [TTBCR.T0SZ](#) is 0 or 1, $x = 5 - \text{TTBCR.T0SZ}$.
- If [TTBCR.T0SZ](#) is greater than 1, $x = 14 - \text{TTBCR.T0SZ}$.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]**When FEAT_TTCNP is implemented:**

Common not Private. When [TTBCR.EAE](#) == 1, this bit indicates whether each entry that is pointed to by TTBR0 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1.

CnP	Meaning
0b0	<p>The translation table entries pointed to by this instance of TTBR0, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR0 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> The value of TTBR0.CnP on those other PEs. The value of TTBCR.EAE on those other PEs. The value of the current ASID or, for the Non-secure instance of TTBR0, the value of the current VMID.
0b1	<p>The translation table entries pointed to by this instance of TTBR0 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1 for this instance of TTBR0 and all of the following apply:</p> <ul style="list-style-type: none"> The translation table entries are pointed to by this instance of TTBR0. The value of the applicable TTBCR.EAE field is 1. The ASID is the same as the current ASID. For the Non-secure instance of TTBR0, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNpredictable, see 'CONstrained UNpredictable behaviors due to caching of control or data values'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register TTBR1 bits [63:0] are architecturally mapped to AArch64 System register [TTBR1_EL1\[63:0\]](#).

This register is present only when AArch32 is supported at [EL0](#). ~~any Exception level~~. Otherwise, direct accesses to TTBR1 are UNDEFINED.

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

[TTBCR](#).EAE determines which TTBR1 format is used:

- [TTBCR](#).EAE == 0b0: 32-bit format is used. TTBR1[63:32] are ignored.
- [TTBCR](#).EAE == 0b1: 64-bit format is used.

Used in conjunction with the [TTBCR](#). When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the [TTBCR](#), not in TTBR1.

Attributes

TTBR1 is a 64-bit register.

Field descriptions

When TTBCR.EAE == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39		38		37	36	35	34	33		32
RES0																																		
TTB1																								IRGN[1]		NOS	RGN	IMP	S	IRGN[0]				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7		6		5	4	3	2	1		0

Bits [63:32]

Reserved, RES0.

TTB1, bits [31:7]

Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [6, 0]

Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

IRGN	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Cacheable.
0b11	Normal memory, Inner Write-Back no Write-Allocate Cacheable.

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for Armv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[1] is TTBR1[6].
- IRGN[0] is TTBR1[0].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR1.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

NOS	Meaning
0b0	Memory is Outer Shareable.
0b1	Memory is Inner Shareable.

This bit is ignored when the value of TTBR1.S is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

RGN	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Cacheable.
0b11	Normal memory, Outer Write-Back no Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is **Shareable**~~Non-shareable~~:

S	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is Shareable shareable . The TTBR1.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								ASID								BADDR															
BADDR																CnP															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The [TTBCR.A1](#) field selects either [TTBR0.ASID](#) or [TTBR1.ASID](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [TTBCR.T1SZ](#) as follows:

- If [TTBCR.T1SZ](#) is 0 or 1, $x = 5 - \text{TTBCR.T1SZ}$.
- If [TTBCR.T1SZ](#) is greater than 1, $x = 14 - \text{TTBCR.T1SZ}$.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. When [TTBCR.EAE](#) == 1, this bit indicates whether each entry that is pointed to by TTBR1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1.

CnP	Meaning
0b0	<p>The translation table entries pointed to by this instance of TTBR1, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR1 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> • The value of TTBR1.CnP on those other PEs. • The value of TTBCR.EAE on those other PEs. • The value of the current ASID or, for the Non-secure instance of TTBR1, the value of the current VMID.
0b1	<p>The translation table entries pointed to by this instance of TTBR1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1 for this instance of TTBR1 and all of the following apply:</p> <ul style="list-style-type: none"> • The translation table entries are pointed to by this instance of TTBR1. • The value of the applicable TTBCR.EAE field is 1. • The ASID is the same as the current ASID. • For the Non-secure instance of TTBR1, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNpredictable, see 'CONstrained UNpredictable behaviors due to caching of control or data values'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VBAR, Vector Base Address Register

The VBAR characteristics are:

Purpose

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

Configuration

AArch32 System register VBAR bits [31:0] are architecturally mapped to AArch64 System register [VBAR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at **ELO.any Exception level**. Otherwise, direct accesses to VBAR are UNDEFINED.

Attributes

VBAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Vector Base Address																										RES0					

Bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [4:0]

Reserved, RES0.

Accessing VBAR

Accesses to this register use the following encodings in the System register encoding space:

VMPIDR, Virtualization Multiprocessor ID Register

The VMPIDR characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of [MPIDR](#).

Configuration

AArch32 System register VMPIDR bits [31:0] are architecturally mapped to AArch64 System register [VMPIDR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at **EL0.any Exception level**. Otherwise, direct accesses to VMPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the [MPIDR](#).

Attributes

VMPIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
M	U	RES0					MT	Aff2								Aff1								Aff0							

M, bit [31]

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

M	Meaning
0b0	This implementation does not include the ARMv7 Multiprocessing Extensions functionality.
0b1	This implementation includes the ARMv7 Multiprocessing Extensions functionality.

From Armv8 this bit is RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.U](#).

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

MT	Meaning
0b0	Performance of PEs at the lowest affinity level is largely independent.
0b1	Performance of PEs at the lowest affinity level is very interdependent.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.MT](#).

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff2](#).

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff1](#).

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or [MPIDR_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff0](#).

Accessing VMPIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

VPIDR, Virtualization Processor ID Register

The VPIDR characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of [MIDR](#).

Configuration

AArch32 System register VPIDR bits [31:0] are architecturally mapped to AArch64 System register [VPIDR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at [EL0](#). ~~any Exception level~~. Otherwise, direct accesses to VPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the [MIDR](#).

Attributes

VPIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Implementer								Variant				Architecture				PartNum								Revision							

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.Implementer](#).

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.Variant](#).

Architecture, bits [19:16]

Architecture version. Defined values are:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.Architecture](#).

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.PartNum](#).

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.Revision](#).

Accessing VPIDR

Accesses to this register use the following encodings in the System register encoding space:

VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

Purpose

The control register for stage 2 of the Non-secure PL1&0 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configuration

AArch32 System register VTCR bits [31:0] are architecturally mapped to AArch64 System register [VTCR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at **EL0, any Exception level**. Otherwise, direct accesses to VTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

VTCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES1	RES0	HWU62	HWU61	HWU60	HWU59	RES0					SH0	ORGN0	IRGN0	SLO	RES0	S	TOSZ														

Bit [31]

Reserved, RES1.

Bits [30:29]

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU61, bit [27]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU59, bit [25]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

Bits [24:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [VTTBR](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [VTTBR](#).

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [VTTBR](#).

IRGNO	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]

Starting level for translation table walks using [VTTBR](#).

SL0	Meaning
0b00	Start at level 2
0b01	Start at level 1

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of T0SZ, then a stage 2 level 1 Translation fault is generated.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

S, bit [4]

Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the stage 2 T0SZ value is treated as an UNKNOWN value

~~Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the behavior is CONSTRAINED UNPREDICTABLE and the stage 2 T0SZ value is treated as an UNKNOWN value, see 'Misprogramming VTCR.S'.~~

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [3:0]

The size offset of the memory region addressed by [VTTBR](#). The region size is $2^{(32-T0SZ)}$ bytes.

This field holds a four-bit signed integer value, meaning it supports values from -8 to 7.

Note

This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 1 Translation fault is generated.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VTCR

Accesses to this register use the following encodings in the System register encoding space:

VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register VTTBR bits [63:0] are architecturally mapped to AArch64 System register [VTTBR_EL2\[63:0\]](#).

This register is present only when AArch32 is supported at [EL0](#). ~~any Exception level.~~ Otherwise, direct accesses to VTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

VTTBR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								VMID								BADDR															
BADDR																															CnP
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:56]

Reserved, RES0.

VMID, bits [55:48]

The VMID for the translation table.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [VTCR.SL0](#) and [VTCR.T0SZ](#) as follows:

- If [VTCR.SL0](#) is 0b00, meaning that lookup starts at level 2, then x is 14 - [VTCR.T0SZ](#).
- If [VTCR.SL0](#) is 0b01, meaning that lookup starts at level 1, then x is 5 - [VTCR.T0SZ](#).

- If [VTCR.SL0](#) is either 0b10 or 0b11 then a stage 2 level 1 Translation fault is generated.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VTTBR are permitted to differ from the entries for VTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VTTBR are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1 and the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the VTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBRs do not point to the same translation table entries when the VMID value is the same as the current VMID, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing VTTBR

Accesses to this register use the following encodings in the System register encoding space:

System Register index by instruction and encoding

Below are indexes for registers and operations accessed in the following ways:

For AArch32

- [MCR/MRC](#)
- [MCRR/MRRC](#)
- [MRS/MSR](#)
- [VMRS/VMSR](#)

For AArch64

- [AT](#)
- [BRB](#)
- [CFP](#)
- [CPP](#)
- [DC](#)
- [DVP](#)
- [IC](#)
- [MRS/MSR](#)
- [TLBI](#)

Registers and operations in AArch32

Accessed using MCR/MRC:

coproc	opc1	Register selectors		opc2	Name	Description

System Register index by functional group

Below are indexes for registers with the following main functional groups:

- [ID](#)
- [Memory](#)
- [Other](#)
- [Exception](#)
- [Special](#)
- [PSTATE](#)
- [Cache](#)
- [Address](#)
- [TLB](#)
- [PMU](#)
- [Reset](#)
- [Thread](#)
- [IMP DEF](#)
- [Timer](#)
- [Debug](#)
- [CTI](#)
- [Virt](#)
- [Secure](#)
- [Float](#)
- [Legacy](#)
- [TraceGIC](#)
- [GICGICD](#)
- [GICDGICR](#)
- [GICRGICC](#)
- [GICCGICV](#)
- [GICVGICH](#)
- [GICHGITS](#)
- [GITSRAS](#)
- [RASMPAM](#)
- [MPAMPointer authentication](#)
- [Pointer authenticationAMU](#)
- [AMURoot](#)
- [RootGIC ITS registers](#)
- [GIC ITS registers](#)

In the ID functional group:

Exec state	Name	Description
AArch32	CCSIDR	Current Cache Size ID Register
AArch32	CCSIDR2	Current Cache Size ID Register 2
AArch32	CLIDR	Cache Level ID Register
AArch32	CSSELR	Cache Size Selection Register
AArch32	CTR	Cache Type Register
AArch32	ID_AFR0	Auxiliary Feature Register 0
AArch32	ID_DFR0	Debug Feature Register 0
AArch32	ID_DFR1	Debug Feature Register 1
AArch32	ID_ISAR0	Instruction Set Attribute Register 0
AArch32	ID_ISAR1	Instruction Set Attribute Register 1
AArch32	ID_ISAR2	Instruction Set Attribute Register 2
AArch32	ID_ISAR3	Instruction Set Attribute Register 3
AArch32	ID_ISAR4	Instruction Set Attribute Register 4
AArch32	ID_ISAR5	Instruction Set Attribute Register 5
AArch32	ID_ISAR6	Instruction Set Attribute Register 6
AArch32	ID_MMFR0	Memory Model Feature Register 0
AArch32	ID_MMFR1	Memory Model Feature Register 1
AArch32	ID_MMFR2	Memory Model Feature Register 2
AArch32	ID_MMFR3	Memory Model Feature Register 3
AArch32	ID_MMFR4	Memory Model Feature Register 4

Exec state	Name	Description
AArch32	ID_MMFR5	Memory Model Feature Register 5
AArch32	ID_PFR0	Processor Feature Register 0
AArch32	ID_PFR1	Processor Feature Register 1
AArch32	ID_PFR2	Processor Feature Register 2
AArch32	MIDR	Main ID Register
AArch32	MPIDR	Multiprocessor Affinity Register
AArch32	REVIDR	Revision ID Register
AArch32	TCMTR	TCM Type Register
AArch32	TLBTR	TLB Type Register
AArch64	CCSIDR2_EL1	Current Cache Size ID Register 2
AArch64	CCSIDR_EL1	Current Cache Size ID Register
AArch64	CLIDR_EL1	Cache Level ID Register
AArch64	CSSELR_EL1	Cache Size Selection Register
AArch64	CTR_EL0	Cache Type Register
AArch64	DCZID_EL0	Data Cache Zero ID register
AArch64	GMID_EL1	Multiple tag transfer ID register
AArch64	ID_AA64AFR0_EL1	AArch64 Auxiliary Feature Register 0
AArch64	ID_AA64AFR1_EL1	AArch64 Auxiliary Feature Register 1
AArch64	ID_AA64DFR0_EL1	AArch64 Debug Feature Register 0
AArch64	ID_AA64DFR1_EL1	AArch64 Debug Feature Register 1
AArch64	ID_AA64ISAR0_EL1	AArch64 Instruction Set Attribute Register 0
AArch64	ID_AA64ISAR1_EL1	AArch64 Instruction Set Attribute Register 1
AArch64	ID_AA64ISAR2_EL1	AArch64 Instruction Set Attribute Register 2
AArch64	ID_AA64MMFR0_EL1	AArch64 Memory Model Feature Register 0
AArch64	ID_AA64MMFR1_EL1	AArch64 Memory Model Feature Register 1
AArch64	ID_AA64MMFR2_EL1	AArch64 Memory Model Feature Register 2
AArch64	ID_AA64PFR0_EL1	AArch64 Processor Feature Register 0
AArch64	ID_AA64PFR1_EL1	AArch64 Processor Feature Register 1
AArch64	ID_AA64SMFR0_EL1	SME Feature ID register 0
AArch64	ID_AA64ZFR0_EL1	SVE Feature ID register 0
AArch64	ID_AFR0_EL1	AArch32 Auxiliary Feature Register 0
AArch64	ID_DFR0_EL1	AArch32 Debug Feature Register 0
AArch64	ID_DFR1_EL1	Debug Feature Register 1
AArch64	ID_ISAR0_EL1	AArch32 Instruction Set Attribute Register 0
AArch64	ID_ISAR1_EL1	AArch32 Instruction Set Attribute Register 1
AArch64	ID_ISAR2_EL1	AArch32 Instruction Set Attribute Register 2
AArch64	ID_ISAR3_EL1	AArch32 Instruction Set Attribute Register 3
AArch64	ID_ISAR4_EL1	AArch32 Instruction Set Attribute Register 4
AArch64	ID_ISAR5_EL1	AArch32 Instruction Set Attribute Register 5
AArch64	ID_ISAR6_EL1	AArch32 Instruction Set Attribute Register 6
AArch64	ID_MMFR0_EL1	AArch32 Memory Model Feature Register 0
AArch64	ID_MMFR1_EL1	AArch32 Memory Model Feature Register 1
AArch64	ID_MMFR2_EL1	AArch32 Memory Model Feature Register 2
AArch64	ID_MMFR3_EL1	AArch32 Memory Model Feature Register 3
AArch64	ID_MMFR4_EL1	AArch32 Memory Model Feature Register 4
AArch64	ID_MMFR5_EL1	AArch32 Memory Model Feature Register 5
AArch64	ID_PFR0_EL1	AArch32 Processor Feature Register 0
AArch64	ID_PFR1_EL1	AArch32 Processor Feature Register 1
AArch64	ID_PFR2_EL1	AArch32 Processor Feature Register 2
AArch64	MIDR_EL1	Main ID Register
AArch64	MPAMIDR_EL1	MPAM ID Register (EL1)
AArch64	MPIDR_EL1	Multiprocessor Affinity Register
AArch64	REVIDR_EL1	Revision ID Register
AArch64	SMIDR_EL1	Streaming Mode Identification Register
External	EDAA32PFR	External Debug Auxiliary Processor Feature Register
External	EDDFR	External Debug Feature Register
External	EDPFR	External Debug Processor Feature Register
External	MIDR_EL1	Main ID Register

In the Memory functional group:

Exec state	Name	Description
AArch32	AMAIR0	Auxiliary Memory Attribute Indirection Register 0

Exec state	Name	Description
AArch32	AMAIR1	Auxiliary Memory Attribute Indirection Register 1
AArch32	CONTEXTIDR	Context ID Register
AArch32	DACR	Domain Access Control Register
AArch32	HAMAIR0	Hyp Auxiliary Memory Attribute Indirection Register 0
AArch32	HAMAIR1	Hyp Auxiliary Memory Attribute Indirection Register 1
AArch32	HMAIR0	Hyp Memory Attribute Indirection Register 0
AArch32	HMAIR1	Hyp Memory Attribute Indirection Register 1
AArch32	HTCR	Hyp Translation Control Register
AArch32	HTTBR	Hyp Translation Table Base Register
AArch32	MAIR0	Memory Attribute Indirection Register 0
AArch32	MAIR1	Memory Attribute Indirection Register 1
AArch32	NMRR	Normal Memory Remap Register
AArch32	PRRR	Primary Region Remap Register
AArch32	TTBCR	Translation Table Base Control Register
AArch32	TTBCR2	Translation Table Base Control Register 2
AArch32	TTBR0	Translation Table Base Register 0
AArch32	TTBR1	Translation Table Base Register 1
AArch32	VTCR	Virtualization Translation Control Register
AArch32	VTTBR	Virtualization Translation Table Base Register
AArch64	AMAIR_EL1	Auxiliary Memory Attribute Indirection Register (EL1)
AArch64	AMAIR_EL2	Auxiliary Memory Attribute Indirection Register (EL2)
AArch64	AMAIR_EL3	Auxiliary Memory Attribute Indirection Register (EL3)
AArch64	CONTEXTIDR_EL1	Context ID Register (EL1)
AArch64	CONTEXTIDR_EL2	Context ID Register (EL2)
AArch64	DACR32_EL2	Domain Access Control Register
AArch64	GPCCR_EL3	Granule Protection Check Control Register (EL3)
AArch64	GPTBR_EL3	Granule Protection Table Base Register
AArch64	LORC_EL1	LORegion Control (EL1)
AArch64	LOREA_EL1	LORegion End Address (EL1)
AArch64	LORID_EL1	LORegionID (EL1)
AArch64	LORN_EL1	LORegion Number (EL1)
AArch64	LORSA_EL1	LORegion Start Address (EL1)
AArch64	MAIR_EL1	Memory Attribute Indirection Register (EL1)
AArch64	MAIR_EL2	Memory Attribute Indirection Register (EL2)
AArch64	MAIR_EL3	Memory Attribute Indirection Register (EL3)
AArch64	TCR_EL1	Translation Control Register (EL1)
AArch64	TCR_EL2	Translation Control Register (EL2)
AArch64	TCR_EL3	Translation Control Register (EL3)
AArch64	TTBR0_EL1	Translation Table Base Register 0 (EL1)
AArch64	TTBR0_EL2	Translation Table Base Register 0 (EL2)
AArch64	TTBR0_EL3	Translation Table Base Register 0 (EL3)
AArch64	TTBR1_EL1	Translation Table Base Register 1 (EL1)
AArch64	TTBR1_EL2	Translation Table Base Register 1 (EL2)
AArch64	VTCR_EL2	Virtualization Translation Control Register
AArch64	VTTBR_EL2	Virtualization Translation Table Base Register

In the Other functional group:

Exec state	Name	Description
AArch32	CPACR	Architectural Feature Access Control Register
AArch32	SCTLR	System Control Register
AArch64	CPACR_EL1	Architectural Feature Access Control Register
AArch64	SCTLR_EL1	System Control Register (EL1)
AArch64	SCTLR_EL3	System Control Register (EL3)
AArch64	SMCR_EL1	SME Control Register (EL1)
AArch64	SMCR_EL2	SME Control Register (EL2)
AArch64	SMCR_EL3	SME Control Register (EL3)
AArch64	SMPRIMAP_EL2	Streaming Mode Priority Mapping Register
AArch64	SMPRI_EL1	Streaming Mode Priority Register
AArch64	ZCR_EL1	SVE Control Register (EL1)
AArch64	ZCR_EL2	SVE Control Register (EL2)
AArch64	ZCR_EL3	SVE Control Register (EL3)

In the Exception functional group:

Exec state	Name	Description
AArch32	ADFSR	Auxiliary Data Fault Status Register
AArch32	AIFSR	Auxiliary Instruction Fault Status Register
AArch32	DFAR	Data Fault Address Register
AArch32	DFSR	Data Fault Status Register
AArch32	HADFSR	Hyp Auxiliary Data Fault Status Register
AArch32	HAIFSR	Hyp Auxiliary Instruction Fault Status Register
AArch32	HDFAR	Hyp Data Fault Address Register
AArch32	HIFAR	Hyp Instruction Fault Address Register
AArch32	HPEFAR	Hyp IPA Fault Address Register
AArch32	HSR	Hyp Syndrome Register
AArch32	HVBAR	Hyp Vector Base Address Register
AArch32	IFAR	Instruction Fault Address Register
AArch32	IFSR	Instruction Fault Status Register
AArch32	ISR	Interrupt Status Register
AArch32	MVBAR	Monitor Vector Base Address Register
AArch32	VBAR	Vector Base Address Register
AArch64	AFSR0_EL1	Auxiliary Fault Status Register 0 (EL1)
AArch64	AFSR0_EL2	Auxiliary Fault Status Register 0 (EL2)
AArch64	AFSR0_EL3	Auxiliary Fault Status Register 0 (EL3)
AArch64	AFSR1_EL1	Auxiliary Fault Status Register 1 (EL1)
AArch64	AFSR1_EL2	Auxiliary Fault Status Register 1 (EL2)
AArch64	AFSR1_EL3	Auxiliary Fault Status Register 1 (EL3)
AArch64	ESR_EL1	Exception Syndrome Register (EL1)
AArch64	ESR_EL2	Exception Syndrome Register (EL2)
AArch64	ESR_EL3	Exception Syndrome Register (EL3)
AArch64	FAR_EL1	Fault Address Register (EL1)
AArch64	FAR_EL2	Fault Address Register (EL2)
AArch64	FAR_EL3	Fault Address Register (EL3)
AArch64	HPFAR_EL2	Hypervisor IPA Fault Address Register
AArch64	IFSR32_EL2	Instruction Fault Status Register (EL2)
AArch64	ISR_EL1	Interrupt Status Register
AArch64	MFAR_EL3	PA Fault Address Register
AArch64	VBAR_EL1	Vector Base Address Register (EL1)
AArch64	VBAR_EL2	Vector Base Address Register (EL2)
AArch64	VBAR_EL3	Vector Base Address Register (EL3)

In the Special functional group:

Exec state	Name	Description
AArch32	DLR	Debug Link Register
AArch32	DSPSR	Debug Saved Program Status Register
AArch32	ELR_hyp	Exception Link Register (Hyp mode)
AArch32	SPSR	Saved Program Status Register
AArch32	SPSR_abt	Saved Program Status Register (Abort mode)
AArch32	SPSR_fiq	Saved Program Status Register (FIQ mode)
AArch32	SPSR_hyp	Saved Program Status Register (Hyp mode)
AArch32	SPSR_irq	Saved Program Status Register (IRQ mode)
AArch32	SPSR_mon	Saved Program Status Register (Monitor mode)
AArch32	SPSR_svc	Saved Program Status Register (Supervisor mode)
AArch32	SPSR_und	Saved Program Status Register (Undefined mode)
AArch64	ELR_EL1	Exception Link Register (EL1)
AArch64	ELR_EL2	Exception Link Register (EL2)
AArch64	ELR_EL3	Exception Link Register (EL3)
AArch64	SPSR_EL1	Saved Program Status Register (EL1)
AArch64	SPSR_EL2	Saved Program Status Register (EL2)
AArch64	SPSR_EL3	Saved Program Status Register (EL3)
AArch64	SPSR_abt	Saved Program Status Register (Abort mode)
AArch64	SPSR_fiq	Saved Program Status Register (FIQ mode)
AArch64	SPSR_irq	Saved Program Status Register (IRQ mode)
AArch64	SPSR_und	Saved Program Status Register (Undefined mode)
AArch64	SP_EL0	Stack Pointer (EL0)

Exec state	Name	Description
AArch64	SP_EL1	Stack Pointer (EL1)
AArch64	SP_EL2	Stack Pointer (EL2)
AArch64	SP_EL3	Stack Pointer (EL3)

In the PSTATE functional group:

Exec state	Name	Description
AArch32	APSR	Application Program Status Register
AArch32	CPSR	Current Program Status Register
AArch64	CurrentEL	Current Exception Level
AArch64	DAIF	Interrupt Mask Bits
AArch64	DIT	Data Independent Timing
AArch64	NZCV	Condition Flags
AArch64	PAN	Privileged Access Never
AArch64	SPSel	Stack Pointer Select
AArch64	SSBS	Speculative Store Bypass Safe
AArch64	SVCR	Streaming Vector Control Register
AArch64	TCO	Tag Check Override
AArch64	UAO	User Access Override

In the Cache functional group:

Exec state	Name	Description
AArch32	BPIALL	Branch Predictor Invalidate All
AArch32	BPIALLIS	Branch Predictor Invalidate All, Inner Shareable
AArch32	BPIMVA	Branch Predictor Invalidate by VA
AArch32	DCCIMVAC	Data Cache line Clean and Invalidate by VA to PoC
AArch32	DCCISW	Data Cache line Clean and Invalidate by Set/Way
AArch32	DCCMVAC	Data Cache line Clean by VA to PoC
AArch32	DCCMVAU	Data Cache line Clean by VA to PoU
AArch32	DCCSW	Data Cache line Clean by Set/Way
AArch32	DCIMVAC	Data Cache line Invalidate by VA to PoC
AArch32	DCISW	Data Cache line Invalidate by Set/Way
AArch32	ICIALLU	Instruction Cache Invalidate All to PoU
AArch32	ICIALLUIS	Instruction Cache Invalidate All to PoU, Inner Shareable
AArch32	ICIMVAU	Instruction Cache line Invalidate by VA to PoU
AArch64	DC CGDSW	Clean of Data and Allocation Tags by Set/Way
AArch64	DC CGDVAC	Clean of Data and Allocation Tags by VA to PoC
AArch64	DC CGDVADP	Clean of Data and Allocation Tags by VA to PoDP
AArch64	DC CGDVAP	Clean of Data and Allocation Tags by VA to PoP
AArch64	DC CGSW	Clean of Allocation Tags by Set/Way
AArch64	DC CGVAC	Clean of Allocation Tags by VA to PoC
AArch64	DC CGVADP	Clean of Allocation Tags by VA to PoDP
AArch64	DC CGVAP	Clean of Allocation Tags by VA to PoP
AArch64	DC CIGDPAPA	Clean and Invalidate of Data and Allocation Tags by PA to PoPA
AArch64	DC CIGDSW	Clean and Invalidate of Data and Allocation Tags by Set/Way
AArch64	DC CIGDVAC	Clean and Invalidate of Data and Allocation Tags by VA to PoC
AArch64	DC CIGSW	Clean and Invalidate of Allocation Tags by Set/Way
AArch64	DC CIGVAC	Clean and Invalidate of Allocation Tags by VA to PoC
AArch64	DC CIPAPA	Data or unified Cache line Clean and Invalidate by PA to PoPA
AArch64	DC CISW	Data or unified Cache line Clean and Invalidate by Set/Way
AArch64	DC CIVAC	Data or unified Cache line Clean and Invalidate by VA to PoC
AArch64	DC CSW	Data or unified Cache line Clean by Set/Way
AArch64	DC CVAC	Data or unified Cache line Clean by VA to PoC
AArch64	DC CVADP	Data or unified Cache line Clean by VA to PoDP
AArch64	DC CVAP	Data or unified Cache line Clean by VA to PoP
AArch64	DC CVAU	Data or unified Cache line Clean by VA to PoU
AArch64	DC GVA	Data Cache set Allocation Tag by VA
AArch64	DC GZVA	Data Cache set Allocation Tags and Zero by VA
AArch64	DC IGDWS	Invalidate of Data and Allocation Tags by Set/Way
AArch64	DC IGDVAC	Invalidate of Data and Allocation Tags by VA to PoC
AArch64	DC IGWS	Invalidate of Allocation Tags by Set/Way

Exec state	Name	Description
AArch64	DC IGVAC	Invalidate of Allocation Tags by VA to PoC
AArch64	DC ISW	Data or unified Cache line Invalidate by Set/Way
AArch64	DC IVAC	Data or unified Cache line Invalidate by VA to PoC
AArch64	DC ZVA	Data Cache Zero by VA
AArch64	IC IALLU	Instruction Cache Invalidate All to PoU
AArch64	IC IALLUIS	Instruction Cache Invalidate All to PoU, Inner Shareable
AArch64	IC IVAU	Instruction Cache line Invalidate by VA to PoU

In the Address functional group:

Exec state	Name	Description
AArch32	ATS12NSOPR	Address Translate Stages 1 and 2 Non-secure Only PL1 Read
AArch32	ATS12NSOPW	Address Translate Stages 1 and 2 Non-secure Only PL1 Write
AArch32	ATS12NSOUR	Address Translate Stages 1 and 2 Non-secure Only Unprivileged Read
AArch32	ATS12NSOUW	Address Translate Stages 1 and 2 Non-secure Only Unprivileged Write
AArch32	ATS1CPR	Address Translate Stage 1 Current state PL1 Read
AArch32	ATS1CPRP	Address Translate Stage 1 Current state PL1 Read PAN
AArch32	ATS1CPW	Address Translate Stage 1 Current state PL1 Write
AArch32	ATS1CPWP	Address Translate Stage 1 Current state PL1 Write PAN
AArch32	ATS1CUR	Address Translate Stage 1 Current state Unprivileged Read
AArch32	ATS1CUW	Address Translate Stage 1 Current state Unprivileged Write
AArch32	ATS1HR	Address Translate Stage 1 Hyp mode Read
AArch32	ATS1HW	Address Translate Stage 1 Hyp mode Write
AArch32	PAR	Physical Address Register
AArch64	AT S12E0R	Address Translate Stages 1 and 2 EL0 Read
AArch64	AT S12E0W	Address Translate Stages 1 and 2 EL0 Write
AArch64	AT S12E1R	Address Translate Stages 1 and 2 EL1 Read
AArch64	AT S12E1W	Address Translate Stages 1 and 2 EL1 Write
AArch64	AT S1E0R	Address Translate Stage 1 EL0 Read
AArch64	AT S1E0W	Address Translate Stage 1 EL0 Write
AArch64	AT S1E1R	Address Translate Stage 1 EL1 Read
AArch64	AT S1E1RP	Address Translate Stage 1 EL1 Read PAN
AArch64	AT S1E1W	Address Translate Stage 1 EL1 Write
AArch64	AT S1E1WP	Address Translate Stage 1 EL1 Write PAN
AArch64	AT S1E2R	Address Translate Stage 1 EL2 Read
AArch64	AT S1E2W	Address Translate Stage 1 EL2 Write
AArch64	AT S1E3R	Address Translate Stage 1 EL3 Read
AArch64	AT S1E3W	Address Translate Stage 1 EL3 Write
AArch64	PAR_EL1	Physical Address Register

In the TLB functional group:

Exec state	Name	Description
AArch32	CFPRCTX	Control Flow Prediction Restriction by Context
AArch32	CPRCTX	Cache Prefetch Prediction Restriction by Context
AArch32	DTLBIALL	Data TLB Invalidate All
AArch32	DTLBIASID	Data TLB Invalidate by ASID match
AArch32	DTLBIMVA	Data TLB Invalidate by VA
AArch32	DVPRCTX	Data Value Prediction Restriction by Context
AArch32	ITLBIALL	Instruction TLB Invalidate All
AArch32	ITLBIASID	Instruction TLB Invalidate by ASID match
AArch32	ITLBIMVA	Instruction TLB Invalidate by VA
AArch32	TLBIALL	TLB Invalidate All
AArch32	TLBIALLH	TLB Invalidate All, Hyp mode
AArch32	TLBIALLHIS	TLB Invalidate All, Hyp mode, Inner Shareable
AArch32	TLBIALLIS	TLB Invalidate All, Inner Shareable
AArch32	TLBIALLNSNH	TLB Invalidate All, Non-Secure Non-Hyp
AArch32	TLBIALLNSNHIS	TLB Invalidate All, Non-Secure Non-Hyp, Inner Shareable
AArch32	TLBIASID	TLB Invalidate by ASID match
AArch32	TLBIASIDIS	TLB Invalidate by ASID match, Inner Shareable
AArch32	TLBIIPAS2	TLB Invalidate by Intermediate Physical Address, Stage 2

Exec state	Name	Description
AArch32	TLBIIPAS2IS	TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable
AArch32	TLBIIPAS2L	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level
AArch32	TLBIIPAS2LIS	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, Inner Shareable
AArch32	TLBIMVA	TLB Invalidate by VA
AArch32	TLBIMVAA	TLB Invalidate by VA, All ASID
AArch32	TLBIMVAAIS	TLB Invalidate by VA, All ASID, Inner Shareable
AArch32	TLBIMVAAL	TLB Invalidate by VA, All ASID, Last level
AArch32	TLBIMVAALIS	TLB Invalidate by VA, All ASID, Last level, Inner Shareable
AArch32	TLBIMVAH	TLB Invalidate by VA, Hyp mode
AArch32	TLBIMVAHIS	TLB Invalidate by VA, Hyp mode, Inner Shareable
AArch32	TLBIMVAIS	TLB Invalidate by VA, Inner Shareable
AArch32	TLBIMVAL	TLB Invalidate by VA, Last level
AArch32	TLBIMVALH	TLB Invalidate by VA, Last level, Hyp mode
AArch32	TLBIMVALHIS	TLB Invalidate by VA, Last level, Hyp mode, Inner Shareable
AArch32	TLBIMVALIS	TLB Invalidate by VA, Last level, Inner Shareable
AArch64	TLBI ALLE1, TLBI ALLE1NXS	TLB Invalidate All, EL1
AArch64	TLBI ALLE1IS, TLBI ALLE1ISNXS	TLB Invalidate All, EL1, Inner Shareable
AArch64	TLBI ALLE1OS, TLBI ALLE1OSNXS	TLB Invalidate All, EL1, Outer Shareable
AArch64	TLBI ALLE2, TLBI ALLE2NXS	TLB Invalidate All, EL2
AArch64	TLBI ALLE2IS, TLBI ALLE2ISNXS	TLB Invalidate All, EL2, Inner Shareable
AArch64	TLBI ALLE2OS, TLBI ALLE2OSNXS	TLB Invalidate All, EL2, Outer Shareable
AArch64	TLBI ALLE3, TLBI ALLE3NXS	TLB Invalidate All, EL3
AArch64	TLBI ALLE3IS, TLBI ALLE3ISNXS	TLB Invalidate All, EL3, Inner Shareable
AArch64	TLBI ALLE3OS, TLBI ALLE3OSNXS	TLB Invalidate All, EL3, Outer Shareable
AArch64	TLBI ASIDE1, TLBI ASIDE1NXS	TLB Invalidate by ASID, EL1
AArch64	TLBI ASIDE1IS, TLBI ASIDE1ISNXS	TLB Invalidate by ASID, EL1, Inner Shareable
AArch64	TLBI ASIDE1OS, TLBI ASIDE1OSNXS	TLB Invalidate by ASID, EL1, Outer Shareable
AArch64	TLBI IPAS2E1, TLBI IPAS2E1NXS	TLB Invalidate by Intermediate Physical Address, Stage 2, EL1
AArch64	TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS	TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable
AArch64	TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS	TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable
AArch64	TLBI IPAS2LE1, TLBI IPAS2LE1NXS	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1
AArch64	TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

Exec state	Name	Description
External	GICD_CLRSPI_NSR	Clear Non-secure SPI Pending Register
External	GICD_CLRSPI_SR	Clear Secure SPI Pending Register
External	GICD_CPENDSGIR<n>	SGI Clear-Pending Registers
External	GICD_CTLR	Distributor Control Register
External	GICD_ICACTIVER<n>	Interrupt Clear-Active Registers
External	GICD_ICACTIVER<n>E	Interrupt Clear-Active Registers (extended SPI range)
External	GICD_ICENABLER<n>	Interrupt Clear-Enable Registers
External	GICD_ICENABLER<n>E	Interrupt Clear-Enable Registers
External	GICD_ICFGR<n>	Interrupt Configuration Registers
External	GICD_ICFGR<n>E	Interrupt Configuration Registers (Extended SPI Range)
External	GICD_ICPENDR<n>	Interrupt Clear-Pending Registers
External	GICD_ICPENDR<n>E	Interrupt Clear-Pending Registers (extended SPI range)
External	GICD_IGROUPR<n>	Interrupt Group Registers
External	GICD_IGROUPR<n>E	Interrupt Group Registers (extended SPI range)
External	GICD_IGRPMODR<n>	Interrupt Group Modifier Registers
External	GICD_IGRPMODR<n>E	Interrupt Group Modifier Registers (extended SPI range)
External	GICD_IIDR	Distributor Implementer Identification Register
External	GICD_IPRIORITYR<n>	Interrupt Priority Registers
External	GICD_IPRIORITYR<n>E	Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.
External	GICD_IROUTER<n>	Interrupt Routing Registers
External	GICD_IROUTER<n>E	Interrupt Routing Registers (Extended SPI Range)

Exec state	Name	Description
External	GICD_ISACTIVER<n>	Interrupt Set-Active Registers
External	GICD_ISACTIVER<n>E	Interrupt Set-Active Registers (extended SPI range)
External	GICD_ISENBALER<n>	Interrupt Set-Enable Registers
External	GICD_ISENBALER<n>E	Interrupt Set-Enable Registers
External	GICD_ISPENDR<n>	Interrupt Set-Pending Registers
External	GICD_ISPENDR<n>E	Interrupt Set-Pending Registers (extended SPI range)
External	GICD_ITARGETSR<n>	Interrupt Processor Targets Registers
External	GICD_NSACR<n>	Non-secure Access Control Registers
External	GICD_NSACR<n>E	Non-secure Access Control Registers
External	GICD_SETSPI_NSR	Set Non-secure SPI Pending Register
External	GICD_SETSPI_SR	Set Secure SPI Pending Register
External	GICD_SGIR	Software Generated Interrupt Register
External	GICD_SPENDSGIR<n>	SGI Set-Pending Registers
External	GICD_STATUSR	Error Reporting Status Register
External	GICD_TYPER	Interrupt Controller Type Register
External	GICD_TYPER2	Interrupt Controller Type Register 2
External	GICM_CLRSPI_NSR	Clear Non-secure SPI Pending Register
External	GICM_CLRSPI_SR	Clear Secure SPI Pending Register
External	GICM_IIDR	Distributor Implementer Identification Register
External	GICM_SETSPI_NSR	Set Non-secure SPI Pending Register
External	GICM_SETSPI_SR	Set Secure SPI Pending Register
External	GICM_TYPER	Distributor MSI Type Register

In the GICR functional group:

Exec state	Name	Description
External	GICR_CLRLPIR	Clear LPI Pending Register
External	GICR_CTLR	Redistributor Control Register
External	GICR_ICACTIVER0	Interrupt Clear-Active Register 0
External	GICR_ICACTIVER<n>E	Interrupt Clear-Active Registers
External	GICR_ICENABLER0	Interrupt Clear-Enable Register 0
External	GICR_ICENABLER<n>E	Interrupt Clear-Enable Registers
External	GICR_ICFGR0	Interrupt Configuration Register 0
External	GICR_ICFGR1	Interrupt Configuration Register 1
External	GICR_ICFGR<n>E	Interrupt configuration registers
External	GICR_ICPENDR0	Interrupt Clear-Pending Register 0
External	GICR_ICPENDR<n>E	Interrupt Clear-Pending Registers
External	GICR_IGROUPR0	Interrupt Group Register 0
External	GICR_IGROUPR<n>E	Interrupt Group Registers
External	GICR_IGRPMODR0	Interrupt Group Modifier Register 0
External	GICR_IGRPMODR<n>E	Interrupt Group Modifier Registers
External	GICR_IIDR	Redistributor Implementer Identification Register
External	GICR_INVALLR	Redistributor Invalidate All Register
External	GICR_INVLPIR	Redistributor Invalidate LPI Register
External	GICR_IPRIORITYR<n>	Interrupt Priority Registers
External	GICR_IPRIORITYR<n>E	Interrupt Priority Registers (extended PPI range)
External	GICR_ISACTIVER0	Interrupt Set-Active Register 0
External	GICR_ISACTIVER<n>E	Interrupt Set-Active Registers
External	GICR_ISENBALER0	Interrupt Set-Enable Register 0
External	GICR_ISENBALER<n>E	Interrupt Set-Enable Registers
External	GICR_ISPENDR0	Interrupt Set-Pending Register 0
External	GICR_ISPENDR<n>E	Interrupt Set-Pending Registers
External	GICR_MPAMIDR	Report maximum PARTID and PMG Register
External	GICR_NSACR	Non-secure Access Control Register
External	GICR_PARTIDR	Set PARTID and PMG Register
External	GICR_PENDBASER	Redistributor LPI Pending Table Base Address Register
External	GICR_PROPBASER	Redistributor Properties Base Address Register
External	GICR_SETLPIR	Set LPI Pending Register
External	GICR_STATUSR	Error Reporting Status Register
External	GICR_SYNCR	Redistributor Synchronize Register
External	GICR_TYPER	Redistributor Type Register
External	GICR_VPENDBASER	Virtual Redistributor LPI Pending Table Base Address Register

Exec state	Name	Description
External	GICR_VPROPBASER	Virtual Redistributor Properties Base Address Register
External	GICR_VSGIPENDR	Redistributor virtual SGI pending state register
External	GICR_VSGIR	Redistributor virtual SGI pending state request register
External	GICR_WAKER	Redistributor Wake Register

In the GICC functional group:

Exec state	Name	Description
External	GICC_ABPR	CPU Interface Aliased Binary Point Register
External	GICC_AEOIR	CPU Interface Aliased End Of Interrupt Register
External	GICC_AHPPIR	CPU Interface Aliased Highest Priority Pending Interrupt Register
External	GICC_AIAR	CPU Interface Aliased Interrupt Acknowledge Register
External	GICC_APR<n>	CPU Interface Active Priorities Registers
External	GICC_BPR	CPU Interface Binary Point Register
External	GICC_CTLR	CPU Interface Control Register
External	GICC_DIR	CPU Interface Deactivate Interrupt Register
External	GICC_EOIR	CPU Interface End Of Interrupt Register
External	GICC_HPPIR	CPU Interface Highest Priority Pending Interrupt Register
External	GICC_IAR	CPU Interface Interrupt Acknowledge Register
External	GICC_IIDR	CPU Interface Identification Register
External	GICC_NSAPR<n>	CPU Interface Non-secure Active Priorities Registers
External	GICC_PMR	CPU Interface Priority Mask Register
External	GICC_RPR	CPU Interface Running Priority Register
External	GICC_STATUSR	CPU Interface Status Register

In the GICV functional group:

Exec state	Name	Description
External	GICV_ABPR	Virtual Machine Aliased Binary Point Register
External	GICV_AEOIR	Virtual Machine Aliased End Of Interrupt Register
External	GICV_AHPPIR	Virtual Machine Aliased Highest Priority Pending Interrupt Register
External	GICV_AIAR	Virtual Machine Aliased Interrupt Acknowledge Register
External	GICV_APR<n>	Virtual Machine Active Priorities Registers
External	GICV_BPR	Virtual Machine Binary Point Register
External	GICV_CTLR	Virtual Machine Control Register
External	GICV_DIR	Virtual Machine Deactivate Interrupt Register
External	GICV_EOIR	Virtual Machine End Of Interrupt Register
External	GICV_HPPIR	Virtual Machine Highest Priority Pending Interrupt Register
External	GICV_IAR	Virtual Machine Interrupt Acknowledge Register
External	GICV_IIDR	Virtual Machine CPU Interface Identification Register
External	GICV_PMR	Virtual Machine Priority Mask Register
External	GICV_RPR	Virtual Machine Running Priority Register
External	GICV_STATUSR	Virtual Machine Error Reporting Status Register

In the GICH functional group:

Exec state	Name	Description
External	GICH_APR<n>	Active Priorities Registers
External	GICH_EISR	End Interrupt Status Register
External	GICH_ELRSR	Empty List Register Status Register
External	GICH_HCR	Hypervisor Control Register
External	GICH_LR<n>	List Registers
External	GICH_MISR	Maintenance Interrupt Status Register
External	GICH_VMCR	Virtual Machine Control Register
External	GICH_VTR	Virtual Type Register

In the GITS functional group:

Exec state	Name	Description
External	GITS_BASER<n>	ITS Translation Table Descriptors

Exec state	Name	Description
External	GITS_CBASER	ITS Command Queue Descriptor
External	GITS_CREADR	ITS Read Register
External	GITS_CTLR	ITS Control Register
External	GITS_CWRITER	ITS Write Register
External	GITS_IIDR	ITS Identification Register
External	GITS_MPAMIDR	Report maximum PARTID and PMG Register
External	GITS_MPIDR	Report ITS's affinity.
External	GITS_PARTIDR	Set PARTID and PMG Register
External	GITS_SGIR	ITS SGI Register
External	GITS_STATUSR	ITS Error Reporting Status Register
External	GITS_TRANSLATER	ITS Translation Register
External	GITS_TYPER	ITS Type Register
External	GITS_UMSIR	ITS Unmapped MSI register

In the RAS functional group:

Exec state	Name	Description
AArch32	DISR	Deferred Interrupt Status Register
AArch32	ERRIDR	Error Record ID Register
AArch32	ERRSELR	Error Record Select Register
AArch32	ERXADDR	Selected Error Record Address Register
AArch32	ERXADDR2	Selected Error Record Address Register 2
AArch32	ERXCTLR	Selected Error Record Control Register
AArch32	ERXCTLR2	Selected Error Record Control Register 2
AArch32	ERXFR	Selected Error Record Feature Register
AArch32	ERXFR2	Selected Error Record Feature Register 2
AArch32	ERXMISC0	Selected Error Record Miscellaneous Register 0
AArch32	ERXMISC1	Selected Error Record Miscellaneous Register 1
AArch32	ERXMISC2	Selected Error Record Miscellaneous Register 2
AArch32	ERXMISC3	Selected Error Record Miscellaneous Register 3
AArch32	ERXMISC4	Selected Error Record Miscellaneous Register 4
AArch32	ERXMISC5	Selected Error Record Miscellaneous Register 5
AArch32	ERXMISC6	Selected Error Record Miscellaneous Register 6
AArch32	ERXMISC7	Selected Error Record Miscellaneous Register 7
AArch32	ERXSTATUS	Selected Error Record Primary Status Register
AArch32	VDFSR	Virtual SError Exception Syndrome Register
AArch32	VDISR	Virtual Deferred Interrupt Status Register
AArch64	DISR_EL1	Deferred Interrupt Status Register
AArch64	ERRIDR_EL1	Error Record ID Register
AArch64	ERRSELR_EL1	Error Record Select Register
AArch64	ERXADDR_EL1	Selected Error Record Address Register
AArch64	ERXCTLR_EL1	Selected Error Record Control Register
AArch64	ERXFR_EL1	Selected Error Record Feature Register
AArch64	ERXMISC0_EL1	Selected Error Record Miscellaneous Register 0
AArch64	ERXMISC1_EL1	Selected Error Record Miscellaneous Register 1
AArch64	ERXMISC2_EL1	Selected Error Record Miscellaneous Register 2
AArch64	ERXMISC3_EL1	Selected Error Record Miscellaneous Register 3
AArch64	ERXPFGCDN_EL1	Selected Pseudo-fault Generation Countdown register
AArch64	ERXPFGCTL_EL1	Selected Pseudo-fault Generation Control register
AArch64	ERXPFGF_EL1	Selected Pseudo-fault Generation Feature register
AArch64	ERXSTATUS_EL1	Selected Error Record Primary Status Register
AArch64	VDISR_EL2	Virtual Deferred Interrupt Status Register
AArch64	VSESR_EL2	Virtual SError Exception Syndrome Register
External	ERR<n>ADDR	Error Record Address Register
External	ERR<n>CTLR	Error Record Control Register
External	ERR<n>FR	Error Record Feature Register

AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

Configuration

External register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register [AMCFGR_EL0\[31:0\]](#).

External register AMCFGR bits [31:0] are architecturally mapped to AArch32 System register [AMCFGR\[31:0\]](#).

The power domain of AMCFGR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are RES0.

Attributes

AMCFGR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NCG				RES0			HDBG	RAZ							SIZE						N										

NCG, bits [31:28]

Defines the number of counter groups.

The number of implemented counter groups is **defined as** $[\text{AMCFGR.NCG} + 1]$.

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

This ~~From Armv8, this~~ feature must be supported, and so this bit is 0b1.

HDBG	Meaning
0b0	AMCR.HDBG is RES0.
0b1	AMCR.HDBG is read/write.

Access to this field is **RO**.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is defined as $[AMCFGR.SIZE + 1]$.

The counters are 64-bit.

~~From Armv8, the counters are 64-bit, and so this field is 0b111111.~~

Note

Software also uses this field to determine the spacing of counters in the memory-map. ~~The From Armv8, the~~ counters are at doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is **RO**.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is defined as [AMCFGR.N + 1].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMCFGR

AMCFGR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xE00	AMCFGR

Accesses on this interface are **RO**.

30/06/2021 15:09:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

htmldiff from-

(new)

The AMCGCR characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configuration

External register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register [AMCGCR_EL0\[31:0\]](#).

External register AMCGCR bits [31:0] are architecturally mapped to AArch32 System register [AMCGCR\[31:0\]](#).

The power domain of AMGCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are RES0.

Attributes

AMCGCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
RES0																CG1NC										CG0NC									

Bits [31:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is 0 to 16.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

ReadsIn asan implementation that includes 0x04FEAT_AMUv1., the value of this field is 4.

Access to this field is **RO**.

Accessing AMCGCR

AMCGCR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xCE0	AMCGCR

Accesses on this interface are **RO**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Configuration

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR1_ELO\[31:0\]](#).

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENCLR1\[31:0\]](#).

The power domain of AMCNTENCLR1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are RES0.

Attributes

AMCNTENCLR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter disable bit for [AMEVCNTR1<n>](#).

When Bits N is less than 16, bits [15:N] are RAZ/AUI, where N is the value in [AMCGCR.CG1NC](#).

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR1<n> is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR1<n> is enabled. When written, disables AMEVCNTR1<n> .

The reset behaviour of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENCLR1

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENCLR1 are **RAZ.RAZ.WI**. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

The number of auxiliary activity monitor event counters implemented is zero exactly when `AMCFGR.NCG == 0b0000`.

AMCNTENCLR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xC24	AMCNTENCLR1

Accesses on this interface are **RO**.

AMCR, Activity Monitors Control Register

The AMCR characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

Configuration

External register AMCR bits [31:0] are architecturally mapped to AArch64 System register [AMCR_EL0\[31:0\]](#).

External register AMCR bits [31:0] are architecturally mapped to AArch32 System register [AMCR\[31:0\]](#).

The power domain of AMCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCR are RES0.

Attributes

AMCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RES0																					HDBG		RES0RAZ/WI										

Bits [31:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

HDBG	Meaning
0b0	Activity monitors do not halt counting when the PE is halted in Debug state.
0b1	Activity monitors halt counting when the PE is halted in Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, ~~RAZ/WI~~, RES0.

AMDEVARCH, Activity Monitors Device Architecture Register

The AMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the AMU component.

Configuration

The power domain of AMDEVARCH is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVARCH is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARCHITECT											PRESENT	REVISION				ARCHID															

ARCHITECT, bits [31:21]

Defines the architecture of the component. For AMU, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is **RO**.

PRESENT, bit [20]

IndicatesWhen set to 1, indicates that the DEVARCH is present.

ReadsThis asfield is 1 in Armv8. 0b1.

Access to this field is **RO**.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

REVISION	Meaning
0b0000	Architecture revision is AMUv1.

All other values are reserved.

Reads as 0b0000.

Access to this field is **RO**.

ARCHID, bits [15:0]

Defines this part to be an AMU component. For architectures defined by Arm this is further subdivided.

For AMU:

- Bits [15:12] are the architecture version, 0x0.
- Bits [11:0] are the architecture part number, 0xA66.

This corresponds to AMU architecture version AMUv1.

Reads as 0x0A66.

Access to this field is **RO**.

Accessing AMDEVARCH

AMDEVARCH can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFBC	AMDEVARCH

Accesses on this interface are **RO**.

30/06/2021 15:09:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

AMDEVTTYPE, Activity Monitors Device Type Register

The AMDEVTTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's performance monitor interface.

Configuration

The power domain of AMDEVTTYPE is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVTTYPE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SUB			MAJOR				

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype.

Subtype. Reads as 0x1, to indicate this is a component within a PE.

Reads as 0b0001.

Access to this field is RO.

MAJOR, bits [3:0]

Major type.

Major type. Reads as 0x6, to indicate this is a performance monitor component.

Reads as 0b0110.

Access to this field is RO.

Accessing AMDEVTTYPE

AMDEVTTYPE can be accessed through the memory-mapped interfaces:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RAZ																RES0															
RAZ																evtCount															

Reserved, RAZ.

Bits [24:16]

Bits [31:16:25]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter [AMEVCNTR1<n>](#).

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter [AMEVCNTR1<n>](#), then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

Note

The reset behaviour of this field is:

AMIIDR, Activity Monitors Implementation Identification Register

The AMIIDR characteristics are:

Purpose

Defines the implementer and revisions of the AMU.

Configuration

The power domain of AMIIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMIIDR are RES0.

Attributes

AMIIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ProductID												Variant				Revision				Implementer											

ProductID, bits [31:20]

This field is an AMU part identifier.

If [AMPIDR0](#) is implemented, [AMPIDR0](#).PART_0 matches bits [27:20] of this field.

If [AMPIDR1](#) is implemented, [AMPIDR1](#).PART_1 matches bits [31:28] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [19:16]

This field distinguishes product variants or major revisions of the product.

If [AMPIDR2](#) is implemented, [AMPIDR2](#).REVISION matches AMIIDR.Variant.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

This field distinguishes minor revisions of the product.

If [AMPIDR3](#) is implemented, [AMPIDR3](#).REVAND matches AMIIDR.Revision.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

AMPIDR2, Activity Monitors Peripheral Identification Register 2

The AMPIDR2 characteristics are:

Purpose

Provides information to identify an activity monitors component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR2 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								REVISION				JEDEC		DES_1	

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

JEDEC, bit [3]

RA0. Indicates a JEP106 identity code is used.
Reads as 0b1.
Access to this field is RO.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code.
For Arm Limited, this field is 0b011.
This field has an IMPLEMENTATION DEFINED value.

Accessing AMPIDR2

AMPIDR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFE8	AMPIDR2

Accesses on this interface are **RO**.

30/06/2021 15:09:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

AMPIDR4, Activity Monitors Peripheral Identification Register 4

The AMPIDR4 characteristics are:

Purpose

Provides information to identify an activity monitors component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR4 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR4 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SIZE				DES_2			

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.
ReadsThis field reads as 0b0000.
Access to this field is RO.

DES_2, bits [3:0]

Designer. JEP106 continuation code, least significant nibble.
For Arm Limited, this field is 0b0100.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

Accessing AMPIDR4

AMPIDR4 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFD0	AMPIDR4

Accesses on this interface are **RO**.

30/06/2021 15:09:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ae282f76da4d6e7fc4cab087e

CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

Purpose

Controls whether the CTI is enabled.

Configuration

CTICONTROL is in the Debug power domain.

Attributes

CTICONTROL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

GLBEN, bit [0]

Enables or disables the CTI mapping functions. Possible values of this field are:

GLBEN	Meaning
0b0	CTI mapping functions and application trigger disabled.
0b1	CTI mapping functions and application trigger enabled.

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it is disabled. All output triggers are disabled by CTI reset. CONstrained UNpredictable which of the following occurs:

- The output trigger remains asserted after the mapping functions are disabled.
- The output trigger is deasserted after the mapping functions are disabled.

All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behaviour of this field is:

- On an External debug reset, this field resets to 0.

Accessing CTICONTROL

CTICONTROL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x000	CTICONTROL

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF1 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then [CTIDEVAFF0](#) must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF1 is a 32-bit register.

Field descriptions

MPIDR_EL1hi, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIDEVAFF1

CTIDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFAC	CTIDEVAFF1

Accesses on this interface are **RO**.

(new)

CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the CTI component.

Configuration

CTIDEVARCH is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is not implemented, [CTIDEVAFF0](#) and [CTIDEVAFF1](#) are also not implemented.

Attributes

CTIDEVARCH is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARCHITECT											PRESENT	REVISION				ARCHID															

ARCHITECT, bits [31:21]

Defines the architecture of the component. For CTI, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is **RO**.

PRESENT, bit [20]

Indicates ~~When set to 1, indicates~~ that the DEVARCH is present.

Reads ~~This as~~ ~~field is 1 in Armv8.~~ 0b1.

Access to this field is **RO**.

REVISION, bits [19:16]

When FEAT_DoPD is implemented:

Revision.

Defines the architecture revision of the component.

REVISION	Meaning	
0b0000	First revision.	
0b0001	As 0b0000, and also adds support for CTIDEVCTL.	

REVISION	Meaning	Applies when
0b0000	First revision.	
0b0001	As 0b0000, and also adds support for CTIDEVCTL.	When FEAT_DoPD is implemented

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Revision.

Defines the architecture revision of the component.

All other values are reserved.

Reads as 0b0000.

Access to this field is **RO**.

ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, 0x1.
- Bits [11:0] are the architecture part number, 0xA14.

This corresponds to CTI architecture version CTIv2.

Reads as 0x1A14.

Access to this field is **RO**.

Accessing CTIDEVARCH

CTIDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFBC	CTIDEVARCH

Accesses on this interface are **RO**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

- 0b000101 5 channels (0..4) implemented.
- 0b000110 6 channels (0..5) implemented.

and so on up to 0b100000, 32 channels (0..31) implemented.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [15:14]

Reserved, RES0.

NUMTRIG, bits [13:8]

Number of triggers implemented. This is one more than the index of the largest trigger, rather than the actual number of triggers. For Armv8, valid values are:

Number of triggers implemented. IMPLEMENTATION DEFINED. This is one more than the index of the largest trigger, rather than the actual number of triggers.

For Armv8, valid values are:

NUMTRIG	Meaning
0b000011	Up to 3 triggers (0..2) implemented.
0b001000	Up to 8 triggers (0..7) implemented.
0b001001	Up to 9 triggers (0..8) implemented.
0b001010	Up to 10 triggers (0..9) implemented.

- 0b000011 Up to 3 triggers (0..2) implemented.
- 0b001000 Up to 8 triggers (0..7) implemented.
- 0b001001 Up to 9 triggers (0..8) implemented.
- 0b001010 Up to 10 triggers (0..9) implemented.

and so on up to 0b100000, 32 triggers (0..31) implemented.

All other values are reserved. If the PE contains a Trace extension, this field must be at least 0b001000. There is no guarantee that any of the implemented triggers, including the highest numbered, are connected to any components.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [7:5]

Reserved, RES0.

EXTMUXNUM, bits [4:0]

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, [ASICCTL](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIDEVID

CTIDEVID can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC8	CTIDEVID

Accesses on this interface are **RO**.

30/06/2021 1509:2239: 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PEs cross-trigger interface.

Configuration

CTIDEVTYPE is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIDEVTYPE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SUB			MAJOR				

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Subtype. Must read as 0x1 to indicate this is a component within a PE.

Reads as 0b0001.

Access to this field is RO.

MAJOR, bits [3:0]

Major type. Indicates this is a cross-trigger component.

Major type. Must read as 0x4 to indicate this is a cross-trigger component.

Reads as 0b0100.

Access to this field is RO.

Accessing CTIDEVTYPE

CTIDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFCC	CTIDEVTYPE

Accesses on this interface are **RO**.

DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>_EL1](#).

Configuration

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGBCR<n>_EL1\[31:0\]](#).

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBCR<n>\[31:0\]](#).

DBGBCR<n>_EL1 is in the Core power domain.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBCR<n>_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								BT				LBN				SSC		HMC	RES0				BAS			RES0	PMC	E			

When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

BT	Meaning
0b0000	Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.
0b0001	As 0b0000 but linked to a Context matching breakpoint.
0b0010	Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value.
0b0011	As 0b0010, with linking enabled.
0b0100	Unlinked instruction address mismatch. DBGBVR<n>_EL1 is the address of an instruction to be stepped.
0b0101	As 0b0100, with linking enabled.
0b0110	Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1 .
0b0111	As 0b0110, with linking enabled.
0b1000	Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID .
0b1001	As 0b1000, with linking enabled.
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1 , and DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID .
0b1011	As 0b1010, with linking enabled.
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBVR<n>_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2 .
0b1101	As 0b1100, with linking enabled.
0b1110	Unlinked Full Context ID match. DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1 , and DBGBVR<n>_EL1.ContextID2 is compared against CONTEXTIDR_EL2 .
0b1111	As 0b1110, with linking enabled.

Constraints on breakpoint programming mean some values are reserved under certain conditions.

For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved DBGBCR<n>_EL1.BT values'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>_EL1.E is 0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values'.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see [DBGBCR<n>_EL1](#).SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When AArch32 is supported at **EL0any Exception level**:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions

All other values are reserved.

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint
0b0011	DBGBVR<n>_EL1	Use for stepping T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for stepping T32 instructions
0b1111	DBGBVR<n>_EL1	Use for stepping A64 and A32 instructions

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the [DBGBCR<n>_EL1.SSC](#) description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint [DBGVCR<n>_EL1](#). Possible values are:

E	Meaning
0b0	Breakpoint disabled.
0b1	Breakpoint enabled.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGBCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x408 + (16 * n)	DBGBCR<n>_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

EDAA32PFR, External Debug Auxiliary Processor Feature Register

The EDAA32PFR characteristics are:

Purpose

Provides information about implemented PE features.

Note

The register mnemonic, EDAA32PFR, is derived from previous definitions of this register that defined this register only when AArch64 was not supported.supported at any Exception level.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

It is IMPLEMENTATION DEFINED whether EDAA32PFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDAA32PFR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																																			
RES0																MSA_frac				EL3				EL2				PMSA				VMSA			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Bits [63:20]

Reserved, RES0.

MSA_frac, bits [19:16]

When EDAA32PFR.PMSA == 0b0000 and EDAA32PFR.VMSA == 0b1111:

Memory System Architecture fractional field. This holds the information on additional Memory System Architectures supported. Defined values are:

MSA_frac	Meaning
0b0001	PMSAv8-64 supported in all translation regimes. VMSAv8-64 not supported.
0b0010	PMSAv8-64 supported in all translation regimes. In addition to PMSAv8-64, stage 1 EL1&0 translation regime also supports VMSAv8-64.

All other values are reserved.

Otherwise:

Reserved, RES0.

EL3, bits [15:12]

When **EDPFR.EL3** == **0b0000**:

AArch32 EL3 Exception level handling. Defined values are:

EL3	Meaning
0b0000	EL3 is not implemented or can be executed in AArch64 state.
0b0001	EL3 can be executed in AArch32 state only.

All other values are reserved.

Note

[EDPFR](#).{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Otherwise:

Reserved, RAZ.

EL2, bits [11:8]

When **EDPFR.EL2** == **0b0000**:

AArch32 EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented or can be executed in AArch64 state.
0b0001	EL2 can be executed in AArch32 state only.

All other values are reserved.

Note

[EDPFR](#).{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Otherwise:

Reserved, RAZ.

PMSA, bits [7:4]

Indicates support for a 32-bit PMSA. Defined values are:

PMSA	Meaning
0b0000	PMSA-32 not supported.
0b0100	PMSAv8-32 supported.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the external debug component.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVARCH is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARCHITECT											PRESENT	REVISION				ARCHVER				ARCHPART											

ARCHITECT, bits [31:21]

Defines the architecture of the component. For debug, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is **RO**.

PRESENT, bit [20]

IndicatesWhen set to 1, indicates that the DEVARCH is present.

ReadsThis asfield is 1 in Armv8. 0b1.

Access to this field is **RO**.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For debug, the revision defined by Armv8-A is 0x0.

All other values are reserved.

Reads as 0b0000.

Access to this field is **RO**.

ARCHVER, bits [15:12]

Defines the architecture version of the component. This is the same value as [ID_AA64DFR0_EL1](#).DebugVer and [DBGDIDR](#).Version. The defined values of this field are:

ARCHVER	Meaning
0b0110	Armv8.0 Debug architecture.
0b0111	Armv8.0 Debug architecture with Virtualization Host Extensions.
0b1000	Armv8.2 Debug architecture.
0b1001	Armv8.4 Debug architecture.

FEAT_Debugv8p4 adds the functionality indicated by the value 0b1001. FEAT_Debugv8p2 adds the functionality indicated by the value 0b1000. If FEAT_VHE is not implemented, the only permitted value is 0b0110.

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHVER is ARCHID[15:12].

ARCHPART, bits [11:0]

ARCHPART	Meaning
0xA15	The part number of the Armv8-A debug component.

The part number of the Armv8-A debug component.

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHPART is ARCHID[11:0].

Reads as 0xA15.

Access to this field is **RO**.

Accessing EDDEVARCH

EDDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFBC	EDDEVARCH

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 1509:2139; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

EDDEVTYPE, External Debug Device Type register

The EDDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PEs debug logic.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVTYPE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SUB			MAJOR				

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

~~Subtype. Must read as 0x1 to indicate this is a component within a PE.~~

Reads as 0b0001.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type. Indicates this is a debug logic component.

~~Major type. Must read as 0x5 to indicate this is a debug logic component.~~

Reads as 0b0101.

Access to this field is **RO**.

Accessing EDDEVTYPE

EDDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFCC	EDDEVTYPE

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

EDDFR, External Debug Feature Register

The EDDFR characteristics are:

Purpose

Provides top level information about the debug system.

Note

Debuggers must use [EDDEVARCH](#) to determine the Debug architecture version.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

It is IMPLEMENTATION DEFINED whether EDDFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDDFR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																				TraceFilt				UNKNOWN							
CTX_CMPs				RES0				WRPs				RES0				BRPs				PMUVer				TraceVer				UNKNOWN			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:44]

Reserved, RES0.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension is not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension is implemented.

All other values are reserved.

FEAT_TRF implements the functionality added by 0b0001.

From Armv8.4, the permitted values are 0b0000 and 0b0001.

Bits [39:32]

Reserved, UNKNOWN.

CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

In an Armv8-A implementation that supports AArch64 ~~state in at least one Exception level~~, this field returns the value of [ID_AA64DFR0_EL1](#).CTX_CMPs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

In an Armv8-A implementation that supports AArch64 ~~state in at least one Exception level~~, this field returns the value of [ID_AA64DFR0_EL1](#).WRPs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

In an Armv8-A implementation that supports AArch64 ~~state in at least one Exception level~~, this field returns the value of [ID_AA64DFR0_EL1](#).BRPs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and also includes support for: <ul style="list-style-type: none"> Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. If EL2 is implemented, the MDCR_EL2.HPMD control bit.
0b0101	PMUv3 for Armv8.4. As 0b0100, and also includes support for the PMMIR_EL1 register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and also includes support for: <ul style="list-style-type: none"> 64-bit event counters. If EL2 is implemented, the MDCR_EL2.HCCD control bit. If EL3 is implemented, the MDCR_EL3.SCCD control bit.
0b0111	PMUv3 for Armv8.7. As 0b0110, and also includes support for: <ul style="list-style-type: none"> The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO control bits. If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} control bits.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.

FEAT_PMUv3p1 implements the functionality identified by the value 0b00010b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b01000b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b01010b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b01100b0111.

From the Armv8.1, if **FEAT_PMUv3** is implemented, the value 0b01110b0001 is not permitted.

From Armv8.4, if **FEAT_PMUv3** is implemented, the value 0b0100 is implemented, the value 0b0001 is not permitted.

From Armv8.5, if **FEAT_PMUv3** is implemented, the value 0b0101 is implemented, the value 0b0100 is not permitted.

From Armv8.7, if **FEAT_PMUv3** is implemented, the value 0b0110 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if **FEAT_PMUv3** is implemented, the value 0b0110 is not permitted.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

TraceVer	Meaning
0b0000	PE trace unit System registers not implemented.
0b0001	PE trace unit System registers implemented.

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of [ID_AA64DFR0_EL1](#).TraceVer.

EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

Purpose

Controls Exception Catch debug events. For more information, see 'Summary of Exception Catch debug event control'.

Configuration

External register EDECCR bits [31:0] are architecturally mapped to AArch64 System register [OSECCR_EL1\[31:0\]](#).

External register EDECCR bits [31:0] are architecturally mapped to AArch32 System register [DBGOSECCR\[31:0\]](#).

EDECCR is in the Core power domain.

Attributes

EDECCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5
RES0									RLR2	RLR1	RLR0	RES0	RLE2	RLE1	RLE0	NSR3	NSR2	NSR1	NSR0	SR3	SR2	SR1	SR0	NSE3	NSE2	NSE1
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	
RTR3	RES0	RTE3	RES0						RLR2	RLR1	RLR0	RES0	RLE2	RLE1	RES0	NSR3	NSR2	NSR1	NSR0	SR3	SR2	SR1	SR0	NSE3	NSE2	

Controls exception catch on exception return to Root EL3 in conjunction with EDECCR.RTE3.

RTR3	Meaning
0b0	If EDECCR.RTE3 is 0, then Exception Catch debug events are disabled for Root EL3. If EDECCR.RTE3 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Root EL3.
0b1	If EDECCR.RTE3 is 0, then Exception Catch debug events are enabled for exception returns to Root EL3. If EDECCR.RTE3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Root EL3.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Bits [31:23]

RTR3, bit [31]

When FEAT_RME is implemented:

Reserved, RES0.

Bits [30:28]

Reserved, RES0.

RTE3, bit [27]**When FEAT_RME is implemented:**

Controls exception catch on exception entry to Root EL3. Also controls exception catch on exception return to Root EL3 in conjunction with EDECCR.RTR3.

RTE3	Meaning
0b0	If EDECCR.RTR3 is 0, then Exception Catch debug events are disabled for Root EL3. If EDECCR.RTR3 is 1, then Exception Catch debug events are enabled for exception returns to Root EL3.
0b1	If EDECCR.RTR3 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Root EL3. If EDECCR.RTR3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Root EL3.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [26:23]

Reserved, RES0.

RLR2, bit [22]**When FEAT_RME is implemented:**

Controls exception catch on exception return to Realm EL2 in conjunction with EDECCR.RLE2.

RLR2	Meaning
0b0	If EDECCR.RLE2 is 0, then Exception Catch debug events are disabled for Realm EL2. If EDECCR.RLE2 is 1, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL2.
0b1	If EDECCR.RLE2 is 0, then Exception Catch debug events are enabled for exception returns to Realm EL2. If EDECCR.RLE2 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL2.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RLR1, bit [21]**When FEAT_RME is implemented:**

Controls exception catch on exception return to Realm EL1 in conjunction with EDECCR.RLE1.

RLR1	Meaning
0b0	If EDECCR.RLE1 is 0, then Exception Catch debug events are disabled for Realm EL1. If EDECCR.RLE1 is 1, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL1.
0b1	If EDECCR.RLE1 is 0, then Exception Catch debug events are enabled for exception returns to Realm EL1. If EDECCR.RLE1 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RLR0, bit [20]**When FEAT_RME is implemented:**

Controls exception catch on exception return to Realm EL0.

RLR0	Meaning
0b0	Exception Catch debug events are disabled for Realm EL0.
0b1	Exception Catch debug events are enabled for exception returns to Realm EL0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [19]

Reserved, RES0.

RLE2, bit [18]**When FEAT_RME is implemented:**

Controls exception catch on exception entry to Realm EL2. Also controls exception catch on exception return to Realm EL2 in conjunction with EDECCR.RLR2.

RLE2	Meaning
0b0	If EDECCR.RLR2 is 0, then Exception Catch debug events are disabled for Realm EL2. If EDECCR.RLR2 is 1, then Exception Catch debug events are enabled for exception returns to Realm EL2.
0b1	If EDECCR.RLR2 is 0, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL2. If EDECCR.RLR2 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL2.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RLE1, bit [17]

When FEAT_RME is implemented:

Controls exception catch on exception entry to Realm EL1. Also controls exception catch on exception return to Realm EL1 in conjunction with EDECCR.RLR1.

RLE1	Meaning
0b0	If EDECCR.RLR1 is 0, then Exception Catch debug events are disabled for Realm EL1. If EDECCR.RLR1 is 1, then Exception Catch debug events are enabled for exception returns to Realm EL1.
0b1	If EDECCR.RLR1 is 0, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL1. If EDECCR.RLR1 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RLE0, bit [16]

Access to this field is Reserved, RES0.

NSR3, bit [15]

Access to this field is RES0.

NSR2, bit [14]

When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:

Controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSE2.

NSR2	Meaning
0b0	If EDECCR.NSE2 is 0, then Exception Catch debug events are disabled for Non-secure EL2. If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2.
0b1	If EDECCR.NSE2 is 0, then Exception Catch debug events are enabled for exception returns to Non-secure EL2. If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL2.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSR1, bit [13]

When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:

Controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSE1.

NSR1	Meaning
0b0	If EDECCR.NSE1 is 0, then Exception Catch debug events are disabled for Non-secure EL1. If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1.
0b1	If EDECCR.NSE1 is 0, then Exception Catch debug events are enabled for exception returns to Non-secure EL1. If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSR0, bit [12]

When FEAT_Debugv8p2 is implemented and Non-secure EL0 is implemented:

Controls exception catch on exception return to Non-secure EL0.

NSR0	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL0.
0b1	Exception Catch debug events are enabled for exception returns to Non-secure EL0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR3, bit [11]

When ~~FEAT_RME is not implemented~~, FEAT_Debugv8p2 is implemented and EL3 is implemented:

Controls exception catch on exception return to EL3 in conjunction with EDECCR.SE3.

SR3	Meaning
0b0	If EDECCR.SE3 is 0, then Exception Catch debug events are disabled for EL3. If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3.
0b1	If EDECCR.SE3 is 0, then Exception Catch debug events are enabled for exception returns to EL3. If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR2, bit [10]

When FEAT_Debugv8p2 is implemented and FEAT_SEL2 is implemented:

Controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SE2.

SR2	Meaning
0b0	If EDECCR.SE2 is 0, then Exception Catch debug events are disabled for Secure EL2. If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2.
0b1	If EDECCR.SE2 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL2. If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR1, bit [9]

When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

Controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SE1.

SR1	Meaning
0b0	If EDECCR.SE1 is 0, then Exception Catch debug events are disabled for Secure EL1. If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1.
0b1	If EDECCR.SE1 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL1. If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR0, bit [8]

When FEAT_Debugv8p2 is implemented and Secure EL0 is implemented:

Controls exception catch on exception return to Secure EL0.

SR0	Meaning
0b0	Exception Catch debug events are disabled for Secure EL0.
0b1	Exception Catch debug events are enabled for exception returns to Secure EL0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSE3, bit [7]

Access to this field is **RES0**.

NSE2, bit [6]

When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:

Controls exception catch on exception entry to Non-secure EL2. Also controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSR2.

NSE2	Meaning
0b0	If EDECCR.NSR2 is 0, then Exception Catch debug events are disabled for Non-secure EL2. If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL2.
0b1	If EDECCR.NSR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2. If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL2.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

When Non-secure EL2 is implemented:

Coarse-grained exception catch for Non-secure EL2. Controls Exception Catch debug events for Non-secure EL2.

NSE2	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL2.
0b1	Exception Catch debug events are enabled for Non-secure EL2.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSE1, bit [5]

When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:

Controls exception catch on exception entry to Non-secure EL1. Also controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSR1.

NSE1	Meaning
0b0	If EDECCR.NSR1 is 0, then Exception Catch debug events are disabled for Non-secure EL1. If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL1.
0b1	If EDECCR.NSR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1. If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

When Non-secure EL1 is implemented:

Coarse-grained exception catch for Non-secure EL1. Controls Exception Catch debug events for Non-secure EL1.

NSE1	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL1.
0b1	Exception Catch debug events are enabled for Non-secure EL1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSE0, bit [4]

Access to this field is **RES0**.

SE3, bit [3]

When **FEAT_RME is not implemented**, **FEAT_Debugv8p2 is implemented** and **EL3 is implemented**:

Controls exception catch on exception entry to EL3. Also controls exception catch on exception return to EL3 in conjunction with EDECCR.SR3.

SE3	Meaning
0b0	If EDECCR.SR3 is 0, then Exception Catch debug events are disabled for EL3. If EDECCR.SR3 is 1, then Exception Catch debug events are enabled for exception returns to EL3.
0b1	If EDECCR.SR3 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3. If EDECCR.SR3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

When **FEAT_Debugv8p2** **FEAT_RME** is not implemented and **EL3 is implemented**:

Coarse-grained exception catch for EL3. Controls Exception Catch debug events for EL3.

SE3	Meaning
0b0	Exception Catch debug events are disabled for EL3.
0b1	Exception Catch debug events are enabled for EL3.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SE2, bit [2]

When **FEAT_Debugv8p2 is implemented** and **FEAT_SEL2 is implemented**:

Controls exception catch on exception entry to Secure EL2. Also controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SR2.

SE2	Meaning
0b0	If EDECCR.SR2 is 0, then Exception Catch debug events are disabled for Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL2.
0b1	If EDECCR.SR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SE1, bit [1]

When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

Controls exception catch on exception entry to Secure EL1. Also controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SR1.

SE1	Meaning
0b0	If EDECCR.SR1 is 0, then Exception Catch debug events are disabled for Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL1.
0b1	If EDECCR.SR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

When Secure EL1 is implemented:

Coarse-grained exception catch for Secure EL1. Controls Exception Catch debug events for Secure EL1.

SE1	Meaning
0b0	Exception Catch debug events are disabled for Secure EL1.
0b1	Exception Catch debug events are enabled for Secure EL1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SE0, bit [0]

Access to this field is **RES0**.

Accessing EDECCR

EDECCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x098	EDECCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

Purpose

Used in Debug state for passing instructions to the PE for execution.

Configuration

EDITR is in the Core power domain.

Attributes

EDITR is a 32-bit register.

Field descriptions

When AArch32 is supported at **EL0any Exception level** and in AArch32 state:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
T32Second																T32First															

T32Second, bits [31:16]

Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information, see 'Behavior in Debug state'.

T32First, bits [15:0]

First halfword of the T32 instruction to be executed on the PE.

When AArch64 is supported at **the highest implementedany** Exception level and in AArch64 state:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
A64 instruction to be executed on the PE																															

Bits [31:0]

A64 instruction to be executed on the PE.

Accessing EDITR

If [EDSCR.ITE](#) == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is **CONSTRAINED UNPREDICTABLE**, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

Purpose

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

It is IMPLEMENTATION DEFINED whether EDPFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDPFR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:60]

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

Bits [59:56]

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

Bits [55:52]

Reserved, RES0.

Bits [51:48]**From Armv8.4:**

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

Bits [43:40]**From Armv8.2:**

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

SEL2, bits [39:36]

Secure EL2. Defined values are:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

All other values are reserved.

SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

SVE	Meaning
0b0000	SVE is not implemented.
0b0001	SVE is implemented.

All other values are reserved.

Bits [31:28]
From Armv8.2:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

GIC, bits [27:24]

System register GIC interface support. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 **state in at least one Exception level**, this field returns the value of [ID_AA64PFR0_EL1](#).GIC.

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following Sisd and SIMD operations: <ul style="list-style-type: none"> Integer byte, halfword, word and doubleword element operations. Single-precision and double-precision floating-point arithmetic. Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support, that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support, that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

In an Armv8-A implementation that supports AArch64 **state in at least one Exception level**, this field returns the value of [ID_AA64PFR0_EL1](#).AdvSIMD.

FP, bits [19:16]

Floating-point. Defined values are:

FP	Meaning
0b0000	Floating-point is implemented, and includes support for: <ul style="list-style-type: none"> Single-precision and double-precision floating-point types. Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support, that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with floating-point support, that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without floating-point support.

In an Armv8-A implementation that supports AArch64 **state in at least one Exception level**, this field returns the value of [ID_AA64PFR0_EL1](#).FP.

EL3, bits [15:12]

AArch64 EL3 Exception level handling. Defined values are:

EL3	Meaning
0b0000	EL3 is not implemented or cannot be executed in AArch64 state.
0b0001	EL3 can be executed in AArch64 state only.
0b0010	EL3 can be executed in both Execution states.

When the value of [EDAA32PFR](#).EL3 is non-zero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 **state in at least one Exception level**, this field returns the value of [ID_AA64PFR0_EL1](#).EL3.

EL2, bits [11:8]

AArch64 EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented or cannot be executed in AArch64 state.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in both Execution states.

When the value of [EDAA32PFR](#).EL2 is non-zero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 **state in at least one Exception level**, this field returns the value of [ID_AA64PFR0_EL1](#).EL2.

EL1, bits [7:4]

AArch64 EL1 Exception level handling. Defined values are:

EL1	Meaning
0b0000	EL1 cannot be executed in AArch64 state. EL1 can be executed in AArch32 state only.
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 **state in at least one Exception level**, this field returns the value of [ID_AA64PFR0_EL1](#).EL1.

EL0, bits [3:0]

AArch64 EL0 Exception level handling. Defined values are:

EL0	Meaning
0b0000	EL0 cannot be executed in AArch64 state. EL0 can be executed in AArch32 state only.
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 **state in at least one Exception level**, this field returns the value of [ID_AA64PFR0_EL1](#).EL0.

Accessing EDPFR

EDPFR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD20	EDPFR	31:0

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

Component	Offset	Instance	Range
Debug	0xD24	EDPFR	63:32

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

EDPIDR0, External Debug Peripheral Identification Register 0

The EDPIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PART 0							

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR0

EDPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE0	EDPIDR0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

EDPIDR1, External Debug Peripheral Identification Register 1

The EDPIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								DES 0				PART 1			

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR1

EDPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE4	EDPIDR1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								REVISION		JEDEC	DES_1				

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

RA0. Indicates a JEP106 identity code is used.

Reads as 0b1.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR2

EDPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE8	EDPIDR2

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:09:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												REVAND				CMOD			

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using [EDPIDR2.REVISION](#) as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR3

EDPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFEC	EDPIDR3

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 1509:2139; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR4 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SIZE			DES 2				

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. ~~RAZ.~~ Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR4

EDPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFD0	EDPIDR4

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

Purpose

Holds information about the reset and powerdown state of the PE.

Configuration

EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT_DoPD is implemented then all fields in this register are in the Core power domain.

Attributes

EDPRSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3			
RES0															EPMAD ETAD ETADE STAD ETAD SDR SPMAD EPMAD SDAD EDAD DLK OSLK HALTED SP																

Bits [31:17]

Reserved, RES0.

EPMAD, bit [16]

When FEAT_RME is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Access Disable Extended Status. Together with EDPRSR.EPMAD, reports whether access to Performance Monitor registers by an external debugger is permitted.

For a description of the values derived by evaluating EPMAD and EPMAD together, see EDPRSR.EPMAD.

Otherwise:

Reserved, RES0.

ETADE, bit [15]

When FEAT_RME is implemented, external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable Extended Status. Together with EDPRSR.ETAD, reports whether access to PE Trace Unit registers by an external debugger is permitted.

For a description of the values derived by evaluating ETAD and ETAD together, see EDPRSR.ETAD.

Otherwise:

Reserved, RES0.

EDADE, bit [14]**When FEAT_RME is implemented:**

External Debug Access Disable Extended Status. Together with EDPRSR.EDAD, reports whether access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) by an external debugger is permitted.

For a description of the values derived by evaluating EDAD and EDADE together, see EDPRSR.EDAD.

Otherwise:

Reserved, RES0.

STAD, bit [13]**When external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:**

Sticky ETAD error. Set to 1 when a Non-secure external debug interface access to an external trace register returns an error because AllowExternalTraceAccess() == FALSE for the access.

STAD	Meaning
0b0	Since EDPRSR was last read, no external accesses to the PE Trace Unit registers have failed because AllowExternalTraceAccess() was FALSE for the access.
0b1	Since EDPRSR was last read, at least one external access to the PE Trace Unit registers has failed because AllowExternalTraceAccess() was FALSE for the access.

If IsCorePowered() == TRUE, the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE then this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE then it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This bit is in the Core power domain.

Note

If FEAT_DoPD is implemented, FEAT_DoubleLock is not implemented.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - DoubleLockStatus()
 - ~~(!IsFeatureImplemented(FEAT_DoPD~~ **is not implemented** ~~)~~ and !IsCorePowered())
 - ~~EDPRSR.Rext-EDPRSR.R~~ == ~~1~~
- Otherwise, access to this field is **RC/WI**.

Otherwise:

Reserved, RES0.

ETAD, bit [12]**When FEAT_RME is implemented, external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:**

External Trace Access Disable Status. Together with EDPRSR.ETADE, reports whether access to PE Trace Unit registers by an external debugger is permitted.

ETADE	ETAD	Meaning
0b0	0b0	Access to PE Trace Unit registers by an external debugger is permitted.
0b0	0b1	Root and Secure access to PE Trace Unit registers by an external debugger is permitted. Realm and Non-secure access to PE Trace Unit registers by an external debugger is not permitted.
0b1	0b0	Root and Realm access to PE Trace Unit registers by an external debugger is permitted. Secure and Non-secure access to PE Trace Unit registers by an external debugger is not permitted.
0b1	0b1	Root access to PE Trace Unit registers by an external debugger is permitted. Secure, Non-secure, and Realm access to PE Trace Unit registers by an external debugger is not permitted.

When external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable status.

ETAD	Meaning
0b0	External Non-secure PE Trace Unit accesses enabled. AllowExternalTraceAccess() == TRUE for a Non-secure access.
0b1	External Non-secure PE Trace Unit accesses disabled. AllowExternalTraceAccess() == FALSE for a Non-secure access.

This bit is in the Core power domain.

Note

If FEAT_DoPD is implemented, FEAT_DoubleLock is not implemented.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - DoubleLockStatus()
 - `(!IsFeatureImplemented(FEAT_DoPD is not implemented) and !IsCorePowered())`
 - `EDPRSR.Ext-EDPRSR.R == 1`
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

SDR, bit [11]

Sticky Debug Restart. Set to 1 when the PE exits Debug state.

Permitted values are:

SDR	Meaning
0b0	The PE has not restarted since EDPRSR was last read.
0b1	The PE has restarted since EDPRSR was last read.

Note

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is UNKNOWN on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If The Core power domain is powered up, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - `(!IsFeatureImplemented(FEAT_DoPD is not implemented))` and `!IsCorePowered()`
 - `DoubleLockStatus()`
 - `EDPRSR.Rext-EDPRSR.R == 1`
- When `SoftwareLockStatus()`, access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

SPMAD, bit [10]

When FEAT_Debugv8p4 is implemented:

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because `AllowExternalPMUAccess() == FALSE`.

Permitted values are:

SPMAD	Meaning
0b0	No Non-secure external debug interface accesses to the external Performance Monitors registers have failed because <code>AllowExternalPMUAccess() == FALSE</code> for the access since EDPRSR was last read.
0b1	At least one Non-secure external debug interface access to the external Performance Monitors register has failed and returned an error because <code>AllowExternalPMUAccess() == FALSE</code> for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - `(!IsFeatureImplemented(FEAT_DoPD is not implemented))` and `!IsCorePowered()`
 - `DoubleLockStatus()`
 - `EDPRSR.Rext-EDPRSR.R == 1`
- When `SoftwareLockStatus()`, access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

Otherwise:

Sticky EPMAD error.

SPMAD	Meaning
0b0	No external debug interface accesses to the Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.
0b1	At least one external debug interface access to the Performance Monitors registers has failed and returned an error because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - ~~(!IsFeatureImplemented~~(FEAT_DoPD **is not implemented**) and !IsCorePowered())
 - OSLockStatus()
 - DoubleLockStatus()
 - **EDPRSR.Rext-EDPRSR.R** == **1**
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

EPMAD, bit [9]

When FEAT_RME is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Access Disable Status. Together with EDPRSR.EPMADE, reports whether access to Performance Monitor registers by an external debugger is permitted.

EPMADE	EPMAD	Meaning
0b0	0b0	Access to Performance Monitor registers by an external debugger is permitted.
0b0	0b1	Root and Secure access to Performance Monitor registers by an external debugger is permitted. Realm and Non-secure access to Performance Monitor registers by an external debugger is not permitted.
0b1	0b0	Root and Realm access to Performance Monitor registers by an external debugger is permitted. Secure and Non-secure access to Performance Monitor registers by an external debugger is not permitted.
0b1	0b1	Root access to Performance Monitor registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Performance Monitor registers by an external debugger is not permitted.

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Non-secure Access Disable status.

EPMAAD	Meaning
0b0	External Non-secure Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE for a Non-secure access.
0b1	External Non-secure Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - ~~(!IsFeatureImplemented~~(FEAT_DoPD ~~is not implemented~~) and !IsCorePowered())
 - DoubleLockStatus()
 - ~~EDPRSR.Rext-EDPRSR.R~~ == ~~1~~!
- Otherwise, access to this field is **RO**.

When FEAT_PMUv3 is implemented:

External Performance Monitors access disable status.

EPMAAD	Meaning
0b0	External Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE.
0b1	External Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - ~~(!IsFeatureImplemented~~(FEAT_DoPD ~~is not implemented~~) and !IsCorePowered())
 - OSLockStatus()
 - DoubleLockStatus()
 - ~~EDPRSR.Rext-EDPRSR.R~~ == ~~1~~!
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

SDAD, bit [8]

When FEAT_Debugv8p4 is implemented:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

SDAD	Meaning
0b0	No Non-secure external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.
0b1	At least one Non-secure external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- UNKNOWN/WI** if any of the following are true:
 - `(!IsFeatureImplemented(FEAT_DoPD is not implemented))` and `!IsCorePowered()`
 - `DoubleLockStatus()`
 - `EDPRSR.Rext-EDPRSR.R == 1`
- Otherwise, access to this field is **RO**.

Otherwise:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because `AllowExternalDebugAccess() == FALSE`.

SDAD	Meaning
0b0	No external debug interface accesses to the debug registers have failed because <code>AllowExternalDebugAccess() == FALSE</code> since EDPRSR was last read.
0b1	At least one external debug interface access to the debug registers has failed and returned an error because <code>AllowExternalDebugAccess() == FALSE</code> since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If `FEAT_DoubleLock` is not implemented or `DoubleLockStatus() == FALSE` this bit clears to 0.
- If `FEAT_DoubleLock` is implemented and `DoubleLockStatus() == TRUE`, it is **CONSTRAINED UNPREDICTABLE** whether this bit clears to 0 or is unchanged.

This bit is **UNKNOWN** on reads if `OSLockStatus() == TRUE` and external debug writes to [OSLAR_EL1](#) do not return an error when `AllowExternalDebugAccess() == FALSE`.

This field is in the Core power domain.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- UNKNOWN/WI** if any of the following are true:
 - `(!IsFeatureImplemented(FEAT_DoPD is not implemented))` and `!IsCorePowered()`
 - `DoubleLockStatus()`
 - `EDPRSR.Rext-EDPRSR.R == 1`
- Otherwise, access to this field is **RO**.

EDAD, bit [7]

When FEAT_RME is implemented:

External Debug Access Disable Status. Together with `EDPRSR.EDADE`, reports whether access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) by an external debugger is permitted.

EDADE	EDAD	Meaning
0b0	0b0	Access to Debug registers by an external debugger is permitted.
0b0	0b1	Root and Secure access to Debug registers by an external debugger is permitted. Realm and Non-secure access to Debug registers by an external debugger is not permitted.
0b1	0b0	Root and Realm access to Debug registers by an external debugger is permitted. Secure and Non-secure access to Debug registers by an external debugger is not permitted.
0b1	0b1	Root access to Debug registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Debug registers by an external debugger is not permitted.

When FEAT_Debugv8p4 is implemented:

External Debug Access Disable status.

EDAD	Meaning
0b0	External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE for a Non-secure access.
0b1	External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - `(!IsFeatureImplemented(FEAT_DoPD is not implemented))` and `!IsCorePowered()`
 - `DoubleLockStatus()`
 - `EDPRSR.Rext-EDPRSR.R == 1`
- Otherwise, access to this field is **RO**.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable status.

EDAD	Meaning
0b0	External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE.
0b1	External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE.

This bit is not valid and reads UNKNOWN if `OSLockStatus() == TRUE` and external debug writes to [OSLAR_EL1](#) do not return an error when `AllowExternalDebugAccess() == FALSE`.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - `(!IsFeatureImplemented(FEAT_DoPD is not implemented))` and `!IsCorePowered()`
 - `DoubleLockStatus()`
 - `EDPRSR.Rext-EDPRSR.R == 1`
- Otherwise, access to this field is **RO**.

Otherwise:

External Debug Access Disable status.

EDAD	Meaning
0b0	External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE.
0b1	External access to breakpoint registers, watchpoint registers disabled. It is IMPLEMENTATION DEFINED whether accesses to OSLAR_EL1 are enabled or disabled. AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - `(!IsFeatureImplemented(FEAT_DoPD is not implemented))` and `!IsCorePowered()`
 - `DoubleLockStatus()`
 - `EDPRSR.Ext-EDPRSR.R == 1`
- Otherwise, access to this field is **RO**.

DLK, bit [6]

When FEAT_Debugv8p4 is implemented:

This field is RES0.

When FEAT_Debugv8p2 is implemented and FEAT_DoubleLock is implemented:

Double Lock.

From Armv8.2, this field is deprecated.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **RAZ/WI** if all of the following are true:
 - `IsCorePowered()`
 - `!DoubleLockStatus()`
- Otherwise, access to this field is **UNKNOWN/WI**.

When FEAT_DoubleLock is implemented:

Double Lock.

This field returns the result of the pseudocode function `DoubleLockStatus()`.

If the Core power domain is powered up and `DoubleLockStatus() == TRUE`, it is IMPLEMENTATION DEFINED whether:

- `EDPRSR.PU` reads as 1, `EDPRSR.DLK` reads as 1, and `EDPRSR.SPD` is UNKNOWN.
- `EDPRSR.PU` reads as 0, `EDPRSR.DLK` is UNKNOWN, and `EDPRSR.SPD` reads as 0.

This field is in the Core power domain.

DLK	Meaning
0b0	<code>DoubleLockStatus()</code> returns FALSE.
0b1	<code>DoubleLockStatus()</code> returns TRUE and the Core power domain is powered up.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:

- `!IsFeatureImplemented(FEAT_DoPD)` is not implemented
- `!IsCorePowered()`
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

OSLK, bit [5]

OS Lock status bit.

A read of this bit returns the value of `OSLSR_EL1.OSLK`.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - `!IsFeatureImplemented(FEAT_DoPD)` is not implemented and `!IsCorePowered()`
 - `DoubleLockStatus()`
 - `EDPRSR.Ext-EDPRSR.R == 1`
- Otherwise, access to this field is **RO**.

HALTED, bit [4]

Halted status bit.

HALTED	Meaning
0b0	PE is in Non-debug state.
0b1	PE is in Debug state.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - `!IsFeatureImplemented(FEAT_DoPD)` is not implemented
 - `!IsCorePowered()`
- Otherwise, access to this field is **RO**.

SR, bit [3]

Sticky core Reset status bit.

Permitted values are:

SR	Meaning
0b0	The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read.
0b1	The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read.

If `EDPRSR.PU` reads as 1 and `EDPRSR.R` reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of EDPRSR:

- If `FEAT_DoubleLock` is not implemented or `DoubleLockStatus() == FALSE` this bit clears to 0.
- If `FEAT_DoubleLock` is implemented and `DoubleLockStatus() == TRUE`, it is UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 1.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - `(!IsFeatureImplemented(FEAT_DoPD is not implemented))` and `!IsCorePowered()`
 - `DoubleLockStatus()`
- When `SoftwareLockStatus()`, access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

R, bit [2]

PE Reset status bit.

Permitted values are:

R	Meaning
0b0	The non-debug logic of the PE is not in reset state.
0b1	The non-debug logic of the PE is in reset state.

If `FEAT_DoubleLock` is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - `(!IsFeatureImplemented(FEAT_DoPD is not implemented))` and `!IsCorePowered()`
 - `DoubleLockStatus()`
- Otherwise, access to this field is **RO**.

SPD, bit [1]

Sticky core Powerdown status bit.

If `FEAT_DoubleLock` is implemented and `DoubleLockStatus() == TRUE`, then:

- If `FEAT_Debugv8p2` is implemented, this bit reads as 0.
- If `FEAT_Debugv8p2` is not implemented, this bit might read as 0 or 1.

For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

SPD	Meaning
0b0	If <code>EDPRSR.PU</code> is 0, it is not known whether the state of the debug registers in the Core power domain is lost. If <code>EDPRSR.PU</code> is 1, the state of the debug registers in the Core power domain has not been lost.
0b1	The state of the debug registers in the Core power domain has been lost.

If the Core power domain is powered up, then, following a read of `EDPRSR`:

- If `FEAT_DoubleLock` is not implemented or `DoubleLockStatus() == FALSE` this bit clears to 0.
- If `FEAT_DoubleLock` is implemented and `DoubleLockStatus() == TRUE`, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

When `FEAT_DoPD` is not implemented and the Core power domain is in either retention or powerdown state, the value of `EDPRSR.SPD` is IMPLEMENTATION DEFINED. For more information, see 'EDPRSR.SPD when the Core domain is in either retention or powerdown state'.

`EDPRSR.{DLK, SPD, PU}` describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

This field is in the Core power domain.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 1.

Accessing this field has the following behavior:

- **RAZ/WI** if all of the following are true:
 - ~~!IsFeatureImplemented~~(FEAT_DoPD **is not implemented**)
 - !IsCorePowered()
- **UNKNOWN/WI** if all of the following are true:
 - IsCorePowered()
 - DoubleLockStatus()
- Otherwise, access to this field is **RO**.

PU, bit [0]

When FEAT_DoPD is implemented:

Core powerup status bit.

Access to this field is **RAO/WI**.

When FEAT_Debugv8p2 is implemented:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

PU	Meaning
0b0	Either the Core power domain is in a low-power or powerdown state, or FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, meaning the debug registers in the Core power domain cannot be accessed.
0b1	The Core power domain is in a powerup state, and either FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, meaning the debug registers in the Core power domain can be accessed.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'

Access to this field is **RO**.

Otherwise:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

When the Core power domain is powered-up and DoubleLockStatus() == TRUE, then the value of EDPRSR.PU is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.

Otherwise, permitted values are:

PU	Meaning
0b0	Core power domain is in a low-power or powerdown state where the debug registers in the Core power domain cannot be accessed.
0b1	Core power domain is in a powerup state where the debug registers in the Core power domain can be accessed.

If FEAT_DoubleLock is implemented, the Core power domain is powered up, and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

Access to this field is **RO**.

Accessing EDPRSR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, then:
 - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
 - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If FEAT_DoPD is not implemented and the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

EDPRSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x314	EDPRSR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

External register EDSCR bits [30:29] are architecturally mapped to AArch64 System register [MDCCSR_EL0\[30:29\]](#).

EDSCR is in the Core power domain.

Attributes

EDSCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TFORXfull	TXfull	ITORXO	TXU	PipeAdv	ITE	INTdis	TDA	MASC2	NSRES0	SDD	NSEHDE	RW	EL	AERR	STATUS																

TFO, bit [31]

When FEAT_TRF is implemented:

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

TFO	Meaning
0b0	Trace Filter controls are not affected.
0b1	Trace Filter controls in TRFCR_EL1 and TRFCR_EL2 are ignored. Trace Filter controls TRFCR and HTRFCR are ignored.

When [OSLSR_EL1](#).OSLK == 1, this bit can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRext](#) System registers.

This bit is ignored by the PE when ExternalSecureNoninvasiveDebugEnabled() == FALSE and the Effective value of [MDCR_EL3](#).STE == 1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

DTRRX full.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

TXfull, bit [29]

DTRTX full.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

ITO, bit [28]

ITR overrun.

If the PE is in Non-debug state, this bit is UNKNOWN. ITO is set to 0 on entry to Debug state.

Access to this field is **RO**.

RXO, bit [27]

DTRRX overrun.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

TXU, bit [26]

DTRTX underrun.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

PipeAdv, bit [25]

Pipeline advance. Set to 1 every time the PE pipeline retires one or more instructions. Cleared to 0 by a write to [EDRCR.CSPA](#).

The architecture does not define precisely when this bit is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing.

Access to this field is **RO**.

ITE, bit [24]

ITR empty.

If the PE is in Non-debug state, this bit is UNKNOWN. It is always valid in Debug state.

Access to this field is **RO**.

INTdis, bits [23:22]

When **FEAT_RMEFEAT_Debugv8p4** is implemented:

Interrupt disable. Disables taking interrupts in Non-debug state.

INTdis	Meaning
0b00	This Masking bit of has interrupts nois effect controlled onby the PSTATE masking and of interrupt interrupts.routing controls.
0b01	If ExternalInvasiveDebugEnabled() is== TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is== TRUE, then all interrupts taken to Secure state are also masked. If ExternalRootInvasiveDebugEnabled() is TRUE, then all interrupts taken to Root state are masked. If ExternalRealmInvasiveDebugEnabled() is TRUE, then all interrupts taken to Realm state are masked.

When [OSLSR_EL1](#).OSLK == 1, this field can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRext](#) System registers.

This field has no effect when ExternalInvasiveDebugEnabled() == FALSE.

When FEAT_Debugv8p4 is implemented, bit[23] of the register is RES0.

Note

All interrupts includes virtual and SError interrupts.

When [OSLSR_EL1](#).OSLK is 1, this field can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRext](#) System registers.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_RME is implemented, bit[23] of this register is RES0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

When FEAT_Debugv8p4 is implemented:

Interrupt disable. Disables taking interrupts in Non-debug state.

INTdis	Meaning
0b00	Masking of interrupts is controlled by PSTATE and interrupt routing controls.
0b01	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked.

Note

All interrupts includes virtual and SError interrupts.

When [OSLSR_EL1](#).OSLK is 1, this field can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRext](#) System registers.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_Debugv8p4 is implemented, bit[23] of this register is RES0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Interrupt disable. Disables taking interrupts in Non-debug state.

INTdis	Meaning
0b00	Masking of interrupts is controlled by PSTATE and interrupt routing controls.
0b01	If ExternalInvasiveDebugEnabled() is == TRUE, then all interrupts taken to Non-secure EL1 are masked.
0b10	If ExternalInvasiveDebugEnabled() is == TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is == TRUE, then all interrupts taken to Secure EL1 are also masked.
0b11	If ExternalInvasiveDebugEnabled() is == TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is == TRUE, then all interrupts taken to Secure state are also masked.

When [OSLSR_EL1.OSLK](#) == 1, this field can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRext](#) System registers.

This field has no effect when ExternalInvasiveDebugEnabled() == FALSE.

Note

All interrupts includes virtual and SError interrupts.

When [OSLSR_EL1.OSLK](#) is 1, this field can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRext](#) System registers.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

Support for the values 0b01 and 0b10 is IMPLEMENTATION DEFINED. If these values are not supported, they are reserved. If programmed with a reserved value, the PE behaves as if INTdis has been programmed with a defined value, other than for a direct read of EDSCR, and the value returned by a read of EDSCR.INTdis is UNKNOWN.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

TDA, bit [21]

Traps accesses to the following debug System registers:

- AArch64: [DBGBCR<n>_EL1](#), [DBGBVR<n>_EL1](#), [DBGWCR<n>_EL1](#), [DBGWVR<n>_EL1](#).
- AArch32: [DBGBCR<n>](#), [DBGBVR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#).

The possible values of this field are:

TDA	Meaning
0b0	Accesses to debug System registers do not generate a Software Access Debug event.
0b1	Accesses to debug System registers generate a Software Access Debug event, if OSLSR_EL1.OSLK is 0 and if halting is allowed.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

MA, bit [20]

Memory access mode. Controls the use of memory-access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

MA	Meaning
0b0	Normal access mode.
0b1	Memory access mode.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and FEAT_PCSRv8p2 is not implemented:

Sample [CONTEXTIDR_EL2](#). Controls whether the PC Sample-based Profiling Extension samples [CONTEXTIDR_EL2](#) or [VTTBR_EL2](#).VMID.

SC2	Meaning
0b0	Sample VTTBR_EL2 .VMID.
0b1	Sample CONTEXTIDR_EL2 .

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NS, bit [18]

When FEAT_RME is implemented:

Non-secure status. Together with the NSE field, gives the current Security state:

NSE	NS	Meaning
0b0	0b0	Secure.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

In Non-debug state, this bit is UNKNOWN.

Access to this field is **RO**.

Otherwise:

Non-secure status. When in Debug state, gives the current Security state:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

In Non-debug state, this bit is UNKNOWN.

Access to this field is **RO**.

Bit [17]

Reserved, RES0.

SDD, bit [16]

When FEAT_RME is implemented:

Secure debug disabled.

Reports the inverse of ExternalRootInvasiveDebugEnabled().

Access to this field is **RO**.

Otherwise:

Secure debug disabled.

On entry to Debug state:

- If entering in Secure state, SDD is set to 0.
- If entering in Non-secure state, SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled().

In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

In Non-debug state:

- SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a context synchronization event is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

Access to this field is **RO**.

NSE, bit [15]

When FEAT_RME is implemented:

Together with the NS field, this field gives the current Security state.

For a description of the values derived by evaluating NS and NSE together, see EDSCR.NS.

In Non-debug state, this bit is UNKNOWN.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

HDE, bit [14]

Halting debug enable. The possible values of this field are:

HDE	Meaning
0b0	Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.
0b1	Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

RW, bits [13:10]

Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level.

RW	Meaning	Applies when
0b1111	AnyAll ofException levels are using AArch64 or the following: PE is in Non-debug state. <ul style="list-style-type: none"> The PE is in Non-debug state. The PE is at EL0 using AArch64. The PE is not at EL0, and EL1, EL2, and EL3 are using AArch64. 	
0b1110	The PE is in Debug statestate, at EL0. EL0 is using AArch32. EL1,All EL2, other andException EL3levels are using AArch64. Only permitted if the PE is executing at EL0.	When AArch32 is supported at EL0any Exception level
0b110x	The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 isand enabledEL3 inare theusing currentAArch64. SecurityOnly statepermitted andif EL2 is usingimplemented AArch64.and Ifenabled implemented,in EL3the iscurrent usingSecurity AArch64.state.	When AArch32 is supported at EL0any andException EL2 is implementedlevel
0b10xx	The PE is in Debug state. EL0, and EL1, areand, usingif AArch32. EL2 is not implemented, disabled in the current Security state, orEL2 are using AArch32. EL3 is using AArch64.	When AArch32 is supported at EL0any Exception level, EL3 is implemented, EL3 is using AArch64 and EL3EL2 is implemented
0b0xxx	The PE is in Debug state. All Exception levels are using AArch32.	When AArch32 is supported at EL0any Exception level

In Non-debug state, this field is RAO.

Access to this field is **RO**.

EL, bits [9:8]

Exception level. In Debug state, this gives the current Exception level of the PE.

In Non-debug state, this field is RAZ.

Access to this field is **RO**.

A, bit [7]

SError interrupt pending. In Debug state, indicates whether an SError interrupt is pending:

- If [HCR_EL2](#).{AMO, TGE} = {1, 0}, EL2 is enabled in the current Security state, and the PE is executing at EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

A	Meaning
0b0	No SError interrupt pending.
0b1	SErrror interrupt pending.

A debugger can read EDSCR to check whether an SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

UNKNOWN in Non-debug state.

Access to this field is **RO**.

ERR, bit [6]

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

STATUS, bits [5:0]

Debug status flags.

STATUS	Meaning
0b000001	PE is restarting, exiting Debug state.
0b000010	PE is in Non-debug state.
0b000111	Breakpoint.
0b010011	External debug request.
0b011011	Halting step, normal.
0b011111	Halting step, exclusive.
0b100011	OS Unlock Catch.
0b100111	Reset Catch.
0b101011	Watchpoint.
0b101111	HLT instruction.
0b110011	Software access to debug register.
0b110111	Exception Catch.
0b111011	Halting step, no syndrome.

All other values of STATUS are reserved.

Access to this field is **RO**.

Accessing EDSCR

EDSCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x088	EDSCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

Purpose

Contains sampled values captured on reading [EDPCSR](#)[31:0].

Configuration

EDVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDVIDSR are RES0.

If FEAT_VHE is implemented, the format of this register differs depending on the value of [EDSCR](#).SC2.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

When the PC Sample-based Profiling Extension is implemented in the external debug registers space, if EL2 is not implemented and EL3 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDVIDSR is a 32-bit register.

Field descriptions

When FEAT_VHE is not implemented or EDSCR.SC2 == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NS	E2	E3	HV	RES0												VMID[15:8]								VMID							

This format applies in all Armv8.0 implementations.

NS, bit [31]

Non-secure state sample. Indicates the Security state associated with the most recent [EDPCSR](#) sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E2, bit [30]**When EL2 is implemented:**

Exception level 2 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL2.

E2	Meaning
0b0	Sample is not from EL2.
0b1	Sample is from EL2.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [29]**When EL3 is implemented and AArch64 is supported at the highest implemented Exception level is using AArch64 state:**

Exception level 3 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL3 using AArch64.

E3	Meaning
0b0	Sample is not from EL3 using AArch64.
0b1	Sample is from EL3 using AArch64.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HV, bit [28]

EDPCSRhi ([EDPCSR](#)[63:32]) valid. Indicates whether bits [63:32] of the most recent [EDPCSR](#) sample might be nonzero:

HV	Meaning
0b0	Bits[63:32] of the most recent EDPCSR sample are zero.
0b1	Bits[63:32] of the most recent EDPCSR sample might be nonzero.

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi ([EDPCSR](#)[63:32]) does not need to be read.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [27:16]

Reserved, RES0.

VMID[15:8], bits [15:8]**When FEAT_VMID16 is implemented and EL2 is implemented:**

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]**When EL2 is implemented:**

VMID sample. The VMID associated with the most recent EDPCSRlo ([EDPCSR](#)[31:0]) sample. When the most recent [EDPCSR](#) sample was generated:

- This field is RES0 if any of the following apply:
 - The PE is executing in Secure state.
 - The PE is executing at EL2.
- Otherwise:
 - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or [VTCR_EL2](#).VS is 1, this field is set to [VTTBR_EL2](#).VMID.
 - If EL2 is using AArch64, FEAT_VMID16 is implemented, and [VTCR_EL2](#).VS is 0, PMVIDSR.VMID[7:0] is set to [VTTBR_EL2](#).VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
 - If EL2 is using AArch32, this field is set to [VTTBR](#).VMID.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and EDSCR.SC2 == 1:**CONTEXTIDR_EL2, bits [31:0]**

Context ID. The value of [CONTEXTIDR_EL2](#) that is associated with the most recent [EDPCSR](#) sample. When the most recent [EDPCSR](#) sample was generated:

- If EL2 was using AArch64 and the PE was executing in Non-secure state, then this field is set to the Context ID sampled from [CONTEXTIDR_EL2](#).
- If EL2 was using AArch32 or the PE was executing in Secure state, then this field is set to an UNKNOWN value.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

EDVIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A8	EDVIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

ERRDEVARCH, Device Architecture Register

The ERRDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

Configuration

ERRDEVARCH is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVARCH is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARCHITECT											PRESENT	REVISION				ARCHVER				ARCHPART											

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

ARCHITECT	Meaning
0b01000111011	JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

PRESENT, bit [20]

DEVARCH Present. Defines that the DEVARCH register is present.

PRESENT	Meaning
0b0	Device Architecture information not present.
0b1	Device Architecture information present.

This field reads as 1.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

REVISION	Meaning
0b0000	RAS System Architecture v1.0.
0b0001	RAS System Architecture v1.1. As 0b0000 and also: <ul style="list-style-type: none"> Simplifies ERR<n>STATUS. Adds support for additional ERR<n>MISC<m> registers. Adds support for the optional RAS Timestamp Extension. Adds support for the optional RAS Common Fault Injection Model Extension.

All other values are reserved.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0000	RAS System Architecture v1.

All other values are reserved.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0b0000.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA00	RAS System Architecture.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA00.

Accessing ERRDEVARCH

ERRDEVARCH can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFBC	ERRDEVARCH

Accesses on this interface are **RO**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

ERR<n>ADDR, Error Record Address Register, n = 0 - 65534

The ERR<n>ADDR characteristics are:

Purpose

If an address is associated with a detected error, then it is written to ERR<n>ADDR when the error is recorded. It is IMPLEMENTATION DEFINED how the recorded address maps to the software-visible physical address. Software might have to reconstruct the actual physical addresses using the identity of the node and knowledge of the system.

Configuration

This register is present only when error record <n> is implemented and error record <n> includes an address associated with an error. Otherwise, direct accesses to ERR<n>ADDR are RES0.

[ERR<q>ER](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

Attributes

ERR<n>ADDR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
NS	SI	AI	VA	NSE	RES0		PADDR																									
PADDR																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

NS, bit [63]
When FEAT_RME is implemented:

Non-secure attribute. With ERR<n>ADDR.NSE, indicates the physical address space of the recorded location.

NS	Meaning
0b0	When ERR<n>ADDR.NSE == 0: ERR<n>ADDR.PADDR is a Secure address. When ERR<n>ADDR.NSE == 1: ERR<n>ADDR.PADDR is a Root address.
0b1	When ERR<n>ADDR.NSE == 0: ERR<n>ADDR.PADDR is a Non-secure address. When ERR<n>ADDR.NSE == 1: ERR<n>ADDR.PADDR is a Realm address.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RME is not implemented:

Non-secure attribute.

NS	Meaning
0b0	ERR<n>ADDR.PADDR is a Secure address.
0b1	ERR<n>ADDR.PADDR is a Non-secure address.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SI, bit [62]

When FEAT_RME is implemented:

Secure Incorrect. Indicates whether ERR<n>ADDR.{NS, NSE} are valid.

SI	Meaning
0b0	ERR<n>ADDR.{NS, NSE} are correct. That is, they match the programmers' view of the physical address space for the recorded location.
0b1	ERR<n>ADDR.{NS, NSE} might not be correct, and might not match the programmers' view of the physical address space for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RME is not implemented:

Secure Incorrect. Indicates whether ERR<n>ADDR.NS is valid.

SI	Meaning
0b0	ERR<n>ADDR.NS is correct. That is, it matches the programmers' view of the Non-secure attribute for the recorded location.
0b1	ERR<n>ADDR.NS might not be correct, and might not match the programmers' view of the Non-secure attribute for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AI, bit [61]

Address Incorrect. Indicates whether ERR<n>ADDR.PADDR is a valid physical address that is known to match the programmers' view of the physical address for the recorded location.

AI	Meaning
0b0	ERR<n>ADDR.PADDR is a valid physical address. That is, it matches the programmers' view of the physical address for the recorded location.
0b1	ERR<n>ADDR.PADDR might not be a valid physical address, and might not match the programmers' view of the physical address for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

VA, bit [60]

Virtual Address. Indicates whether ERR<n>ADDR.PADDR field is a virtual address.

VA	Meaning
0b0	ERR<n>ADDR.PADDR is not a virtual address.
0b1	ERR<n>ADDR.PADDR is a virtual address.

No context information is provided for the virtual address. When ERR<n>ADDR.VA is 1, ERR<n>ADDR.{NS, SI, AI} read as {0, 1, 1}.

Support for this field is optional. If this field is not implemented and ERR<n>ADDR.PADDR field is a virtual address, then ERR<n>ADDR.{NS, SI, AI} read as {0, 1, 1}.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [59]

When FEAT_RME is implemented:

Physical Address Space. Together with ERR<n>ADDR.NS, indicates the address space for ERR<n>ADDR.PADDR.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [58:56]

Reserved, RES0.

PADDR, bits [55:0]

Physical Address. Address of the recorded location. If the physical address size implemented by this component is smaller than the size of this field, then high-order bits are unimplemented and either RES0 or have a fixed read-only IMPLEMENTATION DEFINED value. Low-order address bits might also be unimplemented and RES0, for example, if the physical address is always aligned to the size of a protection granule.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

(old)

htmldiff from-

ERR<n>FR, Error Record Feature Register, n = 0 - 65534

The ERR<n>FR characteristics are:

Purpose

Defines whether <n> is the first record owned by a node:

- If <n> is the first error record owned by a node, then ERR<n>FR.ED is not \neq 0b00.
- If <n> is not the first error record owned by a node, then ERR<n>FR.ED is $==$ 0b00.

If <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

Configuration

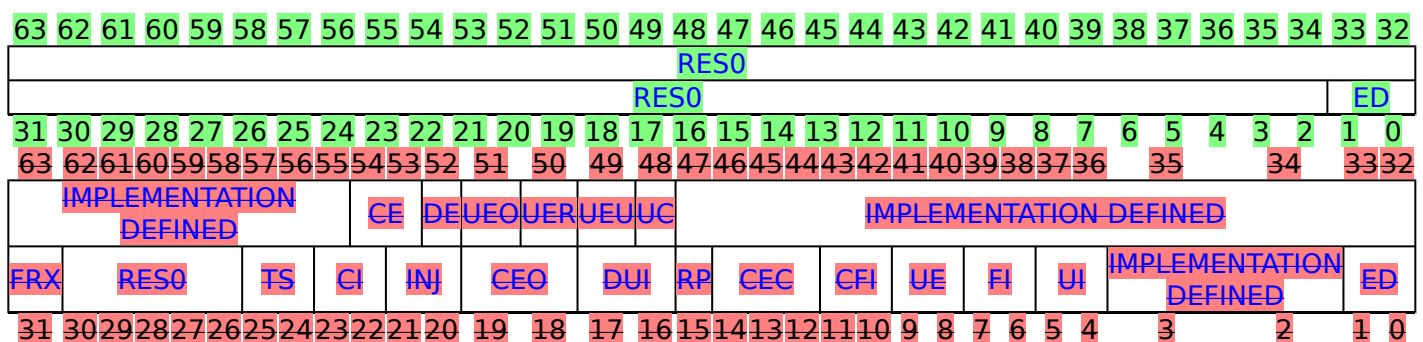

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.

Attributes

ERR<n>FR is a 64-bit register.

Field descriptions

When error record ERR<n>FR.ED is not the first error record owned by the node 0b00:

Bits [63:2]

Reserved, RES0.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is not the first error record owned the node.

ED	Meaning
0b00	Error record <n> is not the first error record owned by the node.

This field reads as 0b00.

When error record <n> is the first error record owned by the node:**IMPLEMENTATION DEFINED, bits [63:55]**

When ERR<n>FR.FRX != 1:

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

CE, bits [54:53]

When ERR<n>FR.FRX == 1:

Corrected Error recording. Describes the types of Corrected errors the node can record, if any.

CE	Meaning
0b00	Does not record any type of Corrected errors.
0b01	Records transient or persistent Corrected errors. That is, (Corrected errors that are recorded by setting as ERR<n>STATUS.CE to either == 0b01 or == 0b11.).
0b10	Records a non-specific Corrected error. That is, Corrected error that is recorded by setting as ERR<n>STATUS.CE to == 0b10.).
0b11	Records all types of Corrected error.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

DE, bit [52]

When ERR<n>FR.FRX == 1:

Deferred Error recording. Describes whether the node supports recording Deferred errors.

DE	Meaning
0b0	Does not record Deferred errors.
0b1	Records Deferred errors.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UEO, bit [51]

When ERR<n>FR.FRX == 1:

Latent or Restartable Error recording. Describes whether the node supports recording Latent or Restartable errors.

UEO	Meaning
0b0	DoesThe node does not record Latentthis or type Restartableof errors.error.
0b1	RecordsThe Latentnode orcan Restartablerecord errors.this type of error.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UER, bit [50]

When ERR<n>FR.FRX == 1:

Signaled or Recoverable Error recording. Describes whether the node supportscan recordingrecord Signaledthis or type Recoverableof errors.error.

UER	Meaning
0b0	DoesThe node does not record Signaledthis or type Recoverableof errors.error.
0b1	RecordsThe Signalednode orcan Recoverablerecord errors.this type of error.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UEU, bit [49]

When ERR<n>FR.FRX == 1:

Unrecoverable Error recording. Describes whether the node supportscan recordingrecord Unrecoverablethis errors.type of error.

UEU	Meaning
0b0	DoesThe node does not record Unrecoverablethis errors.type of error.
0b1	RecordsThe Unrecoverablenode errors.can record this type of error.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UC, bit [48]

When ERR<n>FR.FRX == 1:

Uncontainable Error recording. Describes whether the node supportscan recordingrecord Uncontainablethis errors.type of error.

UC	Meaning
0b0	DoesThe node does not record Uncontainablethis errors.type of error.
0b1	RecordsThe Uncontainablenode errors.can record this type of error.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

IMPLEMENTATION DEFINED, bits [47:32]

Reserved for identifying IMPLEMENTATION DEFINED controls.

FRX, bit [31]

When RAS System Architecture v1.1 is implemented:

Feature Register extension. Defines whether ERR<n>FR[63:48] are architecturally defined.

FRX	Meaning
0b0	ERR<n>FR[63:48] are IMPLEMENTATION DEFINED.
0b1	ERR<n>FR[63:48] are defined by the architecture.

Otherwise:

Reserved, RES0.

Bits [30:26]

Reserved, RES0.

TS, bits [25:24]

Timestamp Extension. Indicates whether, for each error record <m> owned by this node, [ERR<m>MISC3](#) is used as the timestamp register, and, if it is, the timebase used by the timestamp.

TS	Meaning
0b00	Does not support a timestamp register.
0b01	Implements a timestamp register. The timestamp uses the same timebase as the system Generic Timer. ERR<n>MISC3 for each error record <m> owned by the node. The timestamp uses the same timebase as the system Generic Timer.
Note For an error record that which has an affinity to a PE, this is the same timer that is visible through CNTPCT_ELO at the highest Exception level on that PE.	
0b10	Implements a timestamp register. The timebase for the timestamp is ERR<m>MISC3 for each error record <m> owned by the node. The timestamp uses an IMPLEMENTATION DEFINED timebase.

All other values are reserved.

CI, bits [23:22]

Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented by the node.

CI	Meaning
0b00	Does not support the critical error interrupt. ERR<n>CTL.R.CI is RES0.
0b01	Critical error interrupt is supported and always enabled. ERR<n>CTL.R.CI is RES0.
0b10	Critical error interrupt is supported and controllable using ERR<n>CTL.R.CI .

All other values are reserved.

INJ, bits [21:20]

Fault Injection Extension. Indicates whether the RAS Common Fault Injection Model Extension is implemented by the node.

INJ	Meaning
0b00	Does not support the RAS Common Fault Injection Model Extension.
0b01	Supports the RAS Common Fault Injection Model Extension. See ERR<n>PFGF for more information.

All other values are reserved.

CEO, bits [19:18]

When ERR<n>FR.CEC != 0b000:

Corrected Error overwrite. Indicates the behavior of the node when a second or subsequent Corrected error is recorded after a first Corrected error has previously been recorded by an error record <m> owned by the node.

CEO	Meaning
0b00	Counts Corrected errors if a counter is implemented. Keeps the previous error syndrome. If the counter overflows, or no counter is implemented, then ERR<m>STATUS.OF is set to 1.
0b01	Counts Corrected errors. If ERR<m>STATUS.OF is 1 before the Corrected error is counted, then the error record keeps the previous syndrome. Otherwise the previous syndrome is overwritten. If the counter overflows, then ERR<m>STATUS.OF is set to 1.

All other values are reserved.

The second or subsequent Corrected error is counted by the Corrected error counter, regardless of the value of this field. If counting the error causes unsigned overflow of the counter, then ERR<m>STATUS.OF is set to 1.

This means that, if no other error is subsequently recorded that overwrites the syndrome:

- If ERR<n>FR.CEO is 0b00, the error record holds the syndrome for the first recorded Corrected error.
- If ERR<n>FR.CEO is 0b01, the error record holds the syndrome for the most recently recorded Corrected error before the counter overflows.

Otherwise:

Reserved, RES0.

DUI, bits [17:16]

When ERR<n>FR.UI != 0b00:

Error recovery interrupt for deferred errors control. Indicates whether the enabling and disabling of error recovery interrupts on deferred errors are supported by the node.

DUI	Meaning
0b00	Does not support the enabling and disabling of error recovery interrupts on deferred errors. ERR<n>CTLR.DUI is RES0.
0b10	Enabling error recovery interrupts on deferred errors is supported and controllable using ERR<n>CTLR.DUI.
0b11	Enabling and disabling of error recovery interrupts on deferred errors is supported, and controllable using ERR<n>CTLR.WDUI for writes and ERR<n>CTLR.RDUI for reads.

All other values are reserved.

Otherwise:

Reserved, RES0.

RP, bit [15]**When ERR<n>FR.CEC != 0b000:**

Repeat counter. Indicates whether the node implements the second repeat Corrected error counter in ERR<m>MISC0 for each error record <m> owned by the node that can implement record the countable standard errors. Corrected error counter.

RP	Meaning
0b0	Implements a single Corrected CE error counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.
0b1	Implements a first (repeat) counter and a second (other) counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors. The repeat counter is the same size as the primary error counter.

Otherwise:

Reserved, RES0.

CEC, bits [14:12]

Corrected Error Counter. Indicates whether the node implements the standard Corrected error counter (CE counter) mechanisms in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.

CEC	Meaning
0b000	Does not implement the standard Corrected error counter model.
0b010	Implements an 8-bit Corrected error counter in ERR<m>MISC0[39:32] for each error record <m> owned by the node that can record countable errors.
0b100	Implements a 16-bit Corrected error counter in ERR<m>MISC0[47:32] for each error record <m> owned by the node that can record countable errors.

All other values are reserved.

Note

Implementations might include other error counter models, or might include the standard model and not indicate this in ERR<n>FR.

CFI, bits [11:10]**When ERR<n>FR.FI != 0b00:**

Fault handling interrupt for corrected errors control. Indicates whether the enabling control and for disabling enabling of fault handling interrupts on corrected errors is supported by the node implemented.

CFI	Meaning
0b00	Does not support the enabling control and for disabling of enabling fault handling interrupts on corrected errors. ERR<n>CTLR.CFI is RES0.
0b10	Enabling Control and for disabling of enabling fault handling interrupts on corrected errors is supported and controllable using ERR<n>CTLR.CFI.
0b11	Enabling Control and for disabling enabling of fault handling interrupts on corrected errors is supported, and controllable using ERR<n>CTLR.WCFI for writes and ERR<n>CTLR.RCFI for reads.

All other values are reserved.

Otherwise:

Reserved, RES0.

UE, bits [9:8]

In-band error ~~reponse response.~~ (External Abort). Indicates whether the in-band error response ~~(External Abort)~~ and associated controls are ~~implemented by the node.~~ ~~implemented.~~

UE	Meaning
0b00	Does not support the in-band error response response (External Abort). ERR<n>CTLR.UE is RES0.
0b01	In-band error response (External Abort) is supported and always enabled. ERR<n>CTLR.UE is RES0.
0b10	In-band error response (External Abort) is supported and controllable using ERR<n>CTLR.UE.
0b11	In-band error response (External Abort) is supported, and controllable using ERR<n>CTLR.WUE for writes and ERR<n>CTLR.RUE for reads.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

FI, bits [7:6]

Fault handling interrupt. Indicates whether the fault handling interrupt and associated controls are ~~implemented by the node.~~ ~~implemented.~~

FI	Meaning
0b00	Does not support the fault handling interrupt. ERR<n>CTLR.FI is RES0.
0b01	Fault handling interrupt is supported and always enabled. ERR<n>CTLR.FI is RES0.
0b10	Fault handling interrupt is supported and controllable using ERR<n>CTLR.FI.
0b11	Fault handling interrupt is supported, and controllable using ERR<n>CTLR.WFI for writes and ERR<n>CTLR.RFI for reads.

UI, bits [5:4]

Error recovery interrupt for uncorrected errors. Indicates whether the error handling interrupt and associated controls are ~~implemented by the node.~~ ~~implemented.~~

UI	Meaning
0b00	Does not support the error handling interrupt. ERR<n>CTLR .UI is RES0.
0b01	Error handling interrupt is supported and always enabled. ERR<n>CTLR .UI is RES0.
0b10	Error handling interrupt is supported and controllable using ERR<n>CTLR .UI.
0b11	Error handling interrupt is supported, and controllable using ERR<n>CTLR .WUI for writes and ERR<n>CTLR .RUI for reads.

IMPLEMENTATION DEFINED, bits [3:2]

IMPLEMENTATION DEFINED.

ED, bits [1:0]**When ERR<n>FR.ED == 0b00:****Bits [63:2]**

Reserved, RES0.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is not the first record owned the node.

ED	Meaning
0b00	Error record <n> is not the first record owned by the node.

This field reads as 0b00.

Error reporting and logging. Indicates whether error record <n> is the first record owned the node, and, if so, whether the node implements the controls for enabling and disabling error reporting and logging.

ED	Meaning
0b01	Error reporting and logging always enabled. ERR<n>CTLR .ED is RES0.
0b10	Error reporting and logging is controllable using ERR<n>CTLR .ED.

All other values are reserved.

Accessing ERR<n>FR**ERR<n>FR can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
RAS	0x000 + (64 * n)	ERR<n>FR

Accesses on this interface are **RO**.

ERR<n>MISC0, Error Record Miscellaneous Register 0, n = 0 - 65534

The ERR<n>MISC0 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record <n> implements architecturally-defined **Corrected** error counters ([ERR<q>FR.CEC](#) != 0b000), and error record <n> can record countable errors, then ERR<n>MISC0 implements the architecturally-defined **Corrected** error counter or counters.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC0 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC0, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>MISC0 is a 64-bit register.

Field descriptions

When ERR<q>FR.CEC == 0b000:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b100 and ERR<q>FR.RP == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
IMPLEMENTATION DEFINED																OF	CEC															
IMPLEMENTATION DEFINED																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OF, bit [47]

Sticky overflow bit. Set to 1 when ERR<n>MISC0.CEC is incremented and wraps through zero.

OF	Meaning
0b0	Counter has not overflowed.
0b1	Counter has overflowed.

A direct write that modifies this field might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [46:32]

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b010 and ERR<q>FR.RP == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
IMPLEMENTATION DEFINED																							OF	CEC									
IMPLEMENTATION DEFINED																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

IMPLEMENTATION DEFINED, bits [63:40]

IMPLEMENTATION DEFINED syndrome.

OF, bit [39]

Sticky overflow bit. Set to 1 when ERR<n>MISC0.CEC is incremented and wraps through zero.

OF	Meaning
0b0	Counter has not overflowed.
0b1	Counter has overflowed.

A direct write that modifies this field might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [38:32]

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b100 and ERR<q>FR.RP == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
OFO		CECO															OFR		CECR												
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

OFO, bit [63]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

OFO	Meaning
0b0	Other counter has not overflowed.
0b1	Other counter has overflowed.

A direct write that modifies this field might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [62:48]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [47]

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

OFR	Meaning
0b0	Repeat counter has not overflowed.
0b1	Repeat counter has overflowed.

A direct write that modifies this field might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [46:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b010 and ERR<q>FR.RP == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OFO, bit [47]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

OFO	Meaning
0b0	Other counter has not overflowed.
0b1	Other counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [46:40]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [39]

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

OFR	Meaning
0b0	Repeat counter has not overflowed.
0b1	Repeat counter has overflowed.

A direct write that modifies this field might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [38:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC0

Reads from ERR<n>MISC0 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and [ERR<q>PFGF.MV](#) is 1, then some parts of this register are read/write when [ERR<n>STATUS.MV](#) **is** 1. See [ERR<n>PFGF.MV](#) for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When [ERR<n>STATUS.MV](#) **is** 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x020 + (64 * n)	ERR<n>MISC0

Accesses on this interface are **RW**.

30/06/2021 1509:2240; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

ERR<n>MISC1, Error Record Miscellaneous Register 1, n = 0 - 65534

The ERR<n>MISC1 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC1 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC1, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>MISC1 is a 64-bit register.

Field descriptions

ERR<n>MISC2, Error Record Miscellaneous Register 2, n = 0 - 65534

The ERR<n>MISC2 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configuration

This register is present only when (an implementation implements ERR<n>MISC2 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC2 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC2, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<n>MISC2 does not require zeroing to return the record to a quiescent state.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>MISC2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ERR<n>MISC3, Error Record Miscellaneous Register 3, n = 0 - 65534

The ERR<n>MISC3 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record n supports the RAS Timestamp Extension ([ERR<q>FR.TS](#) != 0b00), then ERR<n>MISC3 contains the timestamp value for error record n when the error was detected. Otherwise the contents of ERR<n>MISC3 are IMPLEMENTATION DEFINED.

Configuration

This register is present only when (an implementation implements ERR<n>MISC3 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC3 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC3, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<n>MISC3 does not require zeroing to return the record to a quiescent state.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>MISC3 is a 64-bit register.

Field descriptions

When ERR<q>FR.TS != 0b00:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																TS															
																TS															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

TS, bits [63:0]

Timestamp. Timestamp value recorded when the error was detected. Valid only if [ERR<n>STATUS.V](#) == 1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO** or **RW**.

When ERR<q>FR.TS == 0b00:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																IMPLEMENTATION DEFINED															
																IMPLEMENTATION DEFINED															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC3

Reads from ERR<n>MISC3 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and [ERR<q>PFGF.MV](#) is 1, then some parts of this register are read/write when [ERR<n>STATUS.MV](#) **is==** 1. See [ERR<n>PFGF.MV](#) for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When [ERR<n>STATUS.MV](#) **is==** 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x038 + (64 * n)	ERR<n>MISC3

Accesses on this interface are **RW**.

ERR<n>PFGCDN, Pseudo-fault Generation Countdown Register, n = 0 - 65534

The ERR<n>PFGCDN characteristics are:

Purpose

Generates one of the errors enabled in the corresponding [ERR<n>PFGCTL](#) register.

Configuration

This register is present only when error record <n> is implemented, the node implements the **RAS** Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCDN are RES0.

[ERR<n>FR](#) describes the features implemented by the node.

Attributes

ERR<n>PFGCDN is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																CDN															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

CDN, bits [31:0]

Countdown value.

This field is copied to Error Generation Counter when either:

- Software writes [ERR<n>PFGCTL](#).CDNEN with 1.
- The Error Generation Counter decrements to zero and [ERR<n>PFGCTL](#).R == 1.

While [ERR<n>PFGCTL](#).CDNEN == 1 and the Error Generation Counter is nonzero, the counter decrements by 1 for each cycle at an IMPLEMENTATION DEFINED clock rate. When the counter reaches 0, one of the errors enabled in the [ERR<n>PFGCTL](#) register is generated.

Note

The current Error Generation Counter value is not visible to software.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

R	Meaning
0b0	On reaching zero, the Error Generation Counter will stop counting.
0b1	On reaching zero, the Error Generation Counter is set to ERR<n>PFGCDN.CDN.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:13]

Reserved, RES0.

Bit MV, bit [12]

When the node always supports sets this ERR<n>STATUS.MV to 0b1 when an injected error is recorded control:

MV	Meaning
0b0	ERR<n>STATUS.MV is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.MV is set to 1 when an injected error is recorded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When the node always records some syndrome in ERR<n>MISC<m>, setting ERR<n>STATUS.MV to 1, when an injected error is recorded, access to this field is **RAO/WI**.
- Otherwise, access to this field is **RW**.

Reserved, Miscellaneous RAO/WI syndrome. The value that is written to ERR<n>STATUS.MV when an injected error is recorded.

When the node supports this control:

Miscellaneous syndrome. The value written to ERR<n>STATUS.MV when an injected error is recorded.

MV	Meaning
0b0	ERR<n>STATUS.MV is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.MV is set to 1 when an injected error is recorded.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BitAV, bit [11]

When the node always supports sets this ERR<n>STATUS.AV to 0b1 when an injected error is recorded control:

AV	Meaning
0b0	ERR<n>STATUS.AV is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.AV is set to 1 when an injected error is recorded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When the node always sets ERR<n>STATUS.AV to 0b1 when an injected error is recorded, access to this field is **RAO/WI**.
- Otherwise, access to this field is **RW**.

Reserved, Address RAO/WI syndrome. The value that is written to ERR<n>STATUS.AV when an injected error is recorded.

When the node supports this control:

Address syndrome. The value written to ERR<n>STATUS.AV when an injected error is recorded.

AV	Meaning
0b0	ERR<n>STATUS.AV is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.AV is set to 1 when an injected error is recorded.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PN, bit [10]

When the node supports this control:

Poison flag. The value that is written to ERR<n>STATUS.PN when an injected error is recorded.

PN	Meaning
0b0	ERR<n>STATUS.PN is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.PN is set to 1 when an injected error is recorded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ER, bit [9]**When the node supports this control:**

Error Reported flag. The value ~~that is~~ written to [ERR<n>STATUS](#).ER when an injected error is recorded.

ER	Meaning
0b0	ERR<n>STATUS .ER is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS .ER is set to 1 when an injected error is recorded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CI, bit [8]**When the node supports this control:**

Critical Error flag. The value ~~that is~~ written to [ERR<n>STATUS](#).CI when an injected error is recorded.

CI	Meaning
0b0	ERR<n>STATUS .CI is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS .CI is set to 1 when an injected error is recorded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CE, bits [7:6]**When the node supports this control:**

Corrected Error generation enable. Controls the type of injected Corrected ~~error~~ ~~Error~~ generated condition by that ~~the might fault~~ be injection feature of the node generated.

CE	Meaning
0b00	An No injected error Corrected of error this type will not be generated by the fault injection feature of the node generated.
0b01	An A injected non-specific Corrected error Error , that is, generated a in Corrected the Error fault that injection is state, recorded as ERR<n>STATUS .CE is set to == 0b10, might be generated when the injected Error errorGeneration isCounter recorded, decrements to zero.
0b10	An A injected transient Corrected error Error , that is, generated a in Corrected the Error fault that injection is state, recorded as ERR<n>STATUS .CE is set to == 0b01, might be generated when the injected Error errorGeneration isCounter recorded, decrements to zero.
0b11	An A injected persistent Corrected error Error , that is, generated a in Corrected the Error fault that injection is state, recorded as ERR<n>STATUS .CE is set to == 0b11, might be generated when the injected Error errorGeneration isCounter recorded, decrements to zero.

The set of permitted values for this field is defined by [ERR<n>PFGF](#).CE.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DE, bit [5]

When the node supports this control:

Deferred Error generation enable. Controls whether an injected Deferred error is generated by the fault injection feature of the node.

Deferred Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

DE	Meaning
0b0	An No injectederror Deferredof errorthis type will not be generated by the fault generation feature of the node.generated.
0b1	An injectederror Deferredof errorthis istype might be generated inwhen the faultError injectionGeneration state.Counter decrements to zero.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEO, bit [4]

When the node supports this control:

Latent or Restartable Error generation enable. Controls whether an injected Latent or Restartable error is generated by the fault injection feature of the node.

Latent or Restartable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

UEO	Meaning
0b0	AnNo injectederror Latentof orthis Restartabletype error will not be generated by the fault generation feature of the node.generated.
0b1	An injectederror Latentof orthis Restartabletype errormight isbe generated inwhen the faultError injectionGeneration state.Counter decrements to zero.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UER, bit [3]

When the node supports this control:

Signaled or Recoverable Error generation enable. Controls whether an injected Signaled or Recoverable error is generated by the fault injection feature of the node.

Signaled or Recoverable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

UER	Meaning
0b0	An No injectederror Signaledof orthis Recoverabletype error will not be generated by the fault generation feature of the node.generated.
0b1	An injectederror Signaledof orthis Recoverabletype error might isbe generated inwhen the faultError injectionGeneration state.Counter decrements to zero.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEU, bit [2]

When the node supports this control:

Unrecoverable Error generation enable. Controls whether an injected Unrecoverable error is generated by the fault injection feature of the node.

Unrecoverable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

UEU	Meaning
0b0	AnNo injectederror Unrecoverableof errorthis type will not be generated by the fault generation feature of the node.generated.
0b1	An injectederror Unrecoverableof errorthis istype might be generated inwhen the faultError injectionGeneration state.Counter decrements to zero.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UC, bit [1]

When the node supports this control:

Uncontainable Error generation enable. Controls whether an injected Uncontainable error is generated by the fault injection feature of the node.

Uncontainable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

UC	Meaning
0b0	AnNo injectederror Uncontainableof errorthis type will not be generated by the fault generation feature of the node.generated.
0b1	An injectederror Uncontainableof errorthis istype might be generated inwhen the faultError injectionGeneration state.Counter decrements to zero.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OF, bit [0]

When the node supports this control:

Overflow flag. The value that is written to ERR<n>STATUS.OF when an injected error is recorded.

OF	Meaning
0b0	ERR<n>STATUS.OF is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.OF is set to 1 when an injected error is recorded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing ERR<n>PFGCTL

ERR<n>PFGCTL can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x808 + (64 * n)	ERR<n>PFGCTL

Accesses on this interface are **RW**.

(old)	htmldiff from-	(new)
-------	----------------	-------

(old)htmldiff from-(new)

ERR<n>PFGF, Pseudo-fault Generation Feature Register, n = 0 - 65534

The ERR<n>PFGF characteristics are:

Purpose

Defines which common architecturally-defined fault generation features are implemented.

Configuration

This register is present only when error record <n> is implemented, the node implements the RAS Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGF are RES0.

[ERR<n>FR](#) describes the features implemented by the node.

Attributes

ERR<n>PFGF is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																																
RES0	R	SYN	NA	RES0														MV	AV	PN	ER	CI	CE	DE	UE	O	UE	R	UE	U	C	OF
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:31]

Reserved, RES0.

R, bit [30]

Restartable. Support for Error Generation Counter restart mode.

R	Meaning
0b0	The node does not support this feature. ERR<n>PFGCTL.R is RES0.
0b1	Error Feature Generation Counter restart mode is implemented and is controlled by controllable . ERR<n>PFGCTL.R . ERR<n>PFGCTL.R is a read/write field.

SYN, bit [29]

Syndromes. Fault syndrome injection.

SYN	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS .{IERR, SERR} to IMPLEMENTATION DEFINED values. ERR<n>STATUS .{IERR, SERR} are UNKNOWN when ERR<n>STATUS .V is == 0.
0b1	When an injected error is recorded, the node does not update the ERR<n>STATUS .{IERR, SERR} fields. ERR<n>STATUS .{IERR, SERR} are writable when ERR<n>STATUS .V is == 0.

Note

If ERR<n>PFGF.SYN is == 1, software can write specific values into the [ERR<n>STATUS](#).{IERR, SERR} fields when setting up a fault injection event. The sets of values that can be written to these fields is IMPLEMENTATION DEFINED.

NA, bit [28]

No access required. Defines whether this component fakes detection of the error on an access to the component or spontaneously in the fault injection state.

NA	Meaning
0b0	The component fakes detection of the error on an access to the component.
0b1	The component fakes detection of the error spontaneously in the fault injection state.

Bits [27:13]

Reserved, RES0.

MV, bit [12]

Miscellaneous syndrome.

Additional syndrome injection. Defines whether software can control all or part of the syndrome recorded in the ERR<n>MISC<m> registers when an injected error is recorded.

It is IMPLEMENTATION DEFINED which syndrome fields in ERR<n>MISC<m> this refers to, as some fields might always be recorded by an error. For example, a Corrected Error counter.

MV	Meaning
0b0	When an injected error is recorded, the node might update ERR<n>MISC<m>. If any syndrome is recorded by the node in ERR<n>MISC<m>, then ERR<n>STATUS.MV is set to 1. When an injected error is recorded, the node might record IMPLEMENTATION DEFINED additional syndrome in ERR<n>MISC<m>. If any syndrome is recorded in ERR<n>MISC<m>, then ERR<n>STATUS.MV is set to 1. ERR<n>PFGCTL.MV is RES0.
0b1	When an injected error is recorded, the node might does not update some, all but the not syndrome all fields in the ERR<n>MISC<m> syndrome and fields, does and one updates of: ERR<n>STATUS.MV as follows: <ul style="list-style-type: none"> If The any node syndrome does is not recorded update by any the fields node in ERR<n>MISC<m>, > then and sets ERR<n>STATUS.MV is set to 1. ERR<n>PFGCTL.MV. Otherwise, The node records some syndrome in ERR<n>MISC<m> and sets ERR<n>STATUS.MV is set to 1. ERR<n>PFGCTL.MV. MV is RAO/WI. It The is syndrome fields that the node does not update are unchanged and are writable when IMPLEMENTATION DEFINED which ERR<n>MISC<m> syndrome fields, if any, are updated. Some syndrome fields might always be updated by the node when an error is recorded. For example, a corrected error counter might always be updated when any countable error, including a countable injected error, is recorded. Other ERR<n>MISC<m> syndrome fields are not updated by the node and are writable when ERR<n>STATUS.MV is == 0. If the node always sets ERR<n>STATUS.MV to 1 when recording an injected error then ERR<n>PFGCTL.MV is RAO/WI, otherwise ERR<n>PFGCTL.MV is a read/write field.

Note

If ERR<n>PFGF.MV is == 1, software can write specific additional syndrome values into the ERR<n>MISC<m> registers when setting up a fault injection event. The values that can be written to these registers are IMPLEMENTATION DEFINED.

AV, bit [11]

Address syndrome. Address syndrome injection.

AV	Meaning
0b0	When an injected error is recorded, the node either sets ERR<n>ADDR and ERR<n>STATUS.AV for the access, or leaves these unchanged. ERR<n>PFGCTL.AV is RES0.
0b1	When an injected error is recorded, the node does not update ERR<n>ADDR and does one of: <ul style="list-style-type: none"> Sets ERR<n>STATUS.AV to ERR<n>PFGCTL.AV. ERR<n>PFGCTL.AV is a read/write field. Sets ERR<n>STATUS.AV to 1. ERR<n>PFGCTL.AV is RAO/WI. ERR<n>ADDR is writable when ERR<n>STATUS.AV is == 0.

Note

If ERR<n>PFGF.AV is == 1, software can write a specific address value into ERR<n>ADDR when setting up a fault injection event.

PN, bit [10]

When the node supports this flag:

Poison flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.PN status flag.

PN	Meaning
0b0	When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.PN to 1. ERR<n>PFGCTL.PN is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.PN is set to ERR<n>PFGCTL.PN . ERR<n>PFGCTL.PN is a read/write field.

This behavior replaces the architecture-defined rules for setting the ~~PN bit~~, [ERR<n>STATUS.PN bit](#).

Otherwise:

Reserved, RAZ.

ER, bit [9]

When the node supports this flag:

Error Reported flag. Describes how the fault generation feature of the node sets the [ERR<n>STATUS.ER](#) status flag.

ER	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS.ER according to the architecture-defined rules for setting the ER field. ERR<n>PFGCTL.ER is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.ER is set to ERR<n>PFGCTL.ER . This behavior replaces the architecture-defined rules for setting the ER bit. ERR<n>PFGCTL.ER is a read/write field.

Otherwise:

Reserved, RAZ.

CI, bit [8]

When the node supports this flag:

Critical Error flag. Describes how the fault generation feature of the node sets the [ERR<n>STATUS.CI](#) status flag.

CI	Meaning
0b0	When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.CI to 1. ERR<n>PFGCTL.CI is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.CI is set to ERR<n>PFGCTL.CI . ERR<n>PFGCTL.CI is a read/write field.

This behavior replaces the architecture-defined rules for setting the ~~CI bit~~, [ERR<n>STATUS.CI bit](#).

Otherwise:

Reserved, RAZ.

CE, bits [7:6]

When the node supports this type of error:

Corrected Error generation. Describes the types of Corrected ~~error~~Error that the fault generation feature of the node can generate.

CE	Meaning
0b00	The fault generation feature of the node does cannot not generate Correctedthis errors.type of error. ERR<n>PFGCTL.CE is RES0.
0b01	The fault generation feature of the node allows generation of a non-specific Corrected errorError , that is, a Corrected errorError that is recorded by settingas ERR<n>STATUS.CE to== 0b10. ERR<n>PFGCTL.CE is a read/write field. The values 0b10 and 0b11 in ERR<n>PFGCTL.CE are reserved.
0b11	The fault generation feature of the node allows generation of transient or persistent Corrected errorsErrors , that is, Corrected errorsErrors that are recorded by settingas ERR<n>STATUS.CE to== 0b01 orand 0b11 respectively. ERR<n>PFGCTL.CE is a read/write field. The value 0b01 in ERR<n>PFGCTL.CE is reserved.

All other values are reserved.

If ERR<n>FR.FRX is 1, then ERR<n>FR.CE indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

DE, bit [5]

When the node supports this type of error:

Deferred Error generation. Describes whether the fault generation feature of the node can generate ~~Deferredthis errors.type of error.~~

DE	Meaning
0b0	The fault generation feature of the node does cannot not generate Deferredthis errors.type of error. ERR<n>PFGCTL.DE is RES0.
0b1	The fault generation feature of the node allows generation of Deferredthis errors.type of error. ERR<n>PFGCTL.DE is a read/write field.

If ERR<n>FR.FRX is 1, then ERR<n>FR.DE indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UEO, bit [4]

When the node supports this type of error:

Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate ~~Latentthis ortype Restartableof errors.error.~~

UEO	Meaning
0b0	The fault generation feature of the node does cannot not generate Latentthis ortype Restartableof errors.error. ERR<n>PFGCTL.UEO is RES0.
0b1	The fault generation feature of the node allows generation of Latentthis ortype Restartableof errors.error. ERR<n>PFGCTL.UEO is a read/write field.

If ERR<n>FR.FRX is 1, then ERR<n>FR.UEO indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UER, bit [3]

When the node supports this type of error:

Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate **Signaledthis or type Recoverableof errors.error.**

UER	Meaning
0b0	The fault generation feature of the node doescannot not generate Signaledthis or type Recoverableof errors.error. ERR<n>PFGCTL.UER is RES0.
0b1	The fault generation feature of the node allows generation of Signaledthis or type Recoverableof errors.error. ERR<n>PFGCTL.UER is a read/write field.

If **ERR<n>FR.FRX** is 1, then **ERR<n>FR.UER** indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UEU, bit [2]

When the node supports this type of error:

Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate **Unrecoverablethis errors.type of error.**

UEU	Meaning
0b0	The fault generation feature of the node doescannot not generate Unrecoverablethis errors.type of error. ERR<n>PFGCTL.UEU is RES0.
0b1	The fault generation feature of the node allows generation of Unrecoverablethis errors.type of error. ERR<n>PFGCTL.UEU is a read/write field.

If **ERR<n>FR.FRX** is 1, then **ERR<n>FR.UEU** indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UC, bit [1]

When the node supports this type of error:

Uncontainable Error generation. Describes whether the fault generation feature of the node can generate **Uncontainablethis errors.type of error.**

UC	Meaning
0b0	The fault generation feature of the node doescannot not generate Uncontainablethis errors.type of error. ERR<n>PFGCTL.UC is RES0.
0b1	The fault generation feature of the node allows generation of Uncontainablethis errors.type of error. ERR<n>PFGCTL.UC is a read/write field.

If **ERR<n>FR.FRX** is 1, then **ERR<n>FR.UC** indicates whether the node supports this type of error.

(old)

htmldiff from-

(new)

ERR<n>STATUS, Error Record Primary Status Register, n = 0 - 65534

The ERR<n>STATUS characteristics are:

Purpose

Contains status information for error record <n>, including:

- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a Requester.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An IMPLEMENTATION DEFINED extended error code.

Within this register:

- ERR<n>STATUS.{AV, V, MV} are valid bits that define whether error record <n> registers are valid.
- ERR<n>STATUS.{UE, OF, CE, DE, UET} encode the types of error or errors recorded.
- ERR<n>STATUS.{CI, ER, PN, IERR, SERR} are syndrome fields.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>STATUS are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>STATUS, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>STATUS is a 64-bit register.

Field descriptions

When RAS System Architecture v1.1 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
AV	V	UE	ER	OF	MV	CE	DE	PN	UET	CI	RES0					IERR							SERR								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record <n> includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **W1C**.

UE, bit [29]

Uncorrected Error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

ER, bit [28]

Error Reported.

ER	Meaning
0b0	No in-band error response (External Abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: <ul style="list-style-type: none"> • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is implemented and was 1 when an error was detected and not corrected. • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is not implemented and the component always reports errors.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0.

Note

An in-band error response signaled by the component might be masked and not generate any exception.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - ~~ERRext-ERR~~ERR<n>STATUS.UE == 0
 - ~~ERRext-ERR~~ERR<n>STATUS.DE == 0
 - this field can be set to 0b1 by a Deferred error
- **UNKNOWN/WI** if all of the following are true:
 - ~~ERRext-ERR~~ERR<n>STATUS.UE == 0
 - this field is never set to 0b1 by a Deferred error
- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- A Corrected error counter is implemented, an error is counted, and the counter overflows.
- ERR<n>STATUS.V was previously 1, a Corrected error counter is not implemented, and a Corrected error is recorded.
- ERR<n>STATUS.V was previously 1, and a type of error other than a Corrected error is recorded.

Otherwise, this field is unchanged when an error is recorded.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.

- A direct write to this field that clears this field to zero might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
0b0	Since this field was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed.
0b1	Since this field was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

MV, bit [26]

When error record <n> includes an additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC<m> not valid.
0b1	The IMPLEMENTATION DEFINED contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

DE, bit [23]

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI** if any of the following are true:
 - ERRext-ERR<n>STATUS.V == 0
 - (ERRext-ERR<n>STATUS.DE == 0) and ERRext-ERR<n>STATUS.UE == 0
- Otherwise, access to this field is **W1C**.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

Note

Software might use the information in the error record registers to determine what recovery is necessary.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI** if any of the following are true:
 - ~~ERRext-ERR~~ERR<n>STATUS.V == 0
 - ~~ERRext-ERR~~ERR<n>STATUS.UE == 0
- Otherwise, access to this field is **W1C**.

CI, bit [19]

Critical Error. Indicates whether a critical error condition has been recorded.

CI	Meaning
0b0	No critical error condition.
0b1	Critical error condition.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

Bits [18:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI** if all of the following are true:
 - the ~~RAS~~ Common Fault Injection Model Extension is not implemented by the node that owns this error record

- ~~ERRext-ERR~~<n>STATUS.V == '0'
- **UNKNOWN/WI** if all of the following are true:
 - ~~ERRext-ERR~~<q>PFGF.SYN == '0'
 - ~~ERRext-ERR~~<n>STATUS.V == '0'
- Otherwise, access to this field is **RW**.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, nSEI pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.
0x11	Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another component.
0x14	Internal timeout. For example, timeout on interface within the component.
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.
0x1A	Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI** if all of the following are true:
 - the **RAS** Common Fault Injection Model Extension is not implemented by the node that owns this error record
 - ERR_{ext-ERR}<n>STATUS.V** == **0**
- UNKNOWN/WI** if all of the following are true:
 - ERR_{ext-ERR}<q>PFGF.SYN** == **0**
 - ERR_{ext-ERR}<n>STATUS.V** == **0**
- Otherwise, access to this field is **RW**.

When RAS System Architecture v1.0 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32			
RES0																																		
AV	V	UE	ER	OF	MV	CE	DE	PN	UET	RES0						IERR												SERR						
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record <n> includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- RO** if all of the following are true:
 - ERR_{ext-ERR}<n>STATUS.DE** == **0**
 - ERR_{ext-ERR}<n>STATUS.UE** == **0**
 - ERR_{ext-ERR}<n>STATUS.CE** != **0b00'00**
 - ERR<n>STATUS.CE** is not being cleared to 0b00 in the same write
- RO** if all of the following are true:
 - ERR_{ext-ERR}<n>STATUS.UE** == **0**
 - ERR_{ext-ERR}<n>STATUS.DE** != **0**
 - ERR<n>STATUS.DE** is not being cleared to 0b0 in the same write
- RO** if all of the following are true:
 - ERR_{ext-ERR}<n>STATUS.UE** != **0**
 - ERR<n>STATUS.UE** is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- RO** if all of the following are true:
 - ERR~~ext-ERR~~<n>STATUS.CE != 0b00'00'
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- RO** if all of the following are true:
 - ERR~~ext-ERR~~<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- RO** if all of the following are true:
 - ERR~~ext-ERR~~<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

UE, bit [29]

Uncorrected Error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- RO** if all of the following are true:
 - ERR~~ext-ERR~~<n>STATUS.OF == 1
 - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

ER, bit [28]

Error Reported.

ER	Meaning
0b0	No in-band error response (External Abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: <ul style="list-style-type: none"> The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is implemented and was 1 when an error was detected and not corrected. The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is not implemented and the component always reports errors.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0.

Note

An in-band error response signaled by the component might be masked and not generate any exception.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0, if this field is never set to 1 by a Deferred error.
- Clearing ERR<n>STATUS.{UE,DE} to {0,0}, if this field can be set to 1 by a Deferred error.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - ~~ERRext-ERR~~ERR<n>STATUS.UE == 0
 - ~~ERRext-ERR~~ERR<n>STATUS.DE == 0
 - this field can be set to 0b1 by a Deferred error
- **UNKNOWN/WI** if all of the following are true:
 - ~~ERRext-ERR~~ERR<n>STATUS.UE == 0
 - this field is never set to 0b1 by a Deferred error
- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
 - ~~ERRext-ERR~~ERR<n>STATUS.DE == 0
 - ~~ERRext-ERR~~ERR<n>STATUS.UE == 0
 - ~~ERRext-ERR~~ERR<n>STATUS.CE != 0b00'00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ~~ERRext-ERR~~ERR<n>STATUS.UE == 0
 - ~~ERRext-ERR~~ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ~~ERRext-ERR~~ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 1.
- A Deferred error is detected, ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE != 0b00. ERR<n>STATUS.CE might be updated for the new Corrected error.
- A Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is set to 1 when one of the following occurs:

- A Deferred error is detected and ERR<n>STATUS.UE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, and ERR<n>STATUS.{UE, DE} != {0, 0}.
- A Corrected error counter is implemented, ERR<n>STATUS.{UE, DE} != {0, 0}, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is cleared to 0 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 0.
- A Deferred error is detected, ERR<n>STATUS.UE == 0, and ERR<n>STATUS.DE == 0.
- A Corrected error is detected, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE == 0b00.

The IMPLEMENTATION DEFINED clearing of this field might also depend on the value of the other error status fields.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.
- A direct write to this field that clears this field to 0 might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
0b0	<p>If ERR<n>STATUS.UE == 1, then no error syndrome for an Uncorrected error has been discarded.</p> <p>If ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1, then no error syndrome for a Deferred error has been discarded.</p> <p>If ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and a Corrected error counter is implemented, then the counter has not overflowed.</p> <p>If ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, ERR<n>STATUS.CE != 0b00, and no Corrected error counter is implemented, then no error syndrome for a Corrected error has been discarded.</p>
<p>Note</p> <p>This field might have been set to 1 when an error syndrome was discarded and later cleared to 0 when a higher priority syndrome was recorded.</p>	
0b1	At least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

MV, bit [26]

When error record <n> includes an additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC<m> not valid.
0b1	The IMPLEMENTATION DEFINED contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **RO** if all of the following are true:
 - **ERRext-ERR**<n>STATUS.DE == 0
 - **ERRext-ERR**<n>STATUS.UE == 0

- ~~ERR~~~~ext-ERR~~<n>STATUS.CE != 0b00'00'
- ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ~~ERR~~~~ext-ERR~~<n>STATUS.UE == 0'
 - ~~ERR~~~~ext-ERR~~<n>STATUS.DE != 0'
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ~~ERR~~~~ext-ERR~~<n>STATUS.UE != 0'
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
 - ~~ERR~~~~ext-ERR~~<n>STATUS.OF == 1'
 - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

DE, bit [23]

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
 - ~~ERR~~~~ext-ERR~~<n>STATUS.OF == 1'
 - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write

- Otherwise, access to this field is **W1C**.

PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing both ERR<n>STATUS.{DE, UE} to 0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI** if any of the following are true:
 - ERRext-ERR<n>STATUS.V == 0
 - (ERRext-ERR<n>STATUS.DE == 0 and ERRext-ERR<n>STATUS.UE == 0)
- RO** if all of the following are true:
 - ERRext-ERR<n>STATUS.DE == 0
 - ERRext-ERR<n>STATUS.UE == 0
 - ERRext-ERR<n>STATUS.CE != 0b00'00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- RO** if all of the following are true:
 - ERRext-ERR<n>STATUS.UE == 0
 - ERRext-ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- RO** if all of the following are true:
 - ERRext-ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

Note

Software might use the information in the error record registers to determine what recovery is necessary.

If this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - ~~ERR~~~~ext-ERR~~<n>STATUS.V == '0'
 - ~~ERR~~~~ext-ERR~~<n>STATUS.UE == '0'
- **RO** if all of the following are true:
 - ~~ERR~~~~ext-ERR~~<n>STATUS.DE == '0'
 - ~~ERR~~~~ext-ERR~~<n>STATUS.UE == '0'
 - ~~ERR~~~~ext-ERR~~<n>STATUS.CE != 0b00'00'
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ~~ERR~~~~ext-ERR~~<n>STATUS.UE == '0'
 - ~~ERR~~~~ext-ERR~~<n>STATUS.DE != '0'
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ~~ERR~~~~ext-ERR~~<n>STATUS.UE != '0'
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Bits [19:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - the ~~RAS~~ Common Fault Injection Model Extension is not implemented by the node that owns this error record
 - ~~ERR~~~~ext-ERR~~<n>STATUS.V == '0'
- **UNKNOWN/WI** if all of the following are true:
 - ~~ERR~~~~ext-ERR~~<q>PFGF.SYN == '0'
 - ~~ERR~~~~ext-ERR~~<n>STATUS.V == '0'
- **RO** if all of the following are true:
 - ~~ERR~~~~ext-ERR~~<n>STATUS.DE == '0'
 - ~~ERR~~~~ext-ERR~~<n>STATUS.UE == '0'
 - ~~ERR~~~~ext-ERR~~<n>STATUS.CE != 0b00'00'
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ~~ERR~~~~ext-ERR~~<n>STATUS.UE == '0'
 - ~~ERR~~~~ext-ERR~~<n>STATUS.DE != '0'
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ~~ERR~~~~ext-ERR~~<n>STATUS.UE != '0'
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **RW**.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, nSEI pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.
0x11	Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another component.
0x14	Internal timeout. For example, timeout on interface within the component.
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.
0x1A	Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI** if all of the following are true:
 - the RAS Common Fault Injection Model Extension is not implemented by the node that owns this error record
 - ERRext-ERR<n>STATUS.V == 0
- UNKNOWN/WI** if all of the following are true:
 - ERRext-ERR<q>PFGF.SYN == 0
 - ERRext-ERR<n>STATUS.V == 0
- RO** if all of the following are true:
 - ERRext-ERR<n>STATUS.DE == 0
 - ERRext-ERR<n>STATUS.UE == 0
 - ERRext-ERR<n>STATUS.CE != 0b00'00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- RO** if all of the following are true:
 - ERRext-ERR<n>STATUS.UE == 0
 - ERRext-ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- RO** if all of the following are true:
 - ERRext-ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **RW**.

Accessing ERR<n>STATUS

ERR<n>STATUS.{AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI} are write-one-to-clear (W1C) fields, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero. ERR<n>STATUS.{IERR, SERR} are read/write (RW) fields, although the set of implemented valid values is IMPLEMENTATION DEFINED. See also [ERR<n>PFGF.SYN](#).

After reading ERR<n>STATUS, software must clear the valid fields in the register to allow new errors to be recorded. However, between reading the register and clearing the valid fields, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

- Writes to ERR<n>STATUS.{UE, DE, CE} are ignored if ERR<n>STATUS.OF is 1 and is not being cleared to 0.
- Writes to ERR<n>STATUS.V are ignored if any of ERR<n>STATUS.{UE, DE, CE} are nonzero and are not being cleared to zero.
- Writes to ERR<n>STATUS.{AV, MV} and the ERR<n>STATUS.{ER, PN, UET, IERR, SERR} syndrome fields are ignored if the highest priority nonzero error status field is not being cleared to zero. The error status fields in priority order from highest to lowest, are ERR<n>STATUS.UE, ERR<n>STATUS.DE, and ERR<n>STATUS.CE.

When RAS System Architecture v1.1 is implemented, a write to the register is ignored if all of:

- Any of ERR<n>STATUS.{V, UE, OF, CE, DE} are nonzero before the write.
- The write does not clear the nonzero ERR<n>STATUS.{V, UE, OF, CE, DE} fields to zero by writing ones to the applicable field or fields.

Some of the fields in ERR<n>STATUS are also defined as UNKNOWN where certain combinations of ERR<n>STATUS.{V, DE, UE} are zero. The rules for writes to ERR<n>STATUS allow a node to implement such a field as a fixed read-only value.

For example, when RAS System Architecture v1.1 is implemented, a write to ERR<n>STATUS when ERR<n>STATUS.V is 1 results in either ERR<n>STATUS.V field being cleared to zero, or ERR<n>STATUS.V not changing. Since all fields in ERR<n>STATUS, other than ERR<n>STATUS.{AV, V, MV}, usually read as UNKNOWN values when ERR<n>STATUS.V is zero, this means those fields can be implemented as read-only if applicable.

To ensure correct and portable operation, when software is clearing the valid fields in the register to allow new errors to be recorded, Arm recommends that software:

- Read ERR<n>STATUS and determine which fields need to be cleared to zero.
- Write ones to all the W1C fields that are nonzero in the read value.

- Write zero to all the W1C fields that are zero in the read value.
- Write zero to all the RW fields.

Otherwise, these fields might not have the correct value when a new fault is recorded.

An exception is when the node supports writing to these fields as part of fault injection. See also [ERR<n>PFGF.SYN](#).

ERR<n>STATUS can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x010 + (64 * n)	ERR<n>STATUS

This interface is accessible as follows:

- When $ERR\langle n \rangle STATUS.V \neq 0$, $ERR\langle n \rangle STATUS.V$ is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When $ERR\langle n \rangle STATUS.UE \neq 0$, $ERR\langle n \rangle STATUS.UE$ is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When $ERR\langle n \rangle STATUS.OF \neq 0$, $ERR\langle n \rangle STATUS.OF$ is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When $ERR\langle n \rangle STATUS.CE \neq 0b00$, $ERR\langle n \rangle STATUS.CE$ is not being cleared to 0b000b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When $ERR\langle n \rangle STATUS.DE \neq 0$, $ERR\langle n \rangle STATUS.DE$ is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- Otherwise accesses to this register are **RW**.

GICD_ICFGR<n>, Interrupt Configuration Registers, n = 0 - 63

The GICD_ICFGR<n> characteristics are:

Purpose

Determines whether the corresponding interrupt is edge-triggered or level-sensitive.

Configuration

These registers are available in all GIC configurations. If the GIC implementation supports two Security states, these registers are Common.

GICD_ICFGR1 is Banked for each connected PE with [GICR_TYPER](#).Processor_Number < 8.

Accessing GICD_ICFGR1 from a PE with [GICR_TYPER](#).Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICFGR<n>

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

For SGIs, Int_config fields are RO, meaning that GICD_ICFGR0 is RO.

Changing Int_config when the interrupt is individually enabled is UNPREDICTABLE.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

Fields corresponding to unimplemented interrupts are RAZ/WI.

Attributes

GICD_ICFGR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13
Int_config15	Int_config14	Int_config13	Int_config12	Int_config11	Int_config10	Int_config9	Int_config8	Int_config7	Int_config6	Int_config5	Int_config4	Int_config3	Int_config2	Int_config1	Int_config0	Int_config0	Int_config0	Int_config0

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Int_config[0] (bit [2x]) is RES0.

Possible values of Int_config[1] (bit [2x+1]) are:

Indicates whether the interrupt **with ID 16n + x** is level-sensitive or edge-triggered.

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b10	Corresponding interrupt is edge-triggered.

For SGIs, Int_config[0:1] (bits [2x]) is RAZ/WI, RES0.

For SPIs and PPIs, this Int_config[1] field is always programmable indicates unless edge-triggered. the implementation supports two Security states and the bit corresponds to a Group 0 or Secure Group 1 interrupt, in which case the bit is RAZ/WI to Non-secure accesses.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICD_ICFGR<n>

For SPIs and PPIs, when GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICD_ICFGR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0C00 + (4 * n)	GICD_ICFGR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

The GICD_ICFGR<n>E characteristics are:

Purpose

Determines whether the corresponding SPI in the extended SPI range is edge-triggered or level-sensitive.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICFGR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICFGR<n>E registers is (((GICD_TYPER.ESPI range+1)*2). Registers are numbered from 0.

Attributes

GICD_ICFGR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13
Int_config15	Int_config14	Int_config13	Int_config12	Int_config11	Int_config10	Int_config9	Int_config8	Int_config7	Int_config6	Int_config5	Int_config4	Int_config3	Int_config2	Int_config1	Int_config0	Int_config15	Int_config14	Int_config13

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt with ID $16n + x$ is level-sensitive or edge-triggered.

Int_config[0] (bit[2x]) is RES0.

Possible values of Int_config[1] (bit[2x+1]) are:

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b100b01	Corresponding interrupt is edge-triggered.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICD_ICFGR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICFGR<n>E, the corresponding bit is RES0.

When `GICD_CTLR.DS==0`, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

This interface is accessible as follows:

- 30/06/2021 15:09:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

GICR_ICFGR0, Interrupt Configuration Register 0

The GICR_ICFGR0 characteristics are:

Purpose

Determines whether the corresponding SGI is edge-triggered or level-sensitive.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICFGR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13
Int_config15	Int_config14	Int_config13	Int_config12	Int_config11	Int_config10	Int_config9	Int_config8	Int_config7	Int_config6	Int_config5	Int_config4	Int_config3	Int_config2	Int_config1	Int_config0	RES0	RAO/WI	RAO/WI

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Int_config[0] (bit [2x]) is RES0.

Possible values of Int_config[1] (bit [2x+1]) are:

Indicates whether the interrupt with ID 16n + x is level-sensitive or edge-triggered.

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b100b01	Corresponding interrupt is edge-triggered.

For SGIs, thisInt_config[1] fieldis always indicates edge-triggered.RAO/WI.

A read of this bit always returns the correct value to indicate the interrupt triggering method.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICFGR0

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=0.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICR_ICFGR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
-----------	-------	--------	----------

GIC Redistributor	SGI_base	0x0C00	GICR_ICFGR0
----------------------	----------	--------	-------------

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 1509:2139; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

UMSI, bit [44]

Indicates support for reporting receipt of unmapped MSIs.

UMSI	Meaning
0b0	Reporting of unmapped MSIs is not supported.
0b1	Reporting of unmapped MSIs is supported.

nID, bit [43]

When FEAT_GICv4p1 is implemented:

nID

nID	Meaning
0b0	Individual doorbell interrupt supported.
0b1	Individual doorbell interrupt not supported.

Otherwise:

Reserved, RES0.

SVPET, bits [42:41]

When FEAT_GICv4p1 is implemented:

SVPET

SVPET	Meaning
0b00	vPE Table is not shared with Redistributors.
0b01	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR.Aff3.
0b10	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3 and Aff2.
0b11	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3, Aff2 and Aff1.

Otherwise:

Reserved, RES0.

VMAPP, bit [40]

When FEAT_GICv4p1 is implemented:

VMAPP

VMAPP	Meaning
0b0	FEAT_GICv4 VMAPP command layout.
0b1	FEAT_GICv4p1 VMAPP command layout.

Otherwise:

Reserved, RES0.

VSGI, bit [39]

When FEAT_GICv4p1 is implemented:

VSGI

VSGI	Meaning
0b0	Direct injection of SGIs is not supported.
0b1	Direct injection of SGIs is supported.

Otherwise:

Reserved, RES0.

MPAM, bit [38]

When FEAT_GICv3p1 is implemented:

MPAM

MPAM	Meaning
0b0	MPAM is not supported.
0b1	MPAM is supported.

Otherwise:

Reserved, RES0.

VMOVP, bit [37]

Indicates the form of the VMOVP command.

VMOVP	Meaning
0b0	When moving a vPE, software must issue a VMOVP on all ITSs that have mappings for that vPE. The ITSList and Sequence Number fields in the VMOVP command must ensure synchronization, otherwise behavior is UNPREDICTABLE.
0b1	When moving a vPE, software must only issue a VMOVP on one of the ITSs that has a mapping for that vPE. The ITSList and Sequence Number fields in the VMOVP command are RES0.

CIL, bit [36]

Collection ID Limit.

CIL	Meaning
0b0	ITS supports 16-bit Collection ID, GITS_TYPER.CIDbits is RES0.
0b1	GITS_TYPER.CIDbits indicates supported Collection ID size

In implementations that do not support Collections in external memory, this bit is RES0 and the number of Collections supported is reported by [GITS_TYPER.HCC](#).

CIDbits, bits [35:32]

Number of Collection ID bits.

- The number of bits of Collection ID minus one.
- When [GITS_TYPER.CIL](#) == 0, this field is RES0.

HCC, bits [31:24]

Hardware Collection Count. The number of interrupt collections supported by the ITS without provisioning of external memory.

Note

Collections held in hardware are unmapped at reset.

Bits [23:20]

Reserved, RES0.

PTA, bit [19]

Physical Target Addresses. Indicates the format of the target address:

PTA	Meaning
0b0	The target address corresponds to the PE number specified by GICR_TYPER.Processor_Number .
0b1	The target address corresponds to the base physical address of the required Redistributor.

For more information, see 'RDbase' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

SEIS, bit [18]

SEI support. Indicates whether the virtual CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The ITS does not support local generation of SEIs.
0b1	The ITS supports local generation of SEIs.

Devbits, bits [17:13]

The number of DeviceID bits implemented, minus one.

ID_bits, bits [12:8]

The number of EventID bits implemented, minus one.

ITT_entry_size, bits [7:4]

Read-only. Indicates the number of bytes per translation table entry, minus one.

For more information about the ITS command 'MAPD', see MAPD.

IMPLEMENTATION DEFINED, bit [3]

IMPLEMENTATION DEFINED.

CCT, bit [2]

Cumulative Collection Tables.

CCT	Meaning
0b0	The total number of supported collections is determined by the number of collections held in memory only.
0b1	The total number of supported collections is determined by number of collections that are held in memory and the number indicated by GITS_TYPER.HCC.

If GITS_TYPER.HCC == 0, or if memory backed collections are not supported (all [GITS_BASER<n>.Type](#) != 100), this bit is RES0.

Virtual, bit [1]

When FEAT_GICv4 is implemented:

Indicates whether the ITS supports virtual LPIs and direct injection of virtual LPIs:

Virtual	Meaning
0b0	The ITS does not support virtual LPIs or direct injection of virtual LPIs.
0b1	The ITS supports virtual LPIs and direct injection of virtual LPIs.

Otherwise:

Reserved, RES0.

Physical, bit [0]

Indicates whether the ITS supports physical LPis:

Physical	Meaning
0b0	The ITS does not support physical LPIs.
0b1	The ITS supports physical LPIs.

This field is RES1, indicating that the ITS supports physical LPs.

Accessing GITS_TYPER

GITS_TYPER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0008	GITS TYPER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:09:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

MPAMCFG_CMAX, MPAM Cache Maximum Capacity Partition Configuration Register

The MPAMCFG_CMAX characteristics are:

Purpose

The MPAMCFG_CMAX is a 32-bit read/write register that controls the maximum fraction of the cache capacity that the PARTID selected by [MPAMCFG_PART_SEL](#) is permitted to allocate.

- [MPAMCFG_CMAX_s](#) controls the cache maximum capacity for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#).
- [MPAMCFG_CMAX_ns](#) controls the cache maximum capacity for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#).
- [MPAMCFG_CMAX_rt](#) controls the cache maximum capacity for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#).
- [MPAMCFG_CMAX_rl](#) controls the cache maximum capacity for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

[MPAMCFG_CMAX_s](#) controls the cache maximum capacity for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). [MPAMCFG_CMAX_ns](#) controls the cache maximum capacity for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). [MPAMCFG_CMAX_rt](#) controls the cache maximum capacity for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). [MPAMCFG_CMAX_rl](#) controls the cache maximum capacity for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_CMAX is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CCAP_PART == 1. Otherwise, direct accesses to MPAMCFG_CMAX are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_CMAX is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																CMAX															

Bits [31:16]

Reserved, RES0.

CMAX, bits [15:0]

Maximum cache capacity usage in fixed-point fraction format by the partition selected by [MPAMCFG_PART_SEL](#). The fraction represents the portion of the total cache capacity that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in [MPAMF_CCAP_IDR.CMAX_WD](#). Unimplemented bits within the field are RAZ/WI. The implemented bits of the CMAX field are always the most significant bits of the field.

The fixed-point fraction CMAX is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the cache that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_CMAX

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_CMAX_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_CMAX_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_CMAX_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_CMAX_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_CMAX_s, MPAMCFG_CMAX_ns, MPAMCFG_CMAX_rt, and MPAMCFG_CMAX_rl must be separate registers.

- The Secure instance (MPAMCFG_CMAX_s) accesses the cache capacity partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_CMAX_ns) accesses the cache capacity partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_CMAX_rt) accesses the cache capacity partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_CMAX_rl) accesses the cache capacity partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the cache resource instance selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

When RIS is not implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#), and [MPAMCFG_PART_SEL.INTERNAL](#) must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#), and [MPAMCFG_PART_SEL.INTERNAL](#) must be 0.

MPAMCFG_CMAX can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0108	MPAMCFG_CMAX_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0108	MPAMCFG_CMAX_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0108	MPAMCFG_CMAX_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0108	MPAMCFG_CMAX_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_CPBM<n>, MPAM Cache Portion Bitmap Partition Configuration Register, n = 0 - 1023

The MPAMCFG_CPBM<n> characteristics are:

Purpose

The MPAMCFG_CPBM<n> register array gives access to the cache portion bitmap. Each register in the array is a read/write register that configures the cache portions numbered from <n * 32> to <31 + (n * 32)> that a PARTID is allowed to allocate.

After setting [MPAMCFG_PART_SEL](#) with a PARTID, software writes to the MPAMCFG_CPBM<n> register to configure which cache portions the PARTID is allowed to allocate.

The MPAMCFG_CPBM<n> register that contains the bitmap bit corresponding to cache portion p has n equal to p[15:5]. The field, P<x>, of that MPAMCFG_CPBM<n> register that contains the bitmap bit corresponding to cache portion p has x equal to p[4:0].

- MPAMCFG_CPBM<n>_s controls cache portions for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#).
- MPAMCFG_CPBM<n>_ns controls the cache portions for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#).
- MPAMCFG_CPBM<n>_rt controls cache portions for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#).
- MPAMCFG_CPBM<n>_rl controls the cache portions for the Realm PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#).

MPAMCFG_CPBM<n>_s controls cache portions for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CPBM<n>_ns controls the cache portions for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CPBM<n>_rt controls cache portions for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CPBM<n>_rl controls the cache portions for the Realm PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_CPBM<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CPOR_PART == 1. Otherwise, direct accesses to MPAMCFG_CPBM<n> are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_CPBM<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
P<32 * n + 31>	P<32 * n + 30>	P<32 * n + 29>	P<32 * n + 28>	P<32 * n + 27>	P<32 * n + 26>	P<32 * n + 25>

P<x + (n * 32)>, bit [x], for x = 31 to 0

Portion allocation control bit. Each cache portion allocation control bit, MPAMCFG_CPBM<n>.P<x>, grants permission to the PARTID selected by [MPAMCFG_PART_SEL](#) to allocate cache lines within cache portion <x + (n * 32)>.

P<x + (n * 32)>	Meaning
0b0	The PARTID is not permitted to allocate into cache portion <x + (n * 32)>.
0b1	The PARTID is permitted to allocate within cache portion <x + (n * 32)>.

The number of bits in the cache portion partitioning bit map of this component is given in [MPAMF_CPOR_IDR](#).CPBM_WD. CPBM_WD contains a value from 1 to 2¹⁵, inclusive. Values of CPBM_WD greater than 32 require an array of 32-bit [MPAMCFG_CPBM<n>](#) registers to access the cache portion bitmap, up to 1024 registers.

Bits MPAMCFG_CPBM<n>.P<<x + (n * 32)>>, where <x + (n * 32)> is greater than or equal to CPBM_WD, are RES0:

- If n > MPAMF_CPOR_IDR.CPBM_WD[15:5], the entire 32 P<x> are RES0.
- If n == MPAMF_CPOR_IDR.CPBM_WD[15:5], bits [31: CPBM_WD[4:0]] are RES0 and the remaining bits are valid.
- If n < MPAMF_CPOR_IDR.CPBM_WD[15:5], the entire 32 P<x> are valid.

Accessing MPAMCFG_CPBM<n>

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_CPBM<n>_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_CPBM<n>_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_CPBM<n>_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_CPBM<n>_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_CPBM<n>_s, MPAMCFG_CPBM<n>_ns, MPAMCFG_CPBM<n>_rt, and MPAMCFG_CPBM<n>_rl must be separate registers.

- The Secure instance (MPAMCFG_CPBM<n>_s) accesses the cache portion bitmap used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_CPBM<n>_ns) accesses the cache portion bitmap used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_CPBM<n>_rt) accesses the cache portion bitmap used for Root PARTIDs.
- The Realm instance (MPAMCFG_CPBM<n>_rl) accesses the cache portion bitmap used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the cache resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_CPBM<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
-----------	-------	--------	----------

MPAM	MPAMF_BASE_s	0x1000 + (4 * n)	MPAMCFG_CPBM<n>_s
------	--------------	------------------------	-------------------

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x1000 + (4 * n)	MPAMCFG_CPBM<n>_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x1000 + (4 * n)	MPAMCFG_CPBM<n>_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x1000 + (4 * n)	MPAMCFG_CPBM<n>_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_INTPARTID, MPAM Internal PARTID Narrowing Configuration Register

The MPAMCFG_INTPARTID characteristics are:

Purpose

MPAMCFG_INTPARTID is a 32-bit read/write register that controls the mapping of the PARTID selected by [MPAMCFG_PART_SEL](#) into a narrower internal PARTID (intPARTID).

- [MPAMCFG_INTPARTID_s](#) controls the mapping for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#).
- [MPAMCFG_INTPARTID_ns](#) controls the mapping for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#).
- [MPAMCFG_INTPARTID_rt](#) controls the mapping for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#).
- [MPAMCFG_INTPARTID_rl](#) controls the mapping for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

[MPAMCFG_INTPARTID_s](#) controls the mapping for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). [MPAMCFG_INTPARTID_ns](#) controls the mapping for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). [MPAMCFG_INTPARTID_rt](#) controls the mapping for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). [MPAMCFG_INTPARTID_rl](#) controls the mapping for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

The MPAMCFG_INTPARTID register associates the request PARTID (reqPARTID) in the [MPAMCFG_PART_SEL](#) register with an internal PARTID (intPARTID) in this register. To set that association, store reqPARTID into the [MPAMCFG_PART_SEL](#) register and then store the intPARTID into the MPAMCFG_INTPARTID register. To read the association, store reqPARTID into the MPAMCFG_PART_SEL register and then read MPAMCFG_INTPARTID.

If the intPARTID stored into MPAMCFG_INTPARTID is out-of-range or does not have the INTERNAL bit set, the association of reqPARTID to intPARTID is not written and [MPAMF_ESR](#) is set to indicate an intPARTID_Range error.

If [MPAMCFG_PART_SEL](#).INTERNAL is 1 when MPAMCFG_INTPARTID is read or written, [MPAMF_ESR](#) is set to indicate an Unexpected_INTERNAL error.

Configuration

The power domain of MPAMCFG_INTPARTID is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PARTID_NRW == 1. Otherwise, direct accesses to MPAMCFG_INTPARTID are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_INTPARTID is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																INTERNAL		INTPARTID													

Bits [31:17]

Reserved, RES0.

INTERNAL, bit [16]

Internal PARTID flag.

This bit must be 1 when written to the register. If written as 0, the write will not update the reqPARTID to intPARTID association.

On a read of this register, the bit will always read the value last written.

INTPARTID, bits [15:0]

This field contains the intPARTID mapped to the reqPARTID in [MPAMCFG_PART_SEL](#).

The maximum intPARTID supported is [MPAMF_PARTID_NRW_IDR](#).INTPARTID_MAX.

Accessing MPAMCFG_INTPARTID

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_INTPARTID_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_INTPARTID_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_INTPARTID_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_INTPARTID_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_INTPARTID_s, MPAMCFG_INTPARTID_ns, MPAMCFG_INTPARTID_rt, and MPAMCFG_INTPARTID_rl must be separate registers.

- The Secure instance (MPAMCFG_INTPARTID_s) accesses the PARTID narrowing used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_INTPARTID_ns) accesses the PARTID narrowing used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_INTPARTID_rt) accesses the PARTID narrowing used for Root PARTIDs.
- The Realm instance (MPAMCFG_INTPARTID_rl) accesses the PARTID narrowing used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_INTPARTID access the PARTID narrowing configuration settings without being affected by [MPAMCFG_PART_SEL](#).RIS.

Loads and stores to MPAMCFG_INTPARTID access the PARTID narrowing configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_INTPARTID can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0600	MPAMCFG_INTPARTID_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0600	MPAMCFG_INTPARTID_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0600	MPAMCFG_INTPARTID_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0600	MPAMCFG_INTPARTID_rl

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

The MPAMCFG_MBW_MAX characteristics are:

Purpose

MPAMCFG_MBW_MAX is a 32-bit read/write register that controls the maximum fraction of memory bandwidth that the PARTID selected by [MPAMCFG_PART_SEL](#) is permitted to use.

- `MPAMCFG_MBW_MAX_s` controls maximum bandwidth for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#).
- `MPAMCFG_MBW_MAX_ns` controls the maximum bandwidth for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#).
- `MPAMCFG_MBW_MAX_rt` controls the maximum bandwidth for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#).
- `MPAMCFG_MBW_MAX_rl` controls the maximum bandwidth for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

MPAMCFG_MBW_MAX_s controls maximum bandwidth for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MAX_ns controls the maximum bandwidth for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MAX_rt controls the maximum bandwidth for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MAX_rl controls the maximum bandwidth for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

A PARTID that has used more than MAX is given no access to additional bandwidth if HARDLIM == 1 or is given additional bandwidth only if there are no requests from PARTIDs that have not exceeded their MAX if HARDLIM == 0.

If [MPAMF IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG MBW_MAX is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_MAX == 1. Otherwise, direct accesses to MPAMCFG_MBW_MAX are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG MBW MAX is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HARDLIM		RES0														MAX															

HARDLIM, bit [31]

Hard bandwidth limiting.

HARDLIM	Meaning
0b0	When MAX bandwidth is exceeded, the partition contends with a low preference for downstream bandwidth beyond MAX.
0b1	When MAX bandwidth is exceeded, the partition does not use any more bandwidth until the memory bandwidth measurement for the partition falls below MAX.

Bits [30:16]

Reserved, RES0.

MAX, bits [15:0]

Memory maximum bandwidth allocated to the partition selected by [MPAMCFG_PART_SEL](#). MAX is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in [MPAMF_MBW_IDR.BWA_WD](#). Unimplemented bits are RAZ/WI. The implemented bits of the MAX field are always to the left of the field. For example, if BWA_WD = 3, the implemented bits are MPAMCFG_MBW_MAX[15:13] and MPAMCFG_MBW_MAX[12:0] are unimplemented.

The fixed-point fraction MAX is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the bandwidth that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_MBW_MAX

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_MBW_MAX_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_MAX_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_MAX_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_MAX_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_MAX_s, MPAMCFG_MBW_MAX_ns, MPAMCFG_MBW_MAX_rt, and MPAMCFG_MBW_MAX_rl must be separate registers.

- The Secure instance (MPAMCFG_MBW_MAX_s) accesses the memory maximum bandwidth partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_MAX_ns) accesses the memory maximum bandwidth partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_MAX_rt) accesses the memory maximum bandwidth partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_MAX_rl) accesses the memory maximum bandwidth partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_MBW_MAX can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0208	MPAMCFG_MBW_MAX_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0208	MPAMCFG_MBW_MAX_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0208	MPAMCFG_MBW_MAX_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0208	MPAMCFG_MBW_MAX_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_MBW_MIN, MPAM Memory Bandwidth Minimum Partition Configuration Register

The MPAMCFG_MBW_MIN characteristics are:

Purpose

MPAMCFG_MBW_MIN is a 32-bit read/write register that controls the minimum fraction of memory bandwidth that the PARTID selected by [MPAMCFG_PART_SEL](#) is permitted to use.

- MPAMCFG_MBW_MIN_s controls the minimum bandwidth for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#).
- MPAMCFG_MBW_MIN_ns controls the minimum bandwidth for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#).
- MPAMCFG_MBW_MIN_rt controls the minimum bandwidth for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#).
- MPAMCFG_MBW_MIN_rl controls the minimum bandwidth for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

MPAMCFG_MBW_MIN_s controls the minimum bandwidth for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MIN_ns controls the minimum bandwidth for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MIN_rt controls the minimum bandwidth for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MIN_rl controls the minimum bandwidth for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

A PARTID that has used less than MIN is given preferential access to bandwidth.

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_MIN is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_MIN == 1. Otherwise, direct accesses to MPAMCFG_MBW_MIN are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_MIN is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																MIN															

Bits [31:16]

Reserved, RES0.

MIN, bits [15:0]

Memory minimum bandwidth allocated to the partition selected by [MPAMCFG_PART_SEL](#). MIN is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in [MPAMF_MBW_IDR.BWA_WD](#). Unimplemented bits are RAZ/WI. The implemented bits of the MIN field are always to the left of the field. For example, if BWA_WD = 4, the implemented bits are MPAMCFG_MBW_MIN[15:12] and MPAMCFG_MBW_MIN[11:0] are unimplemented.

The fixed-point fraction MIN is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the bandwidth that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_MBW_MIN

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_MBW_MIN_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_MIN_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_MIN_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_MIN_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_MIN_s, MPAMCFG_MBW_MIN_ns, MPAMCFG_MBW_MIN_rt, and MPAMCFG_MBW_MIN_rl must be separate registers.

- The Secure instance (MPAMCFG_MBW_MIN_s) accesses the memory minimum bandwidth partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_MIN_ns) accesses the memory minimum bandwidth partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_MIN_rt) accesses the memory minimum bandwidth partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_MIN_rl) accesses the memory minimum bandwidth partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_MBW_MIN can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0200	MPAMCFG_MBW_MIN_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0200	MPAMCFG_MBW_MIN_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
-----------	-------	--------	----------

MPAM	MPAMF_BASE_rt	0x0200	MPAMCFG_MBW_MIN_rt
------	---------------	--------	--------------------

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x0200	MPAMCFG_MBW_MIN_r1

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_MBW_PBM<n>, MPAM Bandwidth Portion Bitmap Partition Configuration Register, n = 0 - 127

The MPAMCFG_MBW_PBM<n> characteristics are:

Purpose

The MPAMCFG_MBW_PBM<n> register array gives access to the memory bandwidth portion bitmap. Each register in the array is a read/write register that configures the bandwidth portions <32 * n> to <(32 * n) + 31> that a PARTID is allowed to allocate.

After setting [MPAMCFG_PART_SEL](#) with a PARTID, software writes to one or more of the MPAMCFG_MBW_PBM<n> registers to configure which bandwidth portions the PARTID is allowed to allocate.

The MPAMCFG_MBW_PBM<n> register that contains the bitmap bit corresponding to memory bandwidth portion p has n equal to $p[11:5]$. The field, $P<x + (32 * n)>$ of that MPAMCFG_MBW_PBM<n> register that contains the bitmap bit corresponding to memory bandwidth portion p has x equal to $p[4:0]$.

- The MPAMCFG_MBW_PBM<n>_s registers control the bandwidth portion bitmap for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#).
- The MPAMCFG_MBW_PBM<n>_ns registers control the bandwidth portion bitmap for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#).
- The MPAMCFG_MBW_PBM<n>_rt registers control the bandwidth portion bitmap for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#).
- The MPAMCFG_MBW_PBM<n>_rl registers control the bandwidth portion bitmap for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

The MPAMCFG_MBW_PBM<n>_s registers control the bandwidth portion bitmap for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). The MPAMCFG_MBW_PBM<n>_ns registers control the bandwidth portion bitmap for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). The MPAMCFG_MBW_PBM<n>_rt registers control the bandwidth portion bitmap for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). The MPAMCFG_MBW_PBM<n>_rl registers control the bandwidth portion bitmap for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_MBW_PBM<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_PBM == 1. Otherwise, direct accesses to MPAMCFG_MBW_PBM<n> are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_PBM<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
$P<32 * n + 31>$	$P<32 * n + 30>$	$P<32 * n + 29>$	$P<32 * n + 28>$	$P<32 * n + 27>$	$P<32 * n + 26>$	$P<32 * n + 25>$

P<x + (32 * n)>, bit [x], for x = 31 to 0

Portion allocation control bit. Each bandwidth portion allocation control bit MPAMCFG_MBW_PBM<n>.P<x + (32 * n)>> grants permission to the PARTID selected by [MPAMCFG_PART_SEL](#) to allocate bandwidth within bandwidth portion <x + (32 * n)>.

P<x + (32 * n)>	Meaning
0b0	The PARTID is not permitted to allocate into bandwidth portion <x + (32 * n)>.
0b1	The PARTID is permitted to allocate within bandwidth portion <x + (32 * n)>.

The number of bits in the bandwidth portion partitioning bit map of this component is given in [MPAMF_MBW_IDR.BWPBM_WD](#). BWPBM_WD contains a value from 1 to 2¹², inclusive. Values of BWPBM_WD greater than 32 require a group of 32-bit registers to access the bandwidth portion bitmap, up to 128 32-bit registers.

Bits MPAMCFG_MBW_PBM<n>.P<x + (32 * n)>>, where <x + (32 * n)> is greater than or equal to BWPBM_WD are RES0:

- If n > MPAMF_MBW_IDR.BWPBM_WD[11:5], the entire 32 P<x> are RES0.
- If n == MPAMF_MBW_IDR.BWPBM_WD[11:5], bits [31: BWPBM_WD[4:0]] are RES0 and the remaining bits are valid.
- If n < MPAMF_MBW_IDR.BWPBM_WD[11:5], the entire 32 P<x> are valid.

Accessing MPAMCFG_MBW_PBM<n>

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_MBW_PBM<n>_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_PBM<n>_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_PBM<n>_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_PBM<n>_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_PBM<n>_s, MPAMCFG_MBW_PBM<n>_ns, MPAMCFG_MBW_PBM<n>_rt, and MPAMCFG_MBW_PBM<n>_rl must be separate registers.

- The Secure instance (MPAMCFG_MBW_PBM<n>_s) accesses the memory bandwidth portion bitmap used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_PBM<n>_ns) accesses the memory bandwidth portion bitmap used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_PBM<n>_rt) accesses the memory bandwidth portion bitmap used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_PBM<n>_rl) accesses the memory bandwidth portion bitmap used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_MBW_PBM<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_rl

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

MPAMCFG_MBW_PROP, MPAM Memory Bandwidth Proportional Stride Partition Configuration Register

The MPAMCFG_MBW_PROP characteristics are:

Purpose

Controls the proportional stride of memory bandwidth that the PARTID selected by [MPAMCFG_PART_SEL](#) uses.

- [MPAMCFG_MBW_PROP_s](#) controls the bandwidth proportional stride for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#).
- [MPAMCFG_MBW_PROP_ns](#) controls the bandwidth proportional stride for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#).
- [MPAMCFG_MBW_PROP_rt](#) controls the bandwidth proportional stride for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#).
- [MPAMCFG_MBW_PROP_rl](#) controls the bandwidth proportional stride for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

[MPAMCFG_MBW_PROP_s](#) controls the bandwidth proportional stride for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). [MPAMCFG_MBW_PROP_ns](#) controls the bandwidth proportional stride for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). [MPAMCFG_MBW_PROP_rt](#) controls the bandwidth proportional stride for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). [MPAMCFG_MBW_PROP_rl](#) controls the bandwidth proportional stride for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

Proportional stride is a relative cost of bandwidth requested by one PARTID in relation to the costs of the bandwidths requested by each other PARTID also competing to use the bandwidth.

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_MBW_PROP is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, [MPAMF_IDR.HAS_MBW_PART](#) == 1 and [MPAMF_MBW_IDR.HAS_PROP](#) == 1. Otherwise, direct accesses to MPAMCFG_MBW_PROP are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_PROP is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EN																STRIDEM1															

EN, bit [31]

Enable proportional stride bandwidth partitioning.

EN	Meaning
0b0	The selected partition is not regulated by proportional stride bandwidth partitioning.
0b1	The selected partition has bandwidth usage regulated by proportional stride bandwidth partitioning as controlled by STRIDEM1.

Bits [30:16]

Reserved, RES0.

STRIDEM1, bits [15:0]

Memory bandwidth stride minus 1 allocated to the partition selected by [MPAMCFG_PART_SEL](#). STRIDEM1 represents the normalized cost of bandwidth consumption by the partition.

The proportional stride partitioning control parameter is an unsigned integer representing the normalized cost to a partition for consuming bandwidth. Larger values have a larger cost and correspond to a lesser allocation of bandwidth while smaller values indicate a lesser cost and therefore a higher allocation of bandwidth.

The implemented width of STRIDEM1 is given in MPAMF_MBW_IDR.BWA_WD.

Accessing MPAMCFG_MBW_PROP

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_MBW_PROP_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_PROP_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_PROP_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_PROP_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_PROP_s, MPAMCFG_MBW_PROP_ns, MPAMCFG_MBW_PROP_rt, and MPAMCFG_MBW_PROP_rl must be separate registers.

- The Secure instance (MPAMCFG_MBW_PROP_s) accesses the memory proportional stride bandwidth partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_PROP_ns) accesses the memory proportional stride bandwidth partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_PROP_rt) accesses the memory proportional stride bandwidth partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_PROP_rl) accesses the memory proportional stride bandwidth partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_MBW_PROP can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0500	MPAMCFG_MBW_PROP_s

The MPAMCFG_MBW_WINWD characteristics are:

Purpose

MPAMCFG_MBW_WINWD is a 32-bit register that shows and sets the value of the window width for the PARTID in [MPAMCFG_PART_SEL](#).

- MPAMCFG_MBW_WINWD_s reads and controls the bandwidth control window width for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#).
- MPAMCFG_MBW_WINWD_ns reads and controls the bandwidth control window width for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#).
- MPAMCFG_MBW_WINWD_rt reads and controls the bandwidth control window width for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#).
- MPAMCFG_MBW_WINWD_rl reads and controls the bandwidth control window width for the Real PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

MPAMCFG_MBW_WINWD_s reads and controls the bandwidth control window width for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_WINWD_ns reads and controls the bandwidth control window width for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_WINWD_rt reads and controls the bandwidth control window width for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_WINWD_rl reads and controls the bandwidth control window width for the Real PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

MPAMCFG_MBW_WINWD is read-only if [MPAMF_MBW_IDR](#).WINDWR == 0, and the window width is set by the hardware, even if variable.

MPAMCFG_MBW_WINWD is read/write if [MPAMF_MBW_IDR](#).WINDWR == 1, permitting configuration of the window width for each PARTID independently on hardware that supports this functionality.

If [MPAME_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_WINWD is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_MBW_PART == 1. Otherwise, direct accesses to MPAMCFG MBW_WINWD are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_WINWD is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								US_INT																US_FRAC							

Bits [31:24]

Reserved, RES0.

US_INT, bits [23:8]

Window width, integer microseconds.

This field reads (and sets) the integer part of the window width in microseconds for the PARTID selected by [MPAMCFG_PART_SEL](#).

US_FRAC, bits [7:0]

Window width, fractional microseconds.

This field reads (and sets) the fractional part of the window width in microseconds for the PARTID selected by [MPAMCFG_PART_SEL](#).

Accessing MPAMCFG_MBW_WINWD

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_MBW_WINWD_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_WINWD_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_WINWD_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_WINWD_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_WINWD_s, MPAMCFG_MBW_WINWD_ns, MPAMCFG_MBW_WINWD_rt, and MPAMCFG_MBW_WINWD_rl must be separate registers.

- The Secure instance (MPAMCFG_MBW_WINWD_s) accesses the window width used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_WINWD_ns) accesses the window width used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_WINWD_rt) accesses the window width used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_WINWD_rl) accesses the window width used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_MBW_WINWD can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0220	MPAMCFG_MBW_WINWD_s

This interface is accessible as follows:

- When MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are **RO**.
- When MPAMF_MBW_IDR.WINDWR == 1 accesses to this register are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0220	MPAMCFG_MBW_WINWD_ns

This interface is accessible as follows:

- When MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are **RO**.

This interface is accessible as follows:

- This interface is accessible as follows:

MPAMCFG_PART_SEL, MPAM Partition Configuration Selection Register

The MPAMCFG_PART_SEL characteristics are:

Purpose

Selects a partition ID to configure.

- MPAMCFG_PART_SEL_s selects a Secure PARTID to configure.
- MPAMCFG_PART_SEL_ns selects a Non-secure PARTID to configure.
- MPAMCFG_PART_SEL_rt selects a Root PARTID to configure.
- MPAMCFG_PART_SEL_rl selects a Realm PARTID to configure.

MPAMCFG_PART_SEL_s selects a Secure PARTID to configure. MPAMCFG_PART_SEL_ns selects a Non-secure PARTID to configure. MPAMCFG_PART_SEL_rt selects a Root PARTID to configure. MPAMCFG_PART_SEL_rl selects a Realm PARTID to configure.

After setting this register with a PARTID, software (usually a hypervisor) can perform a series of accesses to MPAMCFG registers to configure parameters for MPAM resource controls to use when requests have that PARTID.

Configuration

The power domain of MPAMCFG_PART_SEL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and (MPAMF_IDR.HAS_CCAP_PART == 1, or MPAMF_IDR.HAS_CPOR_PART == 1, or MPAMF_IDR.HAS_MBW_PART == 1, or MPAMF_IDR.HAS_PRI_PART == 1, or MPAMF_IDR.HAS_PARTID_NRW == 1, or (MPAMF_IDR.EXT == 0 and MPAMF_IDR.HAS_IMPL_IDR == 1) or (MPAMF_IDR.EXT == 1, MPAMF_IDR.HAS_IMPL_IDR == 1 and MPAMF_IDR.NO_IMPL_PART == 0)). Otherwise, direct accesses to MPAMCFG_PART_SEL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_PART_SEL is a 32-bit register.

Reserved, RES0.

RIS, bits [27:24]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MPAMCFG registers and describe with MPAMF ID registers.

Otherwise:

Reserved, RES0.

Bits [23:17]

Reserved, RES0.

INTERNAL, bit [16]

Internal PARTID.

If [MPAMF_IDR.HAS_PARTID_NRW](#) = 0, this field is RAZ/WI.

If [MPAMF_IDR.HAS_PARTID_NRW](#) = 1:

INTERNAL	Meaning
0b0	PARTID_SEL is interpreted as a request PARTID and ignored except for use with MPAMCFG_INTPARTID register access.
0b1	PARTID_SEL is interpreted as an internal PARTID and used for access to MPAMCFG control settings except for MPAMCFG_INTPARTID .

If PARTID narrowing is implemented as indicated by [MPAMF_IDR.HAS_PARTID_NRW](#) = 1, when accessing other MPAMCFG registers the value of the MPAMCFG_PART_SEL.INTERNAL bit is checked for these conditions:

- When the [MPAMCFG_INTPARTID](#) register is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 0, an Unexpected_INTERNAL error is set in [MPAMF_ESR](#).
- When an MPAMCFG register other than [MPAMCFG_INTPARTID](#) is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 1, [MPAMF_ESR](#) is set to indicate an intPARTID_Range error.

In either error case listed here, the value returned by a read operation is UNPREDICTABLE, and the control settings are not affected by a write.

PARTID_SEL, bits [15:0]

Selects the partition ID to configure.

Reads and writes to other MPAMCFG registers are indexed by PARTID_SEL and by the NS bit used to access MPAMCFG_PART_SEL to access the configuration for a single partition.

Accessing MPAMCFG_PART_SEL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_PART_SEL_s must be accessible from the Secure MPAM feature page. MPAMCFG_PART_SEL_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_PART_SEL_s and MPAMCFG_PART_SEL_ns must be separate registers. The Secure instance (MPAMCFG_PART_SEL_s) accesses the PARTID selector used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_PART_SEL_ns) accesses the PARTID selector used for Non-secure PARTIDs.

MPAMCFG_PART_SEL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0100	MPAMCFG_PART_SEL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
-----------	-------	--------	----------

MPAM	MPAMF_BASE_ns	0x0100	MPAMCFG_PART_SEL_ns
------	---------------	--------	---------------------

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0100	MPAMCFG_PART_SEL_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0100	MPAMCFG_PART_SEL_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_PRI, MPAM Priority Partition Configuration Register

The MPAMCFG_PRI characteristics are:

Purpose

Controls the internal and downstream priority of requests attributed to the PARTID selected by [MPAMCFG_PART_SEL](#).

- ~~MPAMCFG_PRI_s controls the priorities for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#).~~
- ~~MPAMCFG_PRI_ns controls the priorities for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#).~~
- ~~MPAMCFG_PRI_rt controls the priorities for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#).~~
- ~~MPAMCFG_PRI_rl controls the priorities for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).~~

~~MPAMCFG_PRI_s controls the priorities for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_PRI_ns controls the priorities for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_PRI_rt controls the priorities for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_PRI_rl controls the priorities for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).~~

If [MPAMF_IDR](#).HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

Configuration

The power domain of MPAMCFG_PRI is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PRI_PART == 1. Otherwise, direct accesses to MPAMCFG_PRI are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_PRI is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DSPRI																INTPRI															

DSPRI, bits [31:16]

Downstream priority.

If [MPAMF_PRI_IDR](#).HAS_DSPRI == 0, bits of this field are RES0 as this field is not used.

If [MPAMF_PRI_IDR](#).HAS_DSPRI == 1, this field is a priority value applied to downstream communications from this MSC for transactions of the partition selected by [MPAMCFG_PART_SEL](#).

The implemented width of this field is [MPAMF_PRI_IDR](#).DSPRI_WD bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of [MPAMF_PRI_IDR.DSPRI_0_IS_LOW](#).

INTPRI, bits [15:0]

Internal priority.

If [MPAMF_PRI_IDR.HAS_INTPRI](#) == 0, bits of this field are RES0 as this field is not used.

If [MPAMF_PRI_IDR.HAS_INTPRI](#) == 1, this field is a priority value applied internally inside this MSC for transactions of the partition selected by [MPAMCFG_PART_SEL](#).

The implemented width of this field is [MPAMF_PRI_IDR.INTPRI_WD](#) bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of [MPAMF_PRI_IDR.INTPRI_0_IS_LOW](#).

Accessing MPAMCFG_PRI

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_PRI_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_PRI_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_PRI_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_PRI_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_PRI_s, MPAMCFG_PRI_ns, MPAMCFG_PRI_rt, and MPAMCFG_PRI_rl must be separate registers.

- The Secure instance (MPAMCFG_PRI_s) accesses the priority partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_PRI_ns) accesses the priority partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_PRI_rt) accesses the priority partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_PRI_rl) accesses the priority partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the priority resource instance selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

When RIS is not implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

When PARTID narrowing is implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#), and [MPAMCFG_PART_SEL.INTERNAL](#) must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#), and [MPAMCFG_PART_SEL.INTERNAL](#) must be 0.

MPAMCFG_PRI can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0400	MPAMCFG_PRI_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0400	MPAMCFG_PRI_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
-----------	-------	--------	----------

MPAM	MPAMF_BASE_rt	0x0400	MPAMCFG_PRI_rt
------	---------------	--------	----------------

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0400	MPAMCFG_PRI_rl

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

-------	----------------	-------

MPAMF_CCAP_IDR, MPAM Features Cache Capacity Partitioning ID register

The MPAMF_CCAP_IDR characteristics are:

Purpose

Indicates the number of fractional bits in [MPAMCFG_CMAX](#).CMAX.

- [MPAMF_CCAP_IDR_s](#) indicates the number of fractional bits in the Secure instance of [MPAMCFG_CMAX](#).
- [MPAMF_CCAP_IDR_ns](#) indicates the number of fractional bits in the Non-secure instance of [MPAMCFG_CMAX](#).
- [MPAMF_CCAP_IDR_rt](#) indicates the number of fractional bits in the Root cache capacity control settings register field, [MPAMCFG_CMAX](#).CMAX.
- [MPAMF_CCAP_IDR_rl](#) indicates the number of fractional bits in the Realm cache capacity control settings register field, [MPAMCFG_CMAX](#).CMAX.

[MPAMF_CCAP_IDR_s](#) indicates the number of fractional bits in the Secure instance of [MPAMCFG_CMAX](#).
[MPAMF_CCAP_IDR_ns](#) indicates the number of fractional bits in the Non-secure instance of [MPAMCFG_CMAX](#).
[MPAMF_CCAP_IDR_rt](#) indicates the number of fractional bits in the Root cache capacity control settings register field, [MPAMCFG_CMAX](#).CMAX. [MPAMF_CCAP_IDR_rl](#) indicates the number of fractional bits in the Realm cache capacity control settings register field, [MPAMCFG_CMAX](#).CMAX.

When [MPAMF_IDR.HAS_RIS](#) is 1, some fields in this register give information for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. The description of every field that is affected by [MPAMCFG_PART_SEL](#).RIS has information within the field description.

Configuration

The power domain of MPAMF_CCAP_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CCAP_PART == 1. Otherwise, direct accesses to MPAMF_CCAP_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_CCAP_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																										CMAX_WD					

Bits [31:6]

Reserved, RES0.

CMAX_WD, bits [5:0]

Number of fractional bits implemented in the cache capacity partitioning control, [MPAMCFG_CMAX](#).CMAX, of this device. See [MPAMCFG_CMAX](#).

This field must contain a value from 1 to 16, inclusive.

If RIS is implemented, this field indicates the number of fractional bits in the cache capacity partitioning control for the resource instance selected by [MPAMCFG PART SEL](#).RIS.

Accessing MPAMF CCAP IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF CCAP IDR is read-only.

MPAMF CCAP IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_CCAP_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_CCAP_IDR_s is permitted to have either the same or different contents to MPAMF_CCAP_IDR_ns, MPAMF_CCAP_IDR_rt, or MPAMF_CCAP_IDR_rl.
- MPAMF_CCAP_IDR_ns is permitted to have either the same or different contents to MPAMF_CCAP_IDR_rt or MPAMF_CCAP_IDR_rl.
- MPAMF_CCAP_IDR_rt is permitted to have either the same or different contents to MPAMF_CCAP_IDR_rl.

There must be separate registers in the Secure (MPAMF_CCAP_IDR_s), Non-secure (MPAMF_CCAP_IDR_ns), Root (MPAMF_CCAP_IDR_rt), and Realm (MPAMF_CCAP_IDR_rl) MPAM feature pages.

When [MPAMF_IDR](#).HAS_RIS is 1, MPAMF_CCAP_IDR shows the configuration of cache capacity partitioning for the cache resource instance selected by [MPAMCFG_PART_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF CCAP IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF BASE s	0x0038	MPAMF CCAP IDR s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE ns	0x0038	MPAMF_CCAP_IDR ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF BASE rt	0x0038	MPAMF CCAP IDR rt

When FEAT RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF BASE rl	0x0038	MPAMF CCAP IDR rl

When FEAT RME is implemented access on this interface are **RO**.

30/06/2021 15:09:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

MPAMF_CPOR_IDR, MPAM Features Cache Portion Partitioning ID register

The MPAMF_CPOR_IDR characteristics are:

Purpose

Indicates the number of bits in [MPAMCFG_CPBM<n>](#).

- [MPAMF_CPOR_IDR_s](#) indicates the number of bits in the Secure instance of [MPAMCFG_CPBM<n>](#).
- [MPAMF_CPOR_IDR_ns](#) indicates the number of bits in the Non-secure instance of [MPAMCFG_CPBM<n>](#).
- [MPAMF_CPOR_IDR_rt](#) indicates the number of bits in the Root instance of [MPAMCFG_CPBM<n>](#).
- [MPAMF_CPOR_IDR_rl](#) indicates the number of bits in the Realm instance of [MPAMCFG_CPBM<n>](#).

[MPAMF_CPOR_IDR_s](#) indicates the number of bits in the Secure instance of [MPAMCFG_CPBM<n>](#).

[MPAMF_CPOR_IDR_ns](#) indicates the number of bits in the Non-secure instance of [MPAMCFG_CPBM<n>](#).

[MPAMF_CPOR_IDR_rt](#) indicates the number of bits in the Root instance of [MPAMCFG_CPBM<n>](#).

[MPAMF_CPOR_IDR_rl](#) indicates the number of bits in the Realm instance of [MPAMCFG_CPBM<n>](#).

When [MPAMF_IDR.HAS_RIS](#) is 1, some fields in this register give information for the resource instance selector, [MPAMCFG_PART_SEL.RIS](#). The description of every field that is affected by [MPAMCFG_PART_SEL.RIS](#) has information within the field description.

Configuration

The power domain of MPAMF_CPOR_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CPOR_PART == 1. Otherwise, direct accesses to MPAMF_CPOR_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_CPOR_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																CPBM_WD															

Bits [31:16]

Reserved, RES0.

CPBM_WD, bits [15:0]

Number of bits in the cache portion partitioning bit map of this device. See [MPAMCFG_CPBM<n>](#).

This field must contain a value from 1 to 32768, inclusive. Values greater than 32 require a group of 32-bit registers to access the CPBM, up to 1024 if CPBM_WD is the largest value.

If RIS is implemented, this field indicates the number bits in the cache portion bitmap for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#).

Accessing MPAMF_CPOR_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_CPOR_IDR is read-only.

MPAMF_CPOR_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_CPOR_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_CPOR_IDR_s is permitted to have either the same or different contents to MPAMF_CPOR_IDR_ns, MPAMF_CPOR_IDR_rt, or MPAMF_CPOR_IDR_rl.
- MPAMF_CPOR_IDR_ns is permitted to have either the same or different contents to MPAMF_CPOR_IDR_rt or MPAMF_CPOR_IDR_rl.
- MPAMF_CPOR_IDR_rt is permitted to have either the same or different contents to MPAMF_CPOR_IDR_rl.

There must be separate registers in the Secure (MPAMF_CPOR_IDR_s), Non-secure (MPAMF_CPOR_IDR_ns), Root (MPAMF_CPOR_IDR_rt), and Realm (MPAMF_CPOR_IDR_rl) MPAM feature pages.

When [MPAMF_IDR.HAS_RIS](#) is 1, MPAMF_CPOR_IDR shows the configuration of cache portion partitioning for the cache resource instance selected by [MPAMCFG_PART_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_CPOR_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0030	MPAMF_CPOR_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0030	MPAMF_CPOR_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0030	MPAMF_CPOR_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0030	MPAMF_CPOR_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

The MPAMF CSUMON IDR characteristics are:

Indicates the number of cache storage usage monitor instances and other properties of the CSU monitoring.

- MPAMF_CSUMON_IDR_s indicates the number and properties of Secure cache storage usage monitoring.
- MPAMF_CSUMON_IDR_ns indicates the number and properties of Non-secure cache storage usage monitoring.
- MPAMF_CSUMON_IDR_rt indicates the number and properties of Root cache storage usage monitoring.
- MPAMF_CSUMON_IDR_rl indicates the number and properties of Realm cache storage usage monitoring.

MPAMF_CSUMON_IDR_s indicates the number and properties of Secure cache storage usage monitoring.
MPAMF_CSUMON_IDR_ns indicates the number and properties of Non-secure cache storage usage monitoring.
MPAMF_CSUMON_IDR_rt indicates the number and properties of Root cache storage usage monitoring.
MPAMF_CSUMON_IDR_rl indicates the number and properties of Realm cache storage usage monitoring.

If `MPAMF_IDR.HAS_RIS` is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by `MPAMCFG_PART_SEL.RIS`. Fields that do not mention RIS are constant across all resource instances.

The power domain of MPAMF_CSUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MPAMF_CSUMON_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

MPAMF CSUMON IDR is a 32-bit register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HAS_CAPTURE	CSU_RO	RES0	HAS_OFSR	RES0												NUM_MON															

HAS_CAPTURE, bit [31]

The implementation supports copying an `MSMON_CSU` to the corresponding `MSMON_CSU_CAPTURE` on a capture event.

HAS_CAPTURE	Meaning
0b0	MSMON_CSU_CAPTURE is not implemented and there is no support for capture events in the CSU monitor.
0b1	The MSMON_CSU_CAPTURE register is implemented and the CSU monitor supports the capture event behavior.

If RIS is implemented, this field indicates that CSU monitor capture is implemented for the resource instance selected by [MPAMCFG PART_SEL](#).RIS.

CSU_RO, bit [30]

The implementation of [MSMON_CSU](#) is read-only.

CSU_RO	Meaning
0b0	MSMON_CSU is read/write.
0b1	MSMON_CSU is read-only.

If RIS is implemented, this field indicates that the [MSMON_CSU](#) monitor register is read-only for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [29:27]

Reserved, RES0.

HAS_OFSR, bit [26]

When [FEAT_MPAMv0p1](#) is implemented or [FEAT_MPAMv1p1](#) is implemented:

The CSU monitor overflow status bitmap register, [MSMON_CSU_OFSR](#), is implemented.

HAS_OFSR	Meaning
0b0	MSMON_CSU_OFSR register is not implemented.
0b1	MSMON_CSU_OFSR register is implemented.

If RIS is implemented, this field indicates that CSU monitor overflow status bitmap register is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

Bits [25:16]

Reserved, RES0.

NUM_MON, bits [15:0]

The number of cache storage usage monitor instances implemented.

The largest [MSMON_CFG_MON_SEL](#).MON_SEL value is NUM_MON minus 1.

If RIS is implemented, this field indicates the number of CSU monitor instances implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_CSUMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_CSUMON_IDR is read-only.

MPAMF_CSUMON_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_CSUMON_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_CSUMON_IDR_s is permitted to have either the same or different contents to MPAMF_CSUMON_IDR_ns, MPAMF_CSUMON_IDR_rt, or MPAMF_CSUMON_IDR_rl.
- MPAMF_CSUMON_IDR_ns is permitted to have either the same or different contents to MPAMF_CSUMON_IDR_rt or MPAMF_CSUMON_IDR_rl.
- MPAMF_CSUMON_IDR_rt is permitted to have either the same or different contents to MPAMF_CSUMON_IDR_rl.

There must be separate registers in the Secure (MPAMF_CSUMON_IDR_s), Non-secure (MPAMF_CSUMON_IDR_ns), Root (MPAMF_CSUMON_IDR_rt), and Realm (MPAMF_CSUMON_IDR_rl) MPAM feature pages.

When [MPAMF_IDR.HAS_RIS](#) is 1, [MPAMF_CSUMON_IDR](#) shows the configuration of cache storage usage monitoring for the cache resource instance selected by [MPAMCFG_PART_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF_CSUMON_IDR is not affected by [MSMON_CFG_MON_SEL](#).RIS.

MPAMF_CSUMON_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0088	MPAMF_CSUMON_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE _{ns}	0x0088	MPAMF_CSUMON_IDR _{ns}

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0088	MPAMF_CSUMON_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x0088	MPAMF_CSUMON_IDR_r1

When FEAT_RME is implemented access on this interface are **RO**.

30/06/2021 15:09:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

The MPAMF_ECR characteristics are:

Purpose

MPAMF_ECR is a 32-bit read/write register that controls MPAM error interrupts for this MSC.

- MPAMF_ECR_s controls Secure MPAM error handling.
- MPAMF_ECR_ns controls Non-secure MPAM error handling.
- MPAMF_ECR_rt controls Root MPAM error handling.
- MPAMF_ECR_rl controls Realm MPAM error handling.

MPAMF_ECR_s controls Secure MPAM error handling. MPAMF_ECR_ns controls Non-secure MPAM error handling. MPAMF_ECR_rt controls Root MPAM error handling. MPAMF_ECR_rl controls Realm MPAM error handling.

Configuration

The power domain of MPAMF_ECR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_ECR are RES0.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the [MPAMF_ESR](#) and MPAMF_ECR must be RAZ/WI.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ECR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

RES0 INTEN

Bits [31:1]

Reserved, RES0.

INTEN, bit [0]

Interrupt Enable.

INTEN	Meaning
0b0	MPAM error interrupts are not signaled.
0b1	MPAM error interrupts are signaled.

Accessing MPAMF ECR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMF_ECR_s must be accessible from the Secure MPAM feature page.
- MPAMF_ECR_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ECR_rt must be accessible from the Root MPAM feature page.
- MPAMF_ECR_rl must be accessible from the Realm MPAM feature page.

MPAMF_ECR_s, MPAMF_ECR_ns, MPAMF_ECR_rt, and MPAMF_ECR_rl must be separate registers.

- The Secure instance (MPAMF_ECR_s) accesses the error interrupt controls used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ECR_ns) accesses the error interrupt controls used for Non-secure PARTIDs.
- The Root instance (MPAMF_ECR_rt) accesses the error interrupt controls used for Root PARTIDs.
- The Realm instance (MPAMF_ECR_rl) accesses the error interrupt controls used for Realm PARTIDs.

MPAMF_ECR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00F0	MPAMF_ECR_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00F0	MPAMF_ECR_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00F0	MPAMF_ECR_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00F0	MPAMF_ECR_rl

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 1509:2239: 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

MPAMF_ERR_MSI_ADDR_H, MPAM Error MSI High-part Address Register

The MPAMF_ERR_MSI_ADDR_H characteristics are:

Purpose

MPAMF_ERR_MSI_ADDR_H is a 32-bit read/write register for the high part of the MPAM error MSI address.

- MPAMF_ERR_MSI_ADDR_H_s is the high part of the MSI write address for error interrupts related to Secure PARTIDs.
- MPAMF_ERR_MSI_ADDR_H_ns is the high part of the MSI write address for error interrupts related to Non-secure PARTIDs.
- MPAMF_ERR_MSI_ADDR_H_rt is the high part of the MSI write address for error interrupts related to Root PARTIDs.
- MPAMF_ERR_MSI_ADDR_H_rl is the high part of the MSI write address for error interrupts related to Realm PARTIDs.

MPAMF_ERR_MSI_ADDR_H_s is the high part of the MSI write address for error interrupts related to Secure PARTIDs. MPAMF_ERR_MSI_ADDR_H_ns is the high part of the MSI write address for error interrupts related to Non-secure PARTIDs. MPAMF_ERR_MSI_ADDR_H_rt is the high part of the MSI write address for error interrupts related to Root PARTIDs. MPAMF_ERR_MSI_ADDR_H_rl is the high part of the MSI write address for error interrupts related to Realm PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_ADDR_H is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_ADDR_H are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ADDR_H is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												MSI_ADDR_H																			

Bits [31:20]

Reserved, RES0.

MSI_ADDR_H, bits [19:0]

MSI write address bits[51:32].

Accessing MPAMF_ERR_MSI_ADDR_H

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMF_ERR_MSI_ADDR_H_s must be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_ADDR_H_s, MPAMF_ERR_MSI_ADDR_H_ns, MPAMF_ERR_MSI_ADDR_H_rt, and MPAMF_ERR_MSI_ADDR_H_rl must be separate registers.

- The Secure instance (MPAMF_ERR_MSI_ADDR_H_s) accesses the high part of the memory address for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ADDR_H_ns) accesses the high part of the memory address for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ADDR_H_rt) accesses the high part of the memory address for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ADDR_H_rl) accesses the high part of the memory address for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_ADDR_H can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00E4	MPAMF_ERR_MSI_ADDR_H_s

Accesses on this interface are **RW**.

MPAMF_ERR_MSI_ADDR_L, MPAM Error MSI Low-part Address Register

The MPAMF_ERR_MSI_ADDR_L characteristics are:

Purpose

MPAMF_ERR_MSI_ADDR_L is a 32-bit read/write register for the low part of the MPAM error MSI address.

- MPAMF_ERR_MSI_ADDR_L_s is the low part of the MSI write address for error interrupts related to Secure PARTIDs.
- MPAMF_ERR_MSI_ADDR_L_ns is the low part of the MSI write address for error interrupts related to Non-secure PARTIDs.
- MPAMF_ERR_MSI_ADDR_L_rt is the low part of the MSI write address for error interrupts related to Root PARTIDs.
- MPAMF_ERR_MSI_ADDR_L_rl is the low part of the MSI write address for error interrupts related to Realm PARTIDs.

MPAMF_ERR_MSI_ADDR_L_s is the low part of the MSI write address for error interrupts related to Secure PARTIDs. MPAMF_ERR_MSI_ADDR_L_ns is the low part of the MSI write address for error interrupts related to Non-secure PARTIDs. MPAMF_ERR_MSI_ADDR_L_rt is the low part of the MSI write address for error interrupts related to Root PARTIDs. MPAMF_ERR_MSI_ADDR_L_rl is the low part of the MSI write address for error interrupts related to Realm PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_ADDR_L is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_ADDR_L are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ADDR_L is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MSI_ADDR_L																		Bits[1:0]													

MSI_ADDR_L, bits [31:2]

MSI write address bits[31:2].

Bits [1:0]

Reads as 0b00.

Access to this field is **RO**.

Accessing MPAMF_ERR_MSI_ADDR_L

This register is within the MPAM feature page memory frames.

- MPAMF_ERR_MSI_ADDR_L_s must be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_L_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_L_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_ADDR_L_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_ADDR_L_s, MPAMF_ERR_MSI_ADDR_L_ns, MPAMF_ERR_MSI_ADDR_L_rt, and MPAMF_ERR_MSI_ADDR_L_rl must be separate registers.

- The Secure instance (MPAMF_ERR_MSI_ADDR_L_s) accesses the low part of the memory address for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ADDR_L_ns) accesses the low part of the memory address for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ADDR_L_rt) accesses the low part of the memory address for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ADDR_L_rl) accesses the low part of the memory address for MSI write to signal an MPAM error used for Realm PARTIDs.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00E0	MPAMF_ERR_MSI_ADDR_L_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00E0	MPAMF_ERR_MSI_ADDR_L_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00E0	MPAMF_ERR_MSI_ADDR_L_rt

When FEAT RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00E0	MPAMF_ERR_MSI_ADDR_L_rl

When FEAT RME is implemented access on this interface are **RW**.

MSI_MEMATTR, bits [27:24]

Memory attributes of MSI writes.

Note: This encoding matches the VMSAv8-64 stage 2 MemAttr[3:0] field as described in the Arm ARM, except that the following encodings are Reserved (not UNPREDICTABLE) and behave as Device-nGnRnE: 0b0100, 0b1000, and 0b1100.

MSI_MEMATTR	Meaning
0b0000	Device-nGnRnE.
0b0001	Device-nGnRE.
0b0010	Device-nGRE.
0b0011	Device-GRE.
0b0100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b0101	Normal Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal Inner Write-Through Cacheable, Outer Non-cacheable.
0b0111	Normal Inner Write-Back Cacheable, Outer Non-cacheable.
0b1000	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1001	Normal Inner Non-Cachable, Outer Write-Through Cacheable.
0b1010	Normal Inner Write-Through Cacheable, Outer Write-Through Cacheable.
0b1011	Normal Inner Write-Back Cacheable, Outer Write-Through Cacheable.
0b1100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1101	Normal Inner Non-cacheable, Outer Write-Back Cacheable.
0b1110	Normal Inner Write-Through Cacheable, Outer Write-Back Cacheable.
0b1111	Normal Inner Write-Back Cacheable, Outer Write-Back Cacheable.

When this field specifies a Device memory type, the contents of MPAMF_ERR_MSI_ATTR.MSI_SH are IGNORED and Shareability is effectively Outer Shareable.

Device types may be implemented as any Device type with more than 'n' characters. For example, if this field is set to 0b0010, an implementation may treat the MSI write as the specified type, Device-nGRE, or as Device-nGnRE or as Device-nGnRnE.

Reserved encodings 0b0100, 0b1000, and 0b1100 must be implemented to behave the same as the 0b0000 encoding.

Bits [23:1]

Reserved, RES0.

MSIEN, bit [0]

Error interrupt MSI Enable.

MSIEN	Meaning
0b0	MPAM error MSI writes are not generated to signal enabled MPAM error interrupts. When error MSI writes are disabled, hardwired error interrupts could be generated.
0b1	MPAM error MSI writes are generated to signal enabled MPAM error interrupts. When error MSI writes are enabled, hardwired error interrupts are not generated.

The value of this field affects whether hardwired error interrupts are generated.

The reset behaviour of this field is:

- On a MSC reset, this field resets to 0.

Accessing MPAMF_ERR_MSI_ATTR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMF_ERR_MSI_ATTR_s must be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_ATTR_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_ATTR_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_ATTR_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_ATTR_s, MPAMF_ERR_MSI_ATTR_ns, MPAMF_ERR_MSI_ATTR_rt, and MPAMF_ERR_MSI_ATTR_rl must be separate registers.

- The Secure instance (MPAMF_ERR_MSI_ATTR_s) accesses the memory access attributes for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ATTR_ns) accesses the memory access attributes for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ATTR_rt) accesses the memory access attributes for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ATTR_rl) accesses the memory access attributes for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_ATTR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00EC	MPAMF_ERR_MSI_ATTR_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00EC	MPAMF_ERR_MSI_ATTR_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00EC	MPAMF_ERR_MSI_ATTR_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00EC	MPAMF_ERR_MSI_ATTR_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_ERR_MSI_DATA, MPAM Error MSI Data Register

The MPAMF_ERR_MSI_DATA characteristics are:

Purpose

MPAMF_ERR_MSI_DATA is a 32-bit read/write register for the MPAM error MSI data.

- ~~MPAMF_ERR_MSI_DATA_s is the data for the MSI write for error interrupts related to Secure PARTIDs.~~
- ~~MPAMF_ERR_MSI_DATA_ns is the data for the MSI write for error interrupts related to Non-secure PARTIDs.~~
- ~~MPAMF_ERR_MSI_DATA_rt is the data for the MSI write for error interrupts related to Root PARTIDs.~~
- ~~MPAMF_ERR_MSI_DATA_rl is the data for the MSI write for error interrupts related to Realm PARTIDs.~~

MPAMF_ERR_MSI_DATA_s is the data for the MSI write for error interrupts related to Secure PARTIDs.

MPAMF_ERR_MSI_DATA_ns is the data for the MSI write for error interrupts related to Non-secure PARTIDs.

MPAMF_ERR_MSI_DATA_rt is the data for the MSI write for error interrupts related to Root PARTIDs.

MPAMF_ERR_MSI_DATA_rl is the data for the MSI write for error interrupts related to Realm PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_DATA is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_DATA are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_DATA is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																MSI_DATA															

MSI_DATA, bits [31:0]

MSI data to be written to ITS to signal an MSI.

Accessing MPAMF_ERR_MSI_DATA

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMF_ERR_MSI_DATA_s must be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_DATA_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_DATA_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_DATA_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_DATA_s, MPAMF_ERR_MSI_DATA_ns, MPAMF_ERR_MSI_DATA_rt, and MPAMF_ERR_MSI_DATA_rl must be separate registers.

- The Secure instance (MPAMF_ERR_MSI_DATA_s) accesses the data for MSI write to signal an MPAM error used for Secure PARTIDs.

- The Non-secure instance (MPAMF_ERR_MSI_DATA_ns) accesses the data for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_DATA_rt) accesses the data for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_DATA_rl) accesses the data for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_DATA can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00E8	MPAMF_ERR_MSI_DATA_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00E8	MPAMF_ERR_MSI_DATA_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00E8	MPAMF_ERR_MSI_DATA_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00E8	MPAMF_ERR_MSI_DATA_rl

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

(old)

htmldiff from-

(new)

The reset behaviour of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMF_ERR_MSI_MPAM

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMF_ERR_MSI_MPAM_s must be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_MPAM_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_MPAM_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_MPAM_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_MPAM_s, MPAMF_ERR_MSI_MPAM_ns, MPAMF_ERR_MSI_MPAM_rt, and MPAMF_ERR_MSI_MPAM_rl must be separate registers.

- The Secure instance (MPAMF_ERR_MSI_MPAM_s) accesses the MPAM information for MSI write request to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_MPAM_ns) accesses the MPAM information for MSI write request to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_MPAM_rt) accesses the MPAM information for MSI write request to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_MPAM_rl) accesses the MPAM information for MSI write request to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_MPAM can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00DC	MPAMF_ERR_MSI_MPAM_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00DC	MPAMF_ERR_MSI_MPAM_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00DC	MPAMF_ERR_MSI_MPAM_rt

When FEAT RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x00DC	MPAMF_ERR_MSI_MPAM_r1

When FEAT RME is implemented access on this interface are **RW**.

The MPAMF_ESR characteristics are:

Purpose

Indicates MPAM error status for this MSC.

- `MPAMF_ESR_s` reports Secure MPAM errors.
- `MPAMF_ESR_ns` reports Non-secure MPAM errors.
- `MPAMF_ESR_rt` reports Root MPAM errors.
- `MPAMF_ESR_rl` reports Realm MPAM errors.

MPAMF_ESR_s reports Secure MPAM errors. MPAMF_ESR_ns reports Non-secure MPAM errors. MPAMF_ESR_rt reports Root MPAM errors. MPAMF_ESR_rl reports Realm MPAM errors.

Software should write this register after reading the status of an error to reset **ERRCODE** to 0x0000 and **OVRWR** to 0 so that future errors are not reported with **OVRWR** set.

Configuration

The power domain of MPAMF_ESR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_ESR are RES0.

MPAMF_ESR is 64-bit register when MPAM v0.1 or v1.1 is implemented and MPAMF_IDR.HAS_EXTD_ESR == 1.

Otherwise, MPAMF ESR is a 32-bit register.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the MPAMF ESR and [MPAMF ECR](#) must be RAZ/WI.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ESR is a:

- 64-bit register when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_EXTD_ESR == 1
- 32-bit register otherwise

Field descriptions

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF IDR.HAS EXT D ESR == 1:

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32																															
RES0																														RIS	
OVRWR	RES0		ERRCODE		PMG										PARTID_MON																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:36]

Reserved, RES0.

RIS, bits [35:32]

When MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. Where applicable to the ERRCODE, captures the RIS value for the error.

Otherwise:

Reserved, RES0.

OVRWR, bit [31]

Overwritten.

If 0 and ERRCODE == 0b0000, no errors have occurred.

If 0 and ERRCODE is non-zero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is non-zero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is zero must not be produced by hardware and is only reached when software writes this combination into this register.

Bits [30:28]

Reserved, RES0.

ERRCODE, bits [27:24]

Error code.

ERRCODE	Meaning
0b0000	No error.
0b0001	PARTID_SEL_Range.
0b0010	Req_PARTID_Range.
0b0011	MSMONCFG_ID_RANGE.
0b0100	Req_PMG_Range.
0b0101	Monitor_Range.
0b0110	intPARTID_Range.
0b0111	Unexpected_INTERNAL.
0b1000	Undefined_RIS_PART_SEL.
0b1001	RIS_No_Control.
0b1010	Undefined_RIS_MON_SEL.
0b1011	RIS_No_Monitor.
0b1100	Reserved.
0b1101	Reserved.
0b1110	Reserved.
0b1111	Reserved.

PMG, bits [23:16]

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to 0x00 on an error that does not capture PMG.

PARTID_MON, bits [15:0]

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OVRWR	RES0	ERRCODE	PMG						PARTID_MON																						

OVRWR, bit [31]

Overwritten.

If 0 and ERRCODE == 0b0000, no errors have occurred.

If 0 and ERRCODE is non-zero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is non-zero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is 0 must not be produced by hardware and is only reached when software writes this combination into this register.

Bits [30:28]

Reserved, RES0.

ERRCODE, bits [27:24]

Error code.

ERRCODE	Meaning
0b0000	No error.
0b0001	PARTID_SEL_Range.
0b0010	Req_PARTID_Range.
0b0011	MSMONCFG_ID_RANGE.
0b0100	Req_PMG_Range.
0b0101	Monitor_Range.
0b0110	intPARTID_Range.
0b0111	Unexpected_INTERNAL.
0b1000	Reserved.
0b1001	Reserved.
0b1010	Reserved.
0b1011	Reserved.
0b1100	Reserved.
0b1101	Reserved.
0b1110	Reserved.
0b1111	Reserved.

PMG, bits [23:16]

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to 0x00 on an error that does not capture PMG.

PARTID_MON, bits [15:0]

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0x0000.

Accessing MPAMF_ESR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMF_ESR_s must be accessible from the Secure MPAM feature page.
- MPAMF_ESR_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ESR_rt must be accessible from the Root MPAM feature page.
- MPAMF_ESR_rl must be accessible from the Realm MPAM feature page.

MPAMF_ESR_s, MPAMF_ESR_ns, MPAMF_ESR_rt, and MPAMF_ESR_rl must be separate registers.

- The Secure instance (MPAMF_ESR_s) accesses the error status used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ESR_ns) accesses the error status used for Non-secure PARTIDs.
- The Root instance (MPAMF_ESR_rt) accesses the error status used for Root PARTIDs.
- The Realm instance (MPAMF_ESR_rl) accesses the error status used for Realm PARTIDs.

MPAMF_ESR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00F8	MPAMF_ESR_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00F8	MPAMF_ESR_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00F8	MPAMF_ESR_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00F8	MPAMF_ESR_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_IDR, MPAM Features Identification Register

The MPAMF_IDR characteristics are:

Purpose

Indicates which memory partitioning and monitoring features are present on this MSC.

~~MPAMF_IDR_ns indicates the MPAM features accessed from the Non-secure MPAM feature page.~~

~~MPAMF_IDR_rt indicates the MPAM features accessed from the Root MPAM feature page.~~

~~MPAMF_IDR_rl indicates the MPAM features accessed from the Realm MPAM feature page.~~

MPAMF_IDR_s indicates the MPAM features accessed from the Secure MPAM feature page. MPAMF_IDR_ns indicates the MPAM features accessed from the Non-secure MPAM feature page. MPAMF_IDR_rt indicates the MPAM features accessed from the Root MPAM feature page. MPAMF_IDR_rl indicates the MPAM features accessed from the Realm MPAM feature page.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. The description of every field that is affected by [MPAMCFG_PART_SEL](#).RIS has that information within the field description.

Configuration

The power domain of MPAMF_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_IDR are RES0.

MPAMF_IDR is 64-bit register when MPAM v0.1 or v1.1 is implemented.

Otherwise, MPAMF_IDR is a 32-bit register.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_IDR is a:

- 64-bit register when FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented
- 32-bit register otherwise

Field descriptions

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

63	62	61	60	59	58	57	56	55
RES0				RIS_MAX				
HAS_PARTID_NRW	HAS_MSMON	HAS_IMPL_IDR_EXT	HAS_PRI_PART	HAS_MBW_PART	HAS_CPOR_PART	HAS_CCAP_PART		
31	30	29	28	27	26	25	24	23

Bits [63:60]

Reserved, RES0.

RIS_MAX, bits [59:56]

When **MPAMF_IDR.EXT == 1** and **MPAMF_IDR.HAS_RIS == 1**:

Maximum RIS value supported in [MPAMCFG_PART_SEL](#). Must be 0b0000 if [MPAMF_IDR.HAS_RIS == 0](#).

Otherwise:

Reserved, RES0.

Bits [55:42]

Reserved, RES0.

SP4, bit [41]

When **FEAT_RME** is implemented:

Indicates whether this MSC supports 4 PARTID spaces.

SP4	Meaning
0b0	This MSC supports two PARTID spaces.
0b1	This MSC supports four PARTID spaces.

This field must read the same in each instance of this register and for any value in [MPAMCFG_PART_SEL.RIS](#).

Otherwise:

Reserved, RES0.

HAS_ERR_MSI, bit [40]

When **MPAMF_IDR.EXT == 1**:

Has support for MSI writes to signal MPAM error interrupts. These registers are implemented: [MPAMF_ERR_MSI_ADDR_L](#), [MPAMF_ERR_MSI_ADDR_H](#), [MPAMF_ERR_MSI_ATTR](#), [MPAMF_ERR_MSI_DATA](#), and [MPAMF_ERR_MSI_MPAM](#).

HAS_ERR_MSI	Meaning
0b0	MPAMF_ERR_MSI_ADDR_L , MPAMF_ERR_MSI_ADDR_H , MPAMF_ERR_MSI_ATTR , MPAMF_ERR_MSI_DATA , and MPAMF_ERR_MSI_MPAM registers are not implemented.
0b1	MPAMF_ERR_MSI_ADDR_L , MPAMF_ERR_MSI_ADDR_H , MPAMF_ERR_MSI_ATTR , MPAMF_ERR_MSI_DATA , and MPAMF_ERR_MSI_MPAM are implemented and can be used to generate writes to signal error interrupts.

If [MPAMF_IDR.HAS_ESR](#) is 0, this bit must also be 0.

Otherwise:

Reserved, RES0.

HAS_ESR, bit [39]

When **MPAMF_IDR.EXT == 1**:

[MPAMF_ESR](#) is implemented.

HAS_ESR	Meaning
0b0	MPAMF_ESR , MPAMF_ECR , and MPAM error handling are not implemented.
0b1	MPAMF_ESR , MPAMF_ECR , and MPAM error handling are implemented.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the [MPAMF_ESR](#) and [MPAMF_ECR](#) must be RAZ/WI.

Otherwise:

Reserved, RES0.

HAS_EXTD_ESR, bit [38]

When [MPAMF_IDR.EXT](#) == 1:

[MPAMF_ESR](#) is 64 bits.

HAS_EXTD_ESR	Meaning
0b0	MPAMF_ESR is 32 bits.
0b1	MPAMF_ESR is 64 bits.

When [MPAMF_IDR.HAS_RIS](#) and [MPAMF_IDR.HAS_ESR](#), this field must be 1.

Otherwise:

Reserved, RES0.

NO_IMPL_MSMON, bit [37]

When [MPAMF_IDR.EXT](#) == 1 and [MPAMF_IDR.HAS_IMPL_IDR](#) == 1:

[MPAMF_IMPL_IDR](#) defines no IMPLEMENTATION DEFINED resource monitors.

NO_IMPL_MSMON	Meaning
0b0	MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource monitor.
0b1	MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource monitors.

If RIS is implemented, this field indicates the presence of IMPLEMENTATION DEFINED resource monitors described in [MPAMF_IMPL_IDR](#) for the selected resource instance.

Otherwise:

Reserved, RES0.

NO_IMPL_PART, bit [36]

When [MPAMF_IDR.EXT](#) == 1 and [MPAMF_IDR.HAS_IMPL_IDR](#) == 1:

[MPAMF_IMPL_IDR](#) defines no IMPLEMENTATION DEFINED resource controls.

NO_IMPL_PART	Meaning
0b0	MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource control.
0b1	MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource controls.

If RIS is implemented, this field indicates the presence of IMPLEMENTATION DEFINED resource controls described in [MPAMF_IMPL_IDR](#) for the selected resource instance.

Otherwise:

Reserved, RES0.

Bits [35:33]

Reserved, RES0.

HAS_RIS, bit [32]

When **MPAMF_IDR.EXT** == 1:

Has resource instance selector. Indicates that [MPAMCFG_PART_SEL](#) contains the RIS field that selects a resource instance to control.

HAS_RIS	Meaning
0b0	MPAMCFG_PART_SEL does not implement the MPAMCFG_PART_SEL .RIS field or multiple resource instance support.
0b1	MPAMCFG_PART_SEL implements the MPAMCFG_PART_SEL .RIS field and MPAM resource instance numbers up to and including MPAMF_IDR.RIS_MAX .

Otherwise:

Reserved, RES0.

HAS_PARTID_NRW, bit [31]

Has PARTID narrowing.

HAS_PARTID_NRW	Meaning
0b0	Does not have MPAMF_PARTID_NRW_IDR , MPAMCFG_INTPARTID , or intPARTID mapping support.
0b1	Supports the MPAMF_PARTID_NRW_IDR , MPAMCFG_INTPARTID registers.

HAS_MSMON, bit [30]

Has resource monitors. Indicates whether this MSC has MPAM resource monitors.

HAS_MSMON	Meaning
0b0	Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR .
0b1	Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR .

HAS_IMPL_IDR, bit [29]

Has [MPAMF_IMPL_IDR](#). Indicates whether this MSC has the IMPLEMENTATION SPECIFIC MPAM features register, [MPAMF_IMPL_IDR](#).

HAS_IMPL_IDR	Meaning
0b0	Does not have MPAMF_IMPL_IDR .
0b1	Has MPAMF_IMPL_IDR .

EXT, bit [28]

When **FEAT_MPAMv0p1** is implemented or **FEAT_MPAMv1p1** is implemented:

Extended MPAMF_IDR.

EXT	Meaning
0b0	MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits.
0b1	MPAMF_IDR has bits defined in [63:32]. The register is 64-bits.

Otherwise:

Reserved, RES0.

HAS_PRI_PART, bit [27]

Has priority partitioning. Indicates that MPAM priority partitioning is implemented and [MPAMF_PRI_IDR](#) exists.

HAS_PRI_PART	Meaning
0b0	Does not support priority partitioning or have MPAMF_PRI_IDR .
0b1	Has priority partitioning and MPAMF_PRI_IDR .

If RIS is implemented, this field indicates the presence of priority partitioning resource controls as described in [MPAMF_PRI_IDR](#) for the selected resource instance.

HAS_MBW_PART, bit [26]

Has memory bandwidth partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and [MPAMF_MBW_IDR](#).

HAS_MBW_PART	Meaning
0b0	Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register.
0b1	Has MPAMF_MBW_IDR register.

If RIS is implemented, this field indicates the presence of memory bandwidth partitioning resource controls as described in [MPAMF_MBW_IDR](#) for the selected resource instance.

HAS_CPOR_PART, bit [25]

Has cache portion partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and [MPAMF_CPOR_IDR](#).

HAS_CPOR_PART	Meaning
0b0	Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPBm<n> registers.
0b1	Has MPAMF_CPOR_IDR and MPAMCFG_CPBm<n> registers.

If RIS is implemented, this field indicates the presence of cache portion partitioning resource controls as described in [MPAMF_CPOR_IDR](#) for the selected resource instance.

HAS_CCAP_PART, bit [24]

Has cache capacity partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the [MPAMF_CCAP_IDR](#) and [MPAMCFG_CMAX](#) registers.

HAS_CCAP_PART	Meaning
0b0	Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.
0b1	Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

If RIS is implemented, this field indicates the presence of cache capacity partitioning resource controls as described in [MPAMF_CPOR_IDR](#) for the selected resource instance.

PMG_MAX, bits [23:16]

Maximum value of Non-secure PMG supported by this component.

PARTID_MAX, bits [15:0]

Maximum value of Non-secure PARTID supported by this component.

Otherwise:

31	30	29	28	27	26	25	24	23
HAS_PARTID_NRW	HAS_MSMON	HAS_IMPL_IDR	EXT	HAS_PRI_PART	HAS_MBW_PART	HAS_CPOR_PART	HAS_CCAP_PART	

HAS_PARTID_NRW, bit [31]

Has PARTID narrowing.

HAS_PARTID_NRW	Meaning
0b0	Does not have MPAMF_PARTID_NRW_IDR , MPAMCFG_INTPARTID , or intPARTID mapping support.
0b1	Supports the MPAMF_PARTID_NRW_IDR , MPAMCFG_INTPARTID registers.

HAS_MSMON, bit [30]

Has resource monitors. Indicates whether this MSC has MPAM resource monitors.

HAS_MSMON	Meaning
0b0	Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR .
0b1	Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR .

HAS_IMPL_IDR, bit [29]

Has [MPAMF_IMPL_IDR](#). Indicates whether this MSC has the IMPLEMENTATION SPECIFIC MPAM features register, [MPAMF_IMPL_IDR](#).

HAS_IMPL_IDR	Meaning
0b0	Does not have MPAMF_IMPL_IDR .
0b1	Has MPAMF_IMPL_IDR .

EXT, bit [28]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Extended MPAMF_IDR.

EXT	Meaning
0b0	MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits.
0b1	MPAMF_IDR has bits defined in [63:32]. The register is 64-bits.

Otherwise:

Reserved, RES0.

HAS_PRI_PART, bit [27]

Has priority partitioning. Indicates whether this MSC implements MPAM priority partitioning and [MPAMF_PRI_IDR](#).

HAS_PRI_PART	Meaning
0b0	Does not support priority partitioning or have MPAMF_PRI_IDR .
0b1	Has MPAMF_PRI_IDR .

HAS_MBW_PART, bit [26]

Has memory bandwidth partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and MPAMF_MBW_IDR.

HAS_MBW_PART	Meaning
0b0	Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register.
0b1	Has MPAMF_MBW_IDR register.

HAS_CPOR_PART, bit [25]

Has cache portion partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and [MPAMF_CPOR_IDR](#).

HAS_CPOR_PART	Meaning
0b0	Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPB<n> registers.
0b1	Has MPAMF_CPOR_IDR and MPAMCFG_CPB<n> registers.

HAS_CCAP_PART, bit [24]

Has cache capacity partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

HAS_CCAP_PART	Meaning
0b0	Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.
0b1	Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

PMG_MAX, bits [23:16]

Maximum value of Non-secure PMG supported by this component.

PARTID_MAX, bits [15:0]

Maximum value of Non-secure PARTID supported by this component.

Accessing MPAMF_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_IDR is read-only.

MPAMF_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_IDR_s is permitted to have either the same or different contents to MPAMF_IDR_ns, MPAMF_IDR_rt, or MPAMF_IDR_rl.
- MPAMF_IDR_ns is permitted to have either the same or different contents to MPAMF_IDR_rt or MPAMF_IDR_rl.
- MPAMF_IDR_rt is permitted to have either the same or different contents to MPAMF_IDR_rl.

There must be separate registers in the Secure (MPAMF_IDR_s), Non-secure (MPAMF_IDR_ns), Root (MPAMF_IDR_rt), and Realm (MPAMF_IDR_rl) MPAM feature pages.

When [MPAMF_IDR.HAS_RIS](#) is 1, MPAMF_IDR shows the configuration of MSC MPAM for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0000	MPAMF_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0000	MPAMF_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0000	MPAMF_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0000	MPAMF_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

MPAMF_IMPL_IDR, MPAM Implementation-Specific Partitioning Feature Identification Register

The MPAMF_IMPL_IDR characteristics are:

Purpose

Indicates the implementation-defined partitioning and monitoring features and parameters of the MSC.

- MPAMF_IMPL_IDR_s indicates IMPLEMENTATION DEFINED partitioning and monitoring features accessed from the Secure MPAM feature page.
- MPAMF_IMPL_IDR_ns indicates those accessed from the Non-secure MPAM feature page.
- MPAMF_IMPL_IDR_rt indicates IMPLEMENTATION DEFINED partitioning and monitoring features accessed from the Root MPAM feature page.
- MPAMF_IMPL_IDR_rl indicates those accessed from the Realm MPAM feature page.

MPAMF_IMPL_IDR_s indicates IMPLEMENTATION DEFINED partitioning and monitoring features accessed from the Secure MPAM feature page. MPAMF_IMPL_IDR_ns indicates those accessed from the Non-secure MPAM feature page. MPAMF_IMPL_IDR_rt indicates IMPLEMENTATION DEFINED partitioning and monitoring features accessed from the Root MPAM feature page. MPAMF_IMPL_IDR_rl indicates those accessed from the Realm MPAM feature page.

If [MPAMF_IDR.HAS_RIS](#) is 1, this register gives the implementation-specific features and parameters of the resource instance selected by [MPAMCFG_PART_SEL.RIS](#) for any features that are specific to the resource.

Configuration

The power domain of MPAMF_IMPL_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_IMPL_IDR == 1. Otherwise, direct accesses to MPAMF_IMPL_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_IMPL_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLFEAT																															

IMPLFEAT, bits [31:0]

All 32 bits of this register are available to be used as the implementer sees fit to indicate the presence of IMPLEMENTATION DEFINED MPAM features in this MSC and to give additional implementation-specific read-only information about the parameters of implementation-specific MPAM features to software.

If RIS is implemented, this register indicates the implementation-specific features and parameters of the resource instance selected by [MPAMCFG_PART_SEL.RIS](#).

Accessing MPAMF_IMPL_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_IMPL_IDR is read-only.

MPAMF_IMPL_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_IMPL_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_IMPL_IDR_s is permitted to have either the same or different contents to MPAMF_IMPL_IDR_ns, MPAMF_IMPL_IDR_rt, or MPAMF_IMPL_IDR_rl.
- MPAMF_IMPL_IDR_ns is permitted to have either the same or different contents to MPAMF_IMPL_IDR_rt or MPAMF_IMPL_IDR_rl.
- MPAMF_IMPL_IDR_rt is permitted to have either the same or different contents to MPAMF_IMPL_IDR_rl.

There must be separate registers in the Secure (MPAMF_IMPL_IDR_s), Non-secure (MPAMF_IMPL_IDR_ns), Root (MPAMF_IMPL_IDR_rt), and Realm (MPAMF_IMPL_IDR_rl) MPAM feature pages.

When [MPAMF_IDR.HAS_RIS](#) is 1, MPAMF_IMPL_IDR shows the configuration of implementation-specific features for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_IMPL_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0028	MPAMF_IMPL_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0028	MPAMF_IMPL_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0028	MPAMF_IMPL_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0028	MPAMF_IMPL_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_MBW_IDR, MPAM Memory Bandwidth Partitioning Identification Register

The MPAMF_MBW_IDR characteristics are:

Purpose

Indicates which MPAM bandwidth partitioning features are present on this MSC.

~~MPAMF_MBW_IDR_ns indicates bandwidth partitioning features accessed from the Non-secure MPAM feature page.~~

~~MPAMF_MBW_IDR_rt indicates bandwidth partitioning features accessed from the Root MPAM feature page.~~

~~MPAMF_MBW_IDR_rl indicates bandwidth partitioning features accessed from the Realm MPAM feature page.~~

MPAMF_MBW_IDR_s indicates bandwidth partitioning features accessed from the Secure MPAM feature page.

MPAMF_MBW_IDR_ns indicates bandwidth partitioning features accessed from the Non-secure MPAM feature page.

MPAMF_MBW_IDR_rt indicates bandwidth partitioning features accessed from the Root MPAM feature page.

MPAMF_MBW_IDR_rl indicates bandwidth partitioning features accessed from the Realm MPAM feature page.

When [MPAMF_IDR.HAS_RIS](#) is 1, some fields in this register give information for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#). The description of every field that is affected by [MPAMCFG_PART_SEL.RIS](#) has that information within the field description.

Configuration

The power domain of MPAMF_MBW_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_MBW_PART == 1. Otherwise, direct accesses to MPAMF_MBW_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MBW_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															

Bits [31:29]

Reserved, RES0.

BWPBM_WD, bits [28:16]

Bandwidth portion bitmap width.

The number of bandwidth portion bits in the [MPAMCFG_MBW_PBM<n>](#) register array.

If MPAMF_MBW_IDR.HAS_PBM is 1, this field must contain a value from 1 to 4096, inclusive. Values greater than 32 require a group of 32-bit registers to access the BWPBM, up to 128 if BWPBM_WD is the largest value.

If MPAMF_MBW_IDR.HAS_PBM is 0, this field must be ignored by software.

If RIS is implemented, this field indicates the width of the memory bandwidth portion bitmap partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bit [15]

Reserved, RES0.

WINDWR, bit [14]

Indicates the bandwidth accounting period register is writable.

WINDWR	Meaning
0b0	The bandwidth accounting period is readable from MPAMCFG_MBW_WINWD which might be fixed or vary due to clock rate reconfiguration of the memory channel or memory controller.
0b1	The bandwidth accounting width is readable and writable per partition in MPAMCFG_MBW_WINWD .

HAS_PROP, bit [13]

Indicates that this MSC implements proportional stride bandwidth partitioning and the [MPAMCFG_MBW_PROP](#) register can be accessed.

HAS_PROP	Meaning
0b0	There is no memory bandwidth proportional stride control and the MPAMCFG_MBW_PROP register is RES0.
0b1	The proportional stride memory bandwidth partitioning scheme is supported and the MPAMCFG_MBW_PROP register can be accessed.

If RIS is implemented, this field indicates the presence of the memory bandwidth proportional stride partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_PBM, bit [12]

Indicates that bandwidth portion partitioning is implemented and the [MPAMCFG_MBW_PBM<n>](#) register array can be accessed.

HAS_PBM	Meaning
0b0	There is no memory bandwidth portion control and the MPAMCFG_MBW_PBM<n> is RES0.
0b1	The memory bandwidth portion allocation scheme exists and the MPAMCFG_MBW_PBM<n> register can be accessed.

If RIS is implemented, this field indicates the presence of the memory bandwidth portion partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_MAX, bit [11]

Indicates that this MSC implements maximum bandwidth partitioning and the [MPAMCFG_MBW_MAX](#) register can be accessed.

HAS_MAX	Meaning
0b0	There is no maximum memory bandwidth control and the MPAMCFG_MBW_MAX register is RES0.
0b1	The maximum memory bandwidth allocation scheme is supported and the MPAMCFG_MBW_MAX register can be accessed.

If RIS is implemented, this field indicates the presence of the maximum bandwidth partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_MIN, bit [10]

Indicates that this MSC implements minimum bandwidth partitioning and the [MPAMCFG_MBW_MIN](#) register can be accessed.

HAS_MIN	Meaning
0b0	There is no minimum memory bandwidth control and the MPAMCFG_MBW_MIN register is RES0.
0b1	The minimum memory bandwidth allocation scheme is supported and the MPAMCFG_MBW_MIN register can be accessed.

If RIS is implemented, this field indicates the presence of the minimum bandwidth partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [9:6]

Reserved, RES0.

BWA_WD, bits [5:0]

Number of implemented bits in the bandwidth allocation fields: MIN, MAX, and STRIDE. See [MPAMCFG_MBW_MIN](#), [MPAMCFG_MBW_MAX](#), and [MPAMCFG_MBW_PROP](#).

In any of these bandwidth allocation fields exist, this field must have a value from 1 to 16, inclusive. Otherwise, it is permitted to be 0.

If RIS is implemented, this field indicates the number of implemented bits in the bandwidth allocation control fields for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_MBW_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_MBW_IDR is read-only.

MPAMF_MBW_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_MBW_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_MBW_IDR_s is permitted to have either the same or different contents to MPAMF_MBW_IDR_ns, MPAMF_MBW_IDR_rt, or MPAMF_MBW_IDR_rl.
- MPAMF_MBW_IDR_ns is permitted to have either the same or different contents to MPAMF_MBW_IDR_rt or MPAMF_MBW_IDR_rl.
- MPAMF_MBW_IDR_rt is permitted to have either the same or different contents to MPAMF_MBW_IDR_rl.

There must be separate registers in the Secure (MPAMF_MBW_IDR_s), Non-secure (MPAMF_MBW_IDR_ns), Root (MPAMF_MBW_IDR_rt), and Realm (MPAMF_MBW_IDR_rl) MPAM feature pages.

When [MPAMF_IDR](#).HAS_RIS is 1, MPAMF_MBW_IDR shows the configuration of memory bandwidth partitioning for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_MBW_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0040	MPAMF_MBW_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
------------------	--------------	---------------	-----------------

MPAM	MPAMF_BASE_ns	0x0040	MPAMF_MBW_IDR_ns
------	---------------	--------	------------------

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0040	MPAMF_MBW_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x0040	MPAMF_MBW_IDR_r1

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_MBWUMON_IDR, MPAM Features Memory Bandwidth Usage Monitoring ID register

The MPAMF_MBWUMON_IDR characteristics are:

Purpose

Indicates the number of memory bandwidth usage monitor instances implemented. This register also indicates several properties of MBWU monitoring, including whether the implementation supports capture, scaling, or long counters.

- [MPAMF_MBWUMON_IDR_s](#) indicates the number of Secure memory bandwidth usage monitor instances.
- [MPAMF_MBWUMON_IDR_ns](#) indicates the number of Non-secure memory bandwidth usage monitor instances.
- [MPAMF_MBWUMON_IDR_rt](#) indicates the number of Root memory bandwidth usage monitor instances.
- [MPAMF_MBWUMON_IDR_rl](#) indicates the number of Realm memory bandwidth usage monitor instances.

[MPAMF_MBWUMON_IDR_s](#) indicates the number of Secure memory bandwidth usage monitor instances.
[MPAMF_MBWUMON_IDR_ns](#) indicates the number of Non-secure memory bandwidth usage monitor instances.
[MPAMF_MBWUMON_IDR_rt](#) indicates the number of Root memory bandwidth usage monitor instances.
[MPAMF_MBWUMON_IDR_rl](#) indicates the number of Realm memory bandwidth usage monitor instances.

If [MPAMF_IDR.HAS_RIS](#) is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#). Fields that do not mention RIS are constant across all resource instances.

Configuration

The power domain of MPAMF_MBWUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MPAMF_MBWUMON_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MBWUMON_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HAS_CAPTURE	HAS_LONG	LWD	HAS_RWBW	RES0	HAS_OFSR	RES0	SCALE	NUM_MON																							

HAS_CAPTURE, bit [31]

The implementation supports copying an [MSMON_MBWU](#) to the corresponding [MSMON_MBWU_CAPTURE](#) on a capture event.

HAS_CAPTURE	Meaning
0b0	MSMON_MBWU_CAPTURE is not implemented and there is no support for capture events in the MBWU monitor.
0b1	The MSMON_MBWU_CAPTURE register is implemented and the MBWU monitor supports the capture event behavior.

If RIS is implemented, this field indicates that MBWU monitor capture is implemented for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#).

If MPAMF_MBWUMON_IDR.HAS_LONG is 1, this also indicates that [MSMON_MBWU_L_CAPTURE](#) is implemented.

HAS_LONG, bit [30]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Indicates whether [MSMON_MBWU_L](#) is implemented.

If HAS_CAPTURE is 1, indicates whether [MSMON_MBWU_L_CAPTURE](#) is implemented.

HAS_LONG	Meaning
0b0	Does not implement MSMON_MBWU_L or MSMON_MBWU_L_CAPTURE .
0b1	Implements MSMON_MBWU_L . If HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE is also implemented.

If RIS is implemented, this field indicates that the long MBWU monitor is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

If MPAMF_MBWUMON_IDR.HAS_CAPTURE is 1, this also indicates that [MSMON_MBWU_L_CAPTURE](#) is implemented.

Otherwise:

Reserved, RES0.

LWD, bit [29]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Long register VALUE width.

If [MPAMF_MBWUMON_IDR](#).HAS_LONG is 0, [MPAMF_MBWUMON_IDR](#).LWD must also be 0.

LWD	Meaning
0b0	If MPAMF_MBWUMON_IDR .HAS_LONG is 1, MSMON_MBWU_L has 44-bit VALUE field in bits [43:0]. Bits [62:44] are RES0. If HAS_LONG is 1 and MPAMF_MBWUMON_IDR .HAS_CAPTURE is 1, MSMON_MBWU_L_CAPTURE also has 44-bit VALUE field in bits [43:0].
0b1	MSMON_MBWU_L has 63-bit VALUE field in bits [62:0]. If MPAMF_MBWUMON_IDR .HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE also has 63-bit VALUE field in bits [62:0].

If RIS is implemented, this field indicates the length of the [MSMON_MBWU_L](#).VALUE field implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

HAS_RWBW, bit [28]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Read/write bandwidth selection is implemented in [MSMON_CFG_MBWU_FLT](#).

HAS_RWBW	Meaning
0b0	Read/write bandwidth selection is not implemented.
0b1	Read/write bandwidth selection is implemented.

If RIS is implemented, this field indicates whether read/write bandwidth collection selection is available in [MSMON_CFG_MBWU_FLT](#) for resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

Bit [27]

Reserved, RES0.

HAS_OFSR, bit [26]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

The MBWU monitor overflow status bitmap register, [MSMON_MBWU_OFSR](#), is implemented.

HAS_OFSR	Meaning
0b0	MSMON_MBWU_OFSR register is not implemented.
0b1	MSMON_MBWU_OFSR register is implemented.

If RIS is implemented, this field indicates that MBWU monitor overflow status bitmap register is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

Bits [25:21]

Reserved, RES0.

SCALE, bits [20:16]

Scaling of [MSMON_MBWU](#).VALUE in bits. If scaling is enabled by [MSMON_CFG_MBWU_CTL](#).SCLEN, the byte count in the VALUE field has been shifted by SCALE bits to the right.

SCALE	Meaning
0b00000	Scaling is not implemented.
0bxxxxx	Other values are right shift count when scaling is enabled.

If RIS is implemented, this field indicates the scale value for [MSMON_MBWU](#).VALUE field for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

NUM_MON, bits [15:0]

The number of memory bandwidth usage monitor instances implemented. The largest monitor instance selector, [MSMON_CFG_MON_SEL](#).MON_SEL, is NUM_MON minus 1.

If RIS is implemented, this field indicates the number of MBWU monitor instances for [MSMON_MBWU](#).VALUE field for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_MBWUMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_MBWUMON_IDR is read-only.

MPAMF_MBWUMON_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_MBWUMON_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_MBWUMON_IDR_s is permitted to have either the same or different contents to MPAMF_MBWUMON_IDR_ns, MPAMF_MBWUMON_IDR_rt, or MPAMF_MBWUMON_IDR_rl.
- MPAMF_MBWUMON_IDR_ns is permitted to have either the same or different contents to MPAMF_MBWUMON_IDR_rt or MPAMF_MBWUMON_IDR_rl.
- MPAMF_MBWUMON_IDR_rt is permitted to have either the same or different contents to MPAMF_MBWUMON_IDR_rl.

There must be separate registers in the Secure (MPAMF_MBWUMON_IDR_s), Non-secure (MPAMF_MBWUMON_IDR_ns), Root (MPAMF_MBWUMON_IDR_rt), and Realm (MPAMF_MBWUMON_IDR_rl) MPAM feature pages.

When [MPAMF_IDR.HAS_RIS](#) is 1, MPAMF_MBWUMON_IDR shows the configuration of memory bandwidth monitoring for the bandwidth resource instance selected by [MPAMCFG_PART_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF_MBWUMON_IDR is not affected by [MSMON_CFG_MON_SEL.RIS](#).

MPAMF_MBWUMON_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0090	MPAMF_MBWUMON_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0090	MPAMF_MBWUMON_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0090	MPAMF_MBWUMON_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0090	MPAMF_MBWUMON_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_MSMON_IDR, MPAM Resource Monitoring Identification Register

The MPAMF_MSMON_IDR characteristics are:

Purpose

Indicates which MPAM monitoring features are present on this MSC.

~~MPAMF_MSMON_IDR_ns indicates Non-secure monitoring features.~~

~~MPAMF_MSMON_IDR_rt indicates Root monitoring features.~~

~~MPAMF_MSMON_IDR_rl indicates Realm monitoring features.~~

MPAMF_MSMON_IDR_s indicates Secure monitoring features. MPAMF_MSMON_IDR_ns indicates Non-secure monitoring features. MPAMF_MSMON_IDR_rt indicates Root monitoring features. MPAMF_MSMON_IDR_rl indicates Realm monitoring features.

If [MPAMF_IDR.HAS_RIS](#) is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#). Fields that do not mention RIS are constant across all resource instances.

Configuration

The power domain of MPAMF_MSMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_MSMON == 1. Otherwise, direct accesses to MPAMF_MSMON_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MSMON_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17
HAS_LOCAL_CAPT_EVNT	NO_HW_OFLW_INTR	HAS_OFLW_MSI	HAS_OFLOW_SR	RES0						MSMON_MBWU				MSMON_MBWU

HAS_LOCAL_CAPT_EVNT, bit [31]

Has local capture event generator. Indicates whether this MSC has the MPAM local capture event generator and the [MSMON_CAPT_EVNT](#) register.

HAS_LOCAL_CAPT_EVNT	Meaning
0b0	Does not support MPAM local capture event generator or MSMON_CAPT_EVNT .
0b1	Supports the MPAM local capture event generator and the MSMON_CAPT_EVNT register.

NO_HW_OFLW_INTR, bit [30]**When FEAT_MPAMv1p1 is implemented:**

Does not have hardwired MPAM monitor overflow interrupt.

NO_HW_OFLW_INTR	Meaning
0b0	Supports generating a hardwired interrupt to signal MPAM monitor overflow.
0b1	No support for a hardwired interrupt to signal MPAM monitor overflow.

If this field is 0, the MSC supports generating a hardwired interrupt for monitor overflow events.

If this field is 0 and the HAS_OFLW_MSI field in this register is 1, the MSC supports generating both hardwired interrupts and MSI writes to signal interrupts.

Otherwise:

Reserved, RES0.

HAS_OFLW_MSI, bit [29]**When FEAT_MPAMv1p1 is implemented:**

Has support for MSI writes to signal MPAM monitor overflow interrupts. These registers are implemented: [MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#) and [MSMON_OFLOW_MSI_MPAM](#).

HAS_OFLW_MSI	Meaning
0b0	MSMON_OFLOW_MSI_ADDR_L , MSMON_OFLOW_MSI_ADDR_H , MSMON_OFLOW_MSI_ATTR , MSMON_OFLOW_MSI_DATA and MSMON_OFLOW_MSI_MPAM registers are not implemented.
0b1	MSMON_OFLOW_MSI_ADDR_L , MSMON_OFLOW_MSI_ADDR_H , MSMON_OFLOW_MSI_ATTR , MSMON_OFLOW_MSI_DATA and MSMON_OFLOW_MSI_ATTR are implemented and can be used to generate writes to signal MPAM monitor overflow interrupts.

If [MPAMF_MSMON_IDR.NO_HW_OFLW_INTR](#) is 1 and this bit is 0, this MSC does not support monitor overflow interrupts.**Otherwise:**

Reserved, RES0.

HAS_OFLOW_SR, bit [28]**When FEAT_MPAMv1p1 is implemented:**Has MPAM monitor overflow status register [MSMON_OFLOW_SR](#).

HAS_OFLOW_SR	Meaning
0b0	Does not have MSMON_OFLOW_SR .
0b1	Supports MSMON_OFLOW_SR .

Otherwise:

Reserved, RES0.

Bits [27:18]

Reserved, RES0.

MSMON_MBWU, bit [17]

Memory bandwidth usage monitoring. Indicates whether MPAM monitoring for Memory Bandwidth Usage by PARTID and PMG is implemented and whether the following bandwidth usage registers are accessible:

- [MPAMF_MBWUMON_IDR](#), [MSMON_CFG_MBWU_CTL](#), [MSMON_CFG_MBWU_FLT](#), [MSMON_MBWU](#).
- The optional [MSMON_MBWU_CAPTURE](#).
- If MPAM v0.1 or MPAM v1.1 is implemented, the optional [MSMON_MBWU_L](#) and the optional [MSMON_MBWU_L_CAPTURE](#).

MSMON_MBWU	Meaning
0b0	Does not have monitoring for memory bandwidth usage and does not use the bandwidth usage registers.
0b1	Has monitoring of memory bandwidth usage and uses the bandwidth usage registers.

If RIS is implemented, this field indicates that memory bandwidth usage monitoring is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS as described in [MPAMF_MBWUMON_IDR](#).

MSMON_CSU, bit [16]

Cache storage usage monitoring. Indicates whether MPAM monitoring of cache storage usage by PARTID and PMG is implemented and the following registers are accessible:

- [MPAMF_CSUMON_IDR](#), [MSMON_CFG_CSU_CTL](#), [MSMON_CFG_CSU_FLT](#), [MSMON_CSU](#).
- The optional [MSMON_CSU_CAPTURE](#).

MSMON_CSU	Meaning
0b0	Does not have monitoring for cache storage usage or the MPAMF_CSUMON_IDR , MSMON_CFG_CSU_CTL , MSMON_CFG_CSU_FLT , MSMON_CSU or MSMON_CSU_CAPTURE registers.
0b1	Has monitoring of cache storage usage and the MPAMF_CSUMON_IDR , MSMON_CFG_CSU_CTL , MSMON_CFG_CSU_FLT , MSMON_CSU and optional MSMON_CSU_CAPTURE registers.

If RIS is implemented, this field indicates that cache storage usage monitoring is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS as described in [MPAMF_CSUMON_IDR](#).

Bits [15:0]

Reserved, RES0.

Accessing MPAMF_MSMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_MSMON_IDR is read-only.

MPAMF_MSMON_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_MSMON_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_MSMON_IDR_s is permitted to have either the same or different contents to MPAMF_MSMON_IDR_ns, MPAMF_MSMON_IDR_rt, or MPAMF_MSMON_IDR_rl.
- MPAMF_MSMON_IDR_ns is permitted to have either the same or different contents to MPAMF_MSMON_IDR_rt or MPAMF_MSMON_IDR_rl.
- MPAMF_MSMON_IDR_rt is permitted to have either the same or different contents to MPAMF_MSMON_IDR_rl.

There must be separate registers in the Secure (MPAMF_MSMON_IDR_s), Non-secure (MPAMF_MSMON_IDR_ns), Root (MPAMF_MSMON_IDR_rt), and Realm (MPAMF_MSMON_IDR_rl) MPAM feature pages.

When [MPAMF_IDR.HAS_RIS](#) is 1, MPAMF_MSMON_IDR shows the configuration of memory system monitoring for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF_MSMON_IDR is not affected by [MSMON_CFG_MON_SEL.RIS](#).

MPAMF_MSMON_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0080	MPAMF_MSMON_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0080	MPAMF_MSMON_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0080	MPAMF_MSMON_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0080	MPAMF_MSMON_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

The MPAMF_PARTID_NRW_IDR characteristics are:

Indicates the largest internal PARTID for this MSC.

- When FEAT_RME is implemented:

- MPAMF_PARTID_NRW_IDR_s indicates the largest Secure internal PARTID. MPAMF_PARTID_NRW_IDR_ns indicates the largest Non-secure internal PARTID.

When FEAT_RME is implemented: MPAMF_PARTID NRW rt indicates the largest Root internal PARTID.
MPAMF_PARTID NRW rl indicates the largest Realm internal PARTID.

PARTID narrowing is global to the MSC and does not vary by resource instance.

The power domain of MPAMF_PARTID_NRW_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PARTID_NRW == 1. Otherwise, direct accesses to MPAMF_PARTID_NRW_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

MPAMF_PARTID_NRW_IDR is a 32-bit register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																INTPARTID_MAX															

Bits [31:16]

Reserved, RES0.

INTPARTID_MAX, bits [15:0]

The largest intPARTID supported in this MSC.

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_PRI_IDR, MPAM Priority Partitioning Identification Register

The MPAMF_PRI_IDR characteristics are:

Purpose

Indicates which MPAM priority partitioning features are present on this MSC.

~~MPAMF_PRI_IDR_ns indicates priority partitioning features accessed from the Non-secure MPAM feature page.~~

~~MPAMF_PRI_IDR_rt indicates priority partitioning features accessed from the Root MPAM feature page.~~

~~MPAMF_PRI_IDR_rl indicates priority partitioning features accessed from the Realm MPAM feature page.~~

MPAMF_PRI_IDR_s indicates priority partitioning features accessed from the Secure MPAM feature page.

MPAMF_PRI_IDR_ns indicates priority partitioning features accessed from the Non-secure MPAM feature page.

MPAMF_PRI_IDR_rt indicates priority partitioning features accessed from the Root MPAM feature page.

MPAMF_PRI_IDR_rl indicates priority partitioning features accessed from the Realm MPAM feature page.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. The description of every field that is affected by [MPAMCFG_PART_SEL](#).RIS has that information within the field description.

Configuration

The power domain of MPAMF_PRI_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PRI_PART == 1. Otherwise, direct accesses to MPAMF_PRI_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_PRI_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0		DSPRI WD		RES0		DSPRI 0 IS_LOW		HAS_DSPRI		RES0		INTPRI WD		RES0		INTPRI 0 IS_LOW		HAS_INTPRI													

Bits [31:26]

Reserved, RES0.

DSPRI_WD, bits [25:20]

Number of implemented bits in the downstream priority field (DSPRI) of [MPAMCFG_PRI](#).

If HAS_DSPRI == 1, this field must contain a value from 1 to 16, inclusive.

If HAS_DSPRI == 0, this field must be 0.

If RIS is implemented, this field indicates the number of downstream priority bits for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [19:18]

Reserved, RES0.

DSPRI_0_IS_LOW, bit [17]

Indicates whether 0 in [MPAMCFG_PRI](#).DSPRI is the lowest or the highest downstream priority.

DSPRI_0_IS_LOW	Meaning
0b0	In the MPAMCFG_PRI .DSPRI field, a value of 0 means the highest priority.
0b1	In the MPAMCFG_PRI .DSPRI field, a value of 0 means the lowest priority.

If RIS is implemented, this field indicates that 0 is the lowest downstream priority for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_DSPRI, bit [16]

Indicates that the [MPAMCFG_PRI](#) register implements the DSPRI field.

HAS_DSPRI	Meaning
0b0	This MSC supports priority partitioning, but does not implement a downstream priority (DSPRI) field in the MPAMCFG_PRI register.
0b1	This MSC supports downstream priority partitioning and implements the downstream priority (DSPRI) field in the MPAMCFG_PRI register.

If RIS is implemented, this field indicates that downstream priority is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [15:10]

Reserved, RES0.

INTPRI_WD, bits [9:4]

Number of implemented bits in the internal priority field (INTPRI) in the [MPAMCFG_PRI](#) register.

If HAS_INTPRI == 1, this field must contain a value from 1 to 16, inclusive.

If HAS_INTPRI == 0, this field must be 0.

If RIS is implemented, this field indicates the number of internal priority bits for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [3:2]

Reserved, RES0.

INTPRI_0_IS_LOW, bit [1]

Indicates whether 0 in [MPAMCFG_PRI](#).INTPRI is the lowest or the highest internal priority.

INTPRI_0_IS_LOW	Meaning
0b0	In the MPAMCFG_PRI .INTPRI field, a value of 0 means the highest priority.
0b1	In the MPAMCFG_PRI .INTPRI field, a value of 0 means the lowest priority.

If RIS is implemented, this field indicates that 0 is the lowest internal priority for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_INTPRI, bit [0]

Indicates that this MSC implements the INTPRI field in the [MPAMCFG_PRI](#) register.

HAS_INTPRI	Meaning
0b0	This MSC supports priority partitioning, but does not implement the internal priority (INTPRI) field in the MPAMCFG_PRI register.
0b1	This MSC supports internal priority partitioning and implements the internal priority (INTPRI) field in the MPAMCFG_PRI register.

If RIS is implemented, this field indicates that internal priority is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_PRI_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_PRI_IDR is read-only.

MPAMF_PRI_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_PRI_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_PRI_IDR_s is permitted to have either the same or different contents to MPAMF_PRI_IDR_ns, MPAMF_PRI_IDR_rt, or MPAMF_PRI_IDR_rl.
- MPAMF_PRI_IDR_ns is permitted to have either the same or different contents to MPAMF_PRI_IDR_rt or MPAMF_PRI_IDR_rl.
- MPAMF_PRI_IDR_rt is permitted to have either the same or different contents to MPAMF_PRI_IDR_rl.

There must be separate registers in the Secure (MPAMF_PRI_IDR_s), Non-secure (MPAMF_PRI_IDR_ns), Root (MPAMF_PRI_IDR_rt), and Realm (MPAMF_PRI_IDR_rl) MPAM feature pages.

When [MPAMF_IDR](#).HAS_RIS is 1, MPAMF_PRI_IDR shows the configuration of priority partitioning for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_PRI_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0048	MPAMF_PRI_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0048	MPAMF_PRI_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0048	MPAMF_PRI_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0048	MPAMF_PRI_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MSMON_CAPT_EVNT, MPAM Capture Event Generation Register

The MSMON_CAPT_EVNT characteristics are:

Purpose

Generates a local capture event when written with bit[0] as 1.

- **MSMON_CAPT_EVNT_s** generates local capture events for Secure monitor instances only or for Secure and Non-secure monitor instances.
- **MSMON_CAPT_EVNT_ns** generates local capture events for Non-secure monitor instances only.
- **MSMON_CAPT_EVNT_rt** generates local capture events for Root monitor instances only or for Root, Secure, Realm, and Non-secure monitor instances.
- **MSMON_CAPT_EVNT_rl** generates local capture events for Realm monitor instances or for for Realm monitor instances or Realm and Non-secure monitor instances.

MSMON_CAPT_EVNT_s generates local capture events for Secure monitor instances only or for Secure and Non-secure monitor instances. **MSMON_CAPT_EVNT_ns** generates local capture events for Non-secure monitor instances only. **MSMON_CAPT_EVNT_rt** generates local capture events for Root monitor instances only or for Root, Secure, Realm, and Non-secure monitor instances. **MSMON_CAPT_EVNT_rl** generates local capture events for Realm monitor instances or for for Realm monitor instances or Realm and Non-secure monitor instances.

Configuration

The power domain of MSMON_CAPT_EVNT is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.HAS_LOCAL_CAPT_EVNT == 1. Otherwise, direct accesses to MSMON_CAPT_EVNT are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CAPT_EVNT is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																ALL		NOW													

Bits [31:2]

Reserved, RES0.

ALL, bit [1]

In the Secure instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Secure and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.
- If ALL is written as 0 and NOW is written as 1, signal a capture event to Secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.

In the Non-secure instance of this register, this bit is RAZ/WI.

In the Root instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Root, Realm, Secure, and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.
- If ALL is written as 0 and NOW is written as 1, signal a capture event to Root monitor instances within this MSC that are configured with CAPT_EVNT = 7.

In the Realm instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Realm and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.
- If ALL is written as 0 and NOW is written as 1, signal a capture event to Realm monitor instances within this MSC that are configured with CAPT_EVNT = 7.

This bit always reads as zero.

ALL	Meaning
0b0	Send capture event only to monitor instances in the same MPAM feature page as this register.
0b1	Send capture event to monitor instances in certain MPAM feature pages as described in the ALL field of this register.

NOW, bit [0]

When written as 1, this bit causes an event to those monitor instances described in the ALL field that have CAPT_EVNT set to the value of 7.

When this bit is written as 0, no event is signaled.

This bit always reads as zero.

Accessing MSMON_CAPT_EVNT

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CAPT_EVNT_s must be accessible from the Secure MPAM feature page. MSMON_CAPT_EVNT_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CAPT_EVNT_s and MSMON_CAPT_EVNT_ns must be separate registers. The Secure instance (MSMON_CAPT_EVNT_s) can generate local capture events for Secure monitor instances only or for Secure and Non-secure monitor instances, and the Non-secure instance (MSMON_CAPT_EVNT_ns) can generate local capture events for Non-secure monitor instances only.

MSMON_CAPT_EVNT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0808	MSMON_CAPT_EVNT_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0808	MSMON_CAPT_EVNT_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0808	MSMON_CAPT_EVNT_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0808	MSMON_CAPT_EVNT_rl

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 15:09:22.39; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

(new)

The MSMON CFG CSU CTL characteristics are:

Controls the CSU monitor selected by [MSMON_CFG_MON_SEL](#).

- `MSMON_CFG_CSU_CTL_s` controls the Secure cache storage usage monitor instance selected by the Secure instance of `MSMON_CFG_MON_SEL`.
- `MSMON_CFG_CSU_CTL_ns` controls Non-secure cache storage usage monitor instance selected by the Non-secure instance of `MSMON_CFG_MON_SEL`.
- `MSMON_CFG_CSU_CTL_rt` controls the monitor configuration for the Root PARTID selected by the Root instance of `MSMON_CFG_MON_SEL`.
- `MSMON_CFG_CSU_CTL_rl` controls the monitor configuration for the Realm PARTID selected by the Realm instance of `MSMON_CFG_MON_SEL`.

MSMON_CFG_CSU_CTL_s controls the Secure cache storage usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_CTL_ns controls Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_CTL_rt controls the monitor configuration for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_CTL_rl controls the monitor configuration for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If `MPAMF_IDR.HAS_RIS` is 1, the monitor instance configuration accessed is for the resource instance currently selected by `MSMON_CFG_MON_SEL.RIS` and the monitor instance of that resource instance selected by `MSMON_CFG_MON_SEL.MON_SEL`.

The power domain of MSMON_CFG_CSU_CTL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CFG_CSU_CTL are RES0.

The power and reset domain of each MSC component is specific to that component.

MSMON_CFG_CSU_CTL is a 32-bit register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
EN	CAPT_EVNT	CAPT_RESET	OFLOW_STATUS	OFLOW_INTR	OFLOW_FRZ	SUBTYPE	RES0	MATCH_PMG	MATCH_PARTID								

EN, bit [31]

Enabled.

EN	Meaning
0b0	The monitor instance is disabled and must not collect any information.
0b1	The monitor instance is enabled to collect information according to the configuration of the instance.

CAPT_EVNT, bits [30:28]

Capture event selector.

Select the event that triggers capture from the following:

CAPT_EVNT	Meaning
0b000	No capture event is triggered.
0b001	External capture event 1 (optional but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

If capture is not implemented for the CSU monitor type as indicated by [MPAMF_CSUMON_IDR.HAS_CAPTURE](#) = 0, this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset after capture.

Controls whether the value of [MSMON_CSU](#) is reset to zero immediately after being copied to [MSMON_CSU_CAPTURE](#).

CAPT_RESET	Meaning
0b0	Monitor is not reset on capture.
0b1	Monitor is reset on capture.

If capture is not implemented for the CSU monitor type as indicated by [MPAMF_CSUMON_IDR.HAS_CAPTURE](#) = 0, this field is RAZ/WI.

Because the CSU monitor type produces a measurement rather than a count, it might not make sense to ever reset the value after a capture. If there is no reason to ever reset a CSU monitor, this field is RAZ/WI.

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of [MSMON_CSU](#) has overflowed.

OFLOW_STATUS	Meaning
0b0	No overflow has occurred.
0b1	At least one overflow has occurred since this bit was last written to zero.

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

OFLOW_INTR, bit [25]

Overflow Interrupt.

Controls whether an overflow interrupt is generated when the value of [MSMON_CSU](#) has overflowed.

OFLOW_INTR	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_CSU .
0b1	On overflow, an implementation-specific interrupt is signaled.

If OFLOW_INTR is not supported by the implementation, this field is RAZ/WI.

OFLOW_FRZ, bit [24]

Freeze Monitor on Overflow.

Controls whether the value of [MSMON_CSU](#) freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	Monitor count wraps on overflow.
0b1	Monitor count freezes on overflow. The frozen value might be 0 or another value if the monitor overflowed with an increment larger than 1.

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

SUBTYPE, bits [23:20]

Subtype. Type of cache storage usage counted by this monitor.

This field is not currently used for CSU monitors, but reserved for future use.

This field is RAZ/WI.

Bits [19:18]

Reserved, RES0.

MATCH_PMG, bit [17]

Match PMG.

Controls whether the monitor measures only storage used with PMG matching [MSMON_CFG_CSU_FLT](#).PMG.

MATCH_PMG	Meaning
0b0	The monitor measures storage used with any PMG value.
0b1	The monitor only measures storage used with the PMG value matching MSMON_CFG_CSU_FLT .PMG.

If MATCH_PMG == 1 and MATCH_PARTID == 0, it is CONSTRAINED UNPREDICTABLE whether the monitor instance:

- Measures the storage used with matching PMG and with any PARTID.
- Measures no storage usage, that is, [MSMON_CSU](#).VALUE is zero.
- Measures the storage used with matching PMG and PARTID, that is, treats MATCH_PARTID as == 1.

MATCH_PARTID, bit [16]

Match PARTID.

Controls whether the monitor measures only storage used with PARTID matching [MSMON_CFG_CSU_FLT](#).PARTID.

MATCH_PARTID	Meaning
0b0	The monitor measures storage used with any PARTID value.
0b1	The monitor only measures storage used with the PARTID value matching MSMON_CFG_CSU_FLT .PARTID.

Bits [15:8]

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code. The CSU monitor is TYPE = 0x43.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x43.

Access to this field is **RO**.

Accessing MSMON_CFG_CSU_CTL

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_CFG_CSU_CTL_s must be accessible from the Secure MPAM feature page.
- MSMON_CFG_CSU_CTL_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_CSU_CTL_rt must be accessible from the Root MPAM feature page.
- MSMON_CFG_CSU_CTL_rl must be accessible from the Realm MPAM feature page.

MSMON_CFG_CSU_CTL_s, MSMON_CFG_CSU_CTL_ns, MSMON_CFG_CSU_CTL_rt, and MSMON_CFG_CSU_CTL_rl must be separate registers.

- The Secure instance (MSMON_CFG_CSU_CTL_s) accesses the cache storage usage monitor controls used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_CSU_CTL_ns) accesses the cache storage usage monitor controls used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_CSU_CTL_rt) accesses the cache storage usage monitor controls used for Root PARTIDs.
- The Realm instance (MSMON_CFG_CSU_CTL_rl) accesses the cache storage usage monitor controls used for Realm PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CFG_CSU_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0818	MSMON_CFG_CSU_CTL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0818	MSMON_CFG_CSU_CTL_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0818	MSMON_CFG_CSU_CTL_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0818	MSMON_CFG_CSU_CTL_rl

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 1509:2239: 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

MSMON_CFG_CSU_FLT, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Filter Register

The MSMON_CFG_CSU_FLT characteristics are:

Purpose

Configures PARTID and PMG to measure or count in the CSU monitor selected by [MSMON_CFG_MON_SEL](#).

- [MSMON_CFG_CSU_FLT_s](#) sets filter conditions for the Secure cache storage usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_CFG_CSU_CTL_ns](#) sets filter conditions for the Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_CFG_CSU_FLT_rt](#) sets the filter conditions for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_CFG_CSU_FLT_rl](#) sets the filter conditions for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

[MSMON_CFG_CSU_FLT_s](#) sets filter conditions for the Secure cache storage usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). [MSMON_CFG_CSU_CTL_ns](#) sets filter conditions for the Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). [MSMON_CFG_CSU_FLT_rt](#) sets the filter conditions for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#). [MSMON_CFG_CSU_FLT_rl](#) sets the filter conditions for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of [MSMON_CFG_CSU_FLT](#) is IMPLEMENTATION DEFINED.

This register is present only when [FEAT_MPAM](#) is implemented, [MPAMF_IDR.HAS_MSMON](#) == 1 and [MPAMF_MSMON_IDR.MSMON_CSU](#) == 1. Otherwise, direct accesses to [MSMON_CFG_CSU_FLT](#) are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

[MSMON_CFG_CSU_FLT](#) is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMG								PARTID															

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter cache storage usage monitoring.

If [MSMON_CFG_CSU_CTL.MATCH_PMG == 0](#), this field is not used to match cache storage to a PMG and the contents of this field is ignored.

If [MSMON_CFG_CSU_CTL.MATCH_PMG == 1](#) and [MSMON_CFG_CSU_CTL.MATCH_PARTID == 1](#), the monitor instance selected by [MSMON_CFG_MON_SEL](#) measures or counts cache storage labeled with PMG equal to this field and PARTID equal to the PARTID field.

If [MSMON_CFG_CSU_CTL.MATCH_PMG == 1](#) and [MSMON_CFG_CSU_CTL.MATCH_PARTID == 0](#), the behavior of the monitor instance selected by [MSMON_CFG_MON_SEL](#) is CONSTRAINED UNPREDICTABLE. See [MSMON_CFG_CSU_CTL.MATCH_PMG](#) for more information.

PARTID, bits [15:0]

Partition ID to filter cache storage usage monitoring.

If [MSMON_CFG_CSU_CTL.MATCH_PARTID == 0](#) and [MSMON_CFG_CSU_CTL.MATCH_PMG == 0](#), the monitor measures all allocated cache storage.

If [MSMON_CFG_CSU_CTL.MATCH_PARTID == 0](#) and [MSMON_CFG_CSU_CTL.MATCH_PMG == 1](#), the behavior of the monitor is CONSTRAINED UNPREDICTABLE. See the description of [MSMON_CFG_CSU_CTL.MATCH_PMG](#).

If [MSMON_CFG_CSU_CTL.MATCH_PARTID == 1](#) and [MSMON_CFG_CSU_CTL.MATCH_PMG == 0](#), the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts cache storage labeled with PARTID equal to this field.

If [MSMON_CFG_CSU_CTL.MATCH_PARTID == 1](#) and [MSMON_CFG_CSU_CTL.MATCH_PMG == 1](#), the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts cache storage labeled with PARTID equal to this field and PMG equal to the PMG field.

Accessing MSMON_CFG_CSU_FLT

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- `MSMON_CFG_CSU_FLT_s` must be accessible from the Secure MPAM feature page.
- `MSMON_CFG_CSU_FLT_ns` must be accessible from the Non-secure MPAM feature page.
- `MSMON_CFG_CSU_FLT_rt` must be accessible from the Root MPAM feature page.
- `MSMON_CFG_CSU_FLT_rl` must be accessible from the Realm MPAM feature page.

`MSMON_CFG_CSU_FLT_s`, `MSMON_CFG_CSU_FLT_ns`, `MSMON_CFG_CSU_FLT_rt`, and `MSMON_CFG_CSU_FLT_rl` must be separate registers.

- The Secure instance (`MSMON_CFG_CSU_FLT_s`) accesses the PARTID and PMG matching for a cache storage usage monitor used for Secure PARTIDs.
- The Non-secure instance (`MSMON_CFG_CSU_FLT_ns`) accesses the PARTID and PMG matching for a cache storage usage monitor used for Non-secure PARTIDs.
- The Root instance (`MSMON_CFG_CSU_FLT_rt`) accesses the PARTID and PMG matching for a cache storage usage monitor used for Root PARTIDs.
- The Realm instance (`MSMON_CFG_CSU_FLT_rl`) accesses the PARTID and PMG matching for a cache storage usage monitor used for Realm PARTIDs.

When RIS is implemented, loads and stores to `MSMON_CFG_CSU_FLT` access the monitor configuration settings for the resource instance selected by [MSMON_CFG_MON_SEL.RIS](#) and the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

When RIS is not implemented, loads and stores to `MSMON_CFG_CSU_FLT` access the monitor configuration settings for the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

MSMON_CFG_CSU_FLT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0810	MSMON_CFG_CSU_FLT_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0810	MSMON_CFG_CSU_FLT_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0810	MSMON_CFG_CSU_FLT_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x0810	MSMON_CFG_CSU_FLT_r1

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 15:09:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

-------	----------------	-------

MSMON_CFG_MBWU_CTL, MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Control Register

The MSMON_CFG_MBWU_CTL characteristics are:

Purpose

Controls the MBWU monitor selected by [MSMON_CFG_MON_SEL](#).

- MSMON_CFG_MBWU_CTL_s controls the Secure memory bandwidth usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#).
- MSMON_CFG_MBWU_CTL_ns controls Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#).
- MSMON_CFG_MBWU_CTL_rt controls the monitor configuration for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#).
- MSMON_CFG_MBWU_CTL_rl controls the monitor configuration for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

MSMON_CFG_MBWU_CTL_s controls the Secure memory bandwidth usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_MBWU_CTL_ns controls Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_MBWU_CTL_rt controls the monitor configuration for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_MBWU_CTL_rl controls the monitor configuration for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR](#).HAS_RIS is 1, the monitor instance configuration accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL](#).RIS and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

Configuration

The power domain of MSMON_CFG_MBWU_CTL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_CFG_MBWU_CTL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MBWU_CTL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EN	CAPT_EVNT	CAPT_RESET	OFLOW_STATUS	OFLOW_INTR	OFLOW_FRZ	SUBTYPE	SCLEN	RES0	MATCH_PMG	MATCH_PART					

EN, bit [31]

Enabled.

EN	Meaning
0b0	The monitor instance is disabled and must not collect any information.
0b1	The monitor instance is enabled to collect information according to the configuration of the instance.

CAPT_EVNT, bits [30:28]

Capture event selector.

When the selected capture event occurs, [MSMON_MBWU](#) of the monitor instance is copied to [MSMON_MBWU_CAPTURE](#) of the same instance. If the long counter is also implemented, [MSMON_MBWU_L](#) is also copied to [MSMON_MBWU_L_CAPTURE](#).

Select the event that triggers capture from the following:

CAPT_EVNT	Meaning
0b000	No capture event is triggered.
0b001	External capture event 1 (optional but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

If capture is not implemented for the MBWU monitor type as indicated by [MPAMF_MBWUMON_IDR](#).HAS_CAPTURE = 0, this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset [MSMON_MBWU](#).VALUE after capture.

Controls whether the VALUE field of the monitor instance is reset to zero immediately after being copied to the corresponding capture register.

CAPT_RESET	Meaning
0b0	MSMON_MBWU .VALUE field of the monitor instance is not reset on capture.
0b1	MSMON_MBWU .VALUE field of the monitor instance is reset on capture.

If capture is not implemented for the MBWU monitor type as indicated by [MPAMF_MBWUMON_IDR](#).HAS_CAPTURE = 0, this field is RAZ/WI.

This control bit affects both [MSMON_MBWU](#) and [MSMON_MBWU_L](#) in implementations that include [MSMON_MBWU_L](#).

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of [MSMON_MBWU](#) has overflowed.

OFLOW_STATUS	Meaning
0b0	MSMON_MBWU .VALUE has not overflowed.
0b1	MSMON_MBWU .VALUE has overflowed at least once since this bit was last written to zero.

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

Overflow status for [MSMON_MBWU_L](#).VALUE is reported in [MSMON_CFG_MBWU_CTL](#).OFLOW_STATUS_L.

OFLOW_INTR, bit [25]

Enable interrupt on overflow of [MSMON_MBWU.VALUE](#).

OFLOW_INTR	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_MBWU.VALUE .
0b1	An implementation-specific interrupt is signaled on an overflow of MSMON_MBWU.VALUE .

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

If overflow interrupt is not supported by the MSC implementation, this field is RAZ/WI.

Interrupt enable for overflow of [MSMON_MBWU_L.VALUE](#) is controlled by [MSMON_CFG_MBWU_CTL.OFLOW_INTR_L](#).

OFLOW_FRZ, bit [24]

Freeze monitor instance on overflow.

Controls whether [MSMON_MBWU.VALUE](#) field of the monitor instance freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	MSMON_MBWU.VALUE field of the monitor instance wraps on overflow.
0b1	MSMON_MBWU.VALUE field of the monitor instance freezes on overflow. If the increment that caused the overflow was 1, the frozen value is the post-increment value of 0. If the increment that caused the overflow was larger than 1, the frozen value of the monitor might be 0 or a larger value less than the final increment.

If overflow is not possible for the instance of the MBWU monitor in the implementation, this field is RAZ/WI.

This control bit affects both [MSMON_MBWU](#) and [MSMON_MBWU_L](#) in implementations that include [MSMON_MBWU_L](#).

SUBTYPE, bits [23:20]

Subtype. Type of bandwidth counted by this monitor.

This field is not currently used for MBWU monitors, but reserved for future use.

This field is RAZ/WI.

SCLEN, bit [19]

[MSMON_MBWU.VALUE](#) Scaling Enable.

Enables scaling of [MSMON_MBWU.VALUE](#) by [MPAMF_MBWUMON_IDR.SCALE](#).

SCLEN	Meaning
0b0	MSMON_MBWU.VALUE has bytes counted by the monitor instance.
0b1	MSMON_MBWU.VALUE has bytes counted by the monitor instance, shifted right by MPAMF_MBWUMON_IDR.SCALE .

Bit [18]

Reserved, RES0.

MATCH_PMG, bit [17]

Match PMG.

Controls whether the monitor instance only counts data transferred with PMG matching [MSMON_CFG_MBWU_FLT](#).PMG.

MATCH_PMG	Meaning
0b0	The monitor instance counts data transferred with any PMG value.
0b1	The monitor instance only counts data transferred with the PMG value matching MSMON_CFG_MBWU_FLT .PMG.

MATCH_PARTID, bit [16]

Match PARTID.

Controls whether the monitor instance counts only data transferred with PARTID matching [MSMON_CFG_MBWU_FLT](#).PARTID.

MATCH_PARTID	Meaning
0b0	The monitor instance counts data transferred with any PARTID value.
0b1	The monitor instance only counts data transferred with the PARTID value matching MSMON_CFG_MBWU_FLT .PARTID.

OFLOW_STATUS_L, bit [15]

When **FEAT_MPAMv0p1** is implemented or **FEAT_MPAMv1p1** is implemented:

Overflow Status of [MSMON_MBWU_L](#).VALUE of the monitor instance.

Indicates whether [MSMON_MBWU_L](#).VALUE has overflowed.

OFLOW_STATUS_L	Meaning
0b0	MSMON_MBWU_L .VALUE has not overflowed.
0b1	MSMON_MBWU_L .VALUE has overflowed at least once since this bit was last written to zero.

If [MPAMF_MBWUMON_IDR](#).HAS_LONG == 0, this bit is RES0.

Overflow status of [MSMON_MBWU](#).VALUE is reported in [MSMON_CFG_MBWU_CTL](#).OFLOW_STATUS.

Otherwise:

Reserved, RES0.

OFLOW_INTR_L, bit [14]

When **FEAT_MPAMv0p1** is implemented or **FEAT_MPAMv1p1** is implemented:

Overflow Interrupt for [MSMON_MBWU_L](#).

Controls whether an MPAM overflow interrupt is generated when [MSMON_MBWU_L](#).VALUE overflows.

OFLOW_INTR_L	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_MBWU_L .VALUE.
0b1	An implementation-specific interrupt is signaled on overflow of MSMON_MBWU_L .VALUE.

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

If the overflow interrupt is not supported by the MSC implementation, this field is RAZ/WI.

If [MPAMF_MBWUMON_IDR](#).HAS_LONG == 0, this bit is RES0.

Otherwise:

Reserved, RES0.

Bits [13:8]

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code. The MBWU monitor is TYPE = 0x42.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x42.

Access to this field is **RO**.

Accessing MSMON_CFG_MBWU_CTL

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- [MSMON_CFG_MBWU_CTL_s](#) must be accessible from the Secure MPAM feature page.
- [MSMON_CFG_MBWU_CTL_ns](#) must be accessible from the Non-secure MPAM feature page.
- [MSMON_CFG_MBWU_CTL_rt](#) must be accessible from the Root MPAM feature page.
- [MSMON_CFG_MBWU_CTL_rl](#) must be accessible from the Realm MPAM feature page.

[MSMON_CFG_MBWU_CTL_s](#), [MSMON_CFG_MBWU_CTL_ns](#), [MSMON_CFG_MBWU_CTL_rt](#), and [MSMON_CFG_MBWU_CTL_rl](#) must be separate registers.

- The Secure instance ([MSMON_CFG_MBWU_CTL_s](#)) accesses the memory bandwidth usage monitor controls used for Secure PARTIDs.
- The Non-secure instance ([MSMON_CFG_MBWU_CTL_ns](#)) accesses the memory bandwidth usage monitor controls used for Non-secure PARTIDs.
- The Root instance ([MSMON_CFG_MBWU_CTL_rt](#)) accesses the memory bandwidth usage monitor controls used for Root PARTIDs.
- The Realm instance ([MSMON_CFG_MBWU_CTL_rl](#)) accesses the memory bandwidth usage monitor controls used for Realm PARTIDs.

When RIS is implemented, loads and stores to [MSMON_CFG_MBWU_CTL](#) access the monitor configuration settings for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, loads and stores to [MSMON_CFG_MBWU_CTL](#) access the monitor configuration settings for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CFG_MBWU_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0828	MSMON_CFG_MBWU_CTL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0828	MSMON_CFG_MBWU_CTL_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0828	MSMON_CFG_MBWU_CTL_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x0828	MSMON_CFG_MBWU_CTL_r1

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 15:09:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

MSMON_CFG_MBWU_FLT, MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Filter Register

The MSMON_CFG_MBWU_FLT characteristics are:

Purpose

Controls PARTID and PMG to measure or count in the MBWU monitor selected by [MSMON_CFG_MON_SEL](#).

- [MSMON_CFG_MBWU_FLT_s](#) sets filter conditions for the Secure memory bandwidth usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_CFG_MBWU_CTL_ns](#) sets filter conditions for the Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_CFG_CSU_FLT_rt](#) sets the filter conditions for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_CFG_CSU_FLT_rl](#) sets the filter conditions for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

[MSMON_CFG_MBWU_FLT_s](#) sets filter conditions for the Secure memory bandwidth usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). [MSMON_CFG_MBWU_CTL_ns](#) sets filter conditions for the Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). [MSMON_CFG_CSU_FLT_rt](#) sets the filter conditions for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#). [MSMON_CFG_CSU_FLT_rl](#) sets the filter conditions for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_CFG_MBWU_FLT is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_CFG_MBWU_FLT are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MBWU_FLT is a 32-bit register.

Field descriptions

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RWBW				RES0								PMG				PARTID															

RW filtering.

RWBW, bits [31:30]

When `MPAMF_MBWUMON_IDR.HAS_RWBW == 1`:

Read/write bandwidth filter. Configures the selected monitor instance to count all bandwidth, only read bandwidth or only write bandwidth.

RWBW	Meaning
0b00	Monitor instance counts read bandwidth and write bandwidth.
0b01	Monitor instance counts write bandwidth only.
0b10	Monitor instance counts read bandwidth only.
0b11	Reserved.

Otherwise:

Reserved, RES0.

Bits [29:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If `MSMON_CFG_MBWU_CTL.MATCH_PMG == 0`, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If `MSMON_CFG_MBWU_CTL.MATCH_PMG == 1`, the monitor selected by `MSMON_CFG_MON_SEL` measures or counts memory bandwidth labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If `MSMON_CFG_MBWU_CTL.MATCH_PARTID == 0`, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If `MSMON_CFG_MBWU_CTL.MATCH_PARTID == 1`, the monitor selected by `MSMON_CFG_MON_SEL` measures or counts memory bandwidth labeled with PARTID equal to this field.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMG								PARTID															

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If `MSMON_CFG_MBWU_CTL.MATCH_PMG == 0`, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If `MSMON_CFG_MBWU_CTL.MATCH_PMG == 1`, the monitor selected by `MSMON_CFG_MON_SEL` measures or counts memory bandwidth labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If [MSMON_CFG_MBWU_CTL.MATCH_PARTID](#) == 0, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If [MSMON_CFG_MBWU_CTL.MATCH_PARTID](#) == 1, the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts memory bandwidth labeled with PARTID equal to this field.

Accessing MSMON_CFG_MBWU_FLT

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- [MSMON_CFG_MBWU_FLT_s](#) must be accessible from the Secure MPAM feature page.
- [MSMON_CFG_MBWU_FLT_ns](#) must be accessible from the Non-secure MPAM feature page.
- [MSMON_CFG_MBWU_FLT_rt](#) must be accessible from the Root MPAM feature page.
- [MSMON_CFG_MBWU_FLT_rl](#) must be accessible from the Realm MPAM feature page.

[MSMON_CFG_MBWU_FLT_s](#), [MSMON_CFG_MBWU_FLT_ns](#), [MSMON_CFG_MBWU_FLT_rt](#), and [MSMON_CFG_MBWU_FLT_rl](#) must be separate registers.

- The Secure instance ([MSMON_CFG_MBWU_FLT_s](#)) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance ([MSMON_CFG_MBWU_FLT_ns](#)) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance ([MSMON_CFG_MBWU_FLT_rt](#)) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance ([MSMON_CFG_MBWU_FLT_rl](#)) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, loads and stores to [MSMON_CFG_MBWU_FLT](#) access the monitor configuration settings for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, loads and stores to [MSMON_CFG_MBWU_FLT](#) access the monitor configuration settings for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CFG_MBWU_FLT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0820	MSMON_CFG_MBWU_FLT_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0820	MSMON_CFG_MBWU_FLT_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0820	MSMON_CFG_MBWU_FLT_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0820	MSMON_CFG_MBWU_FLT_rl

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

MSMON_CFG_MON_SEL, MPAM Monitor Instance Selection Register

The MSMON_CFG_MON_SEL characteristics are:

Purpose

Selects a monitor instance to access through the MSMON configuration and counter registers.

- `MSMON_CFG_MON_SEL_s` selects a Secure monitor instance to access via the Secure MPAM feature page.
- `MSMON_CFG_MON_SEL_ns` selects a Non-secure monitor instance to access via the Non-secure MPAM feature page.
- `MSMON_CFG_MON_SEL_rt` selects a Root monitor instance to access via the Root MPAM feature page.
- `MSMON_CFG_MON_SEL_rl` selects a Realm monitor instance to access via the Realm MPAM feature page.

`MSMON_CFG_MON_SEL_s` selects a Secure monitor instance to access via the Secure MPAM feature page.
`MSMON_CFG_MON_SEL_ns` selects a Non-secure monitor instance to access via the Non-secure MPAM feature page.
`MSMON_CFG_MON_SEL_rt` selects a Root monitor instance to access via the Root MPAM feature page.
`MSMON_CFG_MON_SEL_rl` selects a Realm monitor instance to access via the Realm MPAM feature page.

Note

Different performance monitoring features within an MSC could have different numbers of monitor instances. See the `NUM_MON` field in the corresponding ID register. This means that a monitor out-of-bounds error might be signaled when an `MSMON_CFG` register is accessed because the value in `MSMON_CFG_MON_SEL.MON_SEL` is too large for the particular monitoring feature.

To configure a monitor, set `MON_SEL` in this register to the index of the monitor instance to configure, then write to the `MSMON_CFG_x` register to set the configuration of the monitor. At a later time, read the monitor register (for example, `MSMON_MBWU`) to get the value of the monitor.

Configuration

The power domain of `MSMON_CFG_MON_SEL` is IMPLEMENTATION DEFINED.

This register is present only when `FEAT_MPAM` is implemented and (`MPAMF_IDR.HAS_MSMON == 1`, or (`MPAMF_IDR.HAS_IMPL_IDR == 1` and `MPAMF_IDR.EXT == 0`) or (`MPAMF_IDR.HAS_IMPL_IDR == 1`, `MPAMF_IDR.EXT == 1` and `MPAMF_IDR.NO_IMPL_MSMON == 0`)). Otherwise, direct accesses to `MSMON_CFG_MON_SEL` are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

`MSMON_CFG_MON_SEL` is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				RIS				RES0				MON_SEL																			

Bits [31:28]

Reserved, RES0.

RIS, bits [27:24]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MSMON_CFG registers.

Otherwise:

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

MON_SEL, bits [15:0]

Selects the monitor instance to configure or read.

Reads and writes to other MSMON registers are indexed by MON_SEL and by the NS bit used to access MSMON_CFG_MON_SEL to access the configuration for a single monitor.

Accessing MSMON_CFG_MON_SEL

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_CFG_MON_SEL_s must be accessible from the Secure MPAM feature page.
- MSMON_CFG_MON_SEL_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_MON_SEL_rt must be accessible from the Root MPAM feature page.
- MSMON_CFG_MON_SEL_rl must be accessible from the Realm MPAM feature page.

MSMON_CFG_MON_SEL_s, MSMON_CFG_MON_SEL_ns, MSMON_CFG_MON_SEL_rt, and MSMON_CFG_MON_SEL_rl must be separate registers.

- The Secure instance (MSMON_CFG_MON_SEL_s) accesses the monitor instance selector used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_MON_SEL_ns) accesses the monitor instance selector used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_MON_SEL_rt) accesses the monitor instance selector used for Root PARTIDs.
- The Realm instance (MSMON_CFG_MON_SEL_rl) accesses the monitor instance selector used for Realm PARTIDs.

MSMON_CFG_MON_SEL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0800	MSMON_CFG_MON_SEL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0800	MSMON_CFG_MON_SEL_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0800	MSMON_CFG_MON_SEL_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x0800	MSMON_CFG_MON_SEL_r1

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CSU, MPAM Cache Storage Usage Monitor Register

The MSMON_CSU characteristics are:

Purpose

Accesses the CSU monitor instance selected by [MSMON_CFG_MON_SEL](#).

- [MSMON_CSU_s](#) is a Secure cache storage usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_CSU_ns](#) is a Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_CSU_rt](#) is a Root cache storage usage monitor instance selected by the Root instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_CSU_rl](#) is a Realm cache storage usage monitor instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

[MSMON_CSU_s](#) is a Secure cache storage usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). [MSMON_CSU_ns](#) is a Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). [MSMON_CSU_rt](#) is a Root cache storage usage monitor instance selected by the Root instance of [MSMON_CFG_MON_SEL](#). [MSMON_CSU_rl](#) is a Realm cache storage usage monitor instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_CSU is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, [MPAMF_IDR.HAS_MSMON](#) == 1 and [MPAMF_MSMON_IDR.MSMON_CSU](#) == 1. Otherwise, direct accesses to MSMON_CSU are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NRDY																VALUE															

[NRDY](#), bit [31]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_CSU.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_CSU.VALUE field might be inaccurate or otherwise not represent the actual cache storage usage.

VALUE, bits [30:0]

Cache storage usage measurement value if MSMON_CSU.NRDY is 0. Invalid if MSMON_CSU.NRDY is 1.

VALUE is the cache storage usage measured in bytes meeting the criteria set in [MSMON_CFG_CSU_FLT](#) and [MSMON_CFG_CSU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

Accessing MSMON_CSU

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_CSU_s must be accessible from the Secure MPAM feature page.
- MSMON_CSU_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CSU_rt must be accessible from the Root MPAM feature page.
- MSMON_CSU_rl must be accessible from the Realm MPAM feature page.

MSMON_CSU_s, MSMON_CSU_ns, MSMON_CSU_rt, and MSMON_CSU_rl must be separate registers.

- The Secure instance (MSMON_CSU_s) accesses the cache storage usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSU_ns) accesses the cache storage usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CSU_rt) accesses the cache storage usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_CSU_rl) accesses the cache storage usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to MSMON_CSU access the cache storage usage monitor monitor instance for the cache resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to MSMON_CSU access the cache storage usage monitor monitor instance for the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CSU can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0840	MSMON_CSU_s

This interface is accessible as follows:

- When MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are **RW**.
- When MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0840	MSMON_CSU_ns

This interface is accessible as follows:

- When MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are **RW**.
- When MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0840	MSMON_CSU_rt

This interface is accessible as follows:

- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are **RW**.
- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0840	MSMON_CSU_rl

This interface is accessible as follows:

- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are **RW**.
- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are **RO**.

30/06/2021 15:09:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

MSMON_CSU_CAPTURE, MPAM Cache Storage Usage Monitor Capture Register

The MSMON_CSU_CAPTURE characteristics are:

Purpose

MSMON_CSU_CAPTURE is a 32-bit read-write register that accesses the captured [MSMON_CSU](#) monitor instance selected by [MSMON_CFG_MON_SEL](#).

- [MSMON_CSU_CAPTURE_s](#) is the Secure cache storage usage monitor capture instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_CSU_CAPTURE_ns](#) is the Non-secure cache storage usage monitor capture instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_CSU_CAPTURE_rt](#) is a Root cache storage usage monitor capture instance selected by the Root instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_CSU_CAPTURE_rl](#) is a Realm cache storage usage monitor capture instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

[MSMON_CSU_CAPTURE_s](#) is the Secure cache storage usage monitor capture instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). [MSMON_CSU_CAPTURE_ns](#) is the Non-secure cache storage usage monitor capture instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). [MSMON_CSU_CAPTURE_rt](#) is a Root cache storage usage monitor capture instance selected by the Root instance of [MSMON_CFG_MON_SEL](#). [MSMON_CSU_CAPTURE_rl](#) is a Realm cache storage usage monitor capture instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance capture register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL](#). [RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_CSU_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when [FEAT_MPAM](#) is implemented, [MPAMF_IDR.HAS_MSMON](#) == 1, [MPAMF_MSMON_IDR.MSMON_CSU](#) == 1 and [MPAMF_CSUMON_IDR.HAS_CAPTURE](#) == 1. Otherwise, direct accesses to [MSMON_CSU_CAPTURE](#) are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

[MSMON_CSU_CAPTURE](#) is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NRDY																VALUE															

NRDY, bit [31]

Not Ready. Indicates whether the captured monitor value has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_CSU_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_CSU_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual cache storage usage.

VALUE, bits [30:0]

Captured cache storage usage measurement if MSMON_CSU_CAPTURE.NRDY is 0. Invalid if MSMON_CSU_CAPTURE.NRDY is 1.

VALUE is the captured cache storage usage measurement in bytes meeting the criteria set in [MSMON_CFG_CSU_FLT](#) and [MSMON_CFG_CSU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

Accessing MSMON_CSU_CAPTURE

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_CSU_CAPTURE_s must be accessible from the Secure MPAM feature page.
- MSMON_CSU_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CSU_CAPTURE_rt must be accessible from the Root MPAM feature page.
- MSMON_CSU_CAPTURE_rl must be accessible from the Realm MPAM feature page.

MSMON_CSU_CAPTURE_s, MSMON_CSU_CAPTURE_ns, MSMON_CSU_CAPTURE_rt, and MSMON_CSU_CAPTURE_rl must be separate registers.

- The Secure instance (MSMON_CSU_CAPTURE_s) accesses the captured cache storage usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSU_CAPTURE_ns) accesses the captured cache storage usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CSU_CAPTURE_rt) accesses the captured cache storage usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_CSU_CAPTURE_rl) accesses the captured cache storage usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to MSMON_CSU_CAPTURE access the monitor instance for the cache resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to MSMON_CSU_CAPTURE access the monitor instance for the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CSU_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0848	MSMON_CSU_CAPTURE_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0848	MSMON_CSU_CAPTURE_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0848	MSMON_CSU_CAPTURE_rt

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CSU_CAPTURE, MPAM Cache Storage Usage Monitor Capture Register

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x0848	MSMON_CSU_CAPTURE_r1

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 15:09:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

MSMON_CSU_OFSR, MPAM CSU Monitor Overflow Status Register

The MSMON_CSU_OFSR characteristics are:

Purpose

MSMON_CSU_OFSR is a 32-bit read-only register that shows bitmap of CSU monitor instance overflow status for a contiguous group of 32 monitor instances.

- ~~MSMON_CSU_OFSR_s gives a bitmap of pending CSU overflow status for 32 Secure CSU monitor instances.~~
- ~~MSMON_CSU_OFSR_ns gives a bitmap of pending CSU overflow status for 32 Non-secure CSU monitor instances.~~
- ~~MSMON_CSU_OFSR_rt gives a bitmap of pending CSU overflow status for 32 Root CSU monitor instances.~~
- ~~MSMON_CSU_OFSR_rl gives a bitmap of pending CSU overflow status for 32 Realm CSU monitor instances.~~

MSMON_CSU_OFSR_s gives a bitmap of pending CSU overflow status for 32 Secure CSU monitor instances.
 MSMON_CSU_OFSR_ns gives a bitmap of pending CSU overflow status for 32 Non-secure CSU monitor instances.
 MSMON_CSU_OFSR_rt gives a bitmap of pending CSU overflow status for 32 Root CSU monitor instances.
 MSMON_CSU_OFSR_rl gives a bitmap of pending CSU overflow status for 32 Realm CSU monitor instances.

Configuration

The power domain of MSMON_CSU_OFSR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_CSUMON_IDR.HAS_OFSR == 1. Otherwise, direct accesses to MSMON_CSU_OFSR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU_OFSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
OFPND31	OFPND30	OFPND29	OFPND28	OFPND27	OFPND26	OFPND25	OFPND24	OFPND23	OFPND22	OFPND21	OFPND20

OFPND<i>, bit [i], for i = 31 to 0

Overflow status bitmap for CSU monitor instances. The RIS and the contiguous range of CSU monitor instances are set in [MSMON_CFG_MON_SEL](#). i of 0 corresponds to the CSU monitor instance [MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0](#).

OFPND<i>	Meaning
0b0	CSU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) does not have a pending overflow.
0b1	CSU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) has a pending overflow.

After reading [MSMON_OFLOW_SR](#) to determine that a CSU monitor instance has a pending overflow and which RIS values have pending overflows, an interrupt service routine could poll groups of 32 monitor instances in a RIS for pending monitors by reading this bitmap and incrementing [MSMON_CFG_MON_SEL.MON_SEL](#) by 32.

Accessing MSMON_CSU_OFSR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_CSU_OFSR_s must be accessible from the Secure MPAM feature page.
- MSMON_CSU_OFSR_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CSU_OFSR_rt must be accessible from the Root MPAM feature page.
- MSMON_CSU_OFSR_rl must be accessible from the Realm MPAM feature page.

MSMON_CSU_OFSR_s, MSMON_CSU_OFSR_ns, MSMON_CSU_OFSR_rt, and MSMON_CSU_OFSR_rl must be separate registers.

- The Secure instance (MSMON_CSU_OFSR_s) accesses the CSU monitor overflow status bitmap used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSU_OFSR_ns) accesses the CSU monitor overflow status bitmap used for Non-secure PARTIDs.
- The Root instance (MSMON_CSU_OFSR_rt) accesses the CSU monitor overflow status bitmap used for Root PARTIDs.
- The Realm instance (MSMON_CSU_OFSR_rl) accesses the CSU monitor overflow status bitmap used for Realm PARTIDs.

MSMON_CSU_OFSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0858	MSMON_CSU_OFSR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0858	MSMON_CSU_OFSR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0858	MSMON_CSU_OFSR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0858	MSMON_CSU_OFSR_rl

When FEAT_RME is implemented access on this interface are **RO**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

MSMON_MBWU, MPAM Memory Bandwidth Usage Monitor Register

The MSMON_MBWU characteristics are:

Purpose

Accesses the monitor instance selected by [MSMON_CFG_MON_SEL](#).

- [MSMON_MBWU_s](#) is the Secure memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL_s](#).
- [MSMON_MBWU_ns](#) is the Non-secure memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL_ns](#).
- [MSMON_MBWU_rt](#) is the Root memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL_rt](#).
- [MSMON_MBWU_rl](#) is the Realm memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL_rl](#).

[MSMON_MBWU_s](#) is the Secure memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL_s](#). [MSMON_MBWU_ns](#) is the Non-secure memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL_ns](#). [MSMON_MBWU_rt](#) is the Root memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL_rt](#). [MSMON_MBWU_rl](#) is the Realm memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL_rl](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_MBWU is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_MBWU are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NRDY																VALUE															

NRDY, bit [31]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_MBWU.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_MBWU.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [30:0]

Memory bandwidth usage counter value if MSMON_MBWU.NRDY is 0. Invalid if MSMON_MBWU.NRDY is 1.

VALUE is the scaled count of bytes transferred since the monitor was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

If [MSMON_CFG_MBWU_CTL](#).SCLEN enables scaling, the count in VALUE is the number of bytes shifted right by [MPAMF_MBWUMON_IDR](#).SCALE bit positions and rounded.

Accessing MSMON_MBWU

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_MBWU_s must be accessible from the Secure MPAM feature page.
- MSMON_MBWU_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_rt must be accessible from the Root MPAM feature page.
- MSMON_MBWU_rl must be accessible from the Realm MPAM feature page.

MSMON_MBWU_s, MSMON_MBWU_ns, MSMON_MBWU_rt, and MSMON_MBWU_rl must be separate registers.

- The Secure instance (MSMON_MBWU_s) accesses the memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_ns) accesses the memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_rt) accesses the memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_rl) accesses the memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU access the memory bandwidth usage monitor instance for the resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU access the memory bandwidth usage monitor instance for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_MBWU can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0860	MSMON_MBWU_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0860	MSMON_MBWU_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0860	MSMON_MBWU_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0860	MSMON_MBWU_rl

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

MSMON_MBWU_CAPTURE, MPAM Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU_CAPTURE characteristics are:

Purpose

Accesses the captured MSMON_MBWU monitor instance selected by [MSMON_CFG_MON_SEL](#).

- [MSMON_MBWU_CAPTURE_s](#) is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_MBWU_CAPTURE_ns](#) is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_MBWU_CAPTURE_rt](#) is the Root memory bandwidth usage monitor capture instance selected by the Root instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_MBWU_CAPTURE_rl](#) is the Realm memory bandwidth usage monitor capture instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

[MSMON_MBWU_CAPTURE_s](#) is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). [MSMON_MBWU_CAPTURE_ns](#) is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). [MSMON_MBWU_CAPTURE_rt](#) is the Root memory bandwidth usage monitor capture instance selected by the Root instance of [MSMON_CFG_MON_SEL](#). [MSMON_MBWU_CAPTURE_rl](#) is the Realm memory bandwidth usage monitor capture instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance capture register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_MBWU_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, [MPAMF_IDR.HAS_MSMON](#) == 1, [MPAMF_MSMON_IDR.MSMON_MBWU](#) == 1 and [MPAMF_MBWUMON_IDR.HAS_CAPTURE](#) == 1. Otherwise, direct accesses to [MSMON_MBWU_CAPTURE](#) are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

[MSMON_MBWU_CAPTURE](#) is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NRDY																VALUE															

[NRDY](#), bit [31]

Not Ready. The captured [NRDY](#) bit from the corresponding instance of [MSMON_MBWU](#). This bit indicates whether the captured monitor value has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_MBWU_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_MBWU_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [30:0]

Captured memory bandwidth usage counter value if MSMON_MBWU_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_CAPTURE.NRDY is 1.

VALUE is the captured VALUE field from the corresponding instance of [MSMON_MBWU](#), the count of bytes transferred since the monitor was last reset that meet the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

VALUE captures the [MSMON_MBWU](#).VALUE and preserves any scaling that had been performed on the VALUE field in that register.

Accessing MSMON_MBWU_CAPTURE

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_MBWU_CAPTURE_s must be accessible from the Secure MPAM feature page.
- MSMON_MBWU_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_CAPTURE_rt must be accessible from the Root MPAM feature page.
- MSMON_MBWU_CAPTURE_rl must be accessible from the Realm MPAM feature page.

MSMON_MBWU_CAPTURE_s, MSMON_MBWU_CAPTURE_ns, MSMON_MBWU_CAPTURE_rt, and MSMON_MBWU_CAPTURE_rl must be separate registers.

- The Secure instance (MSMON_MBWU_CAPTURE_s) accesses the captured memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_CAPTURE_ns) accesses the captured memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_CAPTURE_rt) accesses the captured memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_CAPTURE_rl) accesses the captured memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU_CAPTURE access the monitor instance for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU_CAPTURE access the monitor instance for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_MBWU_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0868	MSMON_MBWU_CAPTURE_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0868	MSMON_MBWU_CAPTURE_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0868	MSMON_MBWU_CAPTURE_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ri	0x0868	MSMON_MBWU_CAPTURE_ri

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_MBWU_L, MPAM Long Memory Bandwidth Usage Monitor Register

The MSMON_MBWU_L characteristics are:

Purpose

Accesses the monitor instance selected by [MSMON_CFG_MON_SEL](#).

- [MSMON_MBWU_L_s](#) is the Secure long memory bandwidth usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_MBWU_L_ns](#) is the Non-secure long memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_MBWU_L_rt](#) is the Root long memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL_rt](#).
- [MSMON_MBWU_L_rl](#) is the Realm long memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL_rl](#).

[MSMON_MBWU_L_s](#) is the Secure long memory bandwidth usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). [MSMON_MBWU_L_ns](#) is the Non-secure long memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). [MSMON_MBWU_L_rt](#) is the Root long memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL_rt](#). [MSMON_MBWU_L_rl](#) is the Realm long memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL_rl](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance long monitor register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of [MSMON_MBWU_L](#) is IMPLEMENTATION DEFINED.

This register is present only when [FEAT_MPAM](#) is implemented, [MPAMF_IDR.HAS_MSMON](#) == 1, [MPAMF_MSMON_IDR.MSMON_MBWU](#) == 1 and [MPAMF_MBWUMON_IDR.HAS_LONG](#) == 1. Otherwise, direct accesses to [MSMON_MBWU_L](#) are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

[MSMON_MBWU_L](#) is a 64-bit register.

Field descriptions

When [MPAMF_MBWUMON_IDR.LWD](#) == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NRDY		RES0																		VALUE											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

[NRDY](#), bit [63]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_MBWU_L.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_MBWU_L.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

Bits [62:44]

Reserved, RES0.

VALUE, bits [43:0]

Long (44-bit) memory bandwidth usage counter value if MSMON_MBWU_L.NRDY is 0. Invalid if MSMON_MBWU_L.NRDY is 1.

VALUE is the long count of bytes transferred since the monitor was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

When MPAMF_MBWUMON_IDR.LWD == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NRDY	VALUE																														
VALUE																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NRDY, bit [63]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_MBWU_L.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_MBWU_L.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [62:0]

Long (63-bit) memory bandwidth usage counter value if MSMON_MBWU_L.NRDY is 0. Invalid if MSMON_MBWU_L.NRDY is 1.

VALUE is the long count of bytes transferred since the monitor instance was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

Accessing MSMON_MBWU_L

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_MBWU_L_s must be accessible from the Secure MPAM feature page.
- MSMON_MBWU_L_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_L_rt must be accessible from the Root MPAM feature page.
- MSMON_MBWU_L_rl must be accessible from the Realm MPAM feature page.

MSMON_MBWU_L_s, MSMON_MBWU_L_ns, MSMON_MBWU_L_rt, and MSMON_MBWU_L_rl must be separate registers.

- The Secure instance (MSMON_MBWU_L_s) accesses the long memory bandwidth usage monitor used for Secure PARTIDs.

- The Non-secure instance (MSMON_MBWU_L_ns) accesses the long memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_L_rt) accesses the long memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_L_rl) accesses the long memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU_L access the long memory bandwidth usage monitor instance for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU_L access the long memory bandwidth usage monitor instance for the monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_MBWU_L can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0880	MSMON_MBWU_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0880	MSMON_MBWU_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0880	MSMON_MBWU_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0880	MSMON_MBWU_rl

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

MSMON_MBWU_L_CAPTURE, MPAM Long Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU_L_CAPTURE characteristics are:

Purpose

Accesses the captured [MSMON_MBWU_L](#) monitor instance selected by [MSMON_CFG_MON_SEL](#).

- [MSMON_MBWU_L_CAPTURE_s](#) is the Secure long memory bandwidth usage monitor capture instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_MBWU_L_CAPTURE_ns](#) is the Non-secure long memory bandwidth usage monitor capture instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_MBWU_L_CAPTURE_rt](#) is the Root long memory bandwidth usage monitor capture instance selected by the Root instance of [MSMON_CFG_MON_SEL](#).
- [MSMON_MBWU_L_CAPTURE_rl](#) is the Realm long memory bandwidth usage monitor capture instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

[MSMON_MBWU_L_CAPTURE_s](#) is the Secure long memory bandwidth usage monitor capture instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). [MSMON_MBWU_L_CAPTURE_ns](#) is the Non-secure long memory bandwidth usage monitor capture instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). [MSMON_MBWU_L_CAPTURE_rt](#) is the Root long memory bandwidth usage monitor capture instance selected by the Root instance of [MSMON_CFG_MON_SEL](#). [MSMON_MBWU_L_CAPTURE_rl](#) is the Realm long memory bandwidth usage monitor capture instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance long capture register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL](#). [RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of [MSMON_MBWU_L_CAPTURE](#) is IMPLEMENTATION DEFINED.

This register is present only when [FEAT_MPAM](#) is implemented, [MPAMF_IDR.HAS_MSMON](#) == 1, [MPAMF_MSMON_IDR.MSMON_MBWU](#) == 1, [MPAMF_MBWUMON_IDR.HAS_CAPTURE](#) == 1 and [MPAMF_MBWUMON_IDR.HAS_LONG](#) == 1. Otherwise, direct accesses to [MSMON_MBWU_L_CAPTURE](#) are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

[MSMON_MBWU_L_CAPTURE](#) is a 64-bit register.

Field descriptions

When [MPAMF_MBWUMON_IDR.LWD](#) == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NRDY		RES0																		VALUE											
												VALUE																			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_MBWU_L_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

Bits [62:44]

Reserved, RES0.

VALUE, bits [43:0]

Captured long memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY is 1.

VALUE is the captured 44-bit count of bytes transferred since the monitor instance was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

When MPAMF_MBWUMON_IDR.LWD == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NRDY	VALUE																														
VALUE																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_MBWU_L_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [62:0]

The captured long memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY is 1.

VALUE is the captured 63-bit count of bytes transferred since the monitor instance was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

Accessing MSMON_MBWU_L_CAPTURE

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_MBWU_L_CAPTURE_s must be accessible from the Secure MPAM feature page.
- MSMON_MBWU_L_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_L_CAPTURE_rt must be accessible from the Root MPAM feature page.
- MSMON_MBWU_L_CAPTURE_rl must be accessible from the Realm MPAM feature page.

MSMON_MBWU_L_CAPTURE_s, MSMON_MBWU_L_CAPTURE_ns, MSMON_MBWU_L_CAPTURE_rt, and MSMON_MBWU_L_CAPTURE_rl must be separate registers.

- The Secure instance (MSMON_MBWU_L_CAPTURE_s) accesses the captured long memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_L_CAPTURE_ns) accesses the captured long memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_L_CAPTURE_rt) accesses the captured long memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_L_CAPTURE_rl) accesses the captured long memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU_L_CAPTURE access the monitor instance for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU_L_CAPTURE access the monitor instance for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_MBWU_L_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0890	MSMON_MBWU_CAPTURE_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0890	MSMON_MBWU_CAPTURE_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0890	MSMON_MBWU_CAPTURE_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0890	MSMON_MBWU_CAPTURE_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_MBWU_OFSR, MPAM MBWU Monitor Overflow Status Register

The MSMON_MBWU_OFSR characteristics are:

Purpose

MSMON_MBWU_OFSR is a 32-bit read-only register that shows bitmap of MBWU monitor instance overflow status for a contiguous group of 32 monitor instances.

- MSMON_MBWU_OFSR_s gives a bitmap of pending MBWU overflow status for 32 Secure MBWU monitor instances.
- MSMON_MBWU_OFSR_ns gives a bitmap of pending MBWU overflow status for 32 Non-secure MBWU monitor instances.
- MSMON_MBWU_OFSR_rt gives a bitmap of pending MBWU overflow status for 32 Root MBWU monitor instances.
- MSMON_MBWU_OFSR_rl gives a bitmap of pending MBWU overflow status for 32 Realm MBWU monitor instances.

MSMON_MBWU_OFSR_s gives a bitmap of pending MBWU overflow status for 32 Secure MBWU monitor instances. MSMON_MBWU_OFSR_ns gives a bitmap of pending MBWU overflow status for 32 Non-secure MBWU monitor instances. MSMON_MBWU_OFSR_rt gives a bitmap of pending MBWU overflow status for 32 Root MBWU monitor instances. MSMON_MBWU_OFSR_rl gives a bitmap of pending MBWU overflow status for 32 Realm MBWU monitor instances.

Configuration

The power domain of MSMON_MBWU_OFSR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_MBWUMON_IDR.HAS_OFSR == 1. Otherwise, direct accesses to MSMON_MBWU_OFSR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_OFSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
OFPND31	OFPND30	OFPND29	OFPND28	OFPND27	OFPND26	OFPND25	OFPND24	OFPND23	OFPND22	OFPND21	OFPND20

OFPND<i>, bit [i], for i = 31 to 0

Overflow status bitmap for MBWU monitor instances. The RIS and the contiguous range of MBWU monitor instances are set in [MSMON_CFG_MON_SEL](#). i of 0 corresponds to the MBWU monitor instance [MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0](#).

OFPND<i>	Meaning
0b0	MBWU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) does not have a pending overflow.
0b1	MBWU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) has a pending overflow.

After reading [MSMON_OFLOW_SR](#) to determine that an MBWU monitor instance has a pending overflow and which RIS values have pending overflows, an interrupt service routine could poll groups of 32 monitor instances in a RIS for pending monitors by reading this bitmap and incrementing [MSMON_CFG_MON_SEL.MON_SEL](#) by 32.

A pending overflow may be in either the [MSMON_CFG_MBWU_CTL.OFLOW_STATUS](#) or [MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L](#) field.

Accessing MSMON_MBWU_OFSR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- [MSMON_MBWU_OFSR_s](#) must be accessible from the Secure MPAM feature page.
- [MSMON_MBWU_OFSR_ns](#) must be accessible from the Non-secure MPAM feature page.
- [MSMON_MBWU_OFSR_rt](#) must be accessible from the Root MPAM feature page.
- [MSMON_MBWU_OFSR_rl](#) must be accessible from the Realm MPAM feature page.

[MSMON_MBWU_OFSR_s](#), [MSMON_MBWU_OFSR_ns](#), [MSMON_MBWU_OFSR_rt](#), and [MSMON_MBWU_OFSR_rl](#) must be separate registers.

- The Secure instance ([MSMON_MBWU_OFSR_s](#)) accesses the MBWU monitor overflow status bitmap used for Secure PARTIDs.
- The Non-secure instance ([MSMON_MBWU_OFSR_ns](#)) accesses the MBWU monitor overflow status bitmap used for Non-secure PARTIDs.
- The Root instance ([MSMON_MBWU_OFSR_rt](#)) accesses the MBWU monitor overflow status bitmap used for Root PARTIDs.
- The Realm instance ([MSMON_MBWU_OFSR_rl](#)) accesses the MBWU monitor overflow status bitmap used for Realm PARTIDs.

MSMON_MBWU_OFSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0898	MSMON_MBWU_OFSR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0898	MSMON_MBWU_OFSR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0898	MSMON_MBWU_OFSR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0898	MSMON_MBWU_OFSR_rl

When FEAT_RME is implemented access on this interface are **RO**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

The MSMON OFLOW MSI ADDR H characteristics are:

MSMON_OFLOW_MSI_ADDR_H is a 32-bit read/write register for the high part of the MPAM monitor overflow MSI address.

- `MSMON_OFLOW_MSI_ADDR_H_s` is the high part of the MSI write address for monitor overflow interrupts from Secure monitor instances.
- `MSMON_OFLOW_MSI_ADDR_H_ns` is the high part of the MSI write address for monitor overflow interrupts from Non-secure monitor instances.
- `MSMON_OFLOW_MSI_ADDR_H_rt` is the high part of the MSI write address for monitor overflow interrupts from Root monitor instances.
- `MSMON_OFLOW_MSI_ADDR_H_rl` is the high part of the MSI write address for monitor overflow interrupts from Realm monitor instances.

MSMON_OFLOW_MSI_ADDR_H_s is the high part of the MSI write address for monitor overflow interrupts from Secure monitor instances. MSMON_OFLOW_MSI_ADDR_H_ns is the high part of the MSI write address for monitor overflow interrupts from Non-secure monitor instances. MSMON_OFLOW_MSI_ADDR_H_rt is the high part of the MSI write address for monitor overflow interrupts from Root monitor instances. MSMON_OFLOW_MSI_ADDR_H_rl is the high part of the MSI write address for monitor overflow interrupts from Realm monitor instances.

The power domain of MSMON OFLOW MSI ADDR H is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_ADDR_H are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

MSMON OFLOW MSI ADDR H is a 32-bit register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												MSI_ADDR_H																			

Reserved, RES0.

MSI write address bits[51:32].

The MSMON_OFLOW_MSI_ADDR_L characteristics are:

Purpose

MSMON_OFLOW_MSI_ADDR_L is a 32-bit read/write register for the low part of the MPAM monitor MSI address.

- `MSMON_OFLOW_MSI_ADDR_L_s` is the low part of the MSI write address for overflow interrupts from Secure monitor instances.
- `MSMON_OFLOW_MSI_ADDR_L_ns` is the low part of the MSI write address for overflow interrupts from Non-secure monitor instances.
- `MSMON_OFLOW_MSI_ADDR_L_rt` is the low part of the MSI write address for overflow interrupts from Root monitor instances.
- `MSMON_OFLOW_MSI_ADDR_L_rl` is the low part of the MSI write address for overflow interrupts from Realm monitor instances.

MSMON_OFLOW_MSI_ADDR_L_s is the low part of the MSI write address for overflow interrupts from Secure monitor instances. MSMON_OFLOW_MSI_ADDR_L_ns is the low part of the MSI write address for overflow interrupts from Non-secure monitor instances. MSMON_OFLOW_MSI_ADDR_L_rt is the low part of the MSI write address for overflow interrupts from Root monitor instances. MSMON_OFLOW_MSI_ADDR_L_rl is the low part of the MSI write address for overflow interrupts from Realm monitor instances.

Configuration

The power domain of MSMON_OFLOW_MSI_ADDR_L is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPMV1P1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_ADDR_L are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_ADDR_L is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
 MSI_ADDR_L Bits[1:0]

MSI_ADDR_L, bits [31:2]

MSI write address bits[31:2].

Bits [1:0]

Reads as 0b00.

Access to this field is **RO**.

MSMON_OFLOW_MSI_ATTR, MPAM Monitor Overflow MSI Write Attributes Register

The MSMON_OFLOW_MSI_ATTR characteristics are:

Purpose

MSMON_OFLOW_MSI_ATTR is a 32-bit read/write register that controls MPAM monitor overflow MSI write attributes for MPAM monitor overflows in this MSC.

- ~~MSMON_OFLOW_MSI_ATTR_s controls Secure MPAM monitor overflow MSI writes.~~
- ~~MSMON_OFLOW_MSI_ATTR_ns controls Non-secure MPAM monitor overflow MSI writes.~~
- ~~MSMON_OFLOW_MSI_ATTR_rt controls Root MPAM monitor overflow MSI writes.~~
- ~~MSMON_OFLOW_MSI_ATTR_rl controls Realm MPAM monitor overflow MSI writes.~~

MSMON_OFLOW_MSI_ATTR_s controls Secure MPAM monitor overflow MSI writes. MSMON_OFLOW_MSI_ATTR_ns controls Non-secure MPAM monitor overflow MSI writes. MSMON_OFLOW_MSI_ATTR_rt controls Root MPAM monitor overflow MSI writes. MSMON_OFLOW_MSI_ATTR_rl controls Realm MPAM monitor overflow MSI writes.

Configuration

The power domain of MSMON_OFLOW_MSI_ATTR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_ATTR are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_ATTR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				MSI_SH				MSI_MEMATTR				RES0																		MSIEN	

Bits [31:30]

Reserved, RES0.

MSI_SH, bits [29:28]

Sharability attribute of MSI writes.

MSI_SH	Meaning
0b00	Non-shareable.
0b01	Reserved, CONSTRAINED UNPREDICTABLE.
0b10	Outer Shareable.
0b11	Inner Shareable.

When MSMON_OFLOW_MSI_ATTR.MSI_MEMATTR specifies a Device memory type, the contents of this field are IGNORED and Shareability is effectively Outer Shareable.

MSI_MEMATTR, bits [27:24]

Memory attributes of MSI writes.

Note: This encoding matches the VMSAv8-64 stage 2 MemAttr[3:0] field as described in the Arm ARM, except that the following encodings are Reserved (not UNPREDICTABLE) and behave as Device-nGnRnE: 0b0100, 0b1000, and 0b1100.

MSI_MEMATTR	Meaning
0b0000	Device-nGnRnE.
0b0001	Device-nGnRE.
0b0010	Device-nGRE.
0b0011	Device-GRE.
0b0100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b0101	Normal Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal Inner Write-Through Cacheable, Outer Non-cacheable.
0b0111	Normal Inner Write-Back Cacheable, Outer Non-cacheable.
0b1000	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1001	Normal Inner Non-Cachable, Outer Write-Through Cacheable.
0b1010	Normal Inner Write-Through Cacheable, Outer Write-Through Cachable.
0b1011	Normal Inner Write-Back Cacheable, Outer Write-Through Cachable.
0b1100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1101	Normal Inner Non-cacheable, Outer Write-Back Cacheable.
0b1110	Normal Inner Write-Through Cacheable, Outer Write-Back Cacheable.
0b1111	Normal Inner Write-Back Cacheable, Outer Write-Back Cacheable.

When this field specifies a Device memory type, the contents of MSMON_OFLOW_MSI_ATTR.MSI_SH are IGNORED and Shareability is effectively Outer Shareable.

Device types may be implemented as any Device type with more n characters. For example, if this field is set to 0b0010, an implementation may treat the MSI write as the specified type, Device-nGRE, or as Device-nGnRE or as Device-nGnRnE.

Reserved encodings 0b0100, 0b1000, and 0b1100 must be implemented to behave the same as the 0b0000 encoding.

Bits [23:1]

Reserved, RES0.

MSIEN, bit [0]

Monitor overflow MSI write enable.

MSIEN	Meaning
0b0	MPAM monitor overflow MSI writes are not generated to signal enabled MPAM monitor overflow interrupts. When monitor overflow MSI writes are disabled, hardwired monitor overflow interrupt could be generated if hardwired monitor overflow interrupt is implemented.
0b1	MPAM monitor overflow MSI writes are generated to signal enabled MPAM monitor overflow interrupts. When monitor overflow MSI writes are enabled, hardwired monitor overflow interrupts are not generated.

This enable affects whether a hardwired overflow interrupt is generated.

The reset behaviour of this field is:

- On a MSC reset, this field resets to 0.

Accessing MSMON_OFLOW_MSI_ATTR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_OFLOW_MSI_ATTR_s must be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_ATTR_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_ATTR_rt must be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_ATTR_rl must be accessible from the Realm MPAM feature page.

MSMON_OFLOW_MSI_ATTR_s, MSMON_OFLOW_MSI_ATTR_ns, MSMON_OFLOW_MSI_ATTR_rt, and MSMON_OFLOW_MSI_ATTR_rl must be separate registers.

- The Secure instance (MSMON_OFLOW_MSI_ATTR_s) accesses the monitor overflow MSI write attributes of Secure monitors.
- The Non-secure instance (MSMON_OFLOW_MSI_ATTR_ns) accesses the monitor overflow MSI write attributes of Non-secure monitors.
- The Root instance (MSMON_OFLOW_MSI_ATTR_rt) accesses the monitor overflow MSI write attributes of Root monitors.
- The Realm instance (MSMON_OFLOW_MSI_ATTR_rl) accesses the monitor overflow MSI write attributes of Realm monitors.

MSMON_OFLOW_MSI_ATTR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08EC	MSMON_OFLOW_MSI_ATTR_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08EC	MSMON_OFLOW_MSI_ATTR_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08EC	MSMON_OFLOW_MSI_ATTR_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08EC	MSMON_OFLOW_MSI_ATTR_rl

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

MSMON_OFLOW_MSI_DATA, MPAM Monitor Overflow MSI Write Data Register

The MSMON_OFLOW_MSI_DATA characteristics are:

Purpose

MSMON_OFLOW_MSI_DATA is a 32-bit read/write register for the MPAM monitor overflow MSI data.

- **MSMON_OFLOW_MSI_DATA_s** is the data for the MSI write for monitor overflow from Secure monitor instances.
- **MSMON_OFLOW_MSI_DATA_ns** is the data for the MSI writes for monitor overflow interrupts from Non-secure monitor instances.
- **MSMON_OFLOW_MSI_DATA_rt** is the data for the MSI write for monitor overflow from Root monitor instances.
- **MSMON_OFLOW_MSI_DATA_rl** is the data for the MSI writes for monitor overflow interrupts from Realm monitor instances.

MSMON_OFLOW_MSI_DATA_s is the data for the MSI write for monitor overflow from Secure monitor instances. **MSMON_OFLOW_MSI_DATA_ns** is the data for the MSI writes for monitor overflow interrupts from Non-secure monitor instances. **MSMON_OFLOW_MSI_DATA_rt** is the data for the MSI write for monitor overflow from Root monitor instances. **MSMON_OFLOW_MSI_DATA_rl** is the data for the MSI writes for monitor overflow interrupts from Realm monitor instances.

Configuration

The power domain of MSMON_OFLOW_MSI_DATA is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLOW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_DATA are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_DATA is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MSI_DATA																															

MSI_DATA, bits [31:0]

MSI write data word.

Accessing MSMON_OFLOW_MSI_DATA

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_OFLOW_MSI_DATA_s must be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_DATA_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_DATA_rt must be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_DATA_rl must be accessible from the Realm MPAM feature page.

MSMON_OFLOW_MSI_DATA_s, MSMON_OFLOW_MSI_DATA_ns, MSMON_OFLOW_MSI_DATA_rt, and MSMON_OFLOW_MSI_DATA_rl must be separate registers.

- The Secure instance (MSMON_OFLOW_MSI_DATA_s) accesses the monitor overflow MSI write data of Secure monitors.
- The Non-secure instance (MSMON_OFLOW_MSI_DATA_ns) accesses the monitor overflow MSI write data of Non-secure monitors.
- The Root instance (MSMON_OFLOW_MSI_DATA_rt) accesses the monitor overflow MSI write data of Root monitors.
- The Realm instance (MSMON_OFLOW_MSI_DATA_rl) accesses the monitor overflow MSI write data of Realm monitors.

MSMON_OFLOW_MSI_DATA can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08E8	MSMON_OFLOW_MSI_DATA_s

MSMON_OFLOW_MSI_MPAM, MPAM Monitor Overflow MSI Write MPAM Information Register

The MSMON_OFLOW_MSI_MPAM characteristics are:

Purpose

MSMON_OFLOW_MSI_MPAM is a 32-bit read/write register that sets the MPAM information for a monitor overflow MSI write.

- ~~MSMON_OFLOW_MSI_MPAM_s controls MPAM information labeling of Secure monitor overflow MSI writes.~~
- ~~MSMON_OFLOW_MSI_MPAM_ns controls MPAM information labeling of Non-secure monitor overflow MSI writes.~~
- ~~MSMON_OFLOW_MSI_MPAM_rt controls MPAM information labeling of Root monitor overflow MSI writes.~~
- ~~MSMON_OFLOW_MSI_MPAM_rl controls MPAM information labeling of Realm monitor overflow MSI writes.~~

MSMON_OFLOW_MSI_MPAM_s controls MPAM information labeling of Secure monitor overflow MSI writes.
 MSMON_OFLOW_MSI_MPAM_ns controls MPAM information labeling of Non-secure monitor overflow MSI writes.
 MSMON_OFLOW_MSI_MPAM_rt controls MPAM information labeling of Root monitor overflow MSI writes.
 MSMON_OFLOW_MSI_MPAM_rl controls MPAM information labeling of Realm monitor overflow MSI writes.

Configuration

The power domain of MSMON_OFLOW_MSI_MPAM is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLOW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_MPAM are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_MPAM is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMG								PARTID															

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group property for an MSC monitor overflow MSI write.

The reset behaviour of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition ID for an MSC monitor overflow MSI write.

The PARTID in this field is in the Secure PARTID space in the MSMON_OFLOW_MSI_MPAM_s instance and in the Non-secure PARTID space in the MSMON_OFLOW_MSI_MPAM_ns instance of this register.

The reset behaviour of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

Accessing MSMON_OFLOW_MSI_MPAM

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_OFLOW_MSI_MPAM_s must be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_MPAM_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_MPAM_rt must be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_MPAM_rl must be accessible from the Realm MPAM feature page.

MSMON_OFLOW_MSI_MPAM_s, MSMON_OFLOW_MSI_MPAM_ns, MSMON_OFLOW_MSI_MPAM_rt, and MSMON_OFLOW_MSI_MPAM_rl must be separate registers.

- The Secure instance (MSMON_OFLOW_MSI_MPAM_s) accesses the monitor overflow MSI MPAM information of Secure monitors.
- The Non-secure instance (MSMON_OFLOW_MSI_MPAM_ns) accesses the monitor overflow MSI MPAM information of Non-secure monitors.
- The Root instance (MSMON_OFLOW_MSI_MPAM_rt) accesses the monitor overflow MSI MPAM information of Root monitors.
- The Realm instance (MSMON_OFLOW_MSI_MPAM_rl) accesses the monitor overflow MSI MPAM information of Realm monitors.

MSMON_OFLOW_MSI_MPAM can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08DC	MSMON_OFLOW_MSI_MPAM_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08DC	MSMON_OFLOW_MSI_MPAM_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance

MSMON_OFLOW_SR, MPAM Monitor Overflow Status Register

The MSMON_OFLOW_SR characteristics are:

Purpose

MSMON_OFLOW_SR is a 32-bit read-only register that shows MPAM monitor overflow status for this MSC.

- [MSMON_OFLOW_SR_s](#) gives the status of overflows of Secure MPAM monitors.
- [MSMON_OFLOW_SR_ns](#) gives the status of overflows of Non-secure MPAM monitors.
- [MSMON_OFLOW_SR_rt](#) gives the status of overflows of Root MPAM monitors.
- [MSMON_OFLOW_SR_rl](#) gives the status of overflows of Realm MPAM monitors.

[MSMON_OFLOW_SR_s](#) gives the status of overflows of Secure MPAM monitors. [MSMON_OFLOW_SR_ns](#) gives the status of overflows of Non-secure MPAM monitors. [MSMON_OFLOW_SR_rt](#) gives the status of overflows of Root MPAM monitors. [MSMON_OFLOW_SR_rl](#) gives the status of overflows of Realm MPAM monitors.

Configuration

The power domain of MSMON_OFLOW_SR is IMPLEMENTATION DEFINED.

This register is present only when `MPAMF_MSMON_IDR.HAS_OFLOW_SR == 1`. Otherwise, direct accesses to MSMON_OFLOW_SR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_SR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CSU_OFLOW_PND	MBWU_OFLOW_PND	RES0														RIS_PND15	RIS_PND14	RIS_PND13	RIS_PND12	RIS_PND11	RIS_PND10	RIS_PND9	RIS_PND8	RIS_PND7	RIS_PND6	RIS_PND5	RIS_PND4	RIS_PND3	RIS_PND2	RIS_PND1	RIS_PND0

CSU_OFLOW_PND, bit [31]

At least one cache storage usage monitor has OFLOW_STATUS of 1 in [MSMON_CFG_CSU_CTL](#).

CSU_OFLOW_PND	Meaning
0b0	There are no cache storage usage monitor instances where MSMON_CFG_CSU_CTL.OFLOW_STATUS is 1.
0b1	MSMON_CFG_CSU_CTL for at least one of the cache storage usage monitor instances has OFLOW_STATUS set to 1.

This field clears when [MSMON_CFG_CSU_CTL.OFLOW_STATUS](#) has been reset to 0 for all CSU monitor instances in this MSC.

MBWU_OFLOW_PND, bit [30]

At least one memory bandwidth usage monitor instance has OFLOW_STATUS or OFLOW_STATUS_L of 1 in [MSMON_CFG_MBWU_CTL](#).

MBWU_OFLOW_PND	Meaning
0b0	There are no memory bandwidth usage monitor instances where MSMON_CFG_MBWU_CTL.OFLOW_STATUS is 1.
0b1	MSMON_CFG_MBWU_CTL for at least one of the memory bandwidth usage monitor instances has either OFLOW_STATUS or OFLOW_STATUS_L set to 1.

This field clears when [MSMON_CFG_MBWU_CTL.OFLOW_STATUS](#) and [MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L](#) have been reset to 0 for all MBWU monitor instances in this MSC.

Bits [29:16]

Reserved, RES0.

RIS_PND<r>, bit [r], for r = 15 to 0

Overflow status by RIS.

RIS_PND<r>	Meaning
0b0	RIS r has no unread overflows of any type of monitor.
0b1	RIS r has at least one unread overflow in at least one of the monitor types.

Combined with the CSU_OFLOW_PND and MBWU_OFLOW_PND flags in this register, an interrupt service routine could poll only the monitor types indicated in monitors for the resource instances flagged in this field.

Bit r is set when any monitor instance of any type in resource instance r has [OFLOW_STATUS](#) or [OFLOW_STATUS_L](#) set to 1.

Accessing MSMON_OFLOW_SR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- [MSMON_OFLOW_SR_s](#) must be accessible from the Secure MPAM feature page.
- [MSMON_OFLOW_SR_ns](#) must be accessible from the Non-secure MPAM feature page.
- [MSMON_OFLOW_SR_rt](#) must be accessible from the Root MPAM feature page.
- [MSMON_OFLOW_SR_rl](#) must be accessible from the Realm MPAM feature page.

[MSMON_OFLOW_SR_s](#), [MSMON_OFLOW_SR_ns](#), [MSMON_OFLOW_SR_rt](#), and [MSMON_OFLOW_SR_rl](#) must be separate registers.

- The Secure instance ([MSMON_OFLOW_SR_s](#)) accesses the monitor overflow status summary of Secure monitors.
- The Non-secure instance ([MSMON_OFLOW_SR_ns](#)) accesses the monitor overflow status summary of Non-secure monitors.
- The Root instance ([MSMON_OFLOW_SR_rt](#)) accesses the monitor overflow status summary of Root monitors.
- The Realm instance ([MSMON_OFLOW_SR_rl](#)) accesses the monitor overflow status summary of Realm monitors.

MSMON_OFLOW_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08F0	MSMON_OFLOW_SR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08F0	MSMON_OFLOW_SR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08F0	MSMON_OFLOW_SR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08F0	MSMON_OFLOW_SR_rl

When FEAT_RME is implemented access on this interface are **RO**.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS **Lock.lock**.

Configuration

External register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [OSLAR_EL1\[31:0\]](#).

OSLAR_EL1 is in the Core power domain.

The OS **Lock.lock** can also be locked or unlocked using ~~the AArch32 System register~~ [DBGOSLAR](#).

If FEAT_Debugv8p2 is not implemented, it is IMPLEMENTATION DEFINED whether external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

If FEAT_Debugv8p2 is implemented, external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

Attributes

OSLAR_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															OSLK

Bits [31:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS **Lock.lock**.

Use [EDPRSR](#).OSLK to check the current status of the lock.

Accessing OSLAR_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

OSLAR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x300	OSLAR_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **WO**.
- When IsCorePowered(), !DoubleLockStatus(), !AllowExternalDebugAccess() and FEAT_Debugv8p2 is not implemented accesses to this register are **IMPDEF**.
- Otherwise accesses to this register generate an error response.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR_EL0](#), increments.

Configuration

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMCCFILTR_EL0\[31:0\]](#).

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCCFILTR\[31:0\]](#).

PMCCFILTR_EL0 is in the Core power domain.

On a Warm or Cold reset, RW fields in this register reset to:

- Architecturally UNKNOWN values if the reset is to an Exception level that is using AArch64.
- 0 if the reset is to an Exception level that is using AArch32.

The register is not affected by an External debug reset.

Attributes

PMCCFILTR_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P	U	NSK	NSU	NSH	M	RES0	SH	RES0	RLK	RLU	RLH											RES0									

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMCCFILTR_EL0.RLK bit.

P	Meaning
0b0	Count cycles in EL1.
0b1	Do not count cycles in EL1.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMCCFILTR_EL0.RLU bit.

U	Meaning
0b0	Count cycles in EL0.
0b1	Do not count cycles in EL0.

NSK, bit [29]**When EL3 is implemented:**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

Otherwise:

Reserved, RES0.

NSU, bit [28]**When EL3 is implemented:**

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

Otherwise:

Reserved, RES0.

NSH, bit [27]**When EL2 is implemented:**

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMCCFILTR_EL0.RLH bit.

NSH	Meaning
0b0	Do not count cycles in EL2.
0b1	Count cycles in EL2.

Otherwise:

Reserved, RES0.

M, bit [26]**When EL3 is implemented:**

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

Note

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]

When FEAT_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is disabled, this field is RES0.

Note

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

Otherwise:

Reserved, RES0.

BitBits [23:0]

Reserved, RES0.

RLK, bit [22]

When FEAT_RME is implemented:

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Realm EL1 are counted.

Otherwise, cycles in Realm EL1 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Realm EL0 are counted.

Otherwise, cycles in Realm EL0 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]

When FEAT_RME is implemented:

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Realm EL2 are counted.

Otherwise, cycles in Realm EL2 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCFILTR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x47C	PMCCFILTR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/06/2021 1509:2139; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

Purpose

Contains PMU-specific configuration data.

Configuration

PMCFGR is in the Core power domain.

Attributes

PMCFGR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
NCG				RES0				FZO		RES0		UEN		WTNA		EX		CCD		CC		SIZE						N					

NCG, bits [31:28]

This feature is not supported, so this field is RAZ.

Bits [27:22]

Reserved, RES0.

FZO, bit [21]

Freeze-on-overflow supported. Defined values are:

FZO	Meaning
0b0	Freeze-on-overflow mechanism is not supported. PMCR_ELO .FZO is RES0.
0b1	Freeze-on-overflow mechanism is supported. PMCR_ELO .FZO is RW.

FEAT_PMUv3p7 implements the functionality added by the value 0b1.

From Armv8.7, if FEAT_PMUv3 is implemented, the only permitted value is 0b1.

Bit [20]

Reserved, RES0.

UEN, bit [19]

User-mode Enable Register supported. [PMUSERENR_ELO](#) is not visible in the external debug interface, so this bit is RAZ.

WT, bit [18]

This feature is not supported, so this bit is RAZ.

NA, bit [17]

This feature is not supported, so this bit is RAZ.

EX, bit [16]

Export supported. Value is IMPLEMENTATION DEFINED.

EX	Meaning
0b0	PMCR_ELO.X is RES0.
0b1	PMCR_ELO.X is read/write.

Access to this field is **RO**.

CCD, bit [15]

Cycle counter has prescale.

This is RES1 if AArch32 is supported ~~at any Exception level~~, and RAZ otherwise.

CCD	Meaning
0b0	PMCR_ELO.D is RES0.
0b1	PMCR_ELO.D is read/write.

CC, bit [14]

Dedicated cycle counter (counter 31) supported. This bit is RAO.

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8, the largest counter is 64-bits, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8, the counters are a doubleword-aligned addresses.

N, bits [7:0]

Number of counters implemented in addition to the cycle counter, [PMCCNTR_ELO](#). The maximum number of event counters is 31.

N	Meaning
0x00	Only PMCCNTR_ELO implemented.
0x01	PMCCNTR_ELO plus one event counter implemented.

and so on up to 0b00011111, which indicates [PMCCNTR_ELO](#) and 31 event counters implemented.

Accessing PMCFGR**Note**

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCFGR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE00	PMCFGR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch32 System register [PMCR\[7:0\]](#).

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch64 System register [PMCR_EL0\[7:0\]](#).

PMCR_EL0 is in the Core power domain.

This register is only partially mapped to the internal [PMCR](#) System register. An external agent must use other means to discover the information held in [PMCR\[31:11\]](#), such as accessing [PMCFGR](#) and the ID registers.

Attributes

PMCR_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RAZ/WI																					RES0	FZO	RES0	LP	LC	DP	X	D	C	P	E

Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When [FEAT_PMUv3p7](#) is implemented:

Freeze-on-overflow. Stop event counters on overflow.

FZO	Meaning
0b0	Do not freeze on overflow.
0b1	Event counters do not count when PMOVSLR_EL0 [(N-1):0] is nonzero, where N is the value of MDCR_EL2 .HPMN if EL2 is implemented, and PMCR_EL0.N otherwise.

If EL2 is implemented, then:

- This bit affects the operation of event counters in the range [0 .. ([MDCR_EL2](#).HPMN-1)].
- If [MDCR_EL2](#).HPMN is less than PMCR_EL0.N:

- This bit does not affect the operation of event counters in the range [[MDCR_EL2](#).HPMN .. (PMCR_EL0.N-1)].
- The operation of this bit ignores the values of [PMOVSCLR_EL0](#)[(PMCR_EL0.N-1):[MDCR_EL2](#).HPMN].
- This applies even when EL2 is disabled in the current Security state.

This bit does not affect the operation of [PMCCNTR_EL0](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [63:0].

If EL2 is implemented and [MDCR_EL2](#).HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [[MDCR_EL2](#).HPMN:(PMCR_EL0.N-1)].

If EL2 is implemented and [HDCR](#).HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [[HDCR](#).HPMN..(PMCR_EL0.N-1)].

Note

The effect of [MDCR_EL2](#).HPMN or [HDCR](#).HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of [MDCR_EL2](#).HPMN or [HDCR](#).HPMN.

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

Otherwise:

Reserved, RES0.

LC, bit [6]

When AArch32 is supported at **EL0any-Exception level**:

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0 [31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0 [63:0].

Arm deprecates use of [PMCR_EL0.LC](#) = 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

DP	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this bit.
0b1	When event counting for counters in the range [0.. MDCR_EL2 .HPMN-1]) is prohibited, cycle counting by PMCCNTR_EL0 is disabled.

For more information, see 'Prohibiting event counting'.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

When AArch32 is supported at **EL0any Exception level**:

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR_EL0 counts every clock cycle.
0b1	When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR_EL0 to zero.

Note

Resetting [PMCCNTR_EL0](#) does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is **WO/RAZ**.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

P	Meaning
0b0	No action.
0b1	Reset all event counters, not including PMCCNTR_EL0 , to zero.

Note

Resetting the event counters does not change the event counter overflow bits. If FEAT_PMUv3p5 is implemented, the value of [MDCR_EL2.HLP](#), or PMCR_EL0.LP is ignored and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

E, bit [0]

Enable.

E	Meaning
0b0	All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0 , are disabled.
0b1	All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0 , are enabled by PMCNTENSET_EL0 .

If EL2 is implemented then:

- If EL2 is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If PMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [PMN..(PMCR_EL0.N-1)].

If EL2 is not implemented, PMN is PMCR_EL0.N.

Note

The effect of the following fields on the operation of this bit applies if EL2 is implemented regardless of whether EL2 is enabled in the current Security state:

- [HDCR](#).HPMN. See the description of [HDCR](#).HPMN for more information.
- [MDCR_EL2](#).HPMN. See the description of [MDCR_EL2](#).HPMN for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMCR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE04	PMCR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/06/2021 1509:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMEVCNTR<n>_EL0\[31:0\]](#).

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVCNTR<n>\[31:0\]](#).

PMEVCNTR<n>_EL0 is in the Core power domain.

Attributes

PMEVCNTR<n>_EL0 is a:

- 64-bit register when FEAT_PMUv3p5 is implemented
- 32-bit register otherwise

Field descriptions

When FEAT_PMUv3p5 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Event counter n																															
Event counter n																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If the highest implemented Exception level is using AArch32, the optional external interface to the performance monitors is implemented, and the [PMCR](#).LP and [HDCR](#).HLP bits are RAZ/WI, then locations in the external interface to the performance monitors that map to PMEVCNTR<n>_EL0[63:32] return UNKNOWN values on reads.

If the implementation does not support AArch64 [at any Exception level](#), bits [63:32] of the event counters are not required to be implemented.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Event counter n																															

(old)

htmldiff from-

(new)

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMEVTYPER<n>_EL0\[31:0\]](#).

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVTYPER<n>\[31:0\]](#).

PMEVTYPER<n>_EL0 is in the Core power domain.

If event counter n is not implemented:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess(), accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

Attributes

PMEVTYPER<n>_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P	U	NSK	NSUN	NSH	M	MT	SH	T	RLK	RLU	RLH	RES0				evtCount[15:10]						evtCount[9:0]									

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMEVTYPER<n>_EL0.RLK bit.

P	Meaning
0b0	Count events in EL1.
0b1	Do not count events in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMEVTYPER<n>_EL0.RLU bit.

U	Meaning
0b0	Count events in EL0.
0b1	Do not count events in EL0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMEVTYPER<n>_EL0.RLH bit.

NSH	Meaning
0b0	Do not count events in EL2.
0b1	Count events in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

EL3 filtering bit.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in EL3 are counted.

Otherwise, events in EL3 are not counted.

Most applications can ignore this field and set its value to 0b0.

Note

This field is not visible in the AArch32 [PMEVTYPER<n>](#) System register.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]

When (FEAT_MTPMU is implemented and enabled) or an IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

Note

- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
 - Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.
-

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]**When FEAT_SEL2 is implemented and EL3 is implemented:**

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

Note

This field is not visible in the AArch32 [PMEVTYPER<n>](#) System register.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

T, bit [23]**When FEAT_TME is implemented:**

Transactional state filtering bit. Controls counting in Transactional state.

T	Meaning
0b0	This bit has no effect on the filtering of events.
0b1	Do not count events in Transactional state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]**When FEAT_RME is implemented:**

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Realm EL1 are counted.

Otherwise, events in Realm EL1 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]**When FEAT_RME is implemented:**

Realm EL0 (~~unprivileged~~Unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Realm EL0 are counted.

Otherwise, events in Realm EL0 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]

When FEAT_RME is implemented:

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Realm EL2 are counted.

Otherwise, events in Realm EL2 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter [PMEVCNTR<n>_EL0](#).

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.

UNPREDICTABLE means the event must not expose privileged information.

The reset behaviour of this field is:

- ## Accessing PMEVTYPER<n>_ELO

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Component	Offset	Instance
PMU	0x400 + (4 * n)	PMEVTPER<n>_EL0

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation.

Configuration

PMMIR is in the Core power domain.

This register is present only when FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are RES0.

Attributes

PMMIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												BUS_WIDTHSLOTS				BUS_SLOTS				SLOTS											

Bits [31:208]

Reserved, RES0.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as $\text{Log}_2(\text{number of bytes}) + 1$. Defined values are:

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see [SW_INCR](#).

Configuration

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMSWINC_EL0\[31:0\]](#).

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMSWINC\[31:0\]](#).

PMSWINC_EL0 is in the Core power domain.

Implementation of this register is OPTIONAL.

If this register is implemented, use of it is deprecated.

If 1 is written to bit [n] from the external debug interface, it is CONSTRAINED UNPREDICTABLE whether or not a SW_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

Attributes

PMSWINC_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bit [31]

Reserved, RES0.

P<n>, bit [n], for n = 30 to 0

Event counter software increment bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR](#).N is less than 31, bits [30:[PMCFGR](#).N] are WI.

P<n>	Meaning
0b0	No action. The write to this bit is ignored.
0b1	It is CONSTRAINED UNPREDICTABLE whether a SW_INCR event is generated for event counter n.

Accessing PMSWINC_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMSWINC_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xCA0	PMSWINC_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

TRCIDR0, ID Register 0

The TRCIDR0 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR0 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR0\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR0 are RES0.

Attributes

TRCIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9
RES0	COMMTRANS	COMMOPT	TSSIZE	TSMARK	RES0	TRCEXDATA	QSUPP	QFILT	CONDTYPE	NUMEVENT	RETSTAC											

Bit [31]

Reserved, RES0.

COMMTRANS, bit [30]

Transaction Start element behavior.

COMMTRANS	Meaning
0b0	Transaction Start elements are P0 elements.
0b1	Transaction Start elements are not P0 elements.

COMMOPT, bit [29]

Indicates the contents and encodings of Cycle count packets.

COMMOPT	Meaning
0b0	Commit mode 0.
0b1	Commit mode 1.

The Commit mode defines the contents and encodings of Cycle Count packets, in particular how Commit elements are indicated by these packets. See the descriptions of these packets for more details.

Accessing this field has the following behavior:

- **RAO/WI** if all of the following are true:
 - `TRCIDR0.TRCCCI` == 1
 - `TRCIDR8.MAXSPEC` == 0x0
- When `TRCIDR0.TRCCCI` == 0, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

TSSIZE, bits [28:24]

Indicates that the trace unit implements Global timestamping and the size of the timestamp value.

TSSIZE	Meaning
0b00000	Global timestamping not implemented.
0b01000	Global timestamping implemented with a 64-bit timestamp value.

All other values are reserved.

This field reads as 0b01000.

TSMARK, bit [23]

When FEAT_ETEv1p1 is implemented:

Indicates whether Timestamp Marker elements are generated.

TSMARK	Meaning
0b0	Timestamp Marker elements are not generated.
0b1	Timestamp Marker elements are generated.

Otherwise:

Reserved, RES0.

Bits [22:18]

Reserved, RES0.

TRCEXDATA, bit [17]

When TRCIDR0.TRCDATA != 0b00:

Indicates if the trace unit implements tracing of data transfers for exceptions and exception returns. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

TRCEXDATA	Meaning
0b0	Tracing of data transfers for exceptions and exception returns not implemented.
0b1	Tracing of data transfers for exceptions and exception returns implemented.

Otherwise:

Reserved, RES0.

QSUPP, bits [16:15]

Indicates that the trace unit implements Q element support.

QSUPP	Meaning
0b00	Q element support is not implemented.
0b01	Q element support is implemented, and only supports Q elements with instruction counts.
0b10	Q element support is implemented, and only supports Q elements without instruction counts.
0b11	Q element support is implemented, and supports: <ul style="list-style-type: none"> Q elements with instruction counts. Q elements without instruction counts.

QFILT, bit [14]

Indicates if the trace unit implements Q element filtering.

QFILT	Meaning
0b0	Q element filtering is not implemented.
0b1	Q element filtering is implemented.

If TRCIDR0.QSUPP == 0b00 then this field is 0.

CONDTYPE, bits [13:12]

When TRCIDR0.TRCCOND == 1:

Indicates how conditional instructions are traced. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

CONDTYPE	Meaning
0b00	Conditional instructions are traced with an indication of whether they pass or fail their condition code check.
0b01	Conditional instructions are traced with an indication of the APSR condition flags.

All other values are reserved.

Otherwise:

Reserved, RES0.

NUMEVENT, bits [11:10]

When TRCIDR4.NUMRSPAIR == 0b0000:

Indicates the number of ETEEvents implemented.

NUMEVENT	Meaning
0b00	The trace unit supports 0 ETEEvents.

All other values are reserved.

When TRCIDR4.NUMRSPAIR != 0b0000:

Indicates the number of ETEEvents implemented.

NUMEVENT	Meaning
0b00	The trace unit supports 1 ETEEvent.
0b01	The trace unit supports 2 ETEEvents.
0b10	The trace unit supports 3 ETEEvents.
0b11	The trace unit supports 4 ETEEvents.

Otherwise:

Reserved, RES0.

RETSTACK, bit [9]

Indicates if the trace unit supports the return stack.

RETSTACK	Meaning
0b0	Return stack not implemented.
0b1	Return stack implemented.

Bit [8]

Reserved, RES0.

TRCCCI, bit [7]

Indicates if the trace unit implements cycle counting.

TRCCCI	Meaning
0b0	Cycle counting not implemented.
0b1	Cycle counting implemented.

This field reads as 1.

TRCCOND, bit [6]

Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.

TRCCOND	Meaning
0b0	Conditional instruction tracing not implemented.
0b1	Conditional instruction tracing implemented.

This field reads as 0.

TRCBB, bit [5]

Indicates if the trace unit implements branch broadcasting.

TRCBB	Meaning
0b0	Branch broadcasting not implemented.
0b1	Branch broadcasting implemented.

This field reads as 1.

TRCDATA, bits [4:3]

Indicates if the trace unit implements data tracing. Data tracing is not implemented in ETE and this field is reserved for other trace architectures.

TRCDATA	Meaning
0b00	Data tracing not implemented.
0b11	Data tracing implemented.

All other values are reserved.

This field reads as 0b00.

INSTP0, bits [2:1]

Indicates if load and store instructions are P0 instructions. Load and store instructions as P0 instructions is not implemented in ETE and this field is reserved for other trace architectures.

INSTP0	Meaning
0b00	Load and store instructions are not P0 instructions.
0b11	Load and store instructions are P0 instructions.

All other values are reserved.

This field reads as 0b00.

Bit [0]

Reserved, RES1.

Accessing TRCIDR0

TRCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1E0	TRCIDR0

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:09:2239; 2a17f7750cfd1ab239f20f6cf29877ba8041794f4f5dd962f4e34e1ac282f76da4d6e7fc4cab087e

TRCVICTLR, ViewInst Main Control Register

The TRCVICTLR characteristics are:

Purpose

Controls instruction trace filtering.

Configuration

External register TRCVICTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCVICTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCVICTLR are RES0.

Attributes

TRCVICTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
RES0	EXLEVEL_RL_EL2	EXLEVEL_RL_EL1	EXLEVEL_RL_EL0	RES0	EXLEVEL_NS_EL2	EXLEVEL_NS_EL1	EXLEVEL_NS_EL0	EXLEVEL_RL_EL2	EXLEVEL_RL_EL1	EXLEVEL_RL_EL0	EXLEVEL_NS_EL2

Bits [31:27]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [26]

When TRCIDR6.EXLEVEL_RL_EL2 == 1:

Filter instruction trace for EL2 in Realm state.

EXLEVEL_RL_EL2	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit generates instruction trace for EL2 in Realm state.
	When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit does not generate instruction trace for EL2 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit does not generate instruction trace for EL2 in Realm state.
	When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit generates instruction trace for EL2 in Realm state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [25]**When TRCIDR6.EXLEVEL_RL_EL1 == 1:**

Filter instruction trace for EL1 in Realm state.

EXLEVEL_RL_EL1	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit generates instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit does not generate instruction trace for EL1 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit does not generate instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit generates instruction trace for EL1 in Realm state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_ELO, bit [24]**When TRCIDR6.EXLEVEL_RL_ELO == 1:**

Filter instruction trace for EL0 in Realm state.

EXLEVEL_RL_ELO	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_ELO is 0 the trace unit generates instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_ELO is 1 the trace unit does not generate instruction trace for EL0 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_ELO is 0 the trace unit does not generate instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_ELO is 1 the trace unit generates instruction trace for EL0 in Realm state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]**When Non-secure EL2 is implemented:**

Filter instruction trace for EL2 in Non-secure state.

EXLEVEL_NS_EL2	Meaning
0b0	The trace unit generates instruction trace for EL2 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL2 in Non-secure state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [21]

When Non-secure EL1 is implemented:

Filter instruction trace for EL1 in Non-secure state.

EXLEVEL_NS_EL1	Meaning
0b0	The trace unit generates instruction trace for EL1 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL1 in Non-secure state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_ELO, bit [20]

When Non-secure ELO is implemented:

Filter instruction trace for ELO in Non-secure state.

EXLEVEL_NS_ELO	Meaning
0b0	The trace unit generates instruction trace for ELO in Non-secure state.
0b1	The trace unit does not generate instruction trace for ELO in Non-secure state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [19]

When EL3 is implemented:

Filter instruction trace for EL3.

EXLEVEL_S_EL3	Meaning
0b0	The trace unit generates instruction trace for EL3.
0b1	The trace unit does not generate instruction trace for EL3.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [18]

When EL2 is implemented and FEAT_SEL2 is implemented:

Filter instruction trace for EL2 in Secure state.

EXLEVEL_S_EL2	Meaning
0b0	The trace unit generates instruction trace for EL2 in Secure state.
0b1	The trace unit does not generate instruction trace for EL2 in Secure state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [17]

When Secure EL1 is implemented:

Filter instruction trace for EL1 in Secure state.

EXLEVEL_S_EL1	Meaning
0b0	The trace unit generates instruction trace for EL1 in Secure state.
0b1	The trace unit does not generate instruction trace for EL1 in Secure state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [16]

When Secure EL0 is implemented:

Filter instruction trace for EL0 in Secure state.

EXLEVEL S_ELO	Meaning
0b0	The trace unit generates instruction trace for ELO in Secure state.
0b1	The trace unit does not generate instruction trace for ELO in Secure state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:12]

Reserved, RES0.

TRCERR, bit [11]

When TRCIDR3.TRCERR == 1:

Controls the forced tracing of System Error exceptions.

TRCERR	Meaning
0b0	Forced tracing of System Error exceptions is disabled.
0b1	Forced tracing of System Error exceptions is enabled.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCRESET, bit [10]

Controls the forced tracing of PE Resets.

TRCRESET	Meaning
0b0	Forced tracing of PE Resets is disabled.
0b1	Forced tracing of PE Resets is enabled.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SSSTATUS, bit [9]

ViewInst start/stop function status.

SSSTATUS	Meaning
0b0	Stopped State. The ViewInst start/stop function is in the stopped state.
0b1	Started State. The ViewInst start/stop function is in the started state.

Before software enables the trace unit, it must write to this field to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this field to 1. Arm recommends that the value of this field is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR.SSSTATUS is UNKNOWN and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing TRCPRGCTLR.EN or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- RES1** if all of the following are true:
 - TRCIDR4.NUMACPAIRS_{ext} - TRCIDR4.NUMACPAIRS == 0b0000'0000'
 - TRCIDR4.NUMPC_{ext} - TRCIDR4.NUMPC == 0b0000'0000'
- Otherwise, access to this field is **RW**.

Bit [8]

Reserved, RES0.

EVENT_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

EVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCVICTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCVICTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT.SEL[4] is RES0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors. TRCVICTLR.EVENT.TYPE controls whether TRCVICTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

When TRCIDR4.NUMRSPAIR == 0b0000:

This field is reserved:

- Bits [4:1] are RES0.
- Bit [0] is RES1.

Otherwise:

Reserved, RES0.

Accessing TRCVICTLR

Must be programmed.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCVICTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x080	TRCVICTLR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.
